- Executing BREAK 0 results in a bad break exception.

22.8.5 CALL

Syntax:

```
CALL32{EX}{a} {@}R1 {Immed32|Index32}
CALL64{EX}{a} Immed64
```

Description

The CALL instruction pushes the address of the following instruction on the stack and jumps to a subroutine. The subroutine may be either EBC or native code, and may be to an absolute or IP-relative address. CALL32 is used to jump directly to EBC code within a given application, whereas CALLEX is used to jump to external code (either native or EBC), which requires thunking. Functionally, the CALL does the following:

```
R0 = R0 - 8;
PUSH64 ReturnAddress
if (Opcode.ImmedData64Bit) {
  if (Operands.EbcCall) {
    IP = Immed64;
  } else {
    NativeCall (Immed64);
  }
} else {
  if (Operand1 != R0) {
    Addr = Operand1;
  } else {
    Addr = Immed32;
  }
  if (Operands.EbcCall) {
    if (Operands.RelativeAddress) {
      IP += Addr + SizeOfThisInstruction;
    } else {
      IP = Addr
    }
  } else {
    if (Operands.RelativeAddress) {
      NativeCall (IP + Addr)
    } else {
      NativeCall (Addr)
   }
 }
```

Operation:

```
R0 <= R0 - 16
[R0] <= IP + SizeOfThisInstruction
IP <= IP + SizeOfThisInstruction + Operand 1 (relative CALL)
IP <= Operand 1 (absolute CALL)
```

Table 22.13: CALL Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index data absent 1 = Immediate/index data present
	6	0 = CALL32 with 32-bit immediate data/index if present 1 = CALL64 with 64-bit immediate data
	0..5	Opcode = 0x03
1	Bit	Description
	6..7	Reserved = 0

continues on next page

Table 22.13 – continued from previous page

	5	0 = Call to EBC 1 = Call to native code
	4	0 = Absolute address 1 = Relative address
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..5	Optional 32-bit index/immediate for CALL32	
2..9	Required 64-bit immediate data for CALL64	

BEHAVIOR AND RESTRICTIONS

- For the CALL32 forms, if Operand 1 is indirect, then the immediate data is interpreted as an index, and the Operand 1 value is fetched from memory address [R1 + Index32].
- For the CALL32 forms, if Operand 1 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 1 register contents such that Operand 1 = R1 + Immed32.
- For the CALLEX forms, the VM must fix up the stack pointer and execute a call to native code in a manner compatible with the native code such that the callee is able to access arguments passed on the VM stack..
- For the CALLEX forms, the value returned by the callee should be returned in R7.
- For the CALL64 forms, the Operand 1 fields are ignored.
- If Byte7:Bit6 = 1 (CALL64), then Byte1:Bit4 is assumed to be 0 (absolute address)
- For CALL32 forms, if Operand 1 register = R0, then the register operand is ignored and only the immediate data is used in the calculation of the call address.
- Prior to the call, the VM will decrement the stack pointer R0 by 16 bytes, and store the 64-bit return address on the stack.
- Offsets for relative calls are relative to the address of the instruction following the CALL instruction.

22.8.6 CMP

Syntax

```
CMP[32|64][eq|lte|gte|ulte|ugte] R1, {@}R2 {Index16|Immed16}
```

Description

The CMP instruction is used to compare Operand 1 to Operand 2. Supported comparison modes are =, <=, >=, unsigned <=, and unsigned >=. The comparison size can be 32 bits (CMP32) or 64 bits (CMP64). The effect of this instruction is to set or clear the condition code bit in the Flags register per the comparison results. The operands are compared as signed values except for the CMPulte and CMPugte forms.

Operation:

```
CMPeq: Flags.C <= (Operand 1 == Operand 2)
CMPlte: Flags.C <= (Operand 1 <= Operand 2)
CMPgte: Flags.C <= (Operand 1 >= Operand 2)
CMPulte: Flags.C <= (Operand 1 <= Operand 2) (unsigned)
CMPugte: Flags.C <= (Operand 1>= Operand 2) (unsigned)
```

Table 22.14: CMP Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index data absent 1 = Immediate/index data present
	6	0 = 32-bit comparison 1 = 64-bit comparison
	0..5	Opcode 0x05 = CMPeq compare equal 0x06 = CMPlte compare signed less then/equal 0x07 = CMPgte compare signed greater than/equal 0x08 = CMPulte compare unsigned less than/equal 0x09 = CMPugte compare unsigned greater than/equal
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	Reserved = 0
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the register contents such that Operand 2 = R2 + Immed16.
- Only register direct is supported for Operand 1.

22.8.7 CMPI

Syntax

```
CMPI[32|64]{w|d}[eq|lte|gte|ulte|ugte] {@}R1 {Index16}, Immed16|Immed32
```

Description

Compares two operands, one of which is an immediate value, for =, <=, >=, unsigned <=, or unsigned >=, and sets or clears the condition flag bit in the Flags register accordingly. Comparisons can be performed on a 32-bit (CMPI32) or 64-bit (CMPI64) basis. The size of the immediate data can be either 16 bits (CMPIw) or 32 bits (CMPId).

Operation:

```
CMPIeq: Flags.C <= (Operand 1 == Operand 2)
CMPIlte: Flags.C <= (Operand 1 <= Operand 2)
CMPIgte: Flags.C <= (Operand 1 >= Operand 2)
CMPIulte: Flags.C <= (Operand 1 <= Operand 2)
CMPIugte: Flags.C <= (Operand 1>= Operand 2)
```

Table 22.15: CMPI Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = 16-bit immediate data 1 = 32-bit immediate data
	6	0 = 32-bit comparison 1 = 64-bit comparison
	0..5	Opcode 0x2D = CMPIeq compare equal 0x2E = CMPIlte compare signed less then/equal 0x2F = CMPIgte compare signed greater than/equal 0x30 = CMPIulte compare unsigned less than/equal 0x31 = CMPIugte compare unsigned greater than/equal
1	Bit	Description
	5..7	Reserved = 0
	4	0 = Operand 1 index absent 1 = Operand 1 index present
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit Operand 1 index	

continues on next page

Table 22.15 – continued from previous page

2..3/4..5	16-bit immediate data	
2..5/4..7	32-bit immediate data	

Behaviors and Restrictions

- The immediate data is fetched as a signed value.
- If the immediate data is smaller than the comparison size, then the immediate data is sign-extended appropriately.
- If Operand 1 is direct, and an Operand 1 index is specified, then an instruction encoding exception is generated.

22.8.8 DIV

Syntax:

```
DIV[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Performs a divide operation on two signed operands and stores the result to Operand 1. The operation can be performed on either 32-bit (DIV32) or 64-bit (DIV64) operands.

Operation:

```
Operand 1 <= Operand 1 / Operand 2
```

Table 22.16: DIV Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index absent 1 = Immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x10
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as a signed value at address [R2+ Index16].
- If Operand 2 is direct, then the immediate data is considered a signed value and is added to the register contents such that Operand 2 = R2 + Immed16
- If the instruction is DIV32 form, and Operand 1 is direct, then the upper 32 bits of the result are set to 0 before storing to the Operand 1 register.
- A divide-by-0 exception occurs if Operand 2 = 0.

22.8.9 DIVU

Syntax:

```
DIVU[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Performs a divide operation on two unsigned operands and stores the result to Operand 1. The operation can be performed on either 32-bit (DIVU32) or 64-bit (DIVU64) operands.

Operation:

```
Operand 1 <= Operand 1 / Operand 2
```

Table 22.17: DIVU Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index absent 1 = Immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x11
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the value is fetched from memory as an unsigned value at address [R2+ Index16].
- If Operand 2 is direct, then the immediate data is considered an unsigned value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16
- For the DIVU32 form, if Operand 1 is direct then the upper 32 bits of the result are set to 0 before storing back to the Operand 1 register.
- A divide-by-0 exception occurs if Operand 2 = 0.

22.8.10 EXTNDB

Syntax:

```
EXTNDB[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Sign-extend a byte value and store the result to Operand 1. The byte can be signed extended to 32 bits (EXTNDB32) or 64 bits (EXTNDB64).

Operation:

```
Operand 1 <= (sign extended) Operand 2
```

Table 22.18: EXTNDB Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index absent 1 = Immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x1A
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the byte Operand 2 value is fetched from memory as a signed value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value, is added to the signed-extended byte from the Operand 2 register, and the byte result is sign extended to 32 or 64 bits.
- If the instruction is EXTNDB32 and Operand 1 is direct, then the 32-bit result is stored in the Operand 1 register with the upper 32 bits cleared.

22.8.11 EXTNDD

Syntax:

```
EXTNDD[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Sign-extend a 32-bit Operand 2 value and store the result to Operand 1. The Operand 2 value can be extended to 32 bits (EXTNDD32) or 64 bits (EXTNDD64).

Operation

```
Operand 1 <= (sign extended) Operand 2
```

Table 22.19: EXTNDD Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index absent 1 = Immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x1C
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the 32-bit value is fetched from memory as a signed value at address [R2 + Index16].

- If Operand 2 is direct, then the immediate data is considered a signed immediate value such that Operand 2 = R2 + Immed16, and the value is sign extended to 32 or 64 bits accordingly.
- If the instruction is EXTNDD32 and Operand 1 is direct, then the result is stored in the Operand 1 register with the upper 32 bits cleared.

22.8.12 EXTNDW

Syntax

```
EXTNDW[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Sign-extend a 16-bit Operand 2 value and store the result back to Operand 1. The value can be signed extended to 32 bits (EXTNDW32) or 64 bits (EXTNDW64).

Operation

```
Operand 1 <= (sign extended) Operand 2
```

Table 22.20: EXTNDW Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index absent 1 = Immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x1B
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the word value is fetched from memory as a signed value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value such that Operand 2 = R2 + Immed16, and the value is sign extended to 32 or 64 bits accordingly.

- If the instruction is EXTNDW32 and Operand 1 is direct, then the 32-bit result is stored in the Operand 1 register with the upper 32 bits cleared.

22.8.13 JMP

Syntax

```
JMP32{cs|cc} {@}R1 {Immed32|Index32}
JMP64{cs|cc} Immed64
```

Description

The JMP instruction is used to conditionally or unconditionally jump to a relative or absolute address and continue executing EBC instructions. The condition test is done using the condition bit in the VM Flags register. The JMP64 form only supports an immediate value that can be used for either a relative or absolute jump. The JMP32 form adds support for indirect addressing of the JMP offset or address. The JMP is implemented as:

```
if (ConditionMet) {
  if (Operand.RelativeJump) {
    IP += Operand1 + SizeOfThisInstruction;
  } else {
    IP = Operand1;
  }
}
```

Operation

```
IP <= Operand 1 (absolute address)
IP <= IP + SizeOfThisInstruction + Operand 1 (relative address)
```

Table 22.21: JMP Instruction Encoding

Byte	Description	
0	Bit	Description
	7	0 = Immediate/index data absent 1 = Immediate/index data present
	6	0 = JMP32 1 = JMP64
	0..5	Opcode = 0x01
1	Bit	Description
	7	0 = Unconditional jump 1 = Conditional jump
	6	0 = Jump if Flags.C is clear (cc) 1 = Jump if Flags.C is set (cs)

continues on next page

Table 22.21 – continued from previous page

	5	Reserved = 0
	4	0 = Absolute address 1 = Relative address
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..5	Optional 32-bit immediate data/index for JMP32	
2..9	64-bit immediate data for JMP64	

Behaviors and Restrictions

- Operand 1 fields are ignored for the JMP64 forms
- If the instruction is JMP32, and Operand 1 register = R0, then the register contents are assumed to be 0.
- If the instruction is JMP32, and Operand 1 is indirect, then the immediate data is interpreted as an index, and the jump offset or address is fetched as a 32-bit signed value from address [R1 + Index32]
- If the instruction is JMP32, and Operand 1 is direct, then the immediate data is considered a signed immediate value such that Operand 1 = R1 + Immed32
- If the jump is unconditional, then Byte1:Bit6 (condition) is ignored
- If the instruction is JMP64, and Byte0:Bit7 is clear (no immediate data), then an instruction encoding exception is generated.
- If the instruction is JMP32, and Operand 2 is indirect, then the Operand 2 value is read as a natural value from memory address [R1 + Index32]
- An alignment check exception is generated if the jump is taken and the target address is odd.

22.8.14 JMP8

Syntax

```
JMP8{cs|cc} Immed8
```

Description

Conditionally or unconditionally jump to a relative offset and continue execution. The offset is a signed one-byte offset specified in the number of words. The offset is relative to the start of the following instruction.

Operation

```
IP = IP + SizeOfThisInstruction + (Immed8 * 2)
```

Table 22.22: JMP8 Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Unconditional jump 1 = Conditional jump
	6	0 = Jump if Flags.C is clear (cc) 1 = Jump if Flags.C is set (cs)
	0..5	Opcode = 0x02
1	Immediate data (signed word offset)	

Behaviors and Restrictions

- If the jump is unconditional, then Byte0:Bit6 (condition) is ignored

22.8.15 LOADSP

Syntax

```
LOADSP [Flags], R2
```

Description

This instruction loads a VM dedicated register with the contents of a VM general-purpose register R0-R7. The dedicated register is specified by its index as shown in *Dedicated VM Registers* .

Operation

```
Operand 1 <= R2
```

Table 22.23: LOADSP Instruction Encoding

BYTE	Description	
0	Bit	Description
	6..7	Reserved = 0
	0..5	Opcode = 0x29
1	7	Reserved
	4..6	Operand 2 general purpose register
	3	Reserved
	0..2	Operand 1 dedicated register index

Behaviors and Restrictions

- Attempting to load any register (Operand 1) other than the Flags register results in an instruction encoding exception.
- Specifying a reserved dedicated register index results in an instruction encoding exception.
- If Operand 1 is the Flags register, then reserved bits in the Flags register are not modified by this instruction.

22.8.16 MOD

Syntax

```
MOD[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Perform a modulus on two signed 32-bit (MOD32) or 64-bit (MOD64) operands and store the result to Operand 1.

Operation

```
Operand 1 <= Operand 1 MOD Operand 2
```

Table 22.24: MOD Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index absent 1 = Immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x12
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as a signed value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value such that Operand 2 = R2 + Immed16, and the value is sign extended to 32 or 64 bits accordingly.
- If Operand 2 = 0, then a divide-by-zero exception is generated.

22.8.17 MODU

Syntax

```
MODU[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Perform a modulus on two unsigned 32-bit (MODU32) or 64-bit (MODU64) operands and store the result to Operand 1.

Operation

```
Operand 1 <= Operand 1 MOD Operand 2
```

Table 22.25: MODU Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index absent 1 = Immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x13
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered an unsigned immediate value such that Operand 2 = R2 + Immed16.
- If Operand 2 = 0, then a divide-by-zero exception is generated.

22.8.18 MOV

Syntax

```
MOV[b|w|d|q]{w|d} {@}R1 {Index16|32}, {@}R2 {Index16|32}
MOVqq {@}R1 {Index64}, {@}R2 {Index64}
```

Description

This instruction moves data from Operand 2 to Operand 1. Both operands can be indexed, though both indexes are the same size. In the instruction syntax for the first form, the first variable character indicates the size of the data move, which can be 8 bits (b), 16 bits (w), 32 bits (d), or 64 bits (q). The optional character indicates the presence and size of the index value(s), which may be 16 bits (w) or 32 bits (d). The MOVqq instruction adds support for 64-bit indexes.

Operation

```
Operand 1 <= Operand 2
```

Table 22.26: MOV Instruction Encoding

Byte	Description	
0	Bit	Description
	7	0 = Operand 1 index absent 1 = Operand 1 index present
	6	0 = Operand 2 index absent 1 = Operand 2 index present
	0..5	0x1D = MOVbw opcode 0x1E = MOVww opcode 0x1F = MOVdw opcode 0x20 = MOVqw opcode 0x21 = MOVbd opcode 0x22 = MOVwd opcode 0x23 = MOVdd opcode 0x24 = MOVqd opcode 0x28 = MOVqq opcode
1	Bit	Description

	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1

continues on next page

Table 22.26 – continued from previous page

2..3	Optional Operand 1 16-bit index	
2..3/4..5	Optional Operand 2 16-bit index	
2..5	Optional Operand 1 32-bit index	
2..5/6..9	Optional Operand 2 32-bit index	
2..9	Optional Operand 1 64-bit index (MOVqq)	
2..9/10..17	Optional Operand 2 64-bit index (MOVqq)	

Behaviors and Restrictions

- If an index is specified for Operand 1, and Operand 1 is direct, then an instruction encoding exception is generated.

22.8.19 MOVI

Syntax

```
MOVI[b|w|d|q][w|d|q] {@}R1 {Index16}, Immed16|32|64
```

Description

This instruction moves a signed immediate value to Operand 1. In the instruction syntax, the first variable character specifies the width of the move, which may be 8 bits (b), 16 bits (w), 32-bits (d), or 64 bits (q). The second variable character specifies the width of the immediate data, which may be 16 bits (w), 32 bits (d), or 64 bits (q).

Operation

```
Operand 1 <= Operand 2
```

Table 22.27: MOVI Instruction Encoding

BYTE	Description	
0	Bit	Description
	6..7	0 = Reserved 1 = Immediate data is 16 bits (w) 2 = Immediate data is 32 bits (d) 3 = Immediate data is 64 bits (q)
	0..5	Opcode = 0x37
1	Bit	Description
	7	Reserved = 0
	6	0 = Operand 1 index absent 1 = Operand 1 index present

continues on next page

Table 22.27 – continued from previous page

	4..5	0 = 8 bit (b) move 1 = 16 bit (w) move 2 = 32 bit (d) move 3 = 64 bit (q) move
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit index	
2..3/4..5	16-bit immediate data	
2..5/4..7	32-bit immediate data	
2..9/4..11	64-bit immediate data	

Behaviors and Restrictions

- Specifying an index value with Operand 1 direct results in an instruction encoding exception.
- If the immediate data is smaller than the move size, then the value is sign-extended to the width of the move.
- If Operand 1 is a register, then the value is stored to the register with bits beyond the move size cleared.

22.8.20 MOVIn

Syntax

```
MOVIn[w|d|q] {@}R1 {Index16}, Index16|32|64
```

Description

This instruction moves an indexed value of form (+n,+c) to Operand 1. The index value is converted from (+n, +c) format to a signed offset per the encoding described in *Index Encoding* . The size of the Operand 2 index data can be 16 (w), 32 (d), or 64 (q) bits.

Operation

```
Operand 1 <= Operand 2 (index value)
```

Table 22.28: MOVIn Instruction Encoding

BYTE	Description	
0	Bit	Description
	6..7	0 = Reserved 1 = Operand 2 index value is 16 bits (w) 2 = Operand 2 index value is 32 bits (d)

	0..2	Operand 1
2..3	Optional 16-bit Operand 1 index	
2..3/4..5	16-bit Operand 2 index	
2..5/4..7	32-bit Operand 2 index	
2..9/4..11	64-bit Operand 2 index	

Behaviors and Restrictions

- Specifying an Operand 1 index when Operand 1 is direct results in an instruction encoding exception.
- The Operand 2 index is sign extended to the size of the move if necessary.
- If the Operand 2 index size is smaller than the move size, then the value is truncated.
- If Operand 1 is direct, then the Operand 2 value is sign extended to 64 bits and stored to the Operand 1 register.

22.8.21 MOVn

Syntax

```
MOVn{w|d} {@}R1 {Index16|32}, {@}R2 {Index16|32}
```

Description

This instruction loads an unsigned natural value from Operand 2 and stores the value to Operand 1. Both operands can be indexed, though both operand indexes are the same size. The operand index(s) can be 16 bits (w) or 32 bits (d).

Operation

```
Operand1 <= (UINTN)Operand2
```

Table 22.29: MOVn Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Operand 1 index absent 1 = Operand 1 index present
	6	0 = Operand 2 index absent 1 = Operand 2 index present

continues on next page

Table 22.29 – continued from previous page

	0..5	0x32 = MOVnw opcode 0x33 = MOVnd opcode
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional Operand 1 16-bit index	
2..3/4..5	Optional Operand 2 16-bit index	
2..5	Optional Operand 1 32-bit index	
2..5/6..9	Optional Operand 2 32-bit index	

Behaviors and Restrictions

- If an index is specified for Operand 2, and Operand 2 register is direct, then the Operand 2 index value is added to the register contents such that Operand 2 = (UINTN)(R2 + Index).
- If an index is specified for Operand 1, and Operand 1 is direct, then an instruction encoding exception is generated.
- If Operand 1 is direct, then the Operand 2 value will be 0-extended to 64 bits on a 32-bit machine before storing to the Operand 1 register.

22.8.22 MOVREL

Syntax

```
MOVREL[w|d|q] {@}R1 {Index16}, Immed16|32|64
```

Description

This instruction fetches data at an IP-relative immediate offset (Operand 2) and stores the result to Operand 1. The offset is a signed offset relative to the following instruction. The fetched data is unsigned and may be 16 (w), 32 (d), or 64 (q) bits in size.

Operation

```
Operand 1 <= [IP + SizeOfThisInstruction + Immed]
```

Table 22.30: MOVREL Instruction Encoding

BYTE	Description	
0	Bit	Description

continues on next page

Table 22.30 – continued from previous page

	6..7	0 = Reserved 1 = Immediate data is 16 bits (w) 2 = Immediate data is 32 bits (d) 3 = Immediate data is 64 bits (q)
	0..5	Opcode = 0x39
1	Bit	Description
	7	Reserved = 0
	6	0 = Operand 1 index absent 1 = Operand 1 index present
	4..5	Reserved = 0
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit Operand 1 index	
2..3/4..5	16-bit immediate offset	
2..5/4..7	32-bit immediate offset	
2..9/4..11	64-bit immediate offset	

Behaviors and Restrictions

- If an Operand 1 index is specified and Operand 1 is direct, then an instruction encoding exception is generated.

22.8.23 MOVsn

Syntax

```
MOVsn{w} {@}R1, {Index16}, {@}R2 {Index16|Immed16}
MOVsn{d} {@}R1 {Index32}, {@}R2 {Index32|Immed32}
```

Description

Moves a signed natural value from Operand 2 to Operand 1. Both operands can be indexed, though the indexes are the same size. Indexes can be either 16 bits (MOVsnw) or 32 bits (MOVsnd) in size.

Operation

```
Operand 1 <= Operand 2
```

Table 22.31: MOVsn Instruction Encoding

BYTE	**Description**	
0	Bit	Description

continues on next page

Table 22.31 – continued from previous page

	7	0 = Operand 1 index absent 1 = Operand 1 index present
	6	0 = Operand 2 index/immediate data absent 1 = Operand 2 index/immediate data present
	0..5	0x25 = MOVsnw opcode 0x26 = MOVsnd opcode
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit Operand 1 index (MOVsnw)	
2..3/4..5	Optional 16-bit Operand 2 index (MOVsnw)	
2..5	Optional 32-bit Operand 1 index/immediate data (MOVsnd)	
2..5/6..9	Optional 32-bit Operand 2 index/immediate data (MOVsnd)	

Behaviors and Restrictions

- If Operand 2 is direct, and Operand 2 index/immediate data is specified, then the immediate value is read as a signed immediate value and is added to the contents of Operand 2 register such that Operand 2 = R2 + Immed.
- If Operand 2 is indirect, and Operand 2 index/immediate data is specified, then the immediate data is interpreted as an index and the Operand 2 value is fetched from memory as a signed value at address [R2 + Index16].
- If an index is specified for Operand 1, and Operand 1 is direct, then an instruction encoding exception is generated.
- If Operand 1 is direct, then the Operand 2 value is sign-extended to 64-bits on 32-bit native machines.

22.8.24 MUL

Syntax

```
MUL[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Perform a signed multiply of two operands and store the result back to Operand 1. The operands can be either 32 bits (MUL32) or 64 bits (MUL64).

Operation

```
Operand 1 <= Operand * Operand 2
```

Table 22.32: MUL Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Operand 2 immediate/index absent 1 = Operand 2 immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x0E
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit Operand 2 immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as a signed value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- If the instruction is MUL32, and Operand 1 is direct, then the result is stored to Operand 1 register with the upper 32 bits cleared.

22.8.25 MULU

Syntax

```
MULU[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Performs an unsigned multiply of two 32-bit (MULU32) or 64-bit (MULU64) operands, and stores the result back to Operand 1.

Operation

```
Operand 1 <= Operand * Operand 2
```

Table 22.33: MULU Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Operand 2 immediate/index absent 1 = Operand 2 immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x0F
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- If the instruction is MULU32 and Operand 1 is direct, then the result is written to the Operand 1 register with the upper 32 bits cleared.

22.8.26 NEG

Syntax

```
NEG[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Multiply Operand 2 by negative 1, and store the result back to Operand 1. Operand 2 is a signed value and fetched as either a 32-bit (NEG32) or 64-bit (NEG64) value.

Operation

```
Operand 1 <= -1 * Operand 2
```

Table 22.34: NEG Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Operand 2 immediate/index absent 1 = Operand 2 immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x0B
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as a signed value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- If the instruction is NEG32 and Operand 1 is direct, then the result is stored in Operand 1 register with the upper 32-bits cleared.

22.8.27 NOT

Syntax

```
NOT[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Performs a logical NOT operation on Operand 2, an unsigned 32-bit (NOT32) or 64-bit (NOT64) value, and stores the result back to Operand 1.

Operation

```
Operand 1 <= NOT Operand 2
```

Table 22.35: NOT Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Operand 2 immediate/index absent 1 = Operand 2 immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x0A
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- If the instruction is NOT32 and Operand 1 is a register, then the result is stored in the Operand 1 register with the upper 32 bits cleared.

22.8.28 OR

Syntax

```
OR[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Performs a bit-wise OR of two 32-bit (OR32) or 64-bit (OR64) operands, and stores the result back to Operand 1.

Operation

```
Operand 1 <= Operand 1 OR Operand 2
```

Table 22.36: OR Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Operand 2 immediate/index absent 1 = Operand 2 immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x15
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- If the instruction is OR32 and Operand 1 is direct, then the result is stored to Operand 1 register with the upper 32 bits cleared.

22.8.29 POP

Syntax

```
POP[32|64] {@}R1 {Index16|Immed16}
```

Description

This instruction pops a 32-bit (POP32) or 64-bit (POP64) value from the stack, stores the result to Operand 1, and adjusts the stack pointer R0 accordingly.

Operation

```
Operand 1 <= [R0]
R0 <= R0 + 4 (POP32)
R0 <= R0 + 8 (POP64)
```

Table 22.37: POP Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index absent 1 = Immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x2C
1	Bit	Description
	7..4	Reserved = 0
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 1 is direct, and an index/immediate data is specified, then the immediate data is read as a signed value and is added to the value popped from the stack, and the result stored to the Operand 1 register.
- If Operand 1 is indirect, then the immediate data is interpreted as an index, and the value popped from the stack is stored to address [R1 + Index16].
- If the instruction is POP32, and Operand 1 is direct, then the popped value is sign-extended to 64 bits before storing to the Operand 1 register.

22.8.30 POPn

Syntax

```
POPn {@}R1 {Index16|Immed16}
```

Description

Read an unsigned natural value from memory pointed to by stack pointer R0, adjust the stack pointer accordingly, and store the value back to Operand 1.

Operation

```
Operand 1 <= (UINTN)[R0]
R0 <= R0 + sizeof (VOID *)
```

Table 22.38: POPn Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index absent 1 = Immediate/index present
	6	Reserved = 0
	0..5	Opcode = 0x36
1	Bit	Description
	7..4	Reserved = 0
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 1 is direct, and an index/immediate data is specified, then the immediate data is fetched as a signed value and is added to the value popped from the stack and the result is stored back to the Operand 1 register.
- If Operand 1 is indirect, and an index/immediate data is specified, then the immediate data is interpreted as a natural index and the value popped from the stack is stored at [R1 + Index16].
- If Operand 1 is direct, and the instruction is executed on a 32-bit machine, then the result is stored to the Operand 1 register with the upper 32 bits cleared.

22.8.31 PUSH

Syntax

```
PUSH[32|64] {@}R1 {Index16|Immed16}
```

Description

Adjust the stack pointer R0 and store a 32-bit (PUSH32) or 64-bit (PUSH64) Operand 1 value on the stack.

Operation

```
R0 <= R0 - 4 (PUSH32)
R0 <= R0 - 8 (PUSH64)
[R0] <= Operand 1
```

Table 22.39: PUSH Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index absent 1 = Immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x2B
1	Bit	Description
	7..4	Reserved = 0
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 1 is direct, and an index/immediate data is specified, then the immediate data is read as a signed value and is added to the Operand 1 register contents such that Operand 1 = R1 + Immed16.
- If Operand 1 is indirect, and an index/immediate data is specified, then the immediate data is interpreted as a natural index and the pushed value is read from [R1 + Index16].

22.8.32 PUSHn

Syntax

```
PUSHn {@}R1 {Index16|Immed16}
```

Description

Adjust the stack pointer R0, and store a natural value on the stack.

Operation

```
R0 <= R0 - sizeof (VOID *)
[R0] <= Operand 1
```

Table 22.40: PUSHn Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Immediate/index absent 1 = Immediate/index present
	6	Reserved = 0
	0..5	Opcode = 0x35
1	Bit	Description
	7..4	Reserved = 0
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 1 is direct, and an index/immediate data is specified, then the immediate data is fetched as a signed value and is added to the Operand 1 register contents such that Operand 1 = R1 + Immed16.
- If Operand 1 is indirect, and an index/immediate data is specified, then the immediate data is interpreted as a natural index and the Operand 1 value pushed is fetched from [R1 + Index16].

22.8.33 RET

Syntax

```
RET
```

Description

This instruction fetches the return address from the stack, sets the IP to the value, adjusts the stack pointer register R0, and continues execution at the return address. If the RET is a final return from the EBC driver, then execution control returns to the caller, which may be EBC or native code.

Operation

```
IP <= [R0]
R0 <= R0 + 16
```

Table 22.41: RET Instruction Encoding

BYTE	Description	
0	Bit	Description
	6..7	Reserved = 0
	0..5	Opcode = 0x04
1	Reserved = 0	

Behaviors and Restrictions

- An alignment exception will be generated if the return address is not aligned on a 16-bit boundary.

22.8.34 SHL

Syntax

```
SHL[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Left-shifts Operand 1 by Operand 2 bit positions and stores the result back to Operand 1. The operand sizes may be either 32-bits (SHL32) or 64 bits (SHL64).

Operation

```
Operand 1 <= Operand 1 << Operand 2
```

Table 22.42: SHL Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Operand 2 immediate/index absent 1 = Operand 2 immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x17
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2

continues on next page

Table 22.42 – continued from previous page

	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- If the instruction is SHL32, and Operand 1 is direct, then the result is stored to the Operand 1 register with the upper 32 bits cleared.

22.8.35 SHR

Syntax

```
SHR[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Right-shifts unsigned Operand 1 by Operand 2 bit positions and stores the result back to Operand 1. The operand sizes may be either 32-bits (SHR32) or 64 bits (SHR64).

Operation

```
Operand 1 <= Operand 1 >> Operand 2
```

Table 22.43: SHR Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Operand 2 immediate/index absent 1 = Operand 2 immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x18
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2

continues on next page

Table 22.43 – continued from previous page

	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- If the instruction is SHR32, and Operand 1 is direct, then the result is stored to the Operand 1 register with the upper 32 bits cleared.

22.8.36 STORESP

Syntax

```
STORESP R1, [IP|Flags]
```

Description

This instruction transfers the contents of a dedicated register to a general-purpose register. See the Table, below, *Dedicated VM Registers* for the VM dedicated registers and their corresponding index values.

Operation

```
Operand 1 <= Operand 2
```

Table 22.44: STORESP Instruction Encoding

BYTE	Description	
0	Bit	Description
	6..7	Reserved = 0
	0..5	Opcode = 0x2A
1	7	Reserved = 0
	4..6	Operand 2 dedicated register index
	3	Reserved = 0
	0..2	Operand 1 general purpose register

Behaviors and Restrictions

- Specifying an invalid dedicated register index results in an instruction encoding exception.

22.8.37 SUB

Syntax

```
SUB[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Subtracts a 32-bit (SUB32) or 64-bit (SUB64) signed Operand 2 value from a signed Operand 1 value of the same size, and stores the result to Operand 1.

Operation

```
Operand 1 <= Operand 1 - Operand 2
```

Table 22.45: SUB Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Operand 2 immediate/index absent 1 = Operand 2 immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x0D
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as a signed value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- If the instruction is SUB32 and Operand 1 is direct, then the result is stored to the Operand 1 register with the upper 32 bits cleared.

22.8.38 XOR

Syntax

```
XOR[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Performs a bit-wise exclusive OR of two 32-bit (XOR32) or 64-bit (XOR64) operands, and stores the result back to Operand 1.

Operation

```
Operand 1 <= Operand 1 XOR Operand 2
```

Table 22.46: XOR Instruction Encoding

BYTE	Description	
0	Bit	Description
	7	0 = Operand 2 immediate/index absent 1 = Operand 2 immediate/index present
	6	0 = 32-bit operation 1 = 64-bit operation
	0..5	Opcode = 0x16
1	Bit	Description
	7	0 = Operand 2 direct 1 = Operand 2 indirect
	4..6	Operand 2
	3	0 = Operand 1 direct 1 = Operand 1 indirect
	0..2	Operand 1
2..3	Optional 16-bit immediate data/index	

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- If the instruction is XOR32 and Operand1 is direct, then the result is stored to the Operand 1 register with the upper 32-bits cleared.

22.9 Runtime and Software Conventions

22.9.1 Calling Outside VM

Calls can be made to routines in other modules that are native or in another VM. It is the responsibility of the calling VM to prepare the outgoing arguments correctly to make the call outside the VM. It is also the responsibility of the VM to prepare the incoming arguments correctly for the call from outside the VM. Calls outside the VM must use the CALLEX *CALL* instruction.

22.9.2 Calling Inside VM

Calls inside VM can be made either directly using the *CALL* or *CALLEX* instructions. Using direct CALL instructions is an optimization.

22.9.3 Parameter Passing

Parameters are pushed on the VM stack per the CDECL calling convention. Per this convention, the last argument in the parameter list is pushed on the stack first, and the first argument in the parameter list is pushed on the stack last.

All parameters are stored or accessed as natural size (using naturally sized instruction) except 64-bit integers, which are pushed as 64-bit values. 32-bit integers are pushed as natural size (since they should be passed as 64-bit parameter values on 64-bit machines).

22.9.4 Return Values

Return values of 8 bytes or less in size are returned in general-purpose register R7. Return values larger than 8 bytes are not supported.

22.9.5 Binary Format

PE32+ format will be used for generating binaries for the VM. A VarBss section will be included in the binary image. All global and static variables will be placed in this section. The size of the section will be based on worst-case 64-bit pointers. Initialized data and pointers will also be placed in the VarBss section, with the compiler generating code to initialize the values at runtime.

22.10 Architectural Requirements

This section provides a high level overview of the architectural requirements that are necessary to support execution of EBC on a platform.

22.10.1 EBC Image Requirements

All EBC images will be PE32+ format. Some minor additions to the format will be required to support EBC images. See the Microsoft Portable Executable and Common Object File Format Specification pointed to in *Appendix Q — References* for details of this image file format.

A given EBC image must be executable on different platforms, independent of whether it is a 32- or 64-bit processor. All EBC images should be driver implementations.

22.10.2 EBC Execution Interfacing Requirements

EBC drivers will typically be designed to execute in an (usually preboot) EFI environment. As such, EBC drivers must be able to invoke protocols and expose protocols for use by other drivers or applications. The following execution transitions must be supported:

- EBC calling EBC
- EBC calling native code
- Native code calling EBC
- Native code calling native code
- Returning from all the above transitions

Obviously native code calling native code is available by default, so is not discussed in this document.

To maintain backward compatibility with existing native code, and minimize the overhead for non-EBC drivers calling EBC protocols, all four transitions must be seamless from the application perspective. Therefore, drivers, whether EBC or native, shall not be required to have any knowledge of whether or not the calling code, or the code being called, is native or EBC compiled code. The onus is put on the tools and interpreter to support this requirement.

22.10.3 Interfacing Function Parameters Requirements

To allow code execution across protocol boundaries, the interpreter must ensure that parameters passed across execution transitions are handled in the same manner as the standard parameter passing convention for the native processor.

22.10.4 Function Return Requirements

The interpreter must support standard function returns to resume execution to the caller of external protocols. The details of this requirement are specific to the native processor. The called function must not be required to have any knowledge of whether or not the caller is EBC or native code.

22.10.5 Function Return Values Requirements

The interpreter must support standard function return values from called protocols. The exact implementation of this functionality is dependent on the native processor. This requirement applies to return values of 64 bits or less. The called function must not be required to have any knowledge of whether or not the caller is EBC or native code. Note that returning of structures is not supported.

22.11 EBC Interpreter Protocol

The EFI EBC protocol provides services to execute EBC images, which will typically be loaded into option ROMs.

22.11.1 EFI_EBC_PROTOCOL

Summary

This protocol provides the services that allow execution of EBC images.

GUID

```
#define EFI_EBC_PROTOCOL_GUID \
  {0x13ac6dd1,0x73d0,0x11d4,\
    {0xb0,0x6b,0x00,0xaa,0x00,0xbd,0x6d,0xe7}}
```

Protocol Interface Structure

```
typedef struct _EFI_EBC_PROTOCOL {
  EFI_EBC_CREATE_THUNK          CreateThunk;
  EFI_EBC_UNLOAD_IMAGE          UnloadImage;
  EFI_EBC_REGISTER_ICACHE_FLUSH  RegisterICacheFlush;
  EFI_EBC_GET_VERSION           GetVersion;
}   EFI_EBC_PROTOCOL;
```

Parameters

CreateThunk
Creates a thunk for an EBC image entry point or protocol service, and returns a pointer to the thunk. See the *EFI_EBC_PROTOCOL.CreateThunk()* function description.

UnloadImage
Called when an EBC image is unloaded to allow the interpreter to perform any cleanup associated with the image's execution. See the *EFI_EBC_PROTOCOL.UnloadImage()* function description.

RegisterICacheFlush
Called to register a callback function that the EBC interpreter can call to flush the processor instruction cache after creating thunks. See the *EFI_EBC_PROTOCOL.RegisterICacheFlush()* function description.

GetVersion
Called to get the version of the associated EBC interpreter. See the *EFI_EBC_PROTOCOL.GetVersion()* function description.

Description

The EFI EBC protocol provides services to load and execute EBC images, which will typically be loaded into option ROMs. The image loader will load the EBC image, perform standard relocations, and invoke the *EFI_EBC_PROTOCOL.CreateThunk()* service to create a thunk for the EBC image's entry point. The image can then be run using the standard EFI start image services.

22.11.2 EFI_EBC_PROTOCOL.CreateThunk()

Summary

Creates a thunk for an EBC entry point, returning the address of the thunk.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EBC_CREATE_THUNK) (
  IN EFI_EBC_PROTOCOL         *This,
  IN EFI_HANDLE               ImageHandle,
  IN VOID                     *EbcEntryPoint,
  OUT VOID                    **Thunk
  );
```

Parameters

This
A pointer to the *EFI_EBC_PROTOCOL* instance. This protocol is defined in *EBC Interpreter Protocol* .

ImageHandle
Handle of image for which the thunk is being created.

EbcEntryPoint
Address of the actual EBC entry point or protocol service the thunk should call.

Thunk
Returned pointer to a thunk created.

Description

A PE32+ EBC image, like any other PE32+ image, contains an optional header that specifies the entry point for image execution. However for EBC images this is the entry point of EBC instructions, so is not directly executable by the native processor. Therefore when an EBC image is loaded, the loader must call this service to get a pointer to native code (thunk) that can be executed which will invoke the interpreter to begin execution at the original EBC entry point.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_INVALID_PARAMETER	Image entry point is not 2-byte aligned.
EFI_OUT_OF_RESOURCES	Memory could not be allocated for the thunk.

22.11.3 EFI_EBC_PROTOCOL.UnloadImage()

Summary

Called prior to unloading an EBC image from memory.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EBC_UNLOAD_IMAGE) (
  IN EFI_EBC_PROTOCOL         *This,
  IN EFI_HANDLE               ImageHandle
  );
```

Parameters

This

A pointer to the *EFI_EBC_PROTOCOL* instance. This protocol is defined in *EBC Interpreter Protocol* .

ImageHandle

Image handle of the EBC image that is being unloaded from memory.

Description

This function is called after an EBC image has exited, but before the image is actually unloaded. It is intended to provide the interpreter with the opportunity to perform any cleanup that may be necessary as a result of loading and executing the image.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_INVALID_PARAMETER	Image handle is not recognized as belonging to an EBC image that has been executed.

22.11.4 EFI_EBC_PROTOCOL.RegisterICacheFlush()

Summary

Registers a callback function that the EBC interpreter calls to flush the processor instruction cache following creation of thunks.

Prototype

```
typedef
EFI_STATUS
(* EFI_EBC_REGISTER_ICACHE_FLUSH) (
  IN EFI_EBC_PROTOCOL **This,
  IN EBC_ICACHE_FLUSH *Flush
  );
```

Parameters

This

A pointer to the *EFI_EBC_PROTOCOL* instance. This protocol is defined in *EBC Interpreter Protocol* .

Flush

Pointer to a function of type EBC_ICACH_FLUSH. See “Related Definitions” below for a detailed description of this type.

Related Definitions

```
typedef
EFI_STATUS
(* EBC_ICACHE_FLUSH) (
  IN EFI_PHYSICAL_ADDRESS     Start,
  IN UINT64                   Length
  );
```

Start

The beginning physical address to flush from the processor’s instruction cache.

Length

The number of bytes to flush from the processor's instruction cache.

This is the prototype for the Flush callback routine. A pointer to a routine of this type is passed to the EBC EFI_EBC_REGISTER_ICACHE_FLUSH protocol service.

Description

An EBC image's original PE32+ entry point is not directly executable by the native processor. Therefore to execute an EBC image, a thunk (which invokes the EBC interpreter for the image's original entry point) must be created for the entry point, and the thunk is executed when the EBC image is started. Since the thunks may be created on-the-fly in memory, the processor's instruction cache may require to be flushed after thunks are created. The caller to this EBC service can provide a pointer to a function to flush the instruction cache for any thunks created after the *EFI_EBC_PROTOCOL.CreateThunk()* service has been called. If an instruction-cache flush callback is not provided to the interpreter, then the interpreter assumes the system has no instruction cache, or that flushing the cache is not required following creation of thunks.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.

22.11.5 EFI_EBC_PROTOCOL.GetVersion()

Summary

Called to get the version of the interpreter.

Prototype

```
typedef
EFI_STATUS
(* EFI_EBC_GET_VERSION) (
  IN EFI_EBC_PROTOCOL      *This,
  OUT UINT64               *Version
  );
```

Parameters

This

A pointer to the *EFI_EBC_PROTOCOL* instance. This protocol is defined in *EBC Interpreter Protocol* .

Version

Pointer to where to store the returned version of the interpreter.

Description

This function is called to get the version of the loaded EBC interpreter. The value and format of the returned version is identical to that returned by the EBC *BREAK* 1 instruction.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_INVALID_PARAMETER	Version pointer is *NULL* .

22.12 EBC Tools

22.12.1 EBC C Compiler

This section describes the responsibilities of the EBC C compiler. To fully specify these responsibilities requires that the thunking mechanisms between EBC and native code be described.

22.12.2 C Coding Convention

The EBC C compiler supports only the C programming language. There is no support for C++, inline assembly, floating point types/operations, or C calling conventions other than CDECL.

Pointer type in C is supported only as 64-bit pointer. The code should be 64-bit pointer ready (not assign pointers to integers and vice versa).

The compiler does not support user-defined sections through pragmas.

Global variables containing pointers that are initialized will be put in the uninitialized VarBss section and the compiler will generate code to initialize these variables during load time. The code will be placed in an init text section. This compiler-generated code will be executed before the actual image entry point is executed.

22.12.3 EBC Interface Assembly Instructions

The EBC instruction set includes two forms of a *CALL* instruction that can be used to invoke external protocols. Their assembly language formats are:

```
CALLEX Immed64
CALLEX32 {@}R1 {Immed32}
```

Both forms can be used to invoke external protocols at an absolute address specified by the immediate data and/or register operand. The second form also supports jumping to code at a relative address. When one of these instructions is executed, the interpreter is responsible for thunking arguments and then jumping to the destination address. When the called function returns, code begins execution at the EBC instruction following the CALL instruction. The process by which this happens is called thunking. Later sections describe this operation in detail.

22.12.4 Stack Maintenance and Argument Passing

There are several EBC assembly instructions that directly manipulate the stack contents and stack pointer. These instructions operate on the EBC stack, not the interpreter stack. The instructions include the EBC *PUSH* , *POP* , *PUSHN* , and *POPN* , and all forms of the *MOV* instructions.

These instructions must adjust the EBC stack pointer in the same manner as equivalent instructions of the native instruction set. With this implementation, parameters pushed on the stack by an EBC driver can be accessed normally for stack-based native code. If native code expects parameters in registers, then the interpreter thunking process must transfer the arguments from EBC stack to the appropriate processor registers. The process would need to be reversed when native code calls EBC.

22.12.5 Native to EBC Arguments Calling Convention

The calling convention for arguments passed to EBC functions follows the standard CDECL calling convention. The arguments must be pushed as their native size. After the function arguments have been pushed on the stack, execution is passed to the called EBC function. The overhead of thunking the function parameters depends on the standard parameter passing convention for the host processor. The implementation of this functionality is left to the interpreter.

22.12.6 EBC to Native Arguments Calling Convention

When EBC makes function calls via function pointers, the EBC C compiler cannot determine whether the calls are to native code or EBC. It therefore assumes that the calls are to native code, and emits the appropriate EBC *CALL* instructions. To be compatible with calls to native code, the calling convention of EBC calling native code must follow the parameter passing convention of the native processor. The EBC C compiler generates EBC instructions that push all arguments on the stack. The interpreter is then responsible for performing the necessary thunking. The exact implementation of this functionality is left to the interpreter.

22.12.7 EBC to EBC Arguments Calling Convention

If the EBC C compiler is able to determine that a function call is to a local function, it can emit a standard EBC *CALL* instruction. In this case, the function arguments are passed as described in the other sections of this specification.

22.12.8 Function Returns

When EBC calls an external function, the thunking process includes setting up the host processor stack or registers such that when the called function returns, execution is passed back to the EBC at the instruction following the call. The implementation is left to the interpreter, but it must follow the standard function return process of the host processor. Typically this will require the interpreter to push the return address on the stack or move it to a processor register prior to calling the external function.

22.12.9 Function Return Values

EBC function return values of 8 bytes or less are returned in VM general-purpose register R7. Returning values larger than 8 bytes on the stack is not supported. Instead, the caller or callee must allocate memory for the return value, and the caller can pass a pointer to the callee, or the callee can return a pointer to the value in the standard return register R7.

If an EBC function returns to native code, then the interpreter thunking process is responsible for transferring the contents of R7 to an appropriate location such that the caller has access to the value using standard native code. Typically the value will be transferred to a processor register. Conversely, if a native function returns to an EBC function, the interpreter is responsible for transferring the return value from the native return memory or register location into VM register R7.

22.12.10 Thunking

Thunking is the process by which transitions between execution of native and EBC are handled. The major issues that must be addressed for thunking are the handling of function arguments, how the external function is invoked, and how return values and function returns are handled. The following sections describe the thunking process for the possible transitions.

22.12.10.1 Thunking EBC to Native Code

By definition, all external calls from within EBC are calls to native code. The EBC *CALL* instructions are used to make these calls. A typical application for EBC calling native code would be a simple "Hello World" driver. For a UEFI driver, the code could be written as shown below.

```
EFI_STATUS EfiMain (
  IN EFI_HANDLE ImageHandle,
  IN EFI_SYSTEM_TABLE         *ST
  )
{
      ST->ConOut->OutputString(ST->ConOut, L"Hello World!");
      return EFI_SUCCESS;
}
```

This C code, when compiled to EBC assembly, could result in two PUSHn instructions to push the parameters on the stack, some code to get the absolute address of the *EFI_SIMPLE_TEXT_OUTPUT_PROTOCOL.OutputString()* function, then a CALLEX instruction to jump to native code. Typical pseudo assembly code for the function call could be something like the following:

```
PUSHn       _HelloString
PUSHn       _ConOut
MOVnw R1,   _OutputString
CALLEX64 R1
```

The interpreter is responsible for executing the PUSHn instructions to push the arguments on the EBC stack when interpreting the PUSHn instructions. When the CALLEX instruction is encountered, it must thunk to external native code. The exact thunking mechanism is native processor dependent. For example, a supported 32-bit thunking implementation could simply move the system stack pointer to point to the EBC stack, then perform a *CALL* to the absolute address specified in VM register R1. However, the function calling convention for the Itanium processor family calls for the first 8 function arguments being passed in registers. Therefore, the Itanium processor family thunking mechanism requires the arguments to be copied from the EBC stack into processor registers. Then a CALL can be performed to jump to the absolute address in VM register R1. Note that since the interpreter is not aware of the number of arguments to the function being called, the maximum amount of data may be copied from the EBC stack into processor registers.

22.12.10.2 Thunking Native Code to EBC

An EBC driver may install protocols for use by other EBC drivers, or UEFI drivers or applications. These protocols provide the mechanism by which external native code can call EBC. Typical C code to install a generic protocol is shown below.

```
EFI_STATUS Foo(UINT32 Arg1, UINT32 Arg2);

MyProtInterface->Service1 = Foo;
```

(continues on next page)

(continued from previous page)

```

Status = LibInstallProtocolInterfaces (&Handle, &MyProtGUID, MyProtInterface, NULL);
```

To support thunking native code to EBC, the EBC compiler resolves all EBC function pointers using one level of indirection. In this way, the address of an EBC function actually becomes the address of a piece of native (thunk) code that invokes the interpreter to execute the actual EBC function. As a result of this implementation, any time the address of an EBC function is taken, the EBC C compiler must generate the following:

- A 64-bit function pointer data object that contains the actual address of the EBC function
- EBC initialization code that is executed before the image entry point that will execute EBC *BREAK* 5 instructions to create thunks for each function pointer data object
- Associated relocations for the above

So for the above code sample, the compiler must generate EBC initialization code similar to the following. This code is executed prior to execution of the actual EBC driver's entry point.

```
MOVqq R7, Foo_pointer ; get address of Foo pointer
BREAK 5 ; create a thunk for the function
```

The BREAK instruction causes the interpreter to create native thunk code elsewhere in memory, and then modify the memory location pointed to by R7 to point to the newly created thunk code for EBC function Foo. From within EBC, when the address of Foo is taken, the address of the thunk is actually returned. So for the assignment of the protocol Service1 above, the EBC C compiler will generate something like the following:

```
MOVqq R7, Foo_pointer ; get address of Foo function pointer
MOVqq R7, @R7 ; one level of indirection
MOVn R6, _MyProtInterface->Service1 ; get address of    variable
MOVqq @R6, R7 ; address of thunk to ->Service1
```

22.12.10.3 Thunking EBC to EBC

EBC can call EBC via function pointers or protocols. These two mechanisms are treated identically by the EBC C compiler, and are performed using EBC *CALL* instructions. For EBC to call EBC, the EBC being called must have provided the address of the function. As described above, the address is actually the address of native thunk code for the actual EBC function. Therefore, when EBC calls EBC, the interpreter assumes native code is being called so prepares function arguments accordingly, and then makes the call. The native thunk code assumes native code is calling EBC, so will basically "undo" the preparation of function arguments, and then invoke the interpreter to execute the actual EBC function of interest.

22.12.11 EBC Linker

New constants must be defined for use by the linker in processing EBC images. For EBC images, the linker must set the machine type in the PE file header accordingly to indicate that the image contains EBC.

```
#define IMAGE_FILE_MACHINE_EBC 0x0EBC
```

In addition, the linker must support EBC images with of the following subsystem types as set in a PE32+ optional header:

```
#define IMAGE_SUBSYSTEM_EFI_APPLICATION 10
#define IMAGE_SUBSYSTEM_EFI_BOOT_SERVICE_DRIVER 11
#define IMAGE_SUBSYSTEM_EFI_RUNTIME_DRIVER 12
```

For EFI EBC images and object files, the following relocation types must be supported:

```
// No relocations required
#define IMAGE_REL_EBC_ABSOLUTE      0x0000
// 32-bit address w/o image base
#define IMAGE_REL_EBC_ADDR32NB      0x0001
// 32-bit relative address from byte following relocs
#define IMAGE_REL_EBC_REL32         0x0002
// Section table index
#define IMAGE_REL_EBC_SECTION       0x0003
// Offset within section
#define IMAGE_REL_EBC_SECREL        0x0004
```

The ADDR32NB relocation is used internally to the linker when RVAs are emitted. It also is used for version resources which probably will not be used. The REL32 relocation is for PC relative addressing on code. The SECTION and SECREL relocations are used for debug information.

22.12.12 Image Loader

The EFI image loader is responsible for loading an executable image into memory and applying relocation information so that an image can execute at the address in memory where it has been loaded prior to execution of the image. For EBC images, the image loader must also invoke the interpreter protocol to create a thunk for the image entry point and return the address of this thunk. After loading the image in this manner, the image can be executed in the standard manner. To implement this functionality, only minor changes will be made to EFI service *EFI_BOOT_SERVICES.LoadImage()*, and no changes should be made to *EFI_BOOT_SERVICES.StartImage()* .

After the image is unloaded, the EFI image load service must call the EBC *EFI_BOOT_SERVICES.UnloadImage()* service to perform any cleanup to complete unloading of the image. Typically this will include freeing up any memory allocated for thunks for the image during load and execution.

22.12.13 Debug Support

The interpreter must support debugging in an EFI environment per the EFI debug support protocol.

22.13 VM Exception Handling

This section lists the different types of exceptions that the VM may assert during execution of an EBC image. If a debugger is attached to the EBC driver via the EFI debug support protocol, then the debugger should be able to capture and identify the exception type. If a debugger is not attached, then depending on the severity of the exception, the interpreter may do one of the following:

- Invoke the EFI ASSERT() macro, which will typically display an error message and halt the system
- Sit in a while(1) loop to hang the system
- Ignore the exception and continue execution of the image (minor exceptions only)

It is a platform policy decision as to the action taken in response to EBC exceptions. The following sections describe the exceptions that may be generated by the VM.

22.13.1 Divide By 0 Exception

A divide-by-0 exception can occur for the EBC instructions *DIV* , *DIVU* , *MOD* , and *MODU* .

22.13.2 Debug Break Exception

A debug break exception occurs if the VM encounters a *BREAK* instruction with a break code of 3.

22.13.3 Invalid Opcode Exception

An invalid opcode exception will occur if the interpreter encounters a reserved opcode during execution.

22.13.4 Stack Fault Exception

A stack fault exception can occur if the interpreter detects that function nesting within the interpreter or system interrupts was sufficient to potentially corrupt the EBC image's stack contents. This exception could also occur if the EBC driver attempts to adjust the stack pointer outside the range allocated to the driver.

22.13.5 Alignment Exception

An alignment exception can occur if the particular implementation of the interpreter does not support unaligned accesses to data or code. It may also occur if the stack pointer or instruction pointer becomes misaligned.

22.13.6 Instruction Encoding Exception

An instruction encoding exception can occur for the following:

- For some instructions, if an Operand 1 index is specified and Operand 1 is direct
- If an instruction encoding has reserved bits set to values other than 0
- If an instruction encoding has a field set to a reserved value.

22.13.7 Bad Break Exception

A bad break exception occurs if the VM encounters a *BREAK* instruction with a break code of 0, or any other unrecognized or unsupported break code.

22.13.8 Undefined Exception

An undefined exception can occur for other conditions detected by the VM. The cause of such an exception is dependent on the VM implementation, but will most likely include internal VM faults.

22.14 Option ROM Formats

The new option ROM capability is designed to be a departure from the legacy method of formatting an option ROM. PCI local bus add-in cards are the primary targets for this design although support for future bus types will be added as necessary. EFI EBC drivers can be stored in option ROMs or on hard drives in an EFI system partition.

The new format defined for the UEFI specification is intended to coexist with legacy format PCI Expansion ROM images. This provides the ability for IHVs to make a single option ROM binary that contains both legacy and new format images at the same time. This is important for the ability to have single add-in card SKUs that can work in a variety of systems both with and without native support for UEFI. Support for multiple image types in this way provides a smooth migration path during the period before widespread adoption of UEFI drivers as the primary means of support for software needed to accomplish add-in card operation in the pre-OS boot timeframe.

22.14.1 EFI Drivers for PCI Add-in Cards

The location mechanism for UEFI drivers in PCI option ROM containers is described fully in *EFI_BUS_SPECIFIC_DRIVER_OVERRIDE_PROTOCOL* . Readers should refer to this section for complete details of the scheme and associated data structures.

22.14.2 Non-PCI Bus Support

EFI expansion ROMs are not supported on any other bus besides PCI local bus in the current revision of the UEFI specification.

This means that support for UEFI drivers in legacy ISA add-in card ROMs is explicitly excluded.

Support for UEFI drivers to be located on add-in card type devices for future bus designs other than PCI local bus will be added to future revisions of the UEFI specification. This support will depend upon the specifications that govern such new bus designs with respect to the mechanisms defined for support of driver code on devices.

CHAPTER

TWENTYTHREE

FIRMWARE UPDATE AND REPORTING

The UEFI Firmware Management Protocol provides an abstraction for device to provide firmware management support. The base requirements for managing device firmware images include identifying firmware image revision level and programming the image into the device. The protocol for managing firmware provides the following services.

- Get the attributes of the current firmware image. Attributes include revision level.
- Get a copy of the current firmware image. As an example, this service could be used by a management application to facilitate a firmware roll-back.
- Program the device with a firmware image supplied by the user.
- Label all the firmware images within a device with a single version.

When UEFI Firmware Management Protocol (FMP) instance is intended to perform the update of an option ROM loaded from a PCI or PCI Express device, it is recommended that the FMP instance be attached to the handle with *EFI_LOADED_IMAGE_PROTOCOL* for said Option ROM.

When the FMP instance is intended to update internal device firmware, or a combination of device firmware and Option ROM, the FMP instance may instead be attached to the Controller handle of the device. However in the case where multiple devices represented by multiple controller handles are served by the same firmware store, only a single Controller handle should expose FMP. In all cases a specific updatable hardware firmware store must be represented by exactly one FMP instance.

Care should be taken to ensure that the FMP instance reports current version data that accurately represents the actual contents of the firmware store of the device exposing FMP, because in some cases the device driver currently operating the device may have been loaded from another device or media.

23.1 Firmware Management Protocol

23.1.1 EFI_FIRMWARE_MANAGEMENT_PROTOCOL

Summary

Firmware Management application invokes this protocol to manage device firmware.

GUID

```
// {86C77A67-0B97-4633-A187-49104D0685C7}
#define EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GUID \
 { 0x86c77a67, 0xb97, 0x4633, \
   {0xa1, 0x87, 0x49, 0x10, 0x4d, 0x06, 0x85, 0xc7 }}
```

Protocol

```
typedef struct \_EFI_FIRMWARE_MANAGEMENT_PROTOCOL {
  EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GET_IMAGE_INFO     GetImageInfo;
  EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GET_IMAGE          GetImage;
  EFI_FIRMWARE_MANAGEMENT_PROTOCOL_SET_IMAGE          SetImage;
  EFI_FIRMWARE_MANAGEMENT_PROTOCOL_CHECK_IMAGE        CheckImage;
   EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GET_PACKAGE_INFO  GetPackageInfo;
  EFI_FIRMWARE_MANAGEMENT_PROTOCOL_SET_PACKAGE_INFO   SetPackageInfo;
}  EFI_FIRMWARE_MANAGEMENT_PROTOCOL;
```

Members

GetImageInfo
Returns information about the current firmware image(s) of the device.

GetImage
Retrieves a copy of the current firmware image of the device.

SetImage
Updates the device firmware image of the device.

CheckImage
Checks if the firmware image is valid for the device.

GetPackageInfo
Returns information about the current firmware package.

SetPackageInfo
Updates information about the firmware package.

23.1.2 EFI_FIRMWARE_MANAGEMENT_PROTOCOL.GetImageInfo()

Summary

Returns information about the current firmware image(s) of the device.

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GET_IMAGE_INFO) (
  IN EFI_FIRMWARE_MANAGEMENT_PROTOCOL    *This,
  IN OUT UINTN                           *ImageInfoSize,
  IN OUT EFI_FIRMWARE_IMAGE_DESCRIPTOR   *ImageInfo,
  OUT    UINT32                          *DescriptorVersion
  OUT    UINT8                           *DescriptorCount,
  OUT    UINTN                           *DescriptorSize,
  OUT    UINT32                          *PackageVersion,
  OUT    CHAR16                          **PackageVersionName
  ) ;
```

Parameters

This
A pointer to the *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* instance.

ImageInfoSize
A pointer to the size, in bytes, of the *ImageInfo* buffer. On input, this is the size of the buffer allocated by the

caller. On output, it is the size of the buffer returned by the firmware if the buffer was large enough, or the size of the buffer needed to contain the image(s) information if the buffer was too small.

ImageInfo
A pointer to the buffer in which firmware places the current image(s) information. The information is an array of *EFI_FIRMWARE_IMAGE_DESCRIPTOR* , see "Related Definitions". May be NULL with a zero *ImageInfoSize* in order to determine the size of the buffer needed.

DescriptorVersion
A pointer to the location in which firmware returns the version number associated with the *EFI_FIRMWARE_IMAGE_DESCRIPTOR*. See "Related Definitions".

DescriptorCount
A pointer to the location in which firmware returns the number of descriptors or firmware images within this device.

DescriptorSize
A pointer to the location in which firmware returns the size, in bytes, of an individual *EFI_FIRMWARE_IMAGE_DESCRIPTOR*.

PackageVersion
A version number that represents all the firmware images in the device. The format is vendor specific and new version must have a greater value than the old version. If *PackageVersion* is not supported, the value is 0xFFFFFFFF. A value of 0xFFFFFFFE indicates that package version comparison is to be performed using *PackageVersionName*. A value of 0xFFFFFFFD indicates that package version update is in progress.

PackageVersionName
A pointer to a pointer to a null-terminated string representing the package version name. The buffer is allocated by this function with *AllocatePool()*, and it is the caller's responsibility to free it with a call to *FreePool()*.

Related Definitions

  UINT64                   HardwareInstance;
//Introduced with DescriptorVersion 4+
  EFI_FMP_DEP              *Dependencies;
} EFI_FIRMWARE_IMAGE_DESCRIPTOR;
```

ImageIndex

A unique number identifying the firmware image within the device. The number is between 1 and *DescriptorCount.*

ImageTypeId
A unique GUID identifying the firmware image type.

ImageId
A unique number identifying the firmware image.

ImageIdName
A pointer to a null-terminated string representing the firmware image name.

Version
Identifies the version of the device firmware. The format is vendor specific and new version must have a greater value than an old version.

VersionName
A pointer to a null-terminated string representing the firmware image version name.

Size
Size of the image in bytes. If size=0, then only *ImageIndex* and *ImageTypeId* are valid.

AttributesSupported
Image attributes that are supported by this device. See "Image Attribute Definitions" for possible returned values of this parameter. A value of 1 indicates the attribute is supported and the current setting value is indicated in *AttributesSetting*. A value of 0 indicates the attribute is not supported and the current setting value in *AttributesSetting* is meaningless.

AttributesSetting
Image attributes. See "Image Attribute Definitions" for possible returned values of this parameter.

Compatibilities
Image compatibilities. See "Image Compatibility Definitions" for possible returned values of this parameter.

LowestSupportedImageVersion
Describes the lowest *ImageDescriptor* version that the device will accept. Only present in version 2 or higher.

LastAttemptVersion
Describes the version that was last attempted to update. If no update attempted the value will be 0. If the update attempted was improperly formatted and no version number was available then the value will be zero. Only present in version 3 or higher.

LastAttemptStatus
Describes the status that was last attempted to update. If no update has been attempted the value will be *LAST_ATTEMPT_STATUS_SUCCESS*. See "Related Definitions" in *EFI_SYSTEM_RESOURCE_TABLE* for Last Attempt Status values. Only present in version 3 or higher.

HardwareInstance
An optional number to identify the unique hardware instance within the system for devices that may have multiple instances (Example: a plug in pci network card). This number must be unique within the namespace of the *ImageTypeId* GUID and *ImageIndex*. For FMP instances that have multiple descriptors for a single hardware instance, all descriptors must have the same *HardwareInstance* value. This number must be consistent between boots and should be based on some sort of hardware identified unique id (serial number, etc) whenever possible. If a hardware based number is not available the FMP provider may use some other characteristic such as device path, bus/dev/function, slot num, etc for generating the *HardwareInstance*. For implementations that will never have more than one instance a zero can be used. A zero means the FMP provider is not able to determine a unique hardware instance number or a hardware instance number is not needed. Only present in version 3 or higher.

Dependencies
A pointer to an array of FMP depex expression op-codes that are terminated by an *EFI_FMP_DEP_END* opcode.

```
//*****************************************************************
// Image Attribute Definitions
//*****************************************************************
#define IMAGE_ATTRIBUTE_IMAGE_UPDATABLE            0x0000000000000001
#define IMAGE_ATTRIBUTE_RESET_REQUIRED             0x0000000000000002
#define IMAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED    0x0000000000000004
#define IMAGE_ATTRIBUTE_IN_USE                     0x0000000000000008
#define IMAGE_ATTRIBUTE_UEFI_IMAGE                 0x0000000000000010
#define IMAGE_ATTRIBUTE_DEPENDENCY                 0x0000000000000020
```

The attribute *IMAGE_ATTRIBUTE_DEPENDENCY* indicates that there is an *EFI_FIRMWARE_IMAGE_DEP* section associated with the image. See “Image Attribute - Dependency”.

```
//*****************************************************************
// Image Attribute - Dependency
//*****************************************************************
typedef struct {
  UINT8 Dependencies[];
}  EFI_FIRMWARE_IMAGE_DEP;
```

Dependencies

An array of FMP depex expression op-codes that are terminated by an END op-code (see related definitions below.)

The attribute *IMAGE_ATTRIBUTE_IMAGE_UPDATABLE* indicates this device supports firmware image update.

The attribute *IMAGE_ATTRIBUTE_RESET_REQUIRED* indicates a reset of the device is required for the new firmware image to take effect after a firmware update. The device is the device hosting the firmware image.

The attribute *IMAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED* indicates authentication is required to perform the following image operations: *GetImage(), SetImage(),* and *CheckImage()*. See “Image Attribute - Authentication”.

The attribute I *MAGE_ATTRIBUTE_IN_USE* indicates the current state of the firmware image. This distinguishes firmware images in a device that supports redundant images.

The attribute *IMAGE_ATTRIBUTE_UEFI_IMAGE* indicates that this image is an EFI compatible image.

```
//*****************************************************************
// Image Compatibility Definitions
//*****************************************************************
#define IMAGE_COMPATIBILITY_CHECK_SUPPORTED 0x0000000000000001
```

Values from 0x0000000000000002 thru 0x000000000000FFFF are reserved for future assignments.

Values from 0x0000000000010000 thru 0xFFFFFFFFFFFFFFFF are used by firmware vendor for compatibility check.

```
//*****************************************************************
// Descriptor Version exposed by GetImageInfo() function
//*****************************************************************
#define EFI_FIRMWARE_IMAGE_DESCRIPTOR_VERSION 3

//*****************************************************************
// Image Attribute - Authentication Required
//*****************************************************************
typedef struct {
  UINT64                           MonotonicCount;
```

(continues on next page)

(continued from previous page)

```
  WIN_CERTIFICATE_UEFI_GUID        AuthInfo;
}  EFI_FIRMWARE_IMAGE_AUTHENTICATION;
```

MonotonicCount

It is included in the signature of *AuthInfo*. It is used to ensure freshness/no replay. It is incremented during each firmware image operation.

AuthInfo

Provides the authorization for the firmware image operations.

If the image has dependencies associated with it, a signature across the image data will be created by including the Monotonic Count followed by the dependency values. If there are no dependencies, the signature will be across the image data and the Monotonic Count value.

Caller uses the private key that is associated with a public key that has been provisioned via the key exchange. Because this is defined as a signature, *WIN_CERTIFICATE_UEFI_GUID. CertType* must be *EFI_CERT_TYPE_PKCS7_GUID*.

Description

GetImageInfo() is the only required function. *GetImage()* , *SetImage(), CheckImage(), GetPackageInfo(),* and *SetPackageInfo()* shall return *EFI_UNSUPPORTED* if not supported by the driver.

A package can have one to many firmware images. The firmware images can have the same version naming or different version naming. *PackageVersion* may be used as the representative version for all the firmware images. *PackageVersion* can be obtained from *GetPackageInfo()*. *PackageVersion* is also available in *GetImageInfo()* as *GetPackageInfo()* is optional. It also ensures the package version is in sync with the versions of the images within the package by returning the package version and image version(s) in a single function call.

The value of *ImageTypeID* is implementation specific. This feature facilitates vendor to target a single firmware release to cover multiple products within a product family. As an example, a vendor has an initial product A and then later developed a product B that is of the same product family. Product A and product B will have the same *ImageTypeID* to indicate firmware compatibility between the two products.

To determine image attributes, software must use both *AttributesSupported* and *AttributesSetting*. An attribute setting in *AttributesSetting* is meaningless if the corresponding attribute is not supported in *AttributesSupported*.

Compatibilities are used to ensure the targeted firmware image supports the current hardware configuration. *Compatibilities* are set based on the current hardware configuration and firmware update policy should match the current settings to those supported by the new firmware image, and only permits update to proceed if the new firmware image settings are equal or greater than the current hardware configuration settings. For example, if this function returns *Compatibilities* = 0x0000000000070001 and the new firmware image supports settings=0x0000000000030001, then the update policy should block the firmware update and notify the user that updating the hardware with the new firmware image may render the hardware inoperable. This situation usually occurs when updating the hardware with an older version of firmware.

The authentication support leverages the authentication scheme employed in variable authentication. Please reference *EFI_VARIABLE_AUTHENTICATION* in the "Variable Services" section of "Services - Runtime Services" chapter.

If *IMAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED* is supported and clear, then authentication is not required to perform the firmware image operations. In firmware image operations, the image pointer points to the start of the firmware image and the image size is the firmware image.

If *IMAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED* is supported and set, then authentication is required to perform the firmware image operations. In firmware image operations, the image pointer points to the start of the authentication data and the image size is the size of the authentication data and the size of the firmware image.

If *IMAGE_ATTRIBUTE_DEPENDENCY* is supported and set, then there are dependencies associated with the image. See the *Dependency Expression Instruction Set* for details on the format of the dependency op-codes and how they are

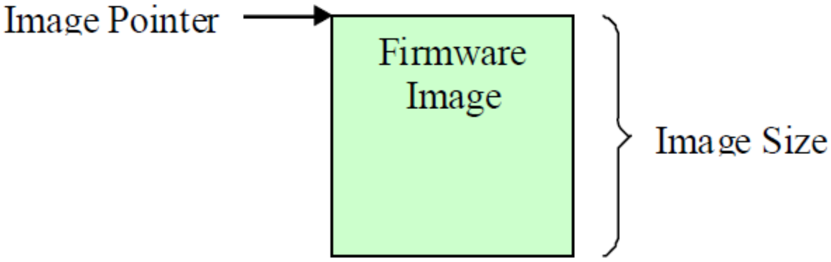

Fig. 23.1: Firmware Image with no Authentication Support

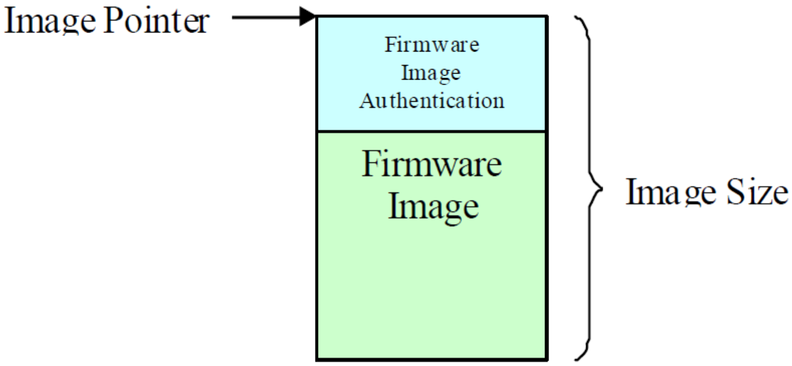

Fig. 23.2: Firmware Image with Authentication Support

to be used.

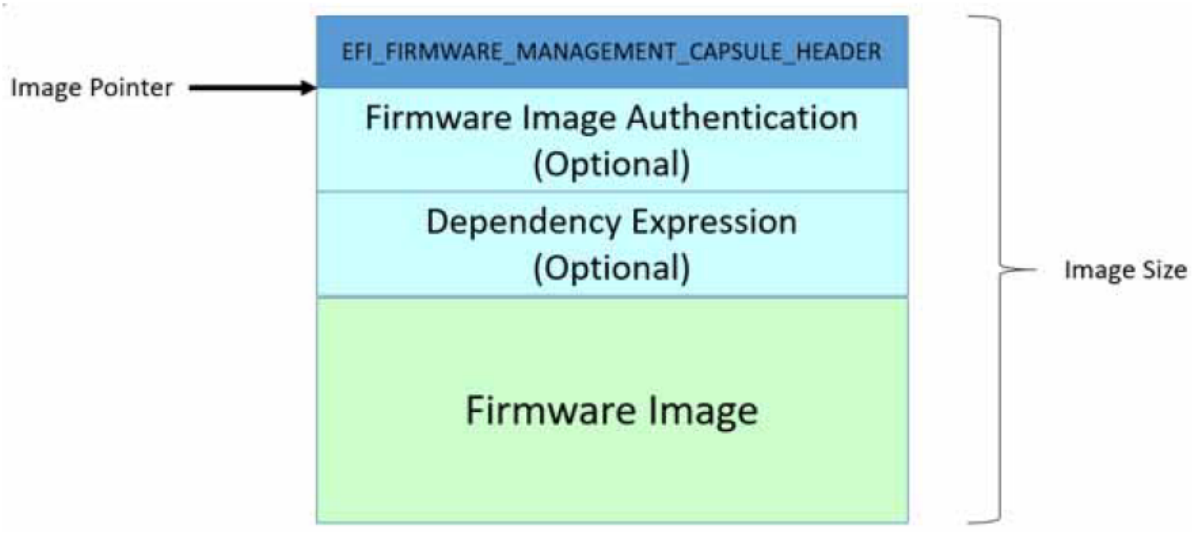

Fig. 23.3: Firmware Image with Dependency/AuthenticationSupport

Status Codes Returned

EFI_SUCCESS	The image information was successfully returned.
EFI_BUFFER_TOO_SMALL	The *ImageInfo* buffer was too small. The current buffer size needed to hold the image(s) information is returned in *ImageInfoSize*.
EFI_INVALID_PARAMETER	*ImageInfoSize* is not too small and *ImageInfo* is NULL.
EFI_INVALID_PARAMETER	*ImageInfoSize* is non-zero and *DescriptorVersion* is *NULL*.
EFI_INVALID_PARAMETER	*ImageInfoSize* is non-zero and *DescriptorCount* is *NULL*.
EFI_INVALID_PARAMETER	*ImageInfoSize* is non-zero and *DescriptorSize* is *NULL*.
EFI_INVALID_PARAMETER	*ImageInfoSize* is non-zero and *PackageVersion* is *NULL*.
EFI_INVALID_PARAMETER	*ImageInfoSize* is non-zero and *PackageVersionName* is *NULL*.
EFI_DEVICE_ERROR	Valid information could not be returned. Possible corrupted image.

23.1.3 EFI_FIRMWARE_MANAGEMENT_PROTOCOL.GetImage()

Summary

Retrieves a copy of the current firmware image of the device.

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GET_IMAGE) (
  IN EFI_FIRMWARE_MANAGEMENT_PROTOCOL    *This,
  IN UINT8                               ImageIndex,
  OUT VOID                               *Image,
  IN OUT UINTN                           *ImageSize
) ;
```

Parameters

This
A pointer to the *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* instance.

ImageIndex
A unique number identifying the firmware image(s) within the device. The number is between 1 and *DescriptorCount*.

Image
Points to the buffer where the current image is copied to. May be NULL with a zero *ImageSize* in order to determine the size of the buffer needed.

ImageSize
On entry, points to the size of the buffer pointed to by *Image,* in bytes. On return, points to the length of the image, in bytes.

Related Definitions

None

Description

This function allows a copy of the current firmware image to be created and saved. The saved copy could later been used, for example, in firmware image recovery or rollback.

Status Codes Returned

EFI_SUCCESS	The current image was successfully copied to the buffer.
EFI_BUFFER_TOO_SMALL	The buffer specified by *ImageSize* is too small to hold the image. The current buffer size needed to hold the image is returned in *ImageSize*.
EFI_INVALID_PARAMETER	The *ImageSize* is not too small and *Image* is NULL
EFI_NOT_FOUND	The current image is not copied to the buffer.
EFI_UNSUPPORTED	The operation is not supported.
EFI_SECURITY_VIOLATION	The operation could not be performed due to an authentication failure.

23.1.4 EFI_FIRMWARE_MANAGEMENT_PROTOCOL.SetImage()

Summary

Updates the firmware image of the device.

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_FIRMWARE_MANAGEMENT_PROTOCOL_SET_IMAGE) (
  IN EFI_FIRMWARE_MANAGEMENT_PROTOCOL                 *This,
  IN UINT8                                            ImageIndex,
  IN CONST VOID                                       *Image,
  IN UINTN                                            ImageSize,
  IN   CONST VOID                                     *VendorCode,
  IN   EFI_FIRMWARE_MANAGEMENT_UPDATE_IMAGE_PROGRESS Progress,
  OUT  CHAR16                                         **AbortReason
  ) ;
```

Parameters

This

A pointer to the *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* instance.

ImageIndex

A unique number identifying the firmware image(s) within the device. The number is between 1 and *DescriptorCount*.

Image

Points to the new image.

ImageSize

Size of the new image in bytes.

VendorCode

This enables vendor to implement vendor-specific firmware image update policy. Null indicates the caller did not specify the policy or use the default policy.

Progress

A function used by the driver to report the progress of the firmware update.

AbortReason

A pointer to a pointer to a null-terminated string providing more details for the aborted operation. The buffer is allocated by this function with *AllocatePool(),* and it is the caller's responsibility to free it with a call to *FreePool()*.

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI *EFI_FIRMWARE_MANAGEMENT_UPDATE_IMAGE_PROGRESS) (
  IN UINTN         Completion
) ;
```

Completion

A value between 1 and 100 indicating the current completion progress of the firmware update. Completion progress is reported as from 1 to 100 percent. A value of 0 is used by the driver to indicate that progress reporting is not supported.

On *EFI_SUCCESS, SetImage()* continues to do the callback if supported. On NOT *EFI_SUCCESS, SetImage()* discontinues the callback and completes the update and returns.

Description

This function updates the hardware with the new firmware image.

This function returns *EFI_UNSUPPORTED* if the firmware image is not updatable.

If the firmware image is updatable, the function should perform the following minimal validations before proceeding to do the firmware image update.

- Validate the image authentication if image has attribute *IMAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED*. The function returns *EFI_SECURITY_VIOLATION* if the validation fails.
- Validate the image is a supported image for this device. The function returns *EFI_ABORTED* if the image is unsupported. The function can optionally provide more detailed information on why the image is not a supported image.
- Validate the data from *VendorCode* if not null. Image validation must be performed before *VendorCode* data validation. *VendorCode* data is ignored or considered invalid if image validation failed. The function returns *EFI_ABORTED* if the data is invalid.

VendorCode enables vendor to implement vendor-specific firmware image update policy. Null if the caller did not specify the policy or use the default policy. As an example, vendor can implement a policy to allow an option to force a firmware image update when the abort reason is due to the new firmware image version is older than the current firmware image version or bad image checksum. Sensitive operations such as those wiping the entire firmware image and render the device to be non-functional should be encoded in the image itself rather than passed with the *VendorCode* .

AbortReason enables vendor to have the option to provide a more detailed description of the abort reason to the caller.

Status Codes Returned

EFI_SUCCESS	The device was successfully updated with the new image.
EFI_ABORTED	The operation is aborted.
EFI_INVALID_PARAMETER	The *Image* was NULL.
EFI_UNSUPPORTED	The operation is not supported.
EFI_SECURITY_VIOLATION	The operation could not be performed due to an authentication failure.

23.1.5 EFI_FIRMWARE_MANAGEMENT_PROTOCOL.CheckImage()

Summary

Checks if the firmware image is valid for the device.

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_FIRMWARE_MANAGEMENT_PROTOCOL_CHECK_IMAGE) (
  IN EFI_FIRMWARE_MANAGEMENT_PROTOCOL            *This,
  IN UINT8                                       ImageIndex,
  IN CONST VOID                                  *Image,
  IN UINTN                                       ImageSize,
  OUT UINT32                                     *ImageUpdatable
  ) ;
```

Parameters

This
A pointer to the *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* instance.

ImageIndex
A unique number identifying the firmware image(s) within the device. The number is between 1 and *DescriptorCount*.

Image
Points to the new image.

ImageSize
Size of the new image in bytes.

ImageUpdatable
Indicates if the new image is valid for update. It also provides, if available, additional information if the image is invalid. See “Related Definitions”.

Related Definitions

```
//*****************************************************************
// ImageUpdatable Definitions
//*****************************************************************
#define IMAGE_UPDATABLE_VALID 0x0000000000000001
#define IMAGE_UPDATABLE_INVALID 0x0000000000000002
#define IMAGE_UPDATABLE_INVALID_TYPE 0x0000000000000004
#define IMAGE_UPDATABLE_INVALID_OLD 0x0000000000000008
#define IMAGE_UPDATABLE_VALID_WITH_VENDOR_CODE \ 0x0000000000000010
```

IMAGE_UPDATABLE_VALID
indicates *SetImage()* will accept the new image and update the device with the new image.The version of the new image could be higher or lower than the current image. *SetImage VendorCode i* s optional but can be used for vendor specific action.

IMAGE_UPDATABLE_INVALID
indicates *SetImage()* will reject the new image. No additional information is provided for the rejection.

IMAGE_UPDATABLE_INVALID_TYPE
indicates *SetImage()* will reject the new image. The rejection is due to the new image is not a firmware image recognized for this device.

IMAGE_UPDATABLE_INVALID_OLD
indicates *SetImage()* will reject the new image. The rejection is due to the new image version is older than the current firmware image version in the device. The device firmware update policy does not support firmware version downgrade.

IMAGE_UPDATABLE_VALID_WITH_VENDOR_CODE
indicates *SetImage()* will accept and update the new image only if a correct *VendorCode* is provided or else image would be rejected and *SetImage* will return appropriate error.

Description

This function allows firmware update application to validate the firmware image without invoking the *SetImage()* first. Please see *SetImage()* for the type of image validations performed.

Status Codes Returned

EFI_SUCCESS	The image was successfully checked.
EFI_INVALID_PARAMETER	The *Image* was NULL.
EFI_UNSUPPORTED	The operation is not supported.
EFI_SECURITY_VIOLATION	The operation could not be performed due to an authentication failure.

23.1.6 EFI_FIRMWARE_MANAGEMENT_PROTOCOL.GetPackageInfo()

Summary

Returns information about the firmware package.

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GET_PACKAGE_INFO) (
  IN EFI_FIRMWARE_MANAGEMENT_PROTOCOL* *This,
  OUT UINT32                 *PackageVersion,
  OUT CHAR16                 **PackageVersionName,
```

(continues on next page)

(continued from previous page)

```
  OUT UINT32                  *PackageVersionNameMaxLen
  OUT UINT64                  *AttributesSupported,
  OUT UINT64                  *AttributesSetting
  ) ;
```

Parameters

This

A pointer to the *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* instance.

PackageVersion

A version number that represents all the firmware images in the device. The format is vendor specific and new version must have a greater value than the old version. If *PackageVersion* is not supported, the value is 0xFFFFFFFF. A value of 0xFFFFFFFE indicates that package version comparison is to be performed using *PackageVersionName*. A value of 0xFFFFFFFD indicates that package version update is in progress.

PackageVersionName

A pointer to a pointer to a null-terminated string representing the package version name. The buffer is allocated by this function with *AllocatePool(),* and it is the caller's responsibility to free it with a call to *FreePool()*.

PackageVersionNameMaxLen

The maximum length of package version name if device supports update of package version name. A value of 0 indicates the device does not support update of package version name. Length is the number of Unicode characters, including the terminating null character.

AttributesSupported

Package attributes that are supported by this device. See "Package Attribute Definitions" for possible returned values of this parameter. A value of 1 indicates the attribute is supported and the current setting value is indicated in *AttributesSetting*. A value of 0 indicates the attribute is not supported and the current setting value in *AttributesSetting* is meaningless.

AttributesSetting

Package attributes. See "Package Attribute Definitions" for possible returned values of this parameter.

Related Definitions

```
//*****************************************************************
// Package Attribute Definitions
//*****************************************************************
#define PACKAGE_ATTRIBUTE_VERSION_UPDATABLE          0x0000000000000001
#define PACKAGE_ATTRIBUTE_RESET_REQUIRED             0x0000000000000002
#define PACKAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED    0x0000000000000004
```

The attribute *PACKAGE_ATTRIBUTE_VERSION_UPDATABLE* indicates this device supports the update of the firmware package version.

The attribute *PACKAGE_ATTRIBUTE_RESET_REQUIRED* indicates a reset of the device is required for the new package info to take effect after an update.

The attribute *PACKAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED* indicates authentication is required to update the package info.

Description

This function returns package information.

Status Codes Returned

EFI_SUCCESS	The package information was successfully returned.
EFI_UNSUPPORTED	The operation is not supported.

23.1.7 EFI_FIRMWARE_MANAGEMENT_PROTOCOL.SetPackageInfo()

Summary

Updates information about the firmware package.

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_FIRMWARE_MANAGEMENT_PROTOCOL_SET_PACKAGE_INFO) (
  IN EFI_FIRMWARE_MANAGEMENT_PROTOCOL* *This,
  IN CONST VOID                 *Image,
  IN UINTN                      ImageSize,
  IN CONST VOID                 *VendorCode,
  IN UINT32                     PackageVersion,
  IN CONST CHAR16               *PackageVersionName
  ) ;
```

Parameters

This
A pointer to the *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* instance.

Image
Points to the authentication image. Null if authentication is not required.

ImageSize
Size of the authentication image in bytes. 0 if authentication is not required.

VendorCode
This enables vendor to implement vendor-specific firmware image update policy. Null indicates the caller did not specify this policy or use the default policy.

PackageVersion
The new package version.

PackageVersionName
A pointer to the new null-terminated Unicode string representing the package version name. The string length is equal to or less than the value returned in *PackageVersionNameMaxLen*.

Description

This function updates package information.

This function returns *EFI_UNSUPPORTED* if the package information is not updatable.

VendorCode enables vendor to implement vendor-specific package information update policy. Null if the caller did not specify this policy or use the default policy.

Status Codes Returned

EFI_SUCCESS	The device was successfully updated with the new package information

continues on next page

Table 23.3 – continued from previous page

EFI_INVALID_PARAMETER	The *PackageVersionName* length is longer than the value returned in *PackageVersionNameMaxLen*.
EFI_UNSUPPORTED	The operation is not supported.
EFI_SECURITY_VIOLATION	The operation could not be performed due to an authentication failure.

23.2 Dependency Expression Instruction Set

The following topics describe each of the firmware management protocol dependency expression (depex) opcodes in detail. Information includes a description of the instruction functionality, binary encoding, and any limitations or unique behaviors of the instruction.

Several of the opcodes require a GUID operand. The GUID operand is a 16-byte value that matches the type *EFI_GUID* that is described in Chapter 2 of the UEFI 2.0 specification. These GUIDs represent the *EFI_FIRMWARE_IMAGE_DESCRIPTOR .ImageTypeId* that are exposed by an *EFI_FIRMWARE_MANAGE_PROTOCOL* instance. A dependency expression is a packed byte stream of opcodes and operands. As a result, some of the GUID operands will not be aligned on natural boundaries. Care must be taken on processor architectures that do allow unaligned accesses.

The dependency expression is stored in a packed byte stream using postfix notation. As a dependency expression is evaluated, the operands are pushed onto a stack. Operands are popped off the stack to perform an operation. After the last operation is performed, the value on the top of the stack represents the evaluation of the entire dependency expression. If a push operation causes a stack overflow, then the entire dependency expression evaluates to *FALSE*. If a pop operation causes a stack underflow, then the entire dependency expression evaluates to *FALSE*. Reasonable implementations of a dependency expression evaluator should not make arbitrary assumptions about the maximum stack size it will support. Instead, it should be designed to grow the dependency expression stack as required. In addition, FMP images that contain dependency expressions should make an effort to keep their dependency expressions as small as possible to help reduce the size of the FMP image.

All opcodes are 8-bit values, and if an invalid opcode is encountered, then the entire dependency expression evaluates to *FALSE*.

When the dependency expression is being evaluated and a GUID specified cannot be found, then the result of the conditional operation evaluates to *FALSE*.

If, when evaluating two popped values from the stack, it is determined that they are of different types (e.g. BOOLEAN value and 32-bit value), then the entire dependency expression evaluates to *FALSE*.

If an END opcode is not present in a dependency expression, then the entire dependency expression evaluates to *FALSE*.

The final evaluation of the dependency expression results in either a *TRUE* or *FALSE* result.

Table 23.4: Dependency Expression Opcode Summary

Opcode	Description
0x00	Push FMP GUID (1 op-code + 16 bytes)
0x01	Push 32-bit version value
0x02	Declare NULL-terminated string (Human-readable Version)
0x03	AND – Pop 2 BOOLEAN values and Push **TRUE** if both are **TRUE**.
0x04	OR – Pop 2 BOOLEAN values and Push **TRUE** if either are **TRUE**.
0x05	NOT – Pop BOOLEAN value Push NOT of BOOLEAN value.
0x06	Push **TRUE**
0x07	Push **FALSE**
0x08	EQ – Pop 2 32-bit version values and push **TRUE** if equal.

continues on next page

Table 23.4 – continued from previous page

0x09	GT - Pop 2 32-bit version values and push **TRUE** if first value is greater than the second.
0x0A	GTE - Pop 2 32-bit version values and push **TRUE** if first value is greater than or equal to the second.
0x0B	LT - Pop 2 32-bit version values and push **TRUE** if first value is less than the second.
0x0C	LTE - Pop 2 32-bit version values and push **TRUE** if first value is less than or equal to the second.
0x0D	END
0x0E	DECLARE_LENGTH - declares a 32-bit byte length of the entire dependency expression

23.2.1 PUSH_GUID

Syntax

```
PUSH_GUID <FMP GUID>
```

Description

Pushes the GUID value onto the stack. This GUID should be exposed by an *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* instance. The GUID should match one of the *EFI_FIRMWARE_IMAGE_DESCRIPTOR*. ImageTypeId values exposed through the GetImageInfo() function.

Operation

1. Search through all instances of the *EFI_FIRMWARE_MANAGEMENT_PROTOCOL*.

   a - In each instance, use the *GetImageInfo()* function to retrieve the ImageInfo->ImageTypeId value and ensure it matches the GUID specified in the op-code.

   b - If it doesn't match the GUID and no other instances match either, POP all values from the stack and PUSH **FALSE** onto the stack when evaluating a conditional operation involving the missing GUID.

2. Having found the matching *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* instance, use the GetImageInfo() function and push the ImageInfo->Version value onto the stack.

Table 23.5: PUSH_GUID Instruction Encoding

Byte	**Description**
0	0x00
1..16	A 16-byte GUID that represents an ImageTypeId in an FMP instance. The format is the same as type *EFI_GUID*.

Behaviors and Restrictions

None.

23.2.2 PUSH_VERSION

Syntax

```
PUSH_VERSION <32-bit Version>
```

Description

Pushes the 32-bit version value to compare against onto the stack. This value will be used to compare against Version values exposed through the *GetImageInfo()* function.

Table 23.6: PUSH_VERSION Instruction Encoding

Byte	Description
0	0x01
1..4	A 32-bit version to compare against.

Behaviors and Restrictions

None.

23.2.3 DECLARE_VERSION_NAME

Syntax

```
DECLARE_VERSION_NAME <NULL-terminated string>
```

Description

Declares an optional null-terminated version string that is the equivalent of the VersionName in the *EFI_FIRMWARE_MANAGEMENT_DESCRIPTOR*. Due to the OEM/IHV-specific format of version strings, this null-terminated string will not be used for purposes of comparison. Only the 32-bit integer values will be used for comparisons.

Table 23.7: DECLARE_VERSION_NAME Instruction Encoding

Byte	Description
0	0x02
1..n	A null-terminated UNICODE string.

Behaviors and Restrictions

None.

23.2.4 AND

Syntax

```
AND
```

Description

Pops two Boolean operands off the stack, performs a Boolean AND operation between the two operands, and pushes the result back onto the stack.

Operation

```
Operand1 <= POP Boolean stack element
Operand2 <= POP Boolean stack element
Result <= Operand1 AND Operand2
PUSH Result
```

Table 23.8: AND Instruction Encoding

Byte	Description
0	0x03

Behaviors and Restrictions

None.

23.2.5 OR

Syntax

```
OR
```

Description

Pops two Boolean operands off the stack, performs a Boolean OR operation between the two operands, and pushes the result back onto the stack.

Operation

```
Operand1 <= POP Boolean stack element
Operand2 <= POP Boolean stack element
Result <= Operand1 OR Operand2
PUSH Result
```

Table 23.9: OR Instruction Encoding

Byte	Description
0	0x04

Behaviors and Restrictions

None.

23.2.6 NOT

Syntax

```
NOT
```

Description

Pops a Boolean operand off the stack, performs a Boolean NOT operation on the operand, and pushes the result back onto the stack.

Operation

```
Operand <= POP Boolean stack element
Result <= NOT Operand PUSH Result
```

Table 23.10: NOT Instruction Encoding

Byte	Description
0	0x05

Behaviors and Restrictions

None.

23.2.7 TRUE

Syntax

```
**TRUE**
```

Description

Pushes a Boolean *TRUE* onto the stack.

Operation

```
PUSH **TRUE**
```

Table 23.11: TRUE Instruction Encoding

Byte	Description
0	0x06

Behaviors and Restrictions

None.

23.2.8 FALSE

Syntax

```
**FALSE**
```

Description

Pushes a Boolean **FALSE** onto the stack.

Operation

```
PUSH **FALSE**
```

Table 23.12: FALSE Instruction Encoding

Byte	Description
0	0x07

Behaviors and Restrictions

None.

23.2.9 EQ

Syntax

```
EQ
```

Description

Pops two 32-bit operands off the stack, performs a Boolean equals comparison operation between the two operands, and pushes the result back onto the stack.

Operation

```
Operand1 ? POP 32-bit stack element
Operand2 ? POP 32-bit stack element
Result ? Operand1 EQ Operand2
PUSH Result
```

Table 23.13: EQ Instruction Encoding

Byte	Description
0	0x08

Behaviors and Restrictions

None.

23.2.10 GT

Syntax

```
GT
```

Description

Pops two 32-bit operands off the stack, performs a Boolean greater-than comparison operation between the two operands, and pushes the result back onto the stack.

Operation

```
Operand1 <= POP 32-bit stack element
Operand2 <= POP 32-bit stack element
Result <= Operand1 GT Operand2
PUSH Result
```

Table 23.14: GT Instruction Encoding

Byte	Description
0	0x09

Behaviors and Restrictions

None.

23.2.11 GTE

Syntax

```
GTE
```

Description

Pops two 32-bit operands off the stack, performs a Boolean greater-than-or-equal comparison operation between the two operands, and pushes the result back onto the stack.

Operation

```
Operand1 ? POP 32-bit stack element
Operand2 ? POP 32-bit stack element
Result ? Operand1 GTE Operand2
PUSH Result
```

Table 23.15: GTE Instruction Encoding

Byte	Description
0	0x0A

Behaviors and Restrictions

None.

23.2.12 LT

Syntax

```
LT
```

Description

Pops two 32-bit operands off the stack, performs a Boolean less-than comparison operation between the two operands, and pushes the result back onto the stack.

Operation

```
Operand1 ? POP 32-bit stack element
Operand2 ? POP 32-bit stack element
Result ? Operand1 LT Operand2
PUSH Result
```

Table 23.16: LT Instruction Encoding

Byte	Description
0	0x0B

Behaviors and Restrictions

None.

23.2.13 LTE

Syntax

```
LTE
```

Description

Pops two 32-bit operands off the stack, performs a Boolean less-than-or-equal comparison operation between the two operands, and pushes the result back onto the stack.

Operation

```
Operand1 ? POP 32-bit stack element
Operand2 ? POP 32-bit stack element
Result ? Operand1 LTE Operand2
PUSH Result
```

Table 23.17: LTE Instruction Encoding

Byte	Description
0	0x0C

Behaviors and Restrictions

None.

23.2.14 END

Syntax

```
END
```

Description

Pops the final result of the dependency expression evaluation off the stack and exits the dependency expression evaluator.

Operation

```
POP Result
RETURN Result
```

Table 23.18: END Instruction Encoding

Byte	Description
0	0x0D

Behaviors and Restrictions

This opcode must be the last one in a dependency expression.

23.2.15 DECLARE_LENGTH

Syntax

```
DECLARE_LENGTH <32-bit Length>
```

Description

Declares an 32-bit byte length of the entire dependency expression.

Table 23.19: DECLARE_LENGTH Instruction Encoding

Byte	Description
0	0X0e 1..4 A 32-bit byte length for the entire dependency expression.

Behaviors and Restrictions

This opcode must be the first one in a dependency expression.

23.3 Delivering Capsules Containing Updates toFirmware Management Protocol

Summary

This section defines a method for delivery of a Firmware Management Protocol defined update using the UpdateCapsule runtime API.

23.3.1 EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID

GUID

```
// {6DCBD5ED-E82D-4C44-BDA1-7194199AD92A}
#define EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID \
  {0x6dcbd5ed, 0xe82d, 0x4c44, \
  {0xbd, 0xa1, 0x71, 0x94, 0x19, 0x9a, 0xd9, 0x2a }}
```

Description

This GUID is used in the *CapsuleGuid* field of *EFI_CAPSULE_HEADER* struct within a capsule constructed according to the definitions of section *Capsule Definition*. Use of this GUID indicates a capsule with body conforming to the additional structure defined in *DEFINED FIRMWARE MANAGEMENT PROTOCOL DATA CAPSULE STRUCTURE* .

When delivered to platform firmware *QueryCapsuleCapabilities()* the capsule will be examined according to the structure defined in *DEFINED FIRMWARE MANAGEMENT PROTOCOL DATA CAPSULE STRUCTURE* . and if it is possible for the platform to process *EFI_SUCCESS* will be returned.

When delivered to platform firmware *UpdateCapsule()* the capsule will be examined according to the structure defined in *DEFINED FIRMWARE MANAGEMENT PROTOCOL DATA CAPSULE STRUCTURE* . and if it is possible for the platform to process the update will be processed.

By definition Firmware Management protocol services are not available in EFI runtime and depending upon platform capabilities, EFI runtime delivery of this capsule may not be supported and may return an error when delivered in EFI runtime with *CAPSULE_FLAGS_PERSIST_ACROSS_RESET* bit defined. However any platform supporting this capability is required to accept this form of capsule in Boot Services, including optional use of *CAPSULE_FLAGS_PERSIST_ACROSS_RESET* bit.

23.3.2 DEFINED FIRMWARE MANAGEMENT PROTOCOL DATA CAPSULE STRUCTURE

Structure of the Capsule Body

Generic EFI Capsule Body is defined in *Capsule Definition*. When an EFI Capsule is identified by *EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID,* the internal structure of the capsule _ *_FIRMWARE_MANAGEMENT_CAPSULE_HEADER* followed by optional EFI drivers to be loaded by the platform and optional binary payload items to be processed and passed to Firmware Management Protocol image update function. Each binary payload item is preceded by *EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER*. Internal capsule structure diagram follows.

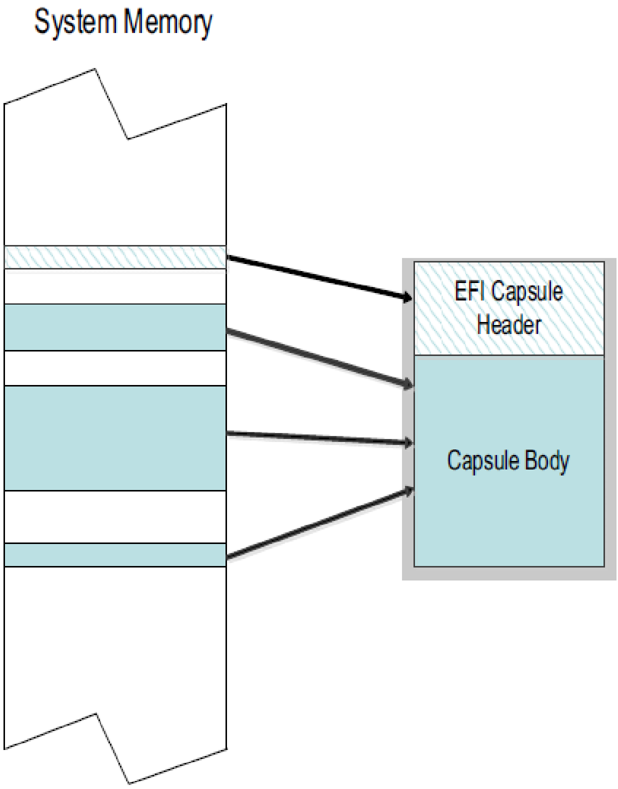

Fig. 23.4: Optional Scatter-Gather Construction of Capsule Submitted to Update Capsule()

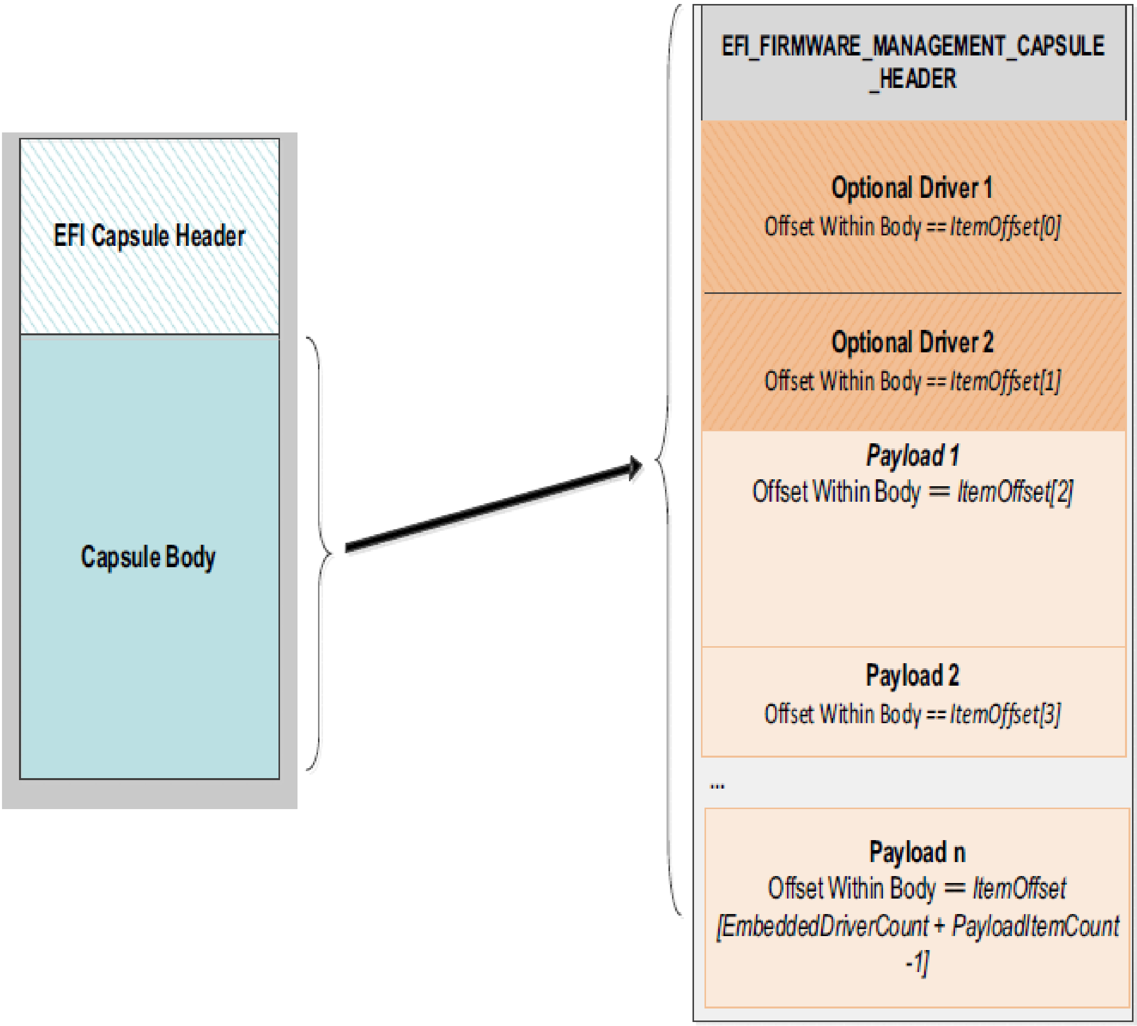

Fig. 23.5: Capsule Header and Firmware Management Capsule Header

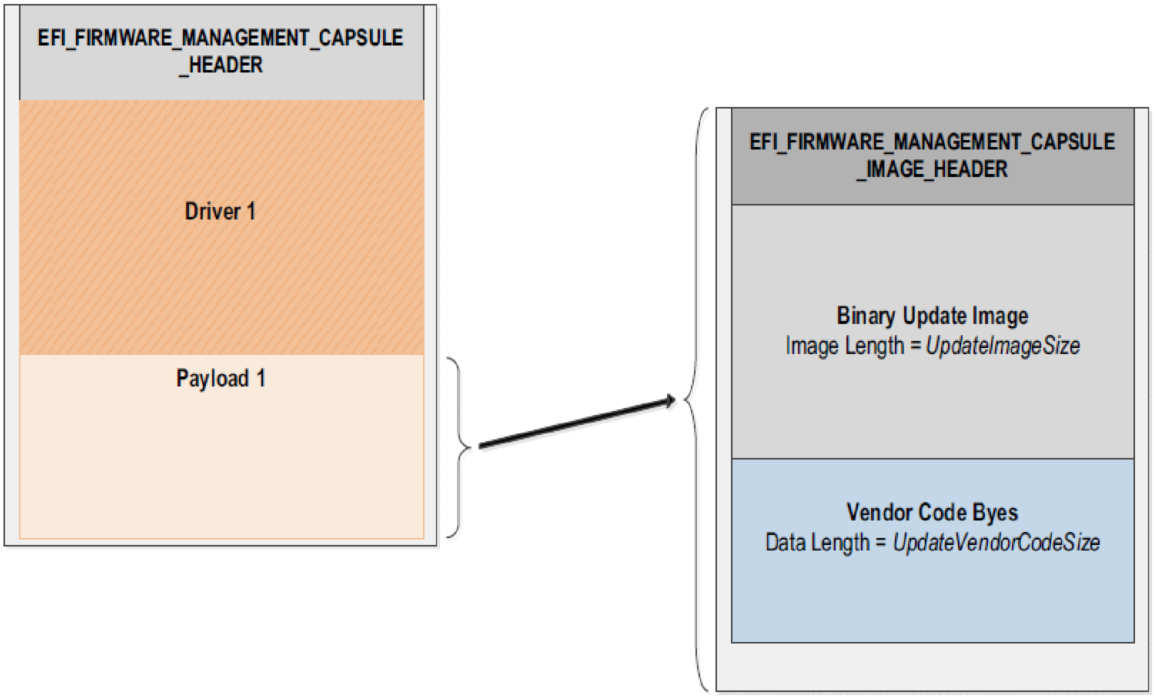

Fig. 23.6: Firmware Management and Firmware Image Management headers

Related Definitions

```
#pragma pack(1)
typedef struct {
  UINT32              Version;
  UINT16              EmbeddedDriverCount;
  UINT16              PayloadItemCount;
  // UINT64           ItemOffsetList[];
}    EFI_FIRMWARE_MANAGEMENT_CAPSULE_HEADER;
```

Version

Version of the structure, initially 0x00000001.

EmbeddedDriverCount

The number of drivers included in the capsule and the number of corresponding offsets stored in *ItemOffsetList* array. This field may be zero in the case where no driver is required.

PayloadItemCount

The number of payload items included in the capsule and the number of corresponding offsets stored in the *ItemOffsetList* array. This field may be zero in the case where no binary payload object is required to accomplish the update.

ItemOffsetList

Variable length array of dimension [*EmbeddedDriverCount* + *PayloadItemCount*] containing offsets of each of the drivers and payload items contained within the capsule. The offsets of the items are calculated relative to the base address of the *EFI_FIRMWARE_MANAGEMENT_CAPSULE_HEADER* struct. Offset may indicate structure begins on any byte boundary. Offsets in the array must be sorted in ascending order with all drivers preceding all binary payload elements.

```
#pragma pack(1)
typedef struct {
  UINT32                Version;
  EFI_GUID              UpdateImageTypeId;
  UINT8                 UpdateImageIndex;
  UINT8                 reserved_bytes[3];
  UINT32                UpdateImageSize;
  UINT32                UpdateVendorCodeSize;
  UINT64                UpdateHardwareInstance; //Introduced in v2
  UINT64                ImageCapsuleSupport; //Introduced in v3
}  EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER;
```

Version

Version of the structure, initially *0x00000003*.

UpdateImageTypeId

Used to identify device firmware targeted by this update. This guid is matched by system firmware against *ImageTypeId* field within a *EFI_FIRMWARE_IMAGE_DESCRIPTOR* returned by an instance of *EFI_FIRMWARE_MANAGEMENT_PROTOCOL.GetImageInfo()* in the system.

UpdateImageIndex

Passed as *ImageIndex* in call to *EFI_FIRMWARE_MANAGEMENT_PROTOCOL.SetImage()*

UpdateImageSize

Size of the binary update image which immediately follows this structure. Passed as *ImageSize* to *EFI_FIRMWARE_MANAGEMENT_PROTOCOL.SetImage()*. This size may or may not include Firmware Image Authentication information.

UpdateVendorCodeSize

Size of the *VendorCode* bytes which optionally immediately follow binary update image in the capsule. Pointer to these bytes passed in *VendorCode* to *EFI_FIRMWARE_MANAGEMENT_PROTOCOL.SetImage()*. If *UpdateVendorCodeSize* is zero, then *VendorCode* is null in *SetImage()* call.

UpdateHardwareInstance

The *HardwareInstance* to target with this update. If value is zero it means match all *HardwareInstances*. This field allows update software to target only a single device in cases where there are more than one device with the same *ImageTypeId* GUID. This header is outside the signed data of the Authentication Info structure and therefore can be modified without changing the Auth data.

ImageCapsuleSupport

A 64-bit bitmask that determines what sections are added to the payload.

```
#define CAPSULE_SUPPORT_AUTHENTICATION 0x0000000000000001
#define CAPSULE_SUPPORT_DEPENDENCY 0x0000000000000002
```

Description

The *EFI_FIRMWARE_MANAGEMENT_CAPSULE_HEADER* structure is located at the lowest offset within the body of the capsule identified by *EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID*. The structure is variable length with the number of element offsets within of the *ItemOffsetList* array determined by the count of drivers within the capsule plus the count of binary payload elements. It is expected that drivers whose presence is indicated by non-zero *EmbeddedDriverCount* will be used to supply an implementation of *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* for devices that lack said protocol within the image to be updated.

Each payload item contained within the capsule body is preceded by a *EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER* struct used to provide information required to prepare the payload item as an image for delivery to a instance of *EFI_FIRMWARE_MANAGEMENT_PROTOCOL.SetImage()* function.

NOTE: *[Caution] The capsule identified by* EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID *uses packed structures and structure fields may not be naturally aligned within the capsule buffer as delivered. Drivers and binary payload elements may start on byte boundary with no padding. Processing firmware may need to copy content elements during capsule unpacking in order to achieve any required natural alignment.*

23.3.3 Firmware Processing of the Capsule Identified by EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID

1. Capsule is presented to system firmware via call to *UpdateCapsule()* or using mass storage delivery procedure of *Delivery of Capsules via file on Mass Storage Device*. The capsule must be constructed to consist of a single *EFI_FIRMWARE_MANAGEMENT_CAPSULE_HEADER* structure with the 0 or more drivers and 0 or more binary payload items. However a capsule in which driver count and payload count are both zero is not processed.
2. Capsule is recognized by *EFI_CAPSULE_HEADER* member *CapsuleGuid* equal to *EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID. CAPSULE_FLAGS_POPULATE_SYSTEM_TABLE* flag must be 0.
3. If system is not in boot services and platform does not support persistence of capsule across reset when initiated within EFI Runtime, *EFI_OUT_OF_RESOURCES* error is returned.
4. If device requires hardware reset to unlock flash write protection, *CAPSULE_FLAGS_PERSIST_ACROSS_RESET* and optionally *CAPSULE_FLAGS_INITIATE_RESET* should be set to 1 in the *EFI_CAPSULE_HEADER*.
5. When reset is requested using *CAPSULE_FLAGS_PERSIST_ACROSS_RESET,* the capsule is processed in Boot Services, before the *EFI_EVENT_GROUP_READY_TO_BOOT* event.

6. All scatter-gather fragmentation is removed by the platform firmware and the capsule is processed as a contiguous buffer.
7. Examining *EFI_FIRMWARE_MANAGEMENT_CAPSULE_HEADER,* if *EmbeddedDriverCount* is non-zero, for each of the included drivers up to indicated count, the portion of the capsule body starting at the offset indicated by *ItemOffsetList[n]* and continuing for a size encompassing all bytes up to the next element's offset stored in *ItemOffsetList[n+1]* or the end of the capsule, will be copied to a buffer. The driver contained within the capsule body may not be naturally aligned and the exact driver size in bytes should be respected to ensure successful security validation. In the case where a driver is last element in the *ItemOffsetList* array, the driver size may be calculated by reference to body size as calculated from *CapsuleImageSize* in *EFI_CAPSULE_HEADER*
8. Each extracted driver is placed into a buffer and passed to *LoadImage()*. The driver image passed to *LoadImage()* must successfully pass all image format, platform type, and security checks including those related to UEFI secure boot, if enabled on the platform. After *LoadImage()* returns the processing of the capsule is continued with next driver if present until all drivers have been passed to *LoadImage()*. The driver being installed must check for matching hardware and instantiate any required protocols during call to *EFI_IMAGE_ENTRY_POINT*. In case where matching hardware is not found the driver should exit with error. In case where capsule creator has preference as to which of several included drivers to be made resident, later drivers in the capsule should confirm earlier driver successfully loaded and then exit with load error.
9. After driver processing is complete the platform firmware examines *PayloadItemCount,* and if zero the capsule processing is complete. Otherwise platform firmware sequentially locates each *EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER* found within the capsule and processes according to steps 10-14.
10. For all instances of *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* in the system, *GetImageInfo()* is called to return arrays of *EFI_FIRMWARE_IMAGE_DESCRIPTOR* structures.
11. Find the matching FMP instance(s):

    a – If the *EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER* is version 1 or it is version 2 with *UpdateHardwareInstance* set to 0, then system firmware will use only the *ImageTypeId* to determine a match. For each instance of *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* that returns a *EFI_FIRMWARE_IMAGE_DESCRIPTOR* containing an *ImageTypeId* GUID that matches the *UpdateImageTypeId* GUID within *EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER,* the system firmware will call *SetImage()* function within that instance. In some cases there may be more than one instance of matching *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* when multiple matching devices are installed in the system and all instances will be checked for GUID match and *SetImage()* call if match is successful.

    b – If the *EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER* is version 2 and contains a non-zero value in the *UpdateHardwareInstance* field, then system firmware will use both *ImageTypeId* and *HardwareInstance* to determine a match. For the instance of *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* that returns a *EFI_FIRMWARE_IMAGE_DESCRIPTOR* containing an *ImageTypeId* GUID that matches the *UpdateImageTypeId* GUID and a *HardwareInstance* matching the *UpdateHardwareInstance* within *EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER,* the system firmware will call the *SetImage()* function within that instance. There will never be more than one instance since the *ImageId* must be unique.
12. In the situation where platform configuration or policy prohibits the processing of a capsule or individual FMP payload, the error *EFI_NOT_READY* will be returned in capsule result variable *CapsuleStatus* field. Otherwise *SetImage()* parameters are constructed using the *UpdateImageIndex, UpdateImageSize* and *UpdateVendorCodeSize* fields within *EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER*. In the case of capsule containing multiple payloads, or a payload matching multiple FMP instances, a separate Capsule Result Variable will be created with the results of each call to *SetImage()*. If any call to *SetImage()* selected per above matching algorithm returns an error, the processing of additional FMP instances or payload items in that capsule will be skipped and *EFI_ABORTED* returned in Capsule Result Variable for each potential call to *SetImage()* that was skipped.
13. *SetImage()* performs any required image authentication as described in that functions definition within this chap-

ter.

14. Note: if multiple separate component updates including multiple *ImageIndex* values are required then additional *EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER* structures and image binaries are included within the capsule.
15. After all items in the capsule are processed the system is restarted by the platform firmware.

23.4 EFI System Resource Table

23.4.1 EFI_SYSTEM_RESOURCE_TABLE

Summary

The EFI System Resource Table (ESRT) provides an optional mechanism for identifying device and system firmware resources for the purposes of targeting firmware updates to those resources. Each entry in the ESRT describes a device or system firmware resource that *can* be targeted by a firmware capsule update. Each entry in the ESRT will also be used to report status of the last attempted update. See *EFI Configuration Table & Properties Table* for description of how to publish ESRT using *EFI_CONFIGURATION_TABLE*. The ESRT shall be stored in memory of type *EfiBootServicesData*. See *Update Capsule* and *Delivery of Capsules via file on Mass Storage Device* for details on delivery of updates to devices listed in ESRT.

GUID

```
#define EFI_SYSTEM_RESOURCE_TABLE_GUID \
    { 0xb122a263, 0x3661, 0x4f68,\
  { 0x99, 0x29, 0x78, 0xf8, 0xb0, 0xd6, 0x21, 0x80 }}
```

Table Structure

```
typedef struct {
  UINT32                        FwResourceCount;
  UINT32                        FwResourceCountMax;
  UINT64                        FwResourceVersion;
  //EFI_SYSTEM_RESOURCE_ENTRY    Entries[];
} EFI_SYSTEM_RESOURCE_TABLE;
```

Members

FwResourceCount
The number of firmware resources in the table, must not be zero.

FwResourceCountMax
The maximum number of resource array entries that can be within the table without reallocating the table, must not be zero.

FwResourceVersion
The version of the *EFI_SYSTEM_RESOURCE_ENTRY* entities used in this table. This field should be set to 1. See *EFI_SYSTEM_RESOURCE_TABLE_FIRMWARE_RESOURCE_VERSION*.

Entries
Array of *EFI_SYSTEM_RESOURCE_ENTRY*

Related Definitions

```
// Current Entry Version
#define EFI_SYSTEM_RESOURCE_TABLE_FIRMWARE_RESOURCE_VERSION 1

typedef struct {
  EFI_GUID       FwClass;
  UINT32         FwType;
  UINT32         FwVersion;
  UINT32         LowestSupportedFwVersion;
  UINT32         CapsuleFlags;
  UINT32         LastAttemptVersion;
  UINT32         LastAttemptStatus;
}   EFI_SYSTEM_RESOURCE_ENTRY;
```

FwClass

The firmware class field contains a GUID that identifies a firmware component that can be updated via *UpdateCapsule()*. This GUID must be unique within all entries of the ESRT.

FwType

Identifies the type of firmware resource. See "Firmware Type Definitions" below for possible values.

FwVersion

The firmware version field represents the current version of the firmware resource, value must always increase as a larger number represents a newer version.

LowestSupportedFwVersion

The lowest firmware resource version to which a firmware resource can be rolled back for the given system/device. Generally this is used to protect against known and fixed security issues.

CapsuleFlags

The capsule flags field contains the *CapsuleGuid* flags (bits 0- 15) as defined in the *EFI_CAPSULE_HEADER* that will be set in the capsule header.

LastAttemptVersion

The last attempt version field describes the last firmware version for which an update was attempted (uses the same format as Firmware Version).

Last Attempt Version is updated each time an *UpdateCapsule()* is attempted for an ESRT entry and is preserved across reboots (non-volatile). However, in cases where the attempt version is not recorded due to limitations in the update process, the field shall set to zero after a failed update. Similarly, in the case of a removable device, this value is set to 0 in cases where the device has not been updated since being added to the system.

LastAttemptStatus

The last attempt status field describes the result of the last firmware update attempt for the firmware resource entry.

LastAttemptStatus is updated each time an *UpdateCapsule()* is attempted for an ESRT entry and is preserved across reboots (non-volatile).

If a firmware update has never been attempted or is unknown, for example after fresh insertion of a removable device, *LastAttemptStatus* must be set to Success.

```
//
// Firmware Type Definitions
//
#define ESRT_FW_TYPE_UNKNOWN           0x00000000
#define ESRT_FW_TYPE_SYSTEMFIRMWARE    0x00000001
#define ESRT_FW_TYPE_DEVICEFIRMWARE    0x00000002
```

(continues on next page)

(continued from previous page)

```
#define ESRT_FW_TYPE_UEFIDRIVER        0x00000003

//
// Last Attempt Status Values
//
#define LAST_ATTEMPT_STATUS_SUCCESS                          0x00000000
#define LAST_ATTEMPT_STATUS_ERROR_UNSUCCESSFUL               0x00000001
#define LAST_ATTEMPT_STATUS_ERROR_INSUFFICIENT_RESOURCES     0x00000002
#define LAST_ATTEMPT_STATUS_ERROR_INCORRECT_VERSION          0x00000003
#define LAST_ATTEMPT_STATUS_ERROR_INVALID_FORMAT             0x00000004
#define LAST_ATTEMPT_STATUS_ERROR_AUTH_ERROR                 0x00000005
#define LAST_ATTEMPT_STATUS_ERROR_PWR_EVT_AC                 0x00000006
#define LAST_ATTEMPT_STATUS_ERROR_PWR_EVT_BATT               0x00000007
#define LAST_ATTEMPT_STATUS_ERROR_UNSATISFIED_DEPENDENCIES   0x00000008

// The LastAttemptStatus values of 0x1000 - 0x4000 are reserved for vendor usage.
#define LAST_ATTEMPT_STATUS_ERROR_UNSUCCESSFUL_VENDOR_RANGE_MIN 0x00001000
#define LAST_ATTEMPT_STATUS_ERROR_UNSUCCESSFUL_VENDOR_RANGE_MAX 0x00004000
```

23.4.2 Adding and Removing Devices from the ESRT

ESRT entries must be updated by System Firmware before handoff to the Operating System under the following conditions. Devices and systems that support hot swapping (once the OS has been loaded) will not get their ESRT entries updated until the next reboot and execution of ESRT updating logic in the UEFI space.

- **Required**: System firmware is responsible for updating the FirmwareVersion, *LowestSupportedFirmwareVersion, LastAttemptVersion* and *LastAttemptStatus* values in the ESRT any time *UpdateCapsule* is called and a firmware update attempt is made for the corresponding ESRT entry.
- **Required**: the ESRT must be updated each time a configuration change is detected by system firmware, such as when a device is added or removed from the system.
- **Optional**: all devices in the ESRT should be polled for any configuration changes any time *UpdateCapsule* is called.

23.4.3 ESRT and Firmware Management Protocol

Although the ESRT does not require firmware to use Firmware Management Protocol for updates it is designed to work with and extend the capabilities of FMP. The ESRT can be used to represent system and device firmware serviced by capsules that have an implementation specific format as well as devices that support Firmware Management Protocol and that are serviced by capsules formatted as described in *Dependency Expression Instruction Set* , Delivering Capsules Containing Updates to Firmware Management Protocol. For system expansion devices, the task of building ESRT table entries is to be performed by the system firmware based upon FMP data published by the device.

23.4.4 Mapping Firmware Management Protocol Descriptors to ESRT Entries

Firmware management Protocol descriptors define most of the information needed for an ESRT entry. The table below helps identify which members map to which fields. Some members are dependent on certain versions of FMP and it is left to system firmware to resolve any mappings when information is not present in the FMP instance. FMP descriptors should only be mapped to ESRT entries if the following are true:

- An entry with the same *ImageTypeId* is not already in the ESRT.
- *AttributesSupported* and *AttributesSetting* have the *IMAGE_ATTRIBUTE_IN_USE* bit set.
- In the case where *DescriptorCount* returned by *GetImageInfo()* is greater than one, firmware shall populate the ESRT according to system policy, noting however that multiple ESRT entries with identical FwClass values are not permitted.

Table 23.20: ESRT and FMP Fields

ESRT Field	FMP Field	Comment
FwClass	*ImageTypeId*	The ImageTypeId GUID from the Firmware Management Protocol instance for a device is used as the Firmware Class GUID in the ESRT. Where there are multiple identical devices in the system, system firmware must create a mapping to ensure that the ESRT FwClass GUIDs are unique and consistent.
FwVersion	*Version*	Represents the current version of device firmware for an FMP instance.
LowestSupported FwVersion	*LowestSupported ImageVersion*	
LastAttemptVersion	*LastAttemptVersion*	To be set after the completion of a firmware update attempt. In descriptor v3+ only. Default value is 0.
LastAttemptStatus	*LastAttemptStatus*	To be set after the completion of a firmware update attempt. In descriptor v3+ only. Default value is SUCCESS.

23.5 Delivering Capsule Containing JSON payload

Summary

This section defines a method for delivery of JSON payload to perform firmware configuration or firmware update using the UpdateCapsule runtime API or using mass storage delivery.

23.5.1 EFI_JSON_CAPSULE_ID_GUID

GUID

```
// {67D6F4CD-D6B8-4573-BF4A-DE5E252D61AE}
#define EFI_JSON_CAPSULE_ID_GUID \
{0x67d6f4cd, 0xd6b8, 0x4573, \
{0xbf, 0x4a, 0xde, 0x5e, 0x25, 0x2d, 0x61, 0xae }}
```

Description

This GUID is used in the *CapsuleGuid* field of *EFI_CAPSULE_HEADER* struct within a capsule constructed according to the definitions of *Update Capsule*. Use of this GUID indicates a capsule with body conforming to the additional structure defined in *Defined JSON Capsule Data Structure* .

When delivered to platform firmware *QueryCapsuleCapabilities()* the capsule will be examined according to the structure defined in *Defined JSON Capsule Data Structure* , and if it is possible for the platform to process that then *EFI_SUCCESS* will be returned.

When delivered to platform firmware *UpdateCapsule()* the capsule will be examined according to the structure defined in *Defined JSON Capsule Data Structure* , and if it is possible for the platform to process that the update will be processed.

By definition, firmware configuration and firmware update are not available in EFI runtime. Depending on platform capabilities, EFI runtime delivery of the capsule may not be supported, and may return an error when delivered in EFI runtime with *CAPSULE_FLAGS_PERSIST_ACROSS_RESET* bit defined. However, any platform supporting this capability is required to accept this form of capsule in Boot Services, including optional use of the *CAPSULE_FLAGS_PERSIST_ACROSS_RESET* bit.

23.5.2 Defined JSON Capsule Data Structure

Structure of the Capsule Body

A generic EFI Capsule Body is defined in *Update Capsule*. When an EFI Capsule is identified by *EFI_JSON_CAPSULE_ID_GUID,* the internal structure of the capsule header is defined in this section, see EFI_JSON_CAPSULE_HEADER. Note that if multiple JSON capsules are delivered together, each JSON capsule should contain one *EFI_CAPSULE_HEADER* and one *EFI_JSON_CAPSULE_HEADER* separately.

Related Definitions

```
#pragma pack(1)
typedef struct {
  UINT32       Version;
  UINT32       CapsuleId;
  UINT32       PayloadLength;
  UINT8        Payload[];
} EFI_JSON_CAPSULE_HEADER;
#pragma pack ()
```

Version
: Version of the structure, initially 0x00000001.

CapsuleId
: The unique identifier of this capsule.

PayloadLength
: The length of the JSON payload immediately following this header, in bytes.

Payload
: Variable length buffer containing the JSON payload that should be parsed and applied to the system. The definition of the JSON schema used in the payload is beyond the scope of this specification.

Description

The *EFI_JSON_CAPSULE_HEADER* structure is located at the lowest offset within the body of the capsule identified by *EFI_JSON_CAPSULE_ID_GUID*. It is expected that drivers which process the JSON payload have the specific knowledge of the JSON schema used in the payload. The drivers should parse the JSON payload firstly to understand whether the capsule wants to perform firmware configure or firmware update then route the JSON payload to corresponding modules. For instance, the capsule may be delivered to *EFI_FIRMWARE_MANAGEMENT_PROTOCOL* instance to update the firmware image.

Structure of the Configuration Data

During the system boot, current configuration data or cached configuration data is reported to the EFI System Configuration Table with *EFI_JSON_CONFIG_DATA_TABLE_GUID* according to the value of *EFI_OS_INDICATIONS_JSON_CONFIG_DATA_REFRESH* bit in *OsIndications*. The structure to record the configuration data is defined in this section, see *EFI_JSON_CAPSULE_CONFIG_DATA*.

Related Definitions

```
#pragma pack(1)
typedef struct {
  UINT32                      Version;
  UINT32                      TotalLength;
  EFI_JSON_CONFIG_DATA_ITEM    ConfigDataList[];
} EFI_JSON_CAPSULE_CONFIG_DATA;
#pragma pack ()
```

Version

Version of the structure, initially 0x00000001.

TotalLength

The total length of *EFI_JSON_CAPSULE_CONFIG_DATA*, in bytes.

ConfigDataList

Array of configuration data groups. Type *EFI_JSON_CONFIG_DATA_ITEM* is defined below.

```
typedef struct {
  UINT32       ConfigDataLength;
  UINT8        ConfigData[];
} EFI_JSON_CONFIG_DATA_ITEM;
```

ConfigDataLength

The length of the following *ConfigData,* in bytes.

ConfigData

Variable length buffer containing the JSON payload that describes one group of configuration data within current system. The definition of the JSON schema used in this payload is beyond the scope of this specification.

Description

For supporting multiple groups of configuration data, a list of *EFI_JSON_CONFIG_DATA_ITEM* are included in *EFI_JSON_CAPSULE_CONFIG_DATA* and each item indicates one group of configuration data. It is expected that particular drivers have the specific knowledge of the JSON schema used in the payload so that they can describe system configuration data in JSON then install to the EFI System Configuration Table. The drivers should check *EFI_OS_INDICATIONS_JSON_CONFIG_DATA_REFRESH* bit in *OsIndications* to understand whether they need collect current configuration firstly.

23.5.3 Firmware Processing of the Capsule Identified by EFI_JSON_CAPSULE_ID_GUID

1. Capsule is presented to system firmware via call to *UpdateCapsule()* or using mass storage delivery procedure of *Delivery of Capsules via file on Mass Storage Device*. The capsule must be constructed to consist of a single *EFI_JSON_CAPSULE_HEADER* structure with JSON payload follows. A capsule in which *PayloadLength* is zero will not be processed.
2. Capsule is recognized by *EFI_CAPSULE_HEADER* member CapsuleGuid equal to *EFI_JSON_CAPSULE_ID_GUID*. *CAPSULE_FLAGS_POPULATE_SYSTEM_TABLE* flag must be 0.
3. If system is not in boot services and platform does not support persistence of capsule across reset when initiated within EFI Runtime, *EFI_OUT_OF_RESOURCES* error is returned.
4. If device requires hardware reset to unlock flash write protection, *CAPSULE_FLAGS_PERSIST_ACROSS_RESET* and optionally CAPSULE_FLAGS_INITIATE_RESET should be set to 1 in the EFI_CAPSULE_HEADER.
5. When reset is requested using CAPSULE_FLAGS_PERSIST_ACROSS_RESET, the capsule is processed in Boot Services, before the EFI_EVENT_GROUP_READY_TO_BOOT event.
6. All scatter-gather fragmentation is removed by the platform firmware and the capsule is processed as a contiguous buffer.
7. When a capsule identified by EFI_JSON_CAPSULE_ID_GUID is received, the system firmware shall place a pointer to the coalesced capsule in the EFI System Configuration Table with EFI_JSON_CAPSULE_DATA_TABLE_GUID before loading any third party modules such as option ROM. If multiple capsules identified by EFI_JSON_CAPSULE_ID_GUID are received, the system firmware shall place a list of pointers to the capsules, preceded by a UINTN that represents the number of pointers, in the EFI System Configuration Table with EFI_JSON_CAPSULE_DATA_TABLE_GUID before loading any third party modules such as option ROM. The UINTN and each pointer must be naturally aligned.
8. The system configuration driver should check EFI System Configuration Table and parse the JSON payload, to identify the configuration data type of JSON payload, and route the JSON payload to corresponding modules. The corresponding capsule pointer shall be removed from the EFI System Configuration Table and also be cleared after it is processed.
9. The processing result shall be installed to EFI System Configuration Table using the format of EFI_CAPSULE_RESULT_VARIABLE_HEADER and EFI_CAPSULE_RESULT_VARIABLE_JSON defined in Section 8.5.6 with EFI_JSON_CAPSULE_RESULT_TABLE_GUID. If the capsule is delivered via mass storage device, the process result shall be recorded by using UEFI variables as described in *UEFI variable reporting on the Success or any Errors encountered in processing of capsules after restart* .

CHAPTER

TWENTYFOUR

NETWORK PROTOCOLS — SNP, PXE, BIS AND HTTP BOOT

24.1 Simple Network Protocol

This section defines the Simple Network Protocol. This protocol provides a packet level interface to a network adapter.

24.1.1 EFI_SIMPLE_NETWORK_PROTOCOL

Summary

The EFI_SIMPLE_NETWORK_PROTOCOL provides services to initialize a network interface, transmit packets, receive packets, and close a network interface.

GUID

```
#define EFI_SIMPLE_NETWORK_PROTOCOL_GUID \
  {0xA19832B9,0xAC25,0x11D3,\
    {0x9A,0x2D,0x00,0x90,0x27,0x3f,0xc1,0x4d}}
```

Revision Number

```
#define EFI_SIMPLE_NETWORK_PROTOCOL_REVISION 0x00010000
```

Protocol Interface Structure

```
typedef struct \_EFI_SIMPLE_NETWORK_PROTOCOL\_ {
  UINT64                              Revision;
  EFI_SIMPLE_NETWORK_START            Start;
  EFI_SIMPLE_NETWORK_STOP             Stop;
  EFI_SIMPLE_NETWORK_INITIALIZE       Initialize;
  EFI_SIMPLE_NETWORK_RESET            Reset;
  EFI_SIMPLE_NETWORK_SHUTDOWN         Shutdown;
  EFI_SIMPLE_NETWORK_RECEIVE_FILTERS  ReceiveFilters;
  EFI_SIMPLE_NETWORK_STATION_ADDRESS  StationAddress;
  EFI_SIMPLE_NETWORK_STATISTICS       Statistics;
  EFI_SIMPLE_NETWORK_MCAST_IP_TO_MAC  MCastIpToMac;
  EFI_SIMPLE_NETWORK_NVDATA           NvData;
  EFI_SIMPLE_NETWORK_GET_STATUS       GetStatus;
  EFI_SIMPLE_NETWORK_TRANSMIT         Transmit;
  EFI_SIMPLE_NETWORK_RECEIVE          Receive;
  EFI_EVENT                           WaitForPacket;
```

(continues on next page)

(continued from previous page)

```
  EFI_SIMPLE_NETWORK_MODE              *Mode;
}   EFI_SIMPLE_NETWORK_PROTOCOL;
```

Parameters

Revision

Revision of the EFI_SIMPLE_NETWORK_PROTOCOL. All future revisions must be backwards compatible. If a future version is not backwards compatible it is not the same GUID.

Start

Prepares the network interface for further command operations. No other EFI_SIMPLE_NETWORK_PROTOCOL interface functions will operate until this call is made. See the *EFI_SIMPLE_NETWORK.Start()* function description.

Stop

Stops further network interface command processing. No other EFI_SIMPLE_NETWORK_PROTOCOL interface functions will operate after this call is made until another Start() call is made. See the *EFI_SIMPLE_NETWORK.Stop()* function description.

Initialize

Resets the network adapter and allocates the transmit and receive buffers. See the *EFI_SIMPLE_NETWORK.Initialize()* function description.

Reset

Resets the network adapter and reinitializes it with the parameters provided in the previous call to *Initialize()* . See the *EFI_SIMPLE_NETWORK.Reset()* function description.

Shutdown

Resets the network adapter and leaves it in a state safe for another driver to initialize. The memory buffers assigned in the Initialize() call are released. After this call, only the Initialize() or Stop() calls may be used. See the *EFI_SIMPLE_NETWORK.Shutdown()* function description.

ReceiveFilters

Enables and disables the receive filters for the network interface and, if supported, manages the filtered multicast HW MAC (Hardware Media Access Control) address list. See the *EFI_SIMPLE_NETWORK.ReceiveFilters()* function description.

StationAddress

Modifies or resets the current station address, if supported. See the *EFI_SIMPLE_NETWORK.StationAddress()* function description.

Statistics

Collects statistics from the network interface and allows the statistics to be reset. See the *EFI_SIMPLE_NETWORK.Statistics()* function description.

MCastIpToMac

Maps a multicast IP address to a multicast HW MAC address. See the *EFI_SIMPLE_NETWORK.MCastIPtoMAC()* function description.

NvData

Reads and writes the contents of the NVRAM devices attached to the network interface. See the *EFI_SIMPLE_NETWORK.NvData()* function description.

GetStatus

Reads the current interrupt status and the list of recycled transmit buffers from the network interface. See the *EFI_SIMPLE_NETWORK.GetStatus()* function description.

Transmit

Places a packet in the transmit queue. See *EFI_SIMPLE_NETWORK.Transmit()* function description.

Receive

Retrieves a packet from the receive queue, along with the status flags that describe the packet type. See the *EFI_SIMPLE_NETWORK.Receive()* function description.

WaitForPacket

Event used with *EFI_BOOT_SERVICES.WaitForEvent()* to wait for a packet to be received.

Mode

Pointer to the EFI_SIMPLE_NETWORK_MODE data for the device. See "Related Definitions" below.

Related Definitions

```
//*******************************************************
// EFI_SIMPLE_NETWORK_MODE
//
// Note that the fields in this data structure are read-only
// and are updated by the code that produces the
// EFI_SIMPLE_NETWORK_PROTOCOL
// functions. All these fields must be discovered
// in a protocol instance of
// EFI_DRIVER_BINDING_PROTOCOL.Start().
//*******************************************************
typedef struct {
  UINT32            State;
  UINT32            HwAddressSize;
  UINT32            MediaHeaderSize;
  UINT32            MaxPacketSize;
  UINT32            NvRamSize;
  UINT32            NvRamAccessSize;
  UINT32            ReceiveFilterMask;
  UINT32            ReceiveFilterSetting;
  UINT32            MaxMCastFilterCount;
  UINT32            MCastFilterCount;
  EFI_MAC_ADDRESS   MCastFilter[MAX_MCAST_FILTER_CNT];
  EFI_MAC_ADDRESS   CurrentAddress;
  EFI_MAC_ADDRESS   BroadcastAddress;
  EFI_MAC_ADDRESS   PermanentAddress;
  UINT8             IfType;

  BOOLEAN           MultipleTxSupported;
  BOOLEAN           MediaPresentSupported;
  BOOLEAN           MediaPresent;
}   EFI_SIMPLE_NETWORK_MODE;
```

State

Reports the current state of the network interface (see EFI_SIMPLE_NETWORK_STATE WORK_STATE below). When an EFI_SIMPLE_NETWORK_PROTOCOL driver initializes a network interface, the network interface is left in the EfiSimpleNetworkStopped state.

HwAddressSize

The size, in bytes, of the network interface's HW address.

MediaHeaderSize

The size, in bytes, of the network interface's media header.

MaxPacketSize

The maximum size, in bytes, of the packets supported by the network interface.

NvRamSize
The size, in bytes, of the NVRAM device attached to the network interface. If an NVRAM device is not attached to the network interface, then this field will be zero. This value must be a multiple of *NvramAccessSize*.

NvRamAccessSize
The size that must be used for all NVRAM reads and writes. The start address for NVRAM read and write operations and the total length of those operations, must be a multiple of this value. The legal values for this field are 0, 1, 2, 4, and 8. If the value is zero, then no NVRAM devices are attached to the network interface.

ReceiveFilterMask
The multicast receive filter settings supported by the network interface.

ReceiveFilterSetting
The current multicast receive filter settings. See "Bit Mask Values for *ReceiveFilterSetting* " below.

MaxMCastFilterCount
The maximum number of multicast address receive filters supported by the driver. If this value is zero, then ReceiveFilters() cannot modify the multicast address receive filters. This field may be less than MAX_MCAST_FILTER_CNT (see below).

MCastFilterCount
The current number of multicast address receive filters.

MCastFilter
Array containing the addresses of the current multicast address receive filters.

CurrentAddress
The current HW MAC address for the network interface.

BroadcastAddress
The current HW MAC address for broadcast packets.

PermanentAddress
The permanent HW MAC address for the network interface.

IfType
The interface type of the network interface. See RFC 3232, section "Number Hardware Type."

MacAddressChangeable
TRUE if the HW MAC address can be changed.

MultipleTxSupported
TRUE if the network interface can transmit more than one packet at a time.

MediaPresentSupported
TRUE if the presence of media can be determined; otherwise **FALSE**. If **FALSE**, *MediaPresent* cannot be used.

MediaPresent
TRUE if media are connected to the network interface; othrwise **FALSE**. This field shows the media present status as of the most recent *GetStatus()* call.

```
//*******************************************************
// EFI_SIMPLE_NETWORK_STATE
//*******************************************************
typedef enum {
EfiSimpleNetworkStopped,
EfiSimpleNetworkStarted,
EfiSimpleNetworkInitialized,
EfiSimpleNetworkMaxState
} EFI_SIMPLE_NETWORK_STATE;
```

(continues on next page)

(continued from previous page)

```
//*******************************************************
// MAX_MCAST_FILTER_CNT
//*******************************************************
#define MAX_MCAST_FILTER_CNT                           16

//*******************************************************
// Bit Mask Values for ReceiveFilterSetting.
//
// Note that all other bit values are reserved.
//*******************************************************
#define EFI_SIMPLE_NETWORK_RECEIVE_UNICAST             0x01
#define EFI_SIMPLE_NETWORK_RECEIVE_MULTICAST           0x02
#define EFI_SIMPLE_NETWORK_RECEIVE_BROADCAST           0x04
#define EFI_SIMPLE_NETWORK_RECEIVE_PROMISCUOUS         0x08
#define EFI_SIMPLE_NETWORK_RECEIVE_PROMISCUOUS_MULTICAST 0x10
```

Description

The EFI_SIMPLE_NETWORK_PROTOCOL protocol is used to initialize access to a network adapter. Once the network adapter initializes, the EFI_SIMPLE_NETWORK_PROTOCOL protocol provides services that allow packets to be transmitted and received. This provides a packet level interface that can then be used by higher level drivers to produce boot services like DHCP, TFTP, and MTFTP. In addition, this protocol can be used as a building block in a full UDP and TCP/IP implementation that can produce a wide variety of application level network interfaces. See the Preboot Execution Environment (PXE) Specification for more information.

NOTE *The underlying network hardware may only be able to access 4 GiB (32-bits) of system memory. Any requests to transfer data to/from memory above 4 GiB with 32-bit network hardware will be double-buffered (using intermediate buffers below 4 GiB) and will reduce performance.*

NOTE *The same handle can have an instance of the* EFI_ADAPTER_INFORMATION_PROTOCOL *with a EFI_ADAPTER_INFO_MEDIA_STATE type structure.*

24.1.2 EFI_SIMPLE_NETWORK.Start()

Summary

Changes the state of a network interface from “stopped” to “started.”

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_START) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL    *This
    );
```

Parameters

This

A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

Description

This function starts a network interface. If the network interface successfully starts, then EFI_SUCCESS will be returned.

Status Codes Returned

EFI_SUCCESS	The network interface was started.
EFI_ALREADY_STARTED	The network interface is already in the started state.
EFI_INVALID_PARAMETER	*This* parameter was *NULL* or did not point to a valid EFI_SIMPLE_NETWORK_PROTOCOL structure.
EFI_DEVICE_ERROR	The command could not be sent to the network interface.
EFI_UNSUPPORTED	This function is not supported by the network interface.

24.1.3 EFI_SIMPLE_NETWORK.Stop()

Summary

Changes the state of a network interface from "started" to "stopped."

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_STOP) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL      *This
  );
```

Parameters

This

A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

Description

This function stops a network interface. This call is only valid if the network interface is in the started state. If the network interface was successfully stopped, then EFI_SUCCESS will be returned.

Status Codes Returned

EFI_SUCCESS	The network interface was stopped.
EFI_NOT_STARTED	The network interface has not been started.
EFI_INVALID_PARAMETER	*This* parameter was *NULL* or did not point to a valid EFI_SIMPLE_NETWORK_PROTOCOL structure.
EFI_DEVICE_ERROR	The command could not be sent to the network interface.
EFI_UNSUPPORTED	This function is not supported by the network interface.

24.1.4 EFI_SIMPLE_NETWORK.Initialize()

Summary

Resets a network adapter and allocates the transmit and receive buffers required by the network interface; optionally, also requests allocation of additional transmit and receive buffers.

Prototype

```
typedef
  EFI_STATUS
  (EFIAPI *EFI_SIMPLE_NETWORK_INITIALIZE) (
```

(continues on next page)

(continued from previous page)

```
    IN EFI_SIMPLE_NETWORK_PROTOCOL        *This,
    IN UINTN                              ExtraRxBufferSize OPTIONAL,
    IN UINTN                              ExtraTxBufferSize OPTIONAL
    );
```

Parameters

This
A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

ExtraRxBufferSize
The size, in bytes, of the extra receive buffer space that the driver should allocate for the network interface. Some network interfaces will not be able to use the extra buffer, and the caller will not know if it is actually being used.

ExtraTxBufferSize
The size, in bytes, of the extra transmit buffer space that the driver should allocate for the network interface. Some network interfaces will not be able to use the extra buffer, and the caller will not know if it is actually being used.

Description

This function allocates the transmit and receive buffers required by the network interface. If this allocation fails, then EFI_OUT_OF_RESOURCES is returned. If the allocation succeeds and the network interface is successfully initialized, then EFI_SUCCESS will be returned.

Status Codes Returned

EFI_SUCCESS	The network interface was initialized.
EFI_NOT_STARTED	The network interface has not been started.
EFI_OUT_OF_RESOURCES	There was not enough memory for the transmit and receive buffers.
EFI_INVALID_PARAMETER	*This* parameter was *NULL* or did not point to a valid EFI_SIMPLE_NETWORK_PROTOCOL structure.
EFI_DEVICE_ERROR	The command could not be sent to the network interface.
EFI_UNSUPPORTED	The increased buffer size feature is not supported.

24.1.5 EFI_SIMPLE_NETWORK.Reset()

Summary

Resets a network adapter and reinitializes it with the parameters that were provided in the previous call to *EFI_SIMPLE_NETWORK.Initialize()*.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_RESET) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL    *This,
  IN BOOLEAN                        ExtendedVerification
  );
```

Parameters

This
A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

ExtendedVerification

Indicates that the driver may perform a more exhaustive verification operation of the device during reset.

Description

This function resets a network adapter and reinitializes it with the parameters that were provided in the previous call to Initialize(). The transmit and receive queues are emptied and all pending interrupts are cleared. Receive filters, the station address, the statistics, and the multicast-IP-to-HW MAC addresses are not reset by this call. If the network interface was successfully reset, then EFI_SUCCESS will be returned. If the driver has not been initialized, EFI_DEVICE_ERROR will be returned.

Status Codes Returned

EFI_SUCCESS	The network interface was reset.
EFI_NOT_STARTED	The network interface has not been started.
EFI_INVALID_PARAMETER	One or more of the parameters has an unsupported value.
EFI_DEVICE_ERROR	The command could not be sent to the network interface.
EFI_UNSUPPORTED	This function is not supported by the network interface.

24.1.6 EFI_SIMPLE_NETWORK.Shutdown()

Summary

Resets a network adapter and leaves it in a state that is safe for another driver to initialize.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_SHUTDOWN) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL       *This
  );
```

Parameters

This

A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

Description

This function releases the memory buffers assigned in the *EFI_SIMPLE_NETWORK.Initialize()* call. Pending transmits and receives are lost, and interrupts are cleared and disabled. After this call, only the Initialize() and *EFI_SIMPLE_NETWORK.Stop()* calls may be used. If the network interface was successfully shutdown, then EFI_SUCCESS will be returned. If the driver has not been initialized, EFI_DEVICE_ERROR will be returned.

Status Codes Returned

EFI_SUCCESS	The network interface was shutdown.
EFI_NOT_STARTED	The network interface has not been started.
EFI_INVALID_PARAMETER	*This* parameter was *NULL* or did not point to a valid EFI_SIMPLE_NETWORK_PROTOCOL structure.
EFI_DEVICE_ERROR	The command could not be sent to the network interface.

24.1.7 EFI_SIMPLE_NETWORK.ReceiveFilters()

Summary

Manages the multicast receive filters of a network interface.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_RECEIVE_FILTERS) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL       *This,
  IN UINT32                            Enable,
  IN UINT32                            Disable,
  IN BOOLEAN                           ResetMCastFilter,
  IN UINTN                             MCastFilterCnt OPTIONAL,
  IN EFI_MAC_ADDRESS                   MCastFilter OPTIONAL,
  );
```

Parameters

This
A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

Enable
A bit mask of receive filters to enable on the network interface.

Disable
A bit mask of receive filters to disable on the network interface. For backward compatibility with EFI 1.1 platforms, the *EFI_SIMPLE_NETWORK_RECEIVE_MULTICAST* bit must be set when the *ResetMCastFilter* parameter is **TRUE**.

ResetMCastFilter
Set to **TRUE** to reset the contents of the multicast receive filters on the network interface to their default values.

MCastFilterCnt
Number of multicast HW MAC addresses in the new *MCastFilter* list. This value must be less than or equal to the *MCastFilterCnt* field of EFI_SIMPLE_NETWORK_MODE. This field is optional if *ResetMCastFilter* is **TRUE**.

MCastFilter
A pointer to a list of new multicast receive filter HW MAC addresses. This list will replace any existing multicast HW MAC address list. This field is optional if *ResetMCastFilter* is **TRUE**.

Description

This function is used enable and disable the hardware and software receive filters for the underlying network device.

The receive filter change is broken down into three steps:

- The filter mask bits that are set (ON) in the Enable parameter are added to the current receive filter settings.
- The filter mask bits that are set (ON) in the Disable parameter are subtracted from the updated receive filter settings.
- If the resulting receive filter setting is not supported by the hardware a more liberal setting is selected.

If the same bits are set in the Enable and Disable parameters, then the bits in the Disable parameter takes precedence.

If the ResetMCastFilter parameter is **TRUE**, then the multicast address list filter is disabled (irregardless of what other multicast bits are set in the Enable and Disable parameters). The SNP->Mode->MCastFilterCount field is set to zero. The Snp->Mode->MCastFilter contents are undefined.

After enabling or disabling receive filter settings, software should verify the new settings by checking the Snp->Mode->ReceiveFilterSettings, Snp->Mode->MCastFilterCount and Snp->Mode->MCastFilter fields.

Note: *Some network drivers and/or devices will automatically promote receive filter settings if the requested setting can not be honored. For example, if a request for four multicast addresses is made and the underlying hardware only supports two multicast addresses the driver might set the promiscuous or promiscuous multicast receive filters instead. The receiving software is responsible for discarding any extra packets that get through the hardware receive filters.*

Note: *To disable all receive filter hardware, the network driver must be Shutdown() and Stopped(). Calling ReceiveFilters() with Disable set to Snp->Mode->ReceiveFilterSettings will make it so no more packets are returned by the Receive() function, but the receive hardware may still be moving packets into system memory before inspecting and discarding them. Unexpected system errors, reboots and hangs can occur if an OS is loaded and the network devices are not Shutdown() and Stopped().*

If *ResetMCastFilter* is *TRUE,* then the multicast receive filter list on the network interface will be reset to the default multicast receive filter list. If *ResetMCastFilter* is **FALSE**, and this network interface allows the multicast receive filter list to be modified, then the *MCastFilterCnt* and *MCastFilter* are used to update the current multicast receive filter list. The modified receive filter list settings can be found in the *MCastFilter* field of EFI_SIMPLE_NETWORK_MODE in *Network Protocols — SNP, PXE, BIS and HTTP Boot*. If the network interface does not allow the multicast receive filter list to be modified, then EFI_INVALID_PARAMETER will be returned. If the driver has not been initialized, EFI_DEVICE_ERROR will be returned.

If the receive filter mask and multicast receive filter list have been successfully updated on the network interface, EFI_SUCCESS will be returned.

Status Codes Returned

EFI_SUCCESS	The multicast receive filter list was updated.
EFI_NOT_STARTED	The network interface has not been started.
EFI_INVALID_PARAMETER	• One or more of the following conditions is *TRUE* : • *This* is *NULL* • There are bits set in Enable that are not set in Snp->Mode->ReceiveFilterMask • There are bits set in Disable that are not set in Snp->Mode->ReceiveFilterMask • Multicast is being enabled (the EFI _SIMPLE_NETWORK_RECEIVE_MULTICAST bit is set in Enable, it is not set in Disable, and ResetMCastFilter is *FALSE*) and MCastFilterCount is zero • Multicast is being enabled and MCastFilterCount is greater than Snp->Mode->MaxMCastFilterCount • Multicast is being enabled and MCastFilter is *NULL* • Multicast is being enabled and one or more of the addresses in the MCastFilter list are not valid multicast MAC addresses
EFI_DEVICE_ERROR	• One or more of the following conditions is *TRUE* : • The network interface has been started but has not been initialized • An unexpected error was returned by the underlying network driver or device
EFI_UNSUPPORTED	This function is not supported by the network interface.

24.1.8 EFI_SIMPLE_NETWORK.StationAddress()

Summary

Modifies or resets the current station address, if supported.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_STATION_ADDRESS) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL       *This,
  IN BOOLEAN                           Reset,
  IN EFI_MAC_ADDRESS                   *New OPTIONAL
  );
```

Parameters

This

A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

Reset

Flag used to reset the station address to the network interface's permanent address.

New

New station address to be used for the network interface.

Description

This function modifies or resets the current station address of a network interface, if supported. If *Reset* is **TRUE**, then the current station address is set to the network interface's permanent address. If *Reset* is **FALSE**, and the network interface allows its station address to be modified, then the current station address is changed to the address specified by *New*. If the network interface does not allow its station address to be modified, then EFI_INVALID_PARAMETER will be returned. If the station address is successfully updated on the network interface, EFI_SUCCESS will be returned. If the driver has not been initialized, EFI_DEVICE_ERROR will be returned.

Status Codes Returned

EFI_SUCCESS	The network interface's station address was updated.
EFI_NOT_STARTED	The Simple Network Protocol interface has not been started by calling *Start()*.
EFI_INVALID_PARAMETER	The *New* station address was not accepted by the NIC.
EFI_INVALID_PARAMETER	*Reset* is *FALSE* and *New* is *NULL*.
EFI_DEVICE_ERROR	The Simple Network Protocol interface has not been initialized by calling *Initialize()*.
EFI_DEVICE_ERROR	An error occurred attempting to set the new station address.
EFI_UNSUPPORTED	The NIC does not support changing the network interface's station address.

24.1.9 EFI_SIMPLE_NETWORK.Statistics()

Summary

Resets or collects the statistics on a network interface.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_STATISTICS) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL       *This,
  IN BOOLEAN                           Reset,
  IN OUT UINTN                         *StatisticsSize OPTIONAL,
  OUT EFI_NETWORK_STATISTICS           *StatisticsTable OPTIONAL
  );
```

Parameters

This

A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

Reset

Set to **TRUE** to reset the statistics for the network interface.

StatisticsSize

On input the size, in bytes, of StatisticsTable. On output the size, in bytes, of the resulting table of statistics.

StatisticsTable

A pointer to the EFI_NETWORK_STATISTICS in *Network Protocols — SNP, PXE, BIS and HTTP Boot* structure that contains the statistics. Type EFI_NETWORK_STATISTICS is defined in "Related Definitions" below.

Related Definitions

```
//*******************************************************
// EFI_NETWORK_STATISTICS
//
// Any statistic value that is -1 is not available
// on the device and is to be ignored.
//*******************************************************

  UINT64     RxDecryptErrorFrames;
  UINT64     TxErrorFrames;
  UINT64     TxRetryFrames;
}   EFI_NETWORK_STATISTICS;
```

RxTotalFrames
Total number of frames received. Includes frames with errors and dropped frames.

RxGoodFrames
Number of valid frames received and copied into receive buffers.

RxUndersizeFrames
Number of frames below the minimum length for the communications device.

RxOversizeFrames
Number of frames longer than the maximum length for the communications device.

RxDroppedFrames
Valid frames that were dropped because receive buffers were full.

RxUnicastFrames
Number of valid unicast frames received and not dropped.

RxBroadcastFrames
Number of valid broadcast frames received and not dropped.

RxMulticastFrames
Number of valid multicast frames received and not dropped.

RxCrcErrorFrames
Number of frames with CRC or alignment errors.

RxTotalBytes
Total number of bytes received. Includes frames with errors and dropped frames.

TxTotalFrames
Total number of frames transmitted. Includes frames with errors and dropped frames.

TxGoodFrames
Number of valid frames transmitted and copied into receive buffers.

TxUndersizeFrames
Number of frames below the minimum length for the media. This would be less than 64 for Ethernet.

TxOversizeFrames
Number of frames longer than the maximum length for the media. This would be greater than 1500 for Ethernet.

TxDroppedFrames
Valid frames that were dropped because receive buffers were full.

TxUnicastFrames
Number of valid unicast frames transmitted and not dropped.

TxBroadcastFrames
Number of valid broadcast frames transmitted and not dropped.

TxMulticastFrames
Number of valid multicast frames transmitted and not dropped.

TxCrcErrorFrames
Number of frames with CRC or alignment errors.

TxTotalBytes
Total number of bytes transmitted. Includes frames with errors and dropped frames.

Collisions
Number of collisions detected on this subnet.

UnsupportedProtocol
Number of frames destined for unsupported protocol.

RxDuplicatedFrames
Number of valid frames received that were duplicated.

RxDecryptErrorFrames
Number of encrypted frames received that failed to decrypt.

TxErrorFrames
Number of frames that failed to transmit after exceeding the retry limit.

TxRetryFrames
Number of frames transmitted successfully after more than one attempt.

Description

This function resets or collects the statistics on a network interface. If the size of the statistics table specified by *StatisticsSize* is not big enough for all the statistics that are collected by the network interface, then a partial buffer of statistics is returned in *StatisticsTable, StatisticsSize* is set to the size required to collect all the available statistics, and EFI_BUFFER_TOO_SMALL is returned.

If *StatisticsSize* is big enough for all the statistics, then *StatisticsTable* will be filled, *StatisticsSize* will be set to the size of the returned *StatisticsTable* structure, and EFI_SUCCESS is returned. If the driver has not been initialized, EFI_DEVICE_ERROR will be returned.

If *Reset* is **FALSE**, and both *StatisticsSize* and *StatisticsTable* are NULL, then no operations will be performed, and EFI_SUCCESS will be returned.

If *Reset* is **TRUE**, then all of the supported statistics counters on this network interface will be reset to zero.

Status Codes Returned

EFI_SUCCESS	The requested operation succeeded.
EFI_NOT_STARTED	The Simple Network Protocol interface has not been started by calling *Start()*.
EFI_BUFFER_TOO_SMALL	*StatisticsSize* is not *NULL* and *StatisticsTable* is *NULL*. The current buffer size that is needed to hold all the statistics is returned in *StatisticsSize*.
EFI_BUFFER_TOO_SMALL	*StatisticsSize* is not *NULL* and *StatisticsTable* is not *NULL*. The current buffer size that is needed to hold all the statistics is returned in *StatisticsSize*. A partial set of statistics is returned in *StatisticsTable*.
EFI_INVALID_PARAMETER	*StatisticsSize* is *NULL* and *StatisticsTable* is not *NULL*.

continues on next page

Table 24.7 – continued from previous page

EFI_DEVICE_ERROR	The Simple Network Protocol interface has not been initialized by calling *Initialize()*.
EFI_DEVICE_ERROR	An error was encountered collecting statistics from the NIC.
EFI_UNSUPPORTED	The NIC does not support collecting statistics from the network interface.

24.1.10 EFI_SIMPLE_NETWORK.MCastIPtoMAC()

Summary

Converts a multicast IP address to a multicast HW MAC address.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_MCAST_IP_TO_MAC) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL       *This,
  IN BOOLEAN                           IPv6,
  IN EFI_IP_ADDRESS                    *IP,
  OUT EFI_MAC_ADDRESS                  *MAC
  );
```

Parameters

This

A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

IPv6

Set to **TRUE** if the multicast IP address is IPv6 [RFC 2460]. Set to **FALSE** if the multicast IP address is IPv4 [RFC 791].

IP

The multicast IP address that is to be converted to a multicast HW MAC address.

MAC

The multicast HW MAC address that is to be generated from IP.

Description

This function converts a multicast IP address to a multicast HW MAC address for all packet transactions. If the mapping is accepted, then EFI_SUCCESS will be returned.

Status Codes Returned

EFI_SUCCESS	The multicast IP address was mapped to the multicast HW MAC address.
EFI_NOT_STARTED	The Simple Network Protocol interface has not been started by calling *Start()*.
EFI_INVALID_PARAMETER	*IP* is *NULL*.
EFI_INVALID_PARAMETER	*MAC* is *NULL*.
EFI_INVALID_PARAMETER	*IP* does not point to a valid IPv4 or IPv6 multicast address.
EFI_DEVICE_ERROR	The Simple Network Protocol interface has not been initialized by calling *Initialize()*.
EFI_UNSUPPORTED	*IPv6* is *TRUE* and the implementation does not support IPv6 multicast to MAC address conversion.

24.1.11 EFI_SIMPLE_NETWORK.NvData()

Summary

Performs read and write operations on the NVRAM device attached to a network interface.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_NVDATA) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL    *This
  IN BOOLEAN                        ReadWrite,
  IN UINTN                          Offset,
  IN UINTN                          BufferSize,
  IN OUT VOID                       *Buffer
  );
```

Parameters

This
A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

ReadWrite
TRUE for read operations, **FALSE** for write operations.

Offset
Byte offset in the NVRAM device at which to start the read or write operation. This must be a multiple of NvRamAccessSize and less than *NvRamSize*. (See EFI_SIMPLE_NETWORK_MODE in *Network Protocols — SNP, PXE, BIS and HTTP Boot* .

BufferSize
The number of bytes to read or write from the NVRAM device. This must also be a multiple of *2*.

Buffer
A pointer to the data buffer.

Description

This function performs read and write operations on the NVRAM device attached to a network interface. If *ReadWrite* is **TRUE**, a read operation is performed. If *ReadWrite* is **FALSE**, a write operation is performed.

Offset specifies the byte offset at which to start either operation. *Offset* must be a multiple of *NvRamAccessSize,* and it must have a value between zero and *NvRamSize*.

BufferSize specifies the length of the read or write operation. *BufferSize* must also be a multiple of *NvRamAccessSize,* and *Offset* + *BufferSize* must not exceed *NvRamSize*.

If any of the above conditions is not met, then EFI_INVALID_PARAMETER will be returned.

If all the conditions are met and the operation is "read," the NVRAM device attached to the network interface will be read into *Buffer* and EFI_SUCCESS will be returned. If this is a write operation, the contents of *Buffer* will be used to update the contents of the NVRAM device attached to the network interface and EFI_SUCCESS will be returned.

Status Codes Returned

EFI_SUCCESS	The NVRAM access was performed.
EFI_NOT_STARTED	The network interface has not been started.

continues on next page

Table 24.9 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is *TRUE* : • The *This* parameter is *NULL* • The *This* parameter does not point to a valid *EFI_SIMPLE_NETWORK_PROTOCOL* structure • The *Offset* parameter is not a multiple of *EFI_SIMPLE_NETWORK_MODE. NvRamAccessSize* • The *Offset* parameter is not less than *EFI_SIMPLE_NETWORK_MODE. NvRamSize* • The *BufferSize* parameter is not a multiple of *EFI_SIMPLE_NETWORK_MODE. NvRamAccessSize* The *Buffer* parameter is *NULL*
EFI_DEVICE_ERROR	The command could not be sent to the network interface.
EFI_UNSUPPORTED	This function is not supported by the network interface.

24.1.12 EFI_SIMPLE_NETWORK.GetStatus()

Summary

Reads the current interrupt status and recycled transmit buffer status from a network interface.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_GET_STATUS) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL       *This,
  OUT UINT32                           *InterruptStatus OPTIONAL,
  OUT VOID                             **TxBuf OPTIONAL
  );
```

Parameters

This

A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

InterruptStatus

A pointer to the bit mask of the currently active interrupts (see "Related Definitions"). If this is NULL, the interrupt status will not be read from the device. If this is not NULL, the interrupt status will be read from the device. When the interrupt status is read, it will also be cleared. Clearing the transmit interrupt does not empty the recycled transmit buffer array.

TxBuf

Recycled transmit buffer address. The network interface will not transmit if its internal recycled transmit buffer array is full. Reading the transmit buffer does not clear the transmit interrupt. If this is NULL, then the transmit buffer status will not be read. If there are no transmit buffers to recycle and *TxBuf* is not NULL, * *TxBuf* will be set to NULL.

Related Definitions

```
//*******************************************************
// Interrupt Bit Mask Settings for InterruptStatus.
```

(continues on next page)

(continued from previous page)

```
// Note that all other bit values are reserved.
//*******************************************************
#define EFI_SIMPLE_NETWORK_RECEIVE_INTERRUPT    0x01
#define EFI_SIMPLE_NETWORK_TRANSMIT_INTERRUPT   0x02
#define EFI_SIMPLE_NETWORK_COMMAND_INTERRUPT    0x04
#define EFI_SIMPLE_NETWORK_SOFTWARE_INTERRUPT   0x08
```

Description

This function gets the current interrupt and recycled transmit buffer status from the network interface. The interrupt status is returned as a bit mask in *InterruptStatus*. If *InterruptStatus* is NULL, the interrupt status will not be read. Upon successful return of the media status, the *MediaPresent* field of *EFI_SIMPLE_NETWORK_MODE* will be updated to reflect any change of media status.Upon successful return of the media status, the *MediaPresent* field of *EFI_SIMPLE_NETWORK_MODE* will be updated to reflect any change of media status. If *TxBuf* is not NULL, a recycled transmit buffer address will be retrieved. If a recycled transmit buffer address is returned in *TxBuf,* then the buffer has been successfully transmitted, and the status for that buffer is cleared. If the status of the network interface is successfully collected, EFI_SUCCESS will be returned. If the driver has not been initialized, EFI_DEVICE_ERROR will be returned.

Status Codes Returned

EFI_SUCCESS	The status of the network interface was retrieved.
EFI_NOT_STARTED	The network interface has not been started.
EFI_INVALID_PARAMETER	*This* parameter was *NULL* or did not point to a valid EFI_SIMPLE_NETWORK_PROTOCOL structure.
EFI_DEVICE_ERROR	The command could not be sent to the network interface.

24.1.13 EFI_SIMPLE_NETWORK.Transmit()

Summary

Places a packet in the transmit queue of a network interface.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_TRANSMIT) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL       *This
  IN UINTN                             HeaderSize,
  IN UINTN                             BufferSize,
  IN VOID                              *Buffer,
  IN EFI_MAC_ADDRESS                   *SrcAddr OPTIONAL,
  IN EFI_MAC_ADDRESS                   *DestAddr OPTIONAL,
  IN UINT16                            *Protocol OPTIONAL,
  );
```

Parameters

This

A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

HeaderSize

The size, in bytes, of the media header to be filled in by the Transmit() function. If *HeaderSize* is nonzero, then it must be equal to *This->Mode->MediaHeaderSize* and the *DestAddr* and *Protocol* parameters must not be NULL.

BufferSize

The size, in bytes, of the entire packet (media header and data) to be transmitted through the network interface.

Buffer

A pointer to the packet (media header followed by data) to be transmitted. This parameter cannot be NULL. If *HeaderSize* is zero, then the media header in *Buffer* must already be filled in by the caller. If *HeaderSize* is nonzero, then the media header will be filled in by the Transmit() function.

SrcAddr

The source HW MAC address. If *HeaderSize* is zero, then this parameter is ignored. If *HeaderSize* is nonzero and *SrcAddr* is NULL, then *This->Mode->CurrentAddress* is used for the source HW MAC address.

DestAddr

The destination HW MAC address. If *HeaderSize* is zero, then this parameter is ignored.

Protocol

The type of header to build. If *HeaderSize* is zero, then this parameter is ignored. See RFC 3232, section "Ether Types," for examples.

Description

This function places the packet specified by *Header* and *Buffer* on the transmit queue. If *HeaderSize* is nonzero and *HeaderSize* is not equal to *This->Mode->MediaHeaderSize,* then EFI_INVALID_PARAMETER will be returned. If *BufferSize* is less than *This->Mode->MediaHeaderSize,* then EFI_BUFFER_TOO_SMALL will be returned. If *Buffer* is NULL, then EFI_INVALID_PARAMETER will be returned. If *HeaderSize* is nonzero and *DestAddr* or *Protocol* is NULL, then EFI_INVALID_PARAMETER will be returned. If the transmit engine of the network interface is busy, then EFI_NOT_READY will be returned. If this packet can be accepted by the transmit engine of the network interface, the packet contents specified by *Buffer* will be placed on the transmit queue of the network interface, and EFI_SUCCESS will be returned. *EFI_SIMPLE_NETWORK.GetStatus()* can be used to determine when the packet has actually been transmitted. The contents of the Buffer must not be modified until the packet has actually been transmitted.

The Transmit() function performs nonblocking I/O. A caller who wants to perform blocking I/O, should call Transmit(), and then GetStatus() until the transmitted buffer shows up in the recycled transmit buffer.

If the driver has not been initialized, EFI_DEVICE_ERROR will be returned.

Status Codes Returned

EFI_SUCCESS	The packet was placed on the transmit queue.
EFI_NOT_STARTED	The network interface has not been started.
EFI_NOT_READY	The network interface is too busy to accept this transmit request.
EFI_BUFFER_TOO_SMALL	The *BufferSize* parameter is too small.
EFI_INVALID_PARAMETER	One or more of the parameters has an unsupported value.
EFI_DEVICE_ERROR	The command could not be sent to the network interface.
EFI_UNSUPPORTED	This function is not supported by the network interface.

24.1.14 EFI_SIMPLE_NETWORK.Receive()

Summary

Receives a packet from a network interface.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_RECEIVE) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL       *This
  OUT  UINTN                           *HeaderSize OPTIONAL,
  IN OUT UINTN                         *BufferSize,
  OUT  VOID                            *Buffer,
  OUT  EFI_MAC_ADDRESS                 *SrcAddr OPTIONAL,
  OUT  EFI_MAC_ADDRESS                 *DestAddr OPTIONAL,
  OUT  UINT16                          *Protocol OPTIONAL
  );
```

Parameters

This
A pointer to the *EFI_SIMPLE_NETWORK_PROTOCOL* instance.

HeaderSize
The size, in bytes, of the media header received on the network interface. If this parameter is NULL, then the media header size will not be returned.

BufferSize
On entry, the size, in bytes, of Buffer. On exit, the size, in bytes, of the packet that was received on the network interface.

Buffer
A pointer to the data buffer to receive both the media header and the data.

SrcAddr
The source HW MAC address. If this parameter is NULL, the HW MAC source address will not be extracted from the media header.

DestAddr
The destination HW MAC address. If this parameter is NULL, the HW MAC destination address will not be extracted from the media header.

Protocol
The media header type. If this parameter is NULL, then the protocol will not be extracted from the media header. See RFC 1700 section “Ether Types” for examples.

Description

This function retrieves one packet from the receive queue of a network interface. If there are no packets on the receive queue, then EFI_NOT_READY will be returned. If there is a packet on the receive queue, and the size of the packet is smaller than *BufferSize,* then the contents of the packet will be placed in *Buffer,* and *BufferSize* will be updated with the actual size of the packet. In addition, if *SrcAddr, DestAddr,* and *Protocol* are not NULL, then these values will be extracted from the media header and returned. EFI_SUCCESS will be returned if a packet was successfully received. If *BufferSize* is smaller than the received packet, then the size of the receive packet will be placed in *BufferSize* and EFI_BUFFER_TOO_SMALL will be returned. If the driver has not been initialized, EFI_DEVICE_ERROR will be returned.

Status Codes Returned

EFI_SUCCESS	The received data was stored in *Buffer,* and *BufferSize* has been updated to the number of bytes received.
EFI_NOT_STARTED	The network interface has not been started.
EFI_NOT_READY	No packets have been received on the network interface.
EFI_BUFFER_TOO_SMALL	*BufferSize* is too small for the received packets. *BufferSize* has been updated to the required size.
EFI_INVALID_PARAMETER	One or more of the following conditions is *TRUE* : • The *This* parameter is *NULL* • The *This* parameter does not point to a valid *EFI_SIMPLE_NETWORK_PROTOCOL* structure. • The *BufferSize* parameter is *NULL* • The *Buffer* parameter is *NULL*
EFI_DEVICE_ERROR	The command could not be sent to the network interface.

24.2 Network Interface Identifier Protocol

This is an optional protocol that is used to describe details about the software layer that is used to produce the Simple Network Protocol. This protocol is only required if the underlying network interface is 16-bit UNDI, 32/64-bit S/W UNDI, or H/W UNDI. It is used to obtain type and revision information about the underlying network interface.

An instance of the Network Interface Identifier protocol must be created for each physical external network interface that is controlled by the !PXE structure. The !PXE structure is defined in the 32/64-bit UNDI Specification in Appendix E.

24.2.1 EFI_NETWORK_INTERFACE_IDENTIFIER_PROTOCOL

Summary

An optional protocol that is used to describe details about the software layer that is used to produce the Simple Network Protocol.

GUID

```
#define EFI_NETWORK_INTERFACE_IDENTIFIER_PROTOCOL_GUID_31 \
  {0x1ACED566, 0x76ED, 0x4218,\
    {0xBC, 0x81, 0x76, 0x7F, 0x1F, 0x97, 0x7A, 0x89}}
```

Revision Number

```
#define EFI_NETWORK_INTERFACE_IDENTIFIER_PROTOCOL_REVISION \ 0x00020000
```

Protocol Interface Structure

```
typedef struct {
  UINT64        Revision;
  UINT64        Id;
  UINT64        ImageAddr;
  UINT32        ImageSize;
  CHAR8         StringId[4];
```

(continues on next page)

(continued from previous page)

```
  UINT8         Type;
  UINT8         MajorVer;
  UINT8         MinorVer;
  BOOLEAN       Ipv6Supported;
  UINT16        IfNum;
} EFI_NETWORK_INTERFACE_IDENTIFIER_PROTOCOL;
```

Parameters

Revision
The revision of the EFI_NETWORK_INTERFACE_IDENTIFIER protocol.

Id
Address of the first byte of the identifying structure for this network interface. This is only valid when the network interface is started (see *EFI_SIMPLE_NETWORK.Start()*). When the network interface is not started, this field is set to zero.

16-bit UNDI and 32/64-bit S/W UNDI:

Id contains the address of the first byte of the copy of the !PXE structure in the relocated UNDI code segment. See the Preboot Execution Environment (PXE) Specification and Appendix E.

H/W UNDI:

Id contains the address of the !PXE structure.

ImageAddr
Address of the unrelocated network interface image.

16-bit UNDI:

ImageAddr is the address of the PXE option ROM image in upper memory.

32/64-bit S/W UNDI:

ImageAddr is the address of the unrelocated S/W UNDI image.

H/W UNDI:

ImageAddr contains zero.

ImageSize
Size of unrelocated network interface image.

16-bit UNDI:

ImageSize is the size of the PXE option ROM image in upper memory.

32/64-bit S/W UNDI:

ImageSize is the size of the unrelocated S/W UNDI image.

H/W UNDI:

ImageSize contains zero.

StringId
A four-character ASCII string that is sent in the class identifier field of option 60 in DHCP. For a Type of EfiNetworkInterfaceUndi, this field is "UNDI."

Type
Network interface type. This will be set to one of the values in EFI_NETWORK_INTERFACE_TYPE (see "Related Definitions" below).

MajorVer

Major version number.

16-bit UNDI:

MajorVer comes from the third byte of the UNDIRev field in the UNDI ROM ID structure. Refer to the Preboot Execution Environment (PXE) Specification.

32/64-bit S/W UNDI and H/W UNDI:

MajorVer comes from the Major field in the !PXE structure. See Appendix E.

MinorVer

Minor version number.

16-bit UNDI:

MinorVer comes from the second byte of the UNDIRev field in the UNDI ROM ID structure. Refer to the Preboot Execution Environment (PXE) Specification.

32/64-bit S/W UNDI and H/W UNDI:

MinorVer comes from the Minor field in the !PXE structure. See Appendix E.

Ipv6Supported

TRUE if the network interface supports IPv6; otherwise **FALSE**.

IfNum

The network interface number that is being identified by this Network Interface Identifier Protocol. This field must be less than or equal to the (IFcnt | IFcntExt <<8) field in the !PXE structure.

Related Definitions

```
//*******************************************************
// EFI_NETWORK_INTERFACE_TYPE
//*******************************************************
typedef enum {
EfiNetworkInterfaceUndi = 1
} EFI_NETWORK_INTERFACE_TYPE;
```

Description

The EFI_NETWORK_INTERFACE_IDENTIFIER_PROTOCOL is used by *EFI_PXE_BASE_CODE_PROTOCOL* and OS loaders to identify the type of the underlying network interface and to locate its initial entry point.

24.3 PXE Base Code Protocol

This section defines the Preboot Execution Environment (PXE) Base Code protocol, which is used to access PXE-compatible devices for network access and network booting. For more information about PXE, see “Links to UEFI-Related Documents” (*http://uefi.org/uefi)* under the heading “Preboot Execution Environment (PXE) Specification”.

24.3.1 EFI_PXE_BASE_CODE_PROTOCOL

Summary

The *EFI_PXE_BASE_CODE_PROTOCOL* is used to control PXE-compatible devices. The features of these devices are defined in the Preboot Execution Environment (PXE) Specification. An *EFI_PXE_BASE_CODE_PROTOCOL* will be layered on top of an *EFI_MANAGED_NETWORK_PROTOCOL* protocol in order to perform packet level transactions. The *EFI_PXE_BASE_CODE_PROTOCOL* handle also supports the See *EFI_LOAD_FILE_PROTOCOL* protocol. This provides a clean way to obtain control from the boot manager if the boot path is from the remote device.

GUID

```
#define EFI_PXE_BASE_CODE_PROTOCOL_GUID \
  {0x03C4E603,0xAC28,0x11d3,\
    {0x9A,0x2D,0x00,0x90,0x27,0x3F,0xC1,0x4D}}
```

Revision Number

```
#define EFI_PXE_BASE_CODE_PROTOCOL_REVISION 0x00010000
```

Protocol Interface Structure

```
typedef struct {
  UINT64                           Revision;
  EFI_PXE_BASE_CODE_START          Start;
  EFI_PXE_BASE_CODE_STOP           Stop;
  EFI_PXE_BASE_CODE_DHCP           Dhcp;
  EFI_PXE_BASE_CODE_DISCOVER       Discover;
  EFI_PXE_BASE_CODE_MTFTP          Mtftp;
  EFI_PXE_BASE_CODE_UDP_WRITE      UdpWrite;
  EFI_PXE_BASE_CODE_UDP_READ       UdpRead;
  EFI_PXE_BASE_CODE_SET_IP_FILTER  SetIpFilter;
  EFI_PXE_BASE_CODE_ARP            Arp;
  EFI_PXE_BASE_CODE_SET_PARAMETERS SetParameters;
  EFI_PXE_BASE_CODE_SET_STATION_IP SetStationIp;
  EFI_PXE_BASE_CODE_SET_PACKETS    SetPackets;
  EFI_PXE_BASE_CODE_MODE           *Mode;
}   EFI_PXE_BASE_CODE_PROTOCOL;
```

Parameters

Revision

The revision of the EFI_PXE_BASE_CODE_PROTOCOL. All future revisions must be backwards compatible. If a future version is not backwards compatible it is not the same GUID.

Start

Starts the PXE Base Code Protocol. Mode structure information is not valid and no other Base Code Protocol functions will operate until the Base Code is started. See the *EFI_PXE_BASE_CODE_PROTOCOL.Start()* function description.

Stop

Stops the PXE Base Code Protocol. Mode structure information is unchanged by this function. No Base Code Protocol functions will operate until the Base Code is restarted. See the *EFI_PXE_BASE_CODE_PROTOCOL.Stop()* function description.

Dhcp

Attempts to complete a DHCPv4 D.O.R.A. (discover / offer / request / acknowledge) or DHCPv6 S.A.R.R (solicit

/ advertise / request / reply) sequence. See the *EFI_PXE_BASE_CODE_PROTOCOL.Dhcp()* function description.

Discover
Attempts to complete the PXE Boot Server and/or boot image discovery sequence. See the *EFI_PXE_BASE_CODE_PROTOCOL.Discover()* function description.

Mtftp
Performs TFTP and MTFTP services. See the *EFI_PXE_BASE_CODE_PROTOCOL.Mtftp()* function description.

UdpWrite
Writes a UDP packet to the network interface. See the *EFI_PXE_BASE_CODE_PROTOCOL.UdpWrite()* function description.

UdpRead
Reads a UDP packet from the network interface. See the *EFI_PXE_BASE_CODE_PROTOCOL.UdpRead()* function description.

SetIpFilter
Updates the IP receive filters of the network device. See the *EFI_PXE_BASE_CODE_PROTOCOL.SetIpFilter()* function description.

Arp
Uses the ARP protocol to resolve a MAC address. See the *EFI_PXE_BASE_CODE_PROTOCOL.Arp()* function description.

SetParameters
Updates the parameters that affect the operation of the PXE Base Code Protocol. See the *EFI_PXE_BASE_CODE_PROTOCOL.SetParameters()* function description.

SetStationIp
Updates the station IP address and subnet mask values. See the *EFI_PXE_BASE_CODE_PROTOCOL.SetStationIp()* function description.

SetPackets
Updates the contents of the cached DHCP and Discover packets. See the *EFI_PXE_BASE_CODE_PROTOCOL.SetPackets()* function description.

Mode
Pointer to the EFI_PXE_BASE_CODE_MODE for this device. The EFI_PXE_BASE_CODE_MODE structure is defined in "Related Definitions" below.

Started

TRUE if this device has been started by calling *EFI_PXE_BASE_CODE_PROTOCOL.Start()* . This field is set to **TRUE** by the Start() function and to **FALSE** by the *EFI_PXE_BASE_CODE_PROTOCOL.Stop()* function.

Ipv6Available

TRUE if the UNDI protocol supports IPv6.

Ipv6Supported

TRUE if this PXE Base Code Protocol implementation supports IPv6.

UsingIpv6

TRUE if this device is currently using IPv6. This field is set by the Start() function.

BisSupported

TRUE if this PXE Base Code implementation supports Boot Integrity Services (BIS). This field is set by the Start() function.

BisDetected

TRUE if this device and the platform support Boot Integrity Services (BIS). This field is set by the Start()

function.

AutoArp

TRUE for automatic ARP packet generation; **FALSE** otherwise. This field is initialized to **TRUE** by Start() and can be modified with the *EFI_PXE_BASE_CODE_PROTOCOL.SetParameters()* function.

SendGUID

This field is used to change the Client Hardware Address (chaddr) field in the DHCP and Discovery packets. Set to **TRUE** to send the SystemGuid (if one is available). Set to **FALSE** to send the client NIC MAC address. This field is initialized to **FALSE** by Start() and can be modified with the SetParameters() function.

DhcpDiscoverValid

This field is initialized to **FALSE** by the Start() function and set to **TRUE** when the *EFI_PXE_BASE_CODE_PROTOCOL.Dhcp()* function completes successfully. When **TRUE**, the *DhcpDiscover* field is valid. This field can also be changed by the *EFI_PXE_BASE_CODE_PROTOCOL.SetPackets()* function.

DhcpAckReceived

This field is initialized to **FALSE** by the *EFI_PXE_BASE_CODE_PROTOCOL.Start()* function and set to **TRUE** when the *EFI_PXE_BASE_CODE_PROTOCOL.Dhcp()* function completes successfully. When **TRUE**, the *DhcpAck* field is valid. This field can also be changed by the *EFI_PXE_BASE_CODE_PROTOCOL.SetPackets()* function.

ProxyOfferReceived

This field is initialized to **FALSE** by the Start() function and set to **TRUE** when the Dhcp() function completes successfully and a proxy DHCP offer packet was received. When **TRUE**, the *ProxyOffer* packet field is valid. This field can also be changed by the SetPackets() function.

PxeDiscoverValid

When **TRUE**, the *PxeDiscover* packet field is valid. This field is set to **FALSE** by the Start() and Dhcp() functions, and can be set to **TRUE** or **FALSE** by the *EFI_PXE_BASE_CODE_PROTOCOL.Discover()* and SetPackets() functions.

PxeReplyReceived

When **TRUE**, the *PxeReply* packet field is valid. This field is set to **FALSE** by the Start() and Dhcp() functions, and can be set to **TRUE** or **FALSE** by the Discover() and SetPackets() functions.

PxeBisReplyReceived

When **TRUE**, the *PxeBisReply* packet field is valid. This field is set to **FALSE** by the Start() and Dhcp() functions, and can be set to **TRUE** or **FALSE** by the Discover() and SetPackets() functions.

IcmpErrorReceived

Indicates whether the *IcmpError* field has been updated. This field is reset to **FALSE** by the Start(), Dhcp(), Discover(), *EFI_PXE_BASE_CODE_PROTOCOL.Mtftp()*, *EFI_PXE_BASE_CODE_PROTOCOL.UdpRead()*, *EFI_PXE_BASE_CODE_PROTOCOL.UdpWrite()* and *EFI_PXE_BASE_CODE_PROTOCOL.Arp()* functions. If an ICMP error is received, this field will be set to **TRUE** after the *IcmpError* field is updated.

TftpErrorReceived

Indicates whether the *TftpError* field has been updated. This field is reset to **FALSE** by the Start() and Mtftp() functions. If a TFTP error is received, this field will be set to **TRUE** after the *TftpError* field is updated.

MakeCallbacks

When **FALSE**, callbacks will not be made. When **TRUE**, make callbacks to the PXE Base Code Callback Protocol. This field is reset to **FALSE** by the Start() function if the PXE Base Code Callback Protocol is not available. It is reset to **TRUE** by the Start() function if the PXE Base Code Callback Protocol is available.

TTL

The "time to live" field of the IP header. This field is initialized to DEFAULT_TTL (See "Related Definitions") by the *Start()* function and can be modified by the *EFI_PXE_BASE_CODE_PROTOCOL.SetParameters()* function.

ToS

The type of service field of the IP header. This field is initialized to DEFAULT_ToS (See "Related Definitions") by *EFI_PXE_BASE_CODE_PROTOCOL.Start()* , and can be modified with the *EFI_PXE_BASE_CODE_PROTOCOL.SetParameters()* function.

StationIp

The device's current IP address. This field is initialized to a zero address by *Start()*. This field is set when the *EFI_PXE_BASE_CODE_PROTOCOL.Dhcp()* function completes successfully. This field can also be set by the *EFI_PXE_BASE_CODE_PROTOCOL.SetStationIp()* function. This field must be set to a valid IP address by either Dhcp() or SetStationIp() before the *EFI_PXE_BASE_CODE_PROTOCOL.Discover()* , *EFI_PXE_BASE_CODE_PROTOCOL.Mtftp()* , *EFI_PXE_BASE_CODE_PROTOCOL.UdpRead()* , *EFI_PXE_BASE_CODE_PROTOCOL.UdpWrite()* and *EFI_PXE_BASE_CODE_PROTOCOL.Arp()* functions are called.

SubnetMask

The device's current subnet mask. This field is initialized to a zero address by the *Start()* function. This field is set when the *Dhcp()* function completes successfully. This field can also be set by the *SetStationIp()* function. This field must be set to a valid subnet mask by either *Dhcp()* or *SetStationIp()* before the *Discover(), Mtftp(), UdpRead(), UdpWrite(),* or *Arp()* functions are called.

DhcpDiscover

Cached DHCP Discover packet. This field is zero-filled by the *Start()* function, and is set when the *Dhcp()* function completes successfully. The contents of this field can replaced by the *EFI_PXE_BASE_CODE_PROTOCOL.SetPackets()* function.

DhcpAck

Cached DHCP Ack packet. This field is zero-filled by the *Start()* function, and is set when the Dhcp() function completes successfully. The contents of this field can be replaced by the *SetPackets()* function.

ProxyOffer

Cached Proxy Offer packet. This field is zero-filled by the *Start()* function, and is set when the Dhcp() function completes successfully. The contents of this field can be replaced by the SetPackets() function.

PxeDiscover

Cached PXE Discover packet. This field is zero-filled by the *Start()* function, and is set when the Discover() function completes successfully. The contents of this field can be replaced by the SetPackets() function.

PxeReply

Cached PXE Reply packet. This field is zero-filled by the *Start()* function, and is set when the Discover() function completes successfully. The contents of this field can be replaced by the SetPackets() function.

PxeBisReply

Cached PXE BIS Reply packet. This field is zero-filled by the *Start()* function, and is set when the Discover() function completes successfully. This field can be replaced by the SetPackets() function.

IpFilter

The current IP receive filter settings. The receive filter is disabled and the number of IP receive filters is set to zero by the *EFI_PXE_BASE_CODE_PROTOCOL.Start()* function, and is set by the *EFI_PXE_BASE_CODE_PROTOCOL.SetIpFilter()* function.

ArpCacheEntries

The number of valid entries in the ARP cache. This field is reset to zero by the Start() function.

ArpCache

Array of cached ARP entries.

RouteTableEntries

The number of valid entries in the current route table. This field is reset to zero by the *Start()* function.

RouteTable
Array of route table entries.

IcmpError
ICMP error packet. This field is updated when an ICMP error is received and is undefined until the first ICMP error is received. This field is zero-filled by the *Start()* function.

TftpError
TFTP error packet. This field is updated when a TFTP error is received and is undefined until the first TFTP error is received. This field is zero-filled by the *Start()* function.

```
//*******************************************************
// EFI_PXE_BASE_CODE_UDP_PORT
//*******************************************************
typedef UINT16 EFI_PXE_BASE_CODE_UDP_PORT;

//*******************************************************

24.3.2 DHCP Packet Data Types

This section defines the data types for DHCP packets, ICMP error packets, and TFTP error packets. All of these are byte-packed data structures.

NOTE: *All the multibyte fields in these structures are stored in network order.*

```
//*******************************************************
// EFI_PXE_BASE_CODE_DHCPV4_PACKET
//*******************************************************
typedef struct {
```

(continues on next page)

(continued from previous page)

```
  UINT8            BootpOpcode;
  UINT8            BootpHwType;
  UINT8            BootpHwAddrLen;
  UINT8            BootpGateHops;
  UINT32           BootpIdent;
  UINT16           BootpSeconds;
  UINT16           BootpFlags;
  UINT8            BootpCiAddr[4];
  UINT8            BootpYiAddr[4];
  UINT8            BootpSiAddr[4];
  UINT8            BootpGiAddr[4];
  UINT8            BootpHwAddr[16];
  UINT8            BootpSrvName[64];
  UINT8            BootpBootFile[128];
  UINT32           DhcpMagik;
  UINT8 DhcpOptions[56];
} EFI_PXE_BASE_CODE_DHCPV4_PACKET;

//**************************************************
// DHCPV6 Packet structure
//**************************************************
typedef struct {

}   EFI_PXE_BASE_CODE_TFTP_ERROR;
```

24.3.3 IP Receive Filter Settings

This section defines the data types for IP receive filter settings.

```
#define EFI_PXE_BASE_CODE_MAX_IPCNT8

//*******************************************************
// EFI_PXE_BASE_CODE_IP_FILTER
//*******************************************************
typedef struct {
  UINT8                               Filters;
  UINT8                               IpCnt;
  UINT16                              reserved;
  EFI_IP_ADDRESS                      IpList[EFI_PXE_BASE_CODE_MAX_IPCNT];
}   EFI_PXE_BASE_CODE_IP_FILTER;

#define EFI_PXE_BASE_CODE_IP_FILTER_STATION_IP             0x0001
#define EFI_PXE_BASE_CODE_IP_FILTER_BROADCAST              0x0002
#define EFI_PXE_BASE_CODE_IP_FILTER_PROMISCUOUS            0x0004
#define EFI_PXE_BASE_CODE_IP_FILTER_PROMISCUOUS_MULTICAST  0x0008
```

24.3.4 ARP Cache Entries

This section defines the data types for ARP cache entries, and route table entries.

```
//*******************************************************
// EFI_PXE_BASE_CODE_ARP\_ENTRY
//*******************************************************
typedef struct {
  EFI_IP_ADDRESS                  IpAddr;
  EFI_MAC_ADDRESS                 MacAddr;
}   EFI_PXE_BASE_CODE_ARP\_ENTRY;

//*******************************************************
// EFI_PXE_BASE_CODE_ROUTE_ENTRY
//*******************************************************
typedef struct {
  EFI_IP_ADDRESS                  IpAddr;
  EFI_IP_ADDRESS                  SubnetMask;
```

(continues on next page)

(continued from previous page)

```
  EFI_IP_ADDRESS                    GwAddr;
}   EFI_PXE_BASE_CODE_ROUTE_ENTRY;
```

24.3.5 Filter Operations for UDP Read/Write Functions

This section defines the types of filter operations that can be used with the *EFI_PXE_BASE_CODE_PROTOCOL.UdpRead()* and *EFI_PXE_BASE_CODE_PROTOCOL.UdpWrite()* functions.

```
#define EFI_PXE_BASE_CODE_UDP_OPFLAGS_ANY_SRC_IP        0x0001
#define EFI_PXE_BASE_CODE_UDP_OPFLAGS_ANY_SRC_PORT      0x0002
#define EFI_PXE_BASE_CODE_UDP_OPFLAGS_ANY_DEST_IP       0x0004
#define EFI_PXE_BASE_CODE_UDP_OPFLAGS_ANY_DEST_PORT     0x0008
#define EFI_PXE_BASE_CODE_UDP_OPFLAGS_USE_FILTER        0x0010
#define EFI_PXE_BASE_CODE_UDP_OPFLAGS_MAY_FRAGMENT      0x0020
#define DEFAULT_TTL                                     16
#define DEFAULT_ToS                                     0
```

The following table defines values for the PXE DHCP and Bootserver Discover packet tags that are specific to the UEFI environment. Complete definitions of all PXE tags are defined in the Table below, “PXE DHCP Options (Full List),” in the PXE Specification.

Table 24.13: PXE Tag Definitions for EFI

Tag Name	Tag #	Length	Data Field
Client Network Interface Identifier	94 [0x5E]	3 [0x03]	Type (1), MajorVer (1), MinorVer (1) Type is a one byte field that identifies the network interface that will be used by the downloaded program. Type is followed by two one byte version number fields, MajorVer and MinorVer. Type UNDI (1) = 0x01 Versions 16-bit UNDI: MajorVer = 0x02. MinorVer = 0x00 PXE-2.0 16-bit UNDI: MajorVer = 0x02, MinorVer = 0x01 32/64-bit UNDI & H/W UNDI: MajorVer = 0x03, MinorVer = 0x00
Client System Architecture	93 [0x5D]	2 [0x02]	Type (2) Type is a two byte, network order, field that identifies the processor and programming environment of the client system. For the various architecture type encodings, see the table "Processor Architecture Types" at "Links to UEFI-Related Documents" (*http:// uefi.org/uefi)* under the heading "Processor Architecture Types"
Class Identifier	60 [0x3C]	32 [0x20]	"PXE Client:Arch:xxx xx:UNDI:yyyzzz" "PXEClient:. . . " is used to identify communication between PXE clients and servers. Information from tags 93 & 94 is embedded in the Class Identifier string. (The strings defined in this tag are case sensitive and must not be NU LL-terminated.) xxxxx = ASCII representation of Client System Architecture. yyyzzz = ASCII representation of Client Network Interface Identifier version numbers MajorVer(yyy) and MinorVer(zzz). **Example** "PX EClient:Arch:00 002:UNDI:00300" identifies an IA64 PC w/ 32/64-bit UNDI

Description

The basic mechanisms and flow for remote booting in UEFI are identical to the remote boot functionality described in detail in the PXE Specification. However, the actual execution environment, linkage, and calling conventions are replaced and enhanced for the UEFI environment.

The DHCP Option for the Client System Architecture is used to inform the DHCP server if the client is a UEFI environment in supported systems. The server may use this information to provide default images if it does not have a specific boot profile for the client.

The DHCP Option for Client Network Interface Identifier is used to inform the DHCP server of the client underlying network interface information. If the NII protocol is present, such information will be acquired by this protocol. Otherwise, Type = 0x01, MajorVer=0x03, MinorVer=0x00 will be the default value.

A handle that supports *EFI_PXE_BASE_CODE_PROTOCOL* is required to support *EFI_LOAD_FILE_PROTOCOL* . The *EFI_LOAD_FILE_PROTOCOL* function is used by the firmware to load files from devices that do not support file system type accesses. Specifically, the firmware's boot manager invokes LoadFile() with *BootPolicy* being **TRUE** when attempting to boot from the device. The firmware then loads and transfers control to the downloaded PXE boot image. Once the remote image is successfully loaded, it may utilize the EFI_PXE_BASE_CODE_PROTOCOL interfaces, or even the *EFI_SIMPLE_NETWORK_PROTOCOL* interfaces, to continue the remote process.

24.3.6 EFI_PXE_BASE_CODE_PROTOCOL.Start()

Summary

Enables the use of the PXE Base Code Protocol functions.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_START) (
  IN EFI_PXE_BASE_CODE_PROTOCOL        *This,
  IN BOOLEAN                           UseIpv6
  );
```

Parameters

This

Pointer to the *EFI_PXE_BASE_CODE_PROTOCOL* instance.

UseIpv6

Specifies the type of IP addresses that are to be used during the session that is being started. Set to **TRUE** for IPv6 addresses, and **FALSE** for IPv4 addresses.

Description

This function enables the use of the PXE Base Code Protocol functions. If the *Started* field of the EFI_PXE_BASE_CODE_MODE structure is already **TRUE**, then EFI_ALREADY_STARTED will be returned. If *UseIpv6* is **TRUE**, then IPv6 formatted addresses will be used in this session. If *UseIpv6* is **FALSE**, then IPv4 formatted addresses will be used in this session. If *UseIpv6* is **TRUE**, and the *Ipv6Supported* field of the EFI_PXE_BASE_CODE_MODE structure is **FALSE**, then EFI_UNSUPPORTED will be returned. If there is not enough memory or other resources to start the PXE Base Code Protocol, then EFI_OUT_OF_RESOURCES will be returned. Otherwise, the PXE Base Code Protocol will be started, and all of the fields of the EFI_PXE_BASE_CODE_MODE structure will be initialized as follows:

```
Started                Set to TRUE.
Ipv6Supported          Unchanged.
Ipv6Available          Unchanged.
UsingIpv6              Set to *UseIpv6*.
BisSupported           Unchanged.
BisDetected            Unchanged.
AutoArp                Set to TRUE.
SendGUID               Set to FALSE.
TTL                    Set to DEFAULT_TTL.
ToS                    Set to DEFAULT_ToS.
DhcpCompleted          Set to FALSE.
ProxyOfferReceived     Set to FALSE.
StationIp              Set to an address of all zeros.
SubnetMask             Set to a subnet mask of all zeros.
DhcpDiscover           Zero-filled.
DhcpAck                Zero-filled.
```

(continues on next page)

(continued from previous page)

```
ProxyOffer           Zero-filled.
PxeDiscoverValid     Set to FALSE.
PxeDiscover          Zero-filled.
PxeReplyValid        Set to FALSE.
PxeReply             Zero-filled.
PxeBisReplyValid     Set to FALSE.
PxeBisReply          Zero-filled.
IpFilter             Set the *Filters* field to 0 and the *IpCnt* field to 0.
ArpCacheEntries      Set to 0.
ArpCache             Zero-filled.
RouteTableEntries    Set to 0.
RouteTable           Zero-filled.
IcmpErrorReceived    Set to FALSE.
IcmpError            Zero-filled.
TftpErroReceived     Set to FALSE.
TftpError            Zero-filled.
MakeCallback         Set to TRUE if the PXE Base Code Callback Protocol is
                     available. Set to FALSE if the PXE Base Code Callback
                     Protocol is not available.
```

Status Codes Returned

EFI_SUCCESS	The PXE Base Code Protocol was started.
EFI_INVALID_PARAMETER	The *This* parameter is *NULL* or does not point to a valid *EFI_PXE_BASE_CODE_PROTOCOL* structure.
EFI_UNSUPPORTED	*UseIpv6* is *TRUE,* but the *Ipv6Supported* field of the EFI_PXE_BASE_CODE_MODE structure is *FALSE*.
EFI_ALREADY_STARTED	The PXE Base Code Protocol is already in the started state.
EFI_DEVICE_ERROR	The network device encountered an error during this operation.
EFI_OUT_OF_RESOURCES	Could not allocate enough memory or other resources to start the PXE Base Code Protocol.

24.3.7 EFI_PXE_BASE_CODE_PROTOCOL.Stop()

Summary

Disables the use of the PXE Base Code Protocol functions.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_STOP) (
  IN EFI_PXE_BASE_CODE_PROTOCOL     *This
  );
```

Parameters

This

Pointer to the *EFI_PXE_BASE_CODE_PROTOCOL* instance.

Description

This function stops all activity on the network device. All the resources allocated in *EFI_PXE_BASE_CODE_PROTOCOL.Start()* are released, the *Started* field of the EFI_PXE_BASE_CODE_MODE structure is set to **FALSE** and EFI_SUCCESS is returned. If the Started field of the EFI_PXE_BASE_CODE_MODE structure is already **FALSE**, then EFI_NOT_STARTED will be returned.

Status Codes Returned

EFI_SUCCESS	The PXE Base Code Protocol was stopped.
EFI_NOT_STARTED	The PXE Base Code Protocol is already in the stopped state.
EFI_INVALID_PARAMETER	The *This* parameter is *NULL* or does not point to a valid *EFI_PXE_BASE_CODE_PROTOCOL* structure.
EFI_DEVICE_ERROR	The network device encountered an error during this operation.

24.3.8 EFI_PXE_BASE_CODE_PROTOCOL.Dhcp()

Summary

Attempts to complete a DHCPv4 D.O.R.A. (discover / offer / request / acknowledge) or DHCPv6 S.A.R.R (solicit / advertise / request / reply) sequence.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_DHCP) (
  IN EFI_PXE_BASE_CODE_PROTOCOL     *This,
  IN BOOLEAN                        SortOffers
  );
```

Parameters

This

Pointer to the *EFI_PXE_BASE_CODE_PROTOCOL* instance.

SortOffers

TRUE if the offers received should be sorted. Set to **FALSE** to try the offers in the order that they are received.

Description

This function attempts to complete the DHCP sequence. If this sequence is completed, then EFI_SUCCESS is returned, and the *DhcpCompleted, ProxyOfferReceived, StationIp, SubnetMask, DhcpDiscover, DhcpAck,* and *ProxyOffer* fields of the EFI_PXE_BASE_CODE_MODE structure are filled in.

If *SortOffers* is **TRUE**, then the cached DHCP offer packets will be sorted before they are tried. If *SortOffers* is **FALSE**, then the cached DHCP offer packets will be tried in the order in which they are received. Please see the Preboot Execution Environment (PXE) Specification for additional details on the implementation of DHCP.

This function can take at least 31 seconds to timeout and return control to the caller. If the DHCP sequence does not complete, then EFI_TIMEOUT will be returned.

If the Callback Protocol does not return EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE, then the DHCP sequence will be stopped and EFI_ABORTED will be returned.

Status Codes Returned

EFI_SUCCESS	Valid DHCP has completed.
EFI_NOT_STARTED	The PXE Base Code Protocol is in the stopped state.

continues on next page

Table 24.16 – continued from previous page

EFI_INVALID_PARAMETER	The *This* parameter is *NULL* or does not point to a valid *EFI_PXE_BASE_CODE_PROTOCOL* structure.
EFI_DEVICE_ERROR	The network device encountered an error during this operation.
EFI_OUT_OF_RESOURCES	Could not allocate enough memory to complete the DHCP Protocol.
EFI_ABORTED	The callback function aborted the DHCP Protocol.
EFI_TIMEOUT	The DHCP Protocol timed out.
EFI_ICMP_ERROR	An ICMP error packet was received during the DHCP session. The ICMP error packet has been cached in the *EFI_PXE_BASE_CODE_MODE. IcmpError* packet structure. Information about ICMP packet contents can be found in RFC 792.
EFI_NO_RESPONSE	Valid PXE offer was not received.

24.3.9 EFI_PXE_BASE_CODE_PROTOCOL.Discover()

Summary

Attempts to complete the PXE Boot Server and/or boot image discovery sequence.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_DISCOVER) (
  IN EFI_PXE_BASE_CODE_PROTOCOL        *This,
  IN UINT16                            Type,
  IN UINT16                            *Layer,
  IN BOOLEAN                           UseBis,
  IN EFI_PXE_BASE_CODE_DISCOVER_INFO   *Info OPTIONAL
);
```

Parameters

This

Pointer to the *EFI_PXE_BASE_CODE_PROTOCOL* instance.

Type

The type of bootstrap to perform. See “Related Definitions” below.

Layer

Pointer to the boot server layer number to discover, which must be PXE_BOOT_LAYER_INITIAL when a new server type is being discovered. This is the only layer type that will perform multicast and broadcast discovery. All other layer types will only perform unicast discovery. If the boot server changes *Layer,* then the new *Layer* will be returned.

UseBis

TRUE if Boot Integrity Services are to be used. **FALSE** otherwise.

Info

Pointer to a data structure that contains additional information on the type of discovery operation that is to be performed. If this field is NULL, then the contents of the cached *DhcpAck* and *ProxyOffer* packets will be used.

  EFI_IP_ADDRESS                ServerMCastIp;
  UINT16                        IpCnt;
  EFI_PXE_BASE_CODE_SRVLIST     SrvList[IpCnt];
}   EFI_PXE_BASE_CODE_DISCOVER_INFO;

//*******************************************************
// EFI_PXE_BASE_CODE_SRVLIST
//*******************************************************
typedef struct {
  UINT16                        Type;
  BOOLEAN                       AcceptAnyResponse;
  UINT8                         reserved;
  EFI_IP_ADDRESS                IpAddr;
}   EFI_PXE_BASE_CODE_SRVLIST;
```

Description

This function attempts to complete the PXE Boot Server and/or boot image discovery sequence. If this sequence is completed, then EFI_SUCCESS is returned, and the *PxeDiscoverValid, PxeDiscover, PxeReplyReceived,* and *PxeReply* fields of the EFI_PXE_BASE_CODE_MODE in *Network Protocols — SNP, PXE, BIS and HTTP Boot* structure are filled in. If *UseBis* is **TRUE**, then the *PxeBisReplyReceived* and *PxeBisReply* fields of the EFI_PXE_BASE_CODE_MODE structure will also be filled in. If *UseBis* is **FALSE**, then *PxeBisReplyValid* will be set to **FALSE**.

In the structure referenced by parameter *Info,* the PXE Boot Server list, *SrvList[],* has two uses: It is the Boot Server IP address list used for unicast discovery (if the *UseUCast* field is **TRUE**), and it is the list used for Boot Server verification (if the *MustUseList* field is **TRUE**). Also, if the *MustUseList* field in that structure is **TRUE** and the *AcceptAnyResponse* field in the *SrvList[]* array is **TRUE**, any Boot Server reply of that type will be accepted. If the *AcceptAnyResponse* field is **FALSE**, only responses from Boot Servers with matching IP addresses will be accepted.

This function can take at least 10 seconds to timeout and return control to the caller. If the Discovery sequence does not complete, then EFI_TIMEOUT will be returned. Please see the Preboot Execution Environment (PXE) Specification for additional details on the implementation of the Discovery sequence.

If the Callback Protocol does not return EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE, then the Discovery sequence is stopped and EFI_ABORTED will be returned.

Status Codes Returned

EFI_SUCCESS	The Discovery sequence has been completed.
EFI_NOT_STARTED	The PXE Base Code Protocol is in the stopped state.
EFI_INVALID_PARAMETER	One or more of the following conditions was *TRUE* : • The *This* parameter was *NULL* • The *This* parameter did not point to a valid *EFI_PXE_BASE_CODE_PROTOCOL* structure • The *Layer* parameter was *NULL* • The *Info->ServerMCastIp* parameter does not contain a valid multicast IP address • The *Info->UseUCast* parameter is not *FALSE* and the *Info->IpCnt* parameter is zero One or more of the IP addresses in the *Info->SrvList[]* array is not a valid unicast IP address.
EFI_DEVICE_ERROR	The network device encountered an error during this operation.
EFI_OUT_OF_RESOURCES	Could not allocate enough memory to complete Discovery.
EFI_ABORTED	The callback function aborted the Discovery sequence.
EFI_TIMEOUT	The Discovery sequence timed out.
EFI_ICMP_ERROR	An ICMP error packet was received during the PXE discovery session. The ICMP error packet has been cached in the *EFI_PXE_BASE_CODE_MODE. IcmpError* packet structure. Information about ICMP packet contents can be found in RFC 792.

24.3.10 EFI_PXE_BASE_CODE_PROTOCOL.Mtftp()

Summary

Used to perform TFTP and MTFTP services.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_MTFTP) (
  IN EFI_PXE_BASE_CODE_PROTOCOL       *This,
  IN EFI_PXE_BASE_CODE_TFTP_OPCODE    Operation,
  IN OUT VOID                         *BufferPtr, OPTIONAL
  IN BOOLEAN                          Overwrite,
  IN OUT UINT64                       *BufferSize,
  IN UINTN                            *BlockSize, OPTIONAL
  IN EFI_IP_ADDRESS                   *ServerIp,
  IN CHAR8                            *Filename, OPTIONAL
  IN EFI_PXE_BASE_CODE_MTFTP_INFO     *Info, OPTIONAL
  IN BOOLEAN                          DontUseBuffer
  );
```

Parameters

This
Pointer to the *EFI_PXE_BASE_CODE_PROTOCOL* instance.

Operation
The type of operation to perform. See “Related Definitions” below for the list of operation types.

BufferPtr
A pointer to the data buffer. Ignored for read file if *DontUseBuffer* is **TRUE**.

Overwrite
Only used on write file operations. **TRUE** if a file on a remote server can be overwritten.

BufferSize
For get-file-size operations, *BufferSize* returns the size of the requested file. For read-file and write-file operations, this parameter is set to the size of the buffer specified by the *BufferPtr* parameter. For read-file operations, if EFI_BUFFER_TOO_SMALL is returned, *BufferSize* returns the size of the requested file.

BlockSize
The requested block size to be used during a TFTP transfer. This must be at least 512. If this field is NULL, then the largest block size supported by the implementation will be used.

ServerIp
The TFTP / MTFTP server IP address.

Filename
A Null-terminated ASCII string that specifies a directory name or a file name. This is ignored by MTFTP read directory.

Info
Pointer to the MTFTP information. This information is required to start or join a multicast TFTP session. It is also required to perform the “get file size” and “read directory” operations of MTFTP. See “Related Definitions” below for the description of this data structure.

DontUseBuffer
Set to **FALSE** for normal TFTP and MTFTP read file operation. Setting this to **TRUE** will cause TFTP and

MTFTP read file operations to function without a receive buffer, and all of the received packets are passed to the Callback Protocol which is responsible for storing them. This field is only used by TFTP and MTFTP read file.

}   EFI_PXE_BASE_CODE_TFTP_OPCODE;

//*******************************************************
// EFI_PXE_BASE_CODE_MTFTP_INFO
//*******************************************************
typedef struct {
  EFI_IP_ADDRESS              MCastIp;
  EFI_PXE_BASE_CODE_UDP_PORT   CPort;
  EFI_PXE_BASE_CODE_UDP_PORT   SPort;
  UINT16                      ListenTimeout;
  UINT16                      TransmitTimeout;
}   EFI_PXE_BASE_CODE_MTFTP_INFO;
```

MCastIp

File multicast IP address. This is the IP address to which the server will send the requested file.

CPort

Client multicast listening port. This is the UDP port to which the server will send the requested file.

SPort

Server multicast listening port. This is the UDP port on which the server listens for multicast open requests and data acks.

ListenTimeout

The number of seconds a client should listen for an active multicast session before requesting a new multicast session.

TransmitTimeout

The number of seconds a client should wait for a packet from the server before retransmitting the previous open request or data ack packet.

Description

This function is used to perform TFTP and MTFTP services. This includes the TFTP operations to get the size of a file, read a directory, read a file, and write a file. It also includes the MTFTP operations to get the size of a file, read a directory, and read a file. The type of operation is specified by *Operation*. If the callback function that is invoked during the TFTP/MTFTP operation does not return EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE, then EFI_ABORTED will be returned.

For read operations, the return data will be placed in the buffer specified by *BufferPtr*. If *BufferSize* is too small to contain the entire downloaded file, then EFI_BUFFER_TOO_SMALL will be returned and *BufferSize* will be set to zero or the size of the requested file (the size of the requested file is only returned if the TFTP server supports TFTP options). If *BufferSize* is large enough for the read operation, then *BufferSize* will be set to the size of the downloaded file, and EFI_SUCCESS will be returned. Applications using the PxeBc.Mtftp() services should use the get-file-size operations to determine the size of the downloaded file prior to using the read-file operations–especially when downloading large (greater than 64 MiB) files–instead of making two calls to the read-file operation. Following this recommendation will save time if the file is larger than expected and the TFTP server does not support TFTP option extensions. Without TFTP option extension support, the client has to download the entire file, counting and discarding the received packets, to determine the file size.

For write operations, the data to be sent is in the buffer specified by *BufferPtr*. *BufferSize* specifies the number of bytes to send. If the write operation completes successfully, then EFI_SUCCESS will be returned.

For TFTP “get file size” operations, the size of the requested file or directory is returned in *BufferSize,* and EFI_SUCCESS will be returned. If the TFTP server does not support options, the file will be downloaded into a bit bucket and the length of the downloaded file will be returned. For MTFTP “get file size” operations, if the MTFTP server does not support the “get file size” option, EFI_UNSUPPORTED will be returned.

This function can take up to 10 seconds to timeout and return control to the caller. If the TFTP sequence does not complete, EFI_TIMEOUT will be returned.

If the Callback Protocol does not return EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE, then the TFTP sequence is stopped and EFI_ABORTED will be returned.

The format of the data returned from a TFTP read directory operation is a null-terminated filename followed by a null-terminated information string, of the form “size year-month-day hour:minute:second” (i.e., %d %d-%d-%d %d:%d:%f - note that the seconds field can be a decimal number), where the date and time are UTC. For an MTFTP read directory command, there is additionally a null-terminated multicast IP address preceding the filename of the form %d.%d.%d.%d for IP v4. The final entry is itself null-terminated, so that the final information string is terminated with two null octets.

Status Codes Returned

EFI_SUCCESS	The TFTP/MTFTP operation was completed.
EFI_NOT_STARTED	The PXE Base Code Protocol is in the stopped state.
EFI_INVALID_PARAMETER	One or more of the following conditions was *TRUE* : • The *This* parameter was *NULL* • The *This* parameter did not point to a valid EFI_PXE_BASE_CODE_PROTOCOL structure • The Operation parameter was not one of the listed EFI_PXE_BASE_CODE_TFTP_OPCODE constants • The *BufferPtr* parameter was *NULL* and the DontUseBuffer parameter was *FALSE* • The *BufferSize* parameter was *NULL* • The BlockSize parameter was not *NULL* and * BlockSize was less than 512 • The ServerIp parameter was *NULL* or did not contain a valid unicast IP address • The Filename parameter was *NULL* for a file transfer or information request • The Info parameter was *NULL* for a multicast request The Info->MCastIp parameter is not a valid multicast IP address
EFI_DEVICE_ERROR	The network device encountered an error during this operation.

continues on next page

Table 24.18 – continued from previous page

EFI_BUFFER_TOO_SMALL	The buffer is not large enough to complete the read operation.
EFI_ABORTED	The callback function aborted the TFTP/MTFTP operation.
EFI_TIMEOUT	The TFTP/MTFTP operation timed out.
EFI_TFTP_ERROR	A TFTP error packet was received during the MTFTP session. The TFTP error packet has been cached in the *EFI_PXE_BASE_CODE_MODE. TftpError* packet structure. Information about TFTP error packet contents can be found in RFC 1350.
EFI_ICMP_ERROR	An ICMP error packet was received during the MTFTP session. The ICMP error packet has been cached in the *EFI_PXE_BASE_CODE_MODE. IcmpError* packet structure. Information about ICMP packet contents can be found in RFC 792.

24.3.11 EFI_PXE_BASE_CODE_PROTOCOL.UdpWrite()

Summary

Writes a UDP packet to the network interface.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_UDP_WRITE) (
  IN EFI_PXE_BASE_CODE_PROTOCOL        *This,
  IN UINT16                            OpFlags,
  IN EFI_IP_ADDRESS                    *DestIp,
  IN EFI_PXE_BASE_CODE_UDP_PORT        *DestPort,
  IN EFI_IP_ADDRESS                    *GatewayIp, OPTIONAL
  IN EFI_IP_ADDRESS                    *SrcIp, OPTIONAL
  IN OUT EFI_PXE_BASE_CODE_UDP_PORT    *SrcPort, OPTIONAL
  IN UINTN                             *HeaderSize, OPTIONAL
  IN VOID                              *HeaderPtr, OPTIONAL
  IN UINTN                             *BufferSize,
  IN VOID                              *BufferPtr
  );
```

Parameters

This

Pointer to the *EFI_PXE_BASE_CODE_PROTOCOL* instance.

OpFlags

The UDP operation flags. If MAY_FRAGMENT is set, then if required, this UDP write operation may be broken up across multiple packets.

DestIp

The destination IP address.

DestPort

The destination UDP port number.

GatewayIp

The gateway IP address. If *DestIp* is not in the same subnet as *StationIp,* then this gateway IP address will be used. If this field is NULL, and the *DestIp* is not in the same subnet as *StationIp,* then the *RouteTable* will be used.

SrcIp
The source IP address. If this field is NULL, then *StationIp* will be used as the source IP address.

SrcPort
The source UDP port number. If *OpFlags* has ANY_SRC_PORT set or *SrcPort* is NULL, then a source UDP port will be automatically selected. If a source UDP port was automatically selected, and *SrcPort* is not NULL, then it will be returned in *SrcPort*.

HeaderSize
An optional field which may be set to the length of a header at *HeaderPtr* to be prefixed to the data at *BufferPtr.*

HeaderPtr
If *HeaderSize* is not *NULL,* a pointer to a header to be prefixed to the data at *BufferPtr*.

BufferSize
A pointer to the size of the data at *BufferPtr*.

BufferPtr
A pointer to the data to be written.

Description

This function writes a UDP packet specified by the (optional *HeaderPtr* and) *BufferPtr* parameters to the network interface. The UDP header is automatically built by this routine. It uses the parameters *OpFlags, DestIp, DestPort, GatewayIp, SrcIp,* and *SrcPort* to build this header. If the packet is successfully built and transmitted through the network interface, then EFI_SUCCESS will be returned. If a timeout occurs during the transmission of the packet, then EFI_TIMEOUT will be returned. If an ICMP error occurs during the transmission of the packet, then the *IcmpErrorReceived* field is set to **TRUE**, the *IcmpError* field is filled in and EFI_ICMP_ERROR will be returned. If the Callback Protocol does not return EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE, then EFI_ABORTED will be returned.

Status Codes Returned

EFI_SUCCESS	The UDP Write operation was completed.
EFI_NOT_STARTED	The PXE Base Code Protocol is in the stopped state.
EFI_INVALID_PARAMETER	One or more of the following conditions was *TRUE* : • The *This* parameter was *NULL* • The *This* parameter did not point to a valid EFI_PXE_BASE_CODE_PROTOCOL structure • Reserved bits in the OpFlags parameter were not set to zero - The DestIp parameter was *NULL* • The DestPort parameter was *NULL* • The GatewayIp parameter was not *NULL* and did not contain a valid unicast IP address. • The HeaderSize parameter was not *NULL* and * HeaderSize is zero • The *HeaderSize parameter was not zero and the HeaderPtr parameter was *NULL* • The BufferSize parameter was *NULL* • The *BufferSize parameter was not zero and the BufferPtr parameter was *NULL*
EFI_DEVICE_ERROR	The network device encountered an error during this operation.
EFI_BAD_BUFFER_SIZE	The buffer is too long to be transmitted.
EFI_ABORTED	The callback function aborted the UDP Write operation.

continues on next page

Table 24.19 – continued from previous page

EFI_TIMEOUT	The UDP Write operation timed out.
EFI_ICMP_ERROR	An ICMP error packet was received during the UDP write session. The ICMP error packet has been cached in the *EFI_PXE_BASE_CODE_MODE. IcmpError* packet structure. Information about ICMP packet contents can be found in RFC 792.

24.3.12 EFI_PXE_BASE_CODE_PROTOCOL.UdpRead()

Summary

Reads a UDP packet from the network interface.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_UDP_READ) (
  IN EFI_PXE_BASE_CODE_PROTOCOL          *This
  IN UINT16                              OpFlags,
  IN OUT EFI_IP_ADDRESS                  *DestIp, OPTIONAL
  IN OUT EFI_PXE_BASE_CODE_UDP_PORT      *DestPort, OPTIONAL
  IN OUT EFI_IP_ADDRESS                  *SrcIp, OPTIONAL
  IN OUT EFI_PXE_BASE_CODE_UDP_PORT      *SrcPort, OPTIONAL
  IN UINTN                               *HeaderSize, OPTIONAL
  IN VOID                                *HeaderPtr, OPTIONAL
  IN OUT UINTN                           *BufferSize,
  IN VOID                                *BufferPtr
  );
```

Parameters

This

Pointer to the *EFI_PXE_BASE_CODE_PROTOCOL* instance.

OpFlags

The UDP operation flags.

DestIp

The destination IP address.

DestPort

The destination UDP port number.

SrcIp

The source IP address.

SrcPort

The source UDP port number.

HeaderSize

An optional field which may be set to the length of a header to be put in *HeaderPtr*.

HeaderPtr

If *HeaderSize* is not NULL, a pointer to a buffer to hold the *HeaderSize* bytes which follow the UDP header.

BufferSize

On input, a pointer to the size of the buffer at *BufferPtr*. On output, the size of the data written to *BufferPtr*.

BufferPtr
A pointer to the data to be read.

Description

This function reads a UDP packet from a network interface. The data contents are returned in (the optional *HeaderPtr* and) *BufferPtr,* and the size of the buffer received is returned in *BufferSize*. If the input *BufferSize* is smaller than the UDP packet received (less optional *HeaderSize*), it will be set to the required size, and EFI_BUFFER_TOO_SMALL will be returned. In this case, the contents of *BufferPtr* are undefined, and the packet is lost. If a UDP packet is successfully received, then EFI_SUCCESS will be returned, and the information from the UDP header will be returned in *DestIp, DestPort, SrcIp,* and *SrcPort* if they are not NULL. Depending on the values of *OpFlags* and the *DestIp, DestPort, SrcIp,* and *SrcPort* input values, different types of UDP packet receive filtering will be performed. The following tables summarize these receive filter operations.

Destination IP Filter Operation

Table 24.20: Destination IP Filter Operations

OpFlags USE_FILTER	OpFlags ANY_DEST_IP	DestIp	Action
0	0	NULL	Receive a packet sent to *StationIp*.
0	1	NULL	Receive a packet sent to any IP address.
1	x	NULL	Receive a packet whose destination IP address passes the IP filter.
0	0	not NULL	Receive a packet whose destination IP address matches *DestIp*.
0	1	not NULL	Receive a packet sent to any IP address and, return the destination IP address in *DestIp*.
1	x	not NULL	Receive a packet whose destination IP address passes the IP filter, and return the destination IP address in *DestIp*.

Table 24.21: Destination UDP Port Filter Operation

OpFlags ANY_DEST_PORT	DestPort	Action
0	NULL	Return *E FI_INVALID_PARAMETER*.
1	NULL	Receive a packet sent to any UDP port.
0	not NULL	Receive a packet whose destination Port matches *DestPort*.
1	not NULL	Receive a packet sent to any UDP port, and return the destination port in *DestPort*

Table 24.22: Source IP Filter Operation

OpFlags ANY_SRC_IP	SrcIp	Action
0	NULL	Return *E FI_INVALID_PARAMETER*.

continues on next page

Table 24.22 – continued from previous page

1	NULL	Receive a packet sent from any IP address.
0	not NULL	Receive a packet whose source IP address matches *SrcIp*.
1	not NULL	Receive a packet sent from any IP address, and return the source IP address in *SrcIp*.

Table 24.23: Source UDP Port Filter Operation

OpFlags ANY_SRC_PORT	**SrcPort**	**Action**
0	NULL	Return *E FI_INVALID_PARAMETER*.
1	NULL	Receive a packet sent from any UDP port.
0	not NULL	Receive a packet whose source UDP port matches *SrcPort*.
1	not NULL	Receive a packet sent from any UDP port, and return the source UPD port in *SrcPort*.

Status Codes Returned

EFI_SUCCESS	The UDP Read operation was completed.
EFI_NOT_STARTED	The PXE Base Code Protocol is in the stopped state.
EFI_INVALID_PARAMETER	One or more of the following conditions was *TRUE* : • The *This* parameter was *NULL* • The *This* parameter did not point to a valid EFI_PXE_BASE_CODE_PROTOCOL structure • Reserved bits in the OpFlags parameter were not set to zero • The HeaderSize parameter is not *NULL* and * HeaderSize is zero • The HeaderSize parameter is not *NULL* L and the HeaderPtr parameter is *NULL* • The BufferSize parameter is *NULL* • The BufferPtr parameter is *NULL*
EFI_DEVICE_ERROR	The network device encountered an error during this operation.
EFI_BUFFER_TOO_SMALL	The packet is larger than *Buffer* can hold.
EFI_ABORTED	The callback function aborted the UDP Read operation.
EFI_TIMEOUT	The UDP Read operation timed out.

24.3.13 EFI_PXE_BASE_CODE_PROTOCOL.SetIpFilter()

Summary

Updates the IP receive filters of a network device and enables software filtering.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_SET_IP_FILTER) (
  IN EFI_PXE_BASE_CODE_PROTOCOL           *This,
  IN EFI_PXE_BASE_CODE_IP_FILTER          *NewFilter
  );
```

Parameters

This

Pointer to the *EFI_PXE_BASE_CODE_PROTOCOL* instance.

NewFilter

Pointer to the new set of IP receive filters.

Description

The *NewFilter* field is used to modify the network device's current IP receive filter settings and to enable a software filter. This function updates the *IpFilter* field of the EFI_PXE_BASE_CODE_MODE in *Network Protocols — SNP, PXE, BIS and HTTP Boot* structure with the contents of *NewIpFilter*. The software filter is used when the USE_FILTER in *OpFlags* is set to *EFI_PXE_BASE_CODE_PROTOCOL.UdpRead()* . The current hardware filter remains in effect no matter what the settings of *OpFlags* are, so that the meaning of ANY_DEST_IP set in *OpFlags* to UdpRead() is from those packets whose reception is enabled in hardware - physical NIC address (unicast), broadcast address, logical address or addresses (multicast), or all (promiscuous). UdpRead() does not modify the IP filter settings.

EFI_PXE_BASE_CODE_PROTOCOL.Dhcp() , *EFI_PXE_BASE_CODE_PROTOCOL.Discover()* , and *EFI_PXE_BASE_CODE_PROTOCOL.Mtftp()* set the IP filter, and return with the IP receive filter list emptied and the filter set to EFI_PXE_BASE_CODE_IP_FILTER_STATION_IP. If an application or driver wishes to preserve the IP receive filter settings, it will have to preserve the IP receive filter settings before these calls, and use *EFI_PXE_BASE_CODE_PROTOCOL.SetIpFilter()* to restore them after the calls. If incompatible filtering is requested (for example, PROMISCUOUS with anything else) or if the device does not support a requested filter setting and it cannot be accommodated in software (for example, PROMISCUOUS not supported), EFI_INVALID_PARAMETER will be returned. The IPlist field is used to enable IPs other than the StationIP. They may be multicast or unicast. If IPcnt is set as well as EFI_PXE_BASE_CODE_IP_FILTER_STATION_IP, then both the StationIP and the IPs from the IPlist will be used.

Status Codes Returned

EFI_SUCCESS	The IP receive filter settings were updated.
EFI_INVALID_PARAMETER	• One or more of the following conditions was *TRUE* : • The *This* parameter was *NULL* • The *This* parameter did not point to a valid EFI_PXE_BASE_CODE_PROTOCOL structure • The *NewFilter* parameter was *NULL* • The *NewFilter* -> *IPlist* [] array contains one or more broadcast IP addresses
EFI_NOT_STARTED	The PXE Base Code Protocol is not in the started state.

24.3.14 EFI_PXE_BASE_CODE_PROTOCOL.Arp()

Summary

Uses the ARP protocol to resolve a MAC address.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_ARP) (
  IN EFI_PXE_BASE_CODE_PROTOCOL        *This,
```

(continues on next page)

(continued from previous page)

```
IN EFI_IP_ADDRESS                    *IpAddr,
IN EFI_MAC_ADDRESS                   *MacAddr OPTIONAL
);
```

Parameters

This

Pointer to the *EFI_PXE_BASE_CODE_PROTOCOL* instance.

IpAddr

Pointer to the IP address that is used to resolve a MAC address. When the MAC address is resolved, the *ArpCacheEntries* and *ArpCache* fields of the EFI_PXE_BASE_CODE_MODE in *Network Protocols — SNP, PXE, BIS and HTTP Boot* structure are updated.

MacAddr

If not NULL, a pointer to the MAC address that was resolved with the ARP protocol.

Description

This function uses the ARP protocol to resolve a MAC address. The *UsingIpv6* field of the EFI_PXE_BASE_CODE_MODE structure is used to determine if IPv4 or IPv6 addresses are being used. The IP address specified by *IpAddr* is used to resolve a MAC address in the case of IPv4; the concept of Arp is not supported in IPv6, though.

If the ARP protocol succeeds in resolving the specified address, then the *ArpCacheEntries* and *ArpCache* fields of the EFI_PXE_BASE_CODE_MODE structure are updated, and EFI_SUCCESS is returned. If *MacAddr* is not NULL, the resolved MAC address is placed there as well.

If the PXE Base Code protocol is in the stopped state, then EFI_NOT_STARTED is returned. If the ARP protocol encounters a timeout condition while attempting to resolve an address, then EFI_TIMEOUT is returned. If the Callback Protocol does not return EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE, then EFI_ABORTED is returned.

Status Codes Returned

EFI_SUCCESS	The IP or MAC address was resolved.
EFI_INVALID_PARAMETER	One or more of the following conditions was : • The *This* parameter was *NULL* • The *This* parameter did not point to a valid *EFI_PXE_BASE_CODE_PROTOCOL* structure • The IpAddr parameter was *NULL*
EFI_DEVICE_ERROR	The network device encountered an error during this operation.
EFI_NOT_STARTED	The PXE Base Code Protocol is in the stopped state.
EFI_TIMEOUT	The ARP Protocol encountered a timeout condition.
EFI_ABORTED	The callback function aborted the ARP Protocol.
EFI_UNSUPPORTED	When Mode->UsingIpv6 is *TRUE* because the Arp is a concept special for IPv4.

24.3.15 EFI_PXE_BASE_CODE_PROTOCOL.SetParameters()

Summary

Updates the parameters that affect the operation of the PXE Base Code Protocol.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_SET_PARAMETERS) (
  IN EFI_PXE_BASE_CODE_PROTOCOL            *This,
  IN BOOLEAN                               *NewAutoArp, OPTIONAL
  IN BOOLEAN                               *NewSendGUID, OPTIONAL
  IN UINT8                                 *NewTTL, OPTIONAL
  IN UINT8                                 *NewToS, OPTIONAL
  IN BOOLEAN                               *NewMakeCallback OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_PXE_BASE_CODE_PROTOCOL* instance.

NewAutoArp
If not NULL, a pointer to a value that specifies whether to replace the current value of *AutoARP*. **TRUE** for automatic ARP packet generation, **FALSE** otherwise. If NULL, this parameter is ignored.

NewSendGUID
If not NULL, a pointer to a value that specifies whether to replace the current value of *SendGUID*. **TRUE** to send the SystemGUID (if there is one) as the client hardware address in DHCP; **FALSE** to send client NIC MAC address. If NULL, this parameter is ignored. If *NewSendGUID* is **TRUE** and there is no SystemGUID, then EFI_INVALID_PARAMETER is returned.

NewTTL
If not NULL, a pointer to be used in place of the current value of *TTL,* the "time to live" field of the IP header. If NULL, this parameter is ignored.

NewToS
If not NULL, a pointer to be used in place of the current value of *ToS,* the "type of service" field of the IP header. If NULL, this parameter is ignored.

NewMakeCallback
If not NULL, a pointer to a value that specifies whether to replace the current value of the *MakeCallback* field of the Mode structure. If NULL, this parameter is ignored. If the Callback Protocol is not available EFI_INVALID_PARAMETER is returned.

Description

This function sets parameters that affect the operation of the PXE Base Code Protocol. The parameter specified by *NewAutoArp* is used to control the generation of ARP protocol packets. If *NewAutoArp* is **TRUE**, then ARP Protocol packets will be generated as required by the PXE Base Code Protocol. If *NewAutoArp* is **FALSE**, then no ARP Protocol packets will be generated. In this case, the only mappings that are available are those stored in the *ArpCache* of the EFI_PXE_BASE_CODE_MODE in *Network Protocols — SNP, PXE, BIS and HTTP Boot* structure. If there are not enough mappings in the *ArpCache* to perform a PXE Base Code Protocol service, then the service will fail. This function updates the *AutoArp* field of the EFI_PXE_BASE_CODE_MODE structure to *NewAutoArp*.

The *EFI_PXE_BASE_CODE_PROTOCOL.SetParameters()* call must be invoked after a Callback Protocol is installed to enable the use of callbacks.

Status Codes Returned

EFI_SUCCESS	The new parameters values were updated.
EFI_INVALID_PARAMETER	• One or more of the following conditions was *TRUE* : • The *This* parameter was *NULL* • The *This* parameter did not point to a valid EFI_PXE_BASE_CODE_PROTOCOL structure • The *NewSendGUID* parameter is not *NULL* and * *NewSendGUID* is *TRUE* and a system GUID could not be located • The *NewMakeCallback* parameter is not *NULL* and * *NewMakeCallback* is *TRUE* and an *EFI _PXE_BASE_CODE_CALLBACK_PROTOCOL* could not be located on the network device handle.
EFI_NOT_STARTED	The PXE Base Code Protocol is not in the started state.

24.3.16 EFI_PXE_BASE_CODE_PROTOCOL.SetStationIp()

Summary

Updates the station IP address and/or subnet mask values of a network device.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_SET_STATION_IP) (
  IN EFI_PXE_BASE_CODE_PROTOCOL           *This,
  IN EFI_IP_ADDRESS                       *NewStationIp, OPTIONAL
  IN EFI_IP_ADDRESS                       *NewSubnetMask OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_PXE_BASE_CODE_PROTOCOL* instance.

NewStationIp

Pointer to the new IP address to be used by the network device. If this field is NULL, then the *StationIp* address will not be modified.

NewSubnetMask

Pointer to the new subnet mask to be used by the network device. If this field is NULL, then the *SubnetMask* will not be modified.

Description

This function updates the station IP address and/or subnet mask values of a network device.

The *NewStationIp* field is used to modify the network device's current IP address. If *NewStationIP* is NULL, then the current IP address will not be modified. Otherwise, this function updates the *StationIp* field of the EFI_PXE_BASE_CODE_MODE in *Network Protocols — SNP, PXE, BIS and HTTP Boot* structure with *NewStationIp*.

The *NewSubnetMask* field is used to modify the network device's current subnet mask. If *NewSubnetMask* is NULL, then the current subnet mask will not be modified. Otherwise, this function updates the *SubnetMask* field of the EFI_PXE_BASE_CODE_MODE structure with *NewSubnetMask*.

Status Codes Returned

EFI_SUCCESS	The new station IP address and/or subnet mask were updated.
EFI_INVALID_PARAMETER	One or more of the following conditions was *TRUE* : • The *This* s parameter was *NULL* • The *This* parameter did not point to a valid EFI_PXE_BASE_CODE_PROTOCOL structure • The NewStationIp parameter is not *NULL* and * *NewStationIp* is not a valid unicast IP address • The *NewSubnetMask* parameter is not *NULL* and * *NewSubnetMask* does not contain a valid IP subnet mask
EFI_NOT_STARTED	The PXE Base Code Protocol is not in the started state.

24.3.17 EFI_PXE_BASE_CODE_PROTOCOL.SetPackets()

Summary

Updates the contents of the cached DHCP and Discover packets.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_SET_PACKETS) (
  IN EFI_PXE_BASE_CODE_PROTOCOL             *This,
  IN BOOLEAN                                *NewDhcpDiscoverValid, OPTIONAL
  IN BOOLEAN                                *NewDhcpAckReceived, OPTIONAL
  IN BOOLEAN                                *NewProxyOfferReceived, OPTIONAL
  IN BOOLEAN                                *NewPxeDiscoverValid, OPTIONAL
  IN BOOLEAN                                *NewPxeReplyReceived, OPTIONAL
  IN BOOLEAN                                *NewPxeBisReplyReceived, OPTIONAL
  IN EFI_PXE_BASE_CODE_PACKET               *NewDhcpDiscover, OPTIONAL
  IN EFI_PXE_BASE_CODE_PACKET               *NewDhcpAck, OPTIONAL
  IN EFI_PXE_BASE_CODE_PACKET               *NewProxyOffer, OPTIONAL
  IN EFI_PXE_BASE_CODE_PACKET               *NewPxeDiscover, OPTIONAL
  IN EFI_PXE_BASE_CODE_PACKET               *NewPxeReply, OPTIONAL
  IN EFI_PXE_BASE_CODE_PACKET               *NewPxeBisReply OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_PXE_BASE_CODE_PROTOCOL* instance.

NewDhcpDiscoverValid
Pointer to a value that will replace the current *DhcpDiscoverValid* field. If NULL, this parameter is ignored.

NewDhcpAckReceived
Pointer to a value that will replace the current *DhcpAckReceived* field. If NULL, this parameter is ignored.

NewProxyOfferReceived
Pointer to a value that will replace the current *ProxyOfferReceived* field. If NULL, this parameter is ignored.

NewPxeDiscoverValid
Pointer to a value that will replace the current *ProxyOfferReceived* field. If NULL, this parameter is ignored.

NewPxeReplyReceived
Pointer to a value that will replace the current *PxeReplyReceived* field. If NULL, this parameter is ignored.

NewPxeBisReplyReceived
Pointer to a value that will replace the current *PxeBisReplyReceived* field. If NULL, this parameter is ignored.

NewDhcpDiscover
Pointer to the new cached DHCP Discover packet contents. If NULL, this parameter is ignored.

NewDhcpAck
Pointer to the new cached DHCP Ack packet contents. If NULL, this parameter is ignored.

NewProxyOffer
Pointer to the new cached Proxy Offer packet contents. If NULL, this parameter is ignored.

NewPxeDiscover
Pointer to the new cached PXE Discover packet contents. If NULL, this parameter is ignored.

NewPxeReply
Pointer to the new cached PXE Reply packet contents. If NULL, this parameter is ignored.

NewPxeBisReply
Pointer to the new cached PXE BIS Reply packet contents. If NULL, this parameter is ignored.

Description

The pointers to the new packets are used to update the contents of the cached packets in the EFI_PXE_BASE_CODE_MODE structure.

Status Codes Returned

EFI_SUCCESS	The cached packet contents were updated.
EFI_INVALID_PARAMETER	• One or more of the following conditions was *TRUE* : • The *This* parameter was *NULL* The *This* parameter did not point to a valid EFI_PXE_BASE_CODE_PROTOCOL structure.
EFI_NOT_STARTED	The PXE Base Code Protocol is not in the started state.

24.3.18 Netboot6

For IPv4, PXE drivers typically install a LoadFile protocol on the NIC handle. In the case of supporting both IPv4 and IPv6 where two PXE Base Code and LoadFile protocol instances need be produced, the PXE driver will have to create two child handles and install *EFI_LOAD_FILE_PROTOCOL, EFI_SIMPLE_NETWORK_PROTOCOL* and *PXE_BASE_CODE_PROTOCOL* on each child handle. To distinguish these two child handles, an IP device path node can be appended to the parent device path, for example:

```
PciRoot(0x0)/Pci(0x19,0x0)/MAC(001320F4B4FF,0x0)/IPv4(...)
PciRoot(0x0)/Pci(0x19,0x0)/MAC(001320F4B4FF,0x0)/IPv6(...)
```

These two instances allow for the boot manager to decide a preference of IPv6 versus IPv4 since the IETF and other bodies do not speak to this policy choice.

24.3.18.1 DHCP6 options for PXE

In IPv4-based PXE, as defined by the rfc2131, rfc2132 and rfc4578, and described by the PXE2.1 specification and the UEFI specification, there are the following PXE related options/fields in DHCPv4 packet:

- siaddr field/ServerAddress option (54) - next server address.
- BootFileName option (67
-) – NBP file name.
- BootFileSize option (13)
- – NBP file size.
- ClassIdentifier (60)
- – PXE client tag.
- ClientSystemArchitectureType option (93)
- – client architecture type.
- ClientNetworkInterface Identifier option (94)
- – client network interface identifier.

In IPv6-based PXE, or 'netboot6', there are the following PXE related options in the DHCPv6 packet:

- BootFileURL option - OPT_BOOTFILE_URL (59) — next server address and NBP (Network Bootable Program) file name.
- BootFileParameters option
- – OPT_BOOTFILE_PARAM (60) — NBP file size.
- VendorClass option (16)
- – PXE client tag.
- ClientSystemArchitectureType option — OPTION_CLIENT_ARCH_TYPE (61) — client architecture type.
- ClientNetworkInterfaceIdentifier option (
- 62). – client network interface identifier.

The BootFileURL option is used to deliver the next server address or the next server address with NBP file name.

As an example where the next server address delivered only: "tftp://{[}FEDC:BA98:7654:3210:FEDC:BA98:7654:3210{]};mode=octet".

As an example where the next server address and BOOTFILE_NAME delivered both: "tftp://{[}FEDC:BA98:7654:3210:FEDC:BA98:7654:3210{]}/ BOOTFILE_NAME ;mode=octet".

The BootFileParameters option is used to deliver the NBP file size with the unit of 512-octet blocks. The maximum of the NBP file size is 65535 * 512 bytes.

As an example where the NBP file size is 1600 * 512 bytes:

```
para-len 1 = 4
parameter 1 = "1600"
```

The VendorClass option is used to deliver the PXE client tag.

As an example where the client architecture is EFI-X64 and the client network interface identifier is UNDI:

```
Enterprise-number = (343)
Vendor-class-data = "PXEClient:Arch:00006:UNDI:003016"

#define DUID-UUID 4
```

The Netboot6 client will use the DUID-UUID to report the platform identifier as part of the netboot6 DHCP options.

24.3.18.2 IPv6-based PXE boot

As PXE 2.1 specification describes step-by-step synopsis of the IPv4-based PXE process, Figure 1 describes the corresponding synopsis for netboot6.

24.3.18.2.1 Step 1.

The client multicasts a SOLICIT message to the standard DHCP6 port (547). It contains the following:

- A tag for client UNDI version.
- A tag for the client system architecture.
- A tag for PXE client, Vendor Class data set to
- “PXEClient:Arch:xxxxx:UNDI:yyyzzz”.

24.3.18.2.2 Step 2.

The DHCP6 or Proxy DHCP6 service responds by sending a ADVERTISE message to the client on the standard DHCP6 reply port (546). If this is a Proxy DHCP6 service, the next server (Boot Server) address is delivered by Boot File URL option. If this is a DHCP6 service, the new assigned client address is delivered by IA option. The extension tags information will be conveyed via the VENDOR OPTS field.

24.3.18.2.3 Steps 3 and 4.

If the client selects an address from a DHCP6 service, then it must complete the standard DHCP6 process by sending a REQUEST for the address back to the service and then waiting for an REPLY from the service.

24.3.18.2.4 Step 5.

The client multicasts a REQUEST message to the Boot Server port 4011, it contains the following:

- A tag for client UNDI version.
- A tag for the client system architecture.
- A tag for PXE client, Vendor Class option, set to
- “PXEClient:Arch:xxxxx:UNDI:yyyzzz”.

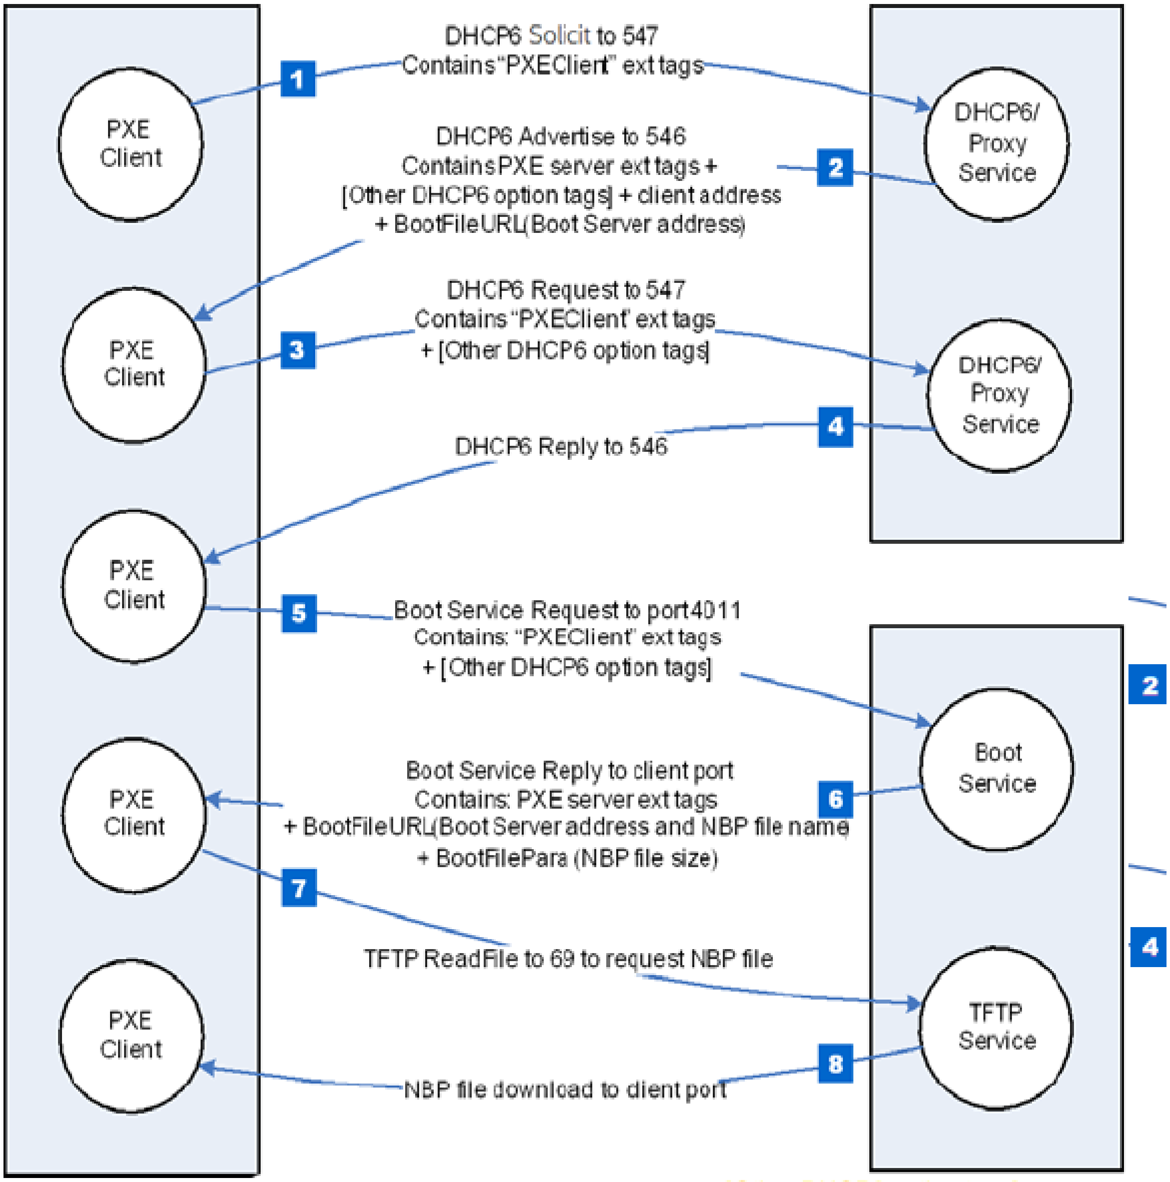

Fig. 24.1: IPv6-based PXE Boot

24.3.18.2.5 Step 6.

The Boot Server unicasts a REPLY message back to the client on the client port. It contains the following:

- A tag for NBP file name.
- A tag for NBP file size if needed.

24.3.18.2.6 Step 7.

The client requests the NBP file using TFTP (port 69).

24.3.18.2.7 Step 8.

The NBP file, dependent on the client's CPU architecture, is downloaded into client's memory.

24.3.18.3 Proxy DHCP6

The netboot6 DHCP6 options may be supplied by the DHCP6 service or a Proxy DHCP6 service. This Proxy DHCP6 service may reside on the same server as the DHCP6 service, or it ma be located on a separate server. A Proxy DHCP6 service on the same server as the DHCP6 service is illustrated in Figure 2. In this case, the Proxy DHCP6 service is listening to UDP port (4011), and communication with the Proxy DHCP6 service occurs after completing the standard DHCP6 process. Proxy DHCP6 uses port (4011) because is cannot share port (547) with the DHCP6 service. The netboot6 client knows how to interrogate the Proxy DHCP6 service because the ADVERTISE from the DHCP6 service contains a VendorClass option "PXEClient" tag without a BootFileURL option (including NBP file name). The client will not request option 16 (*OPTION_VENDOR_CLASS*) in ORO, but server must still reply with "PXEClient" in order to inform the client to start the Proxy DHCPv6 mode. The client will accept just the string "PXEClient" as sufficient, the server need not echo back the entire *OPTION_VENDOR_CLASS*.

The Figure below, *IPv6-based PXE boot (DHCP6 and ProxyDHCP6reside on the different server)* illustrates the case of a Proxy DHCP6 service and the DHCP6 service on different servers. In this case, the Proxy DHCP6 service listens to UDP port (547) and responds in parallel with DHCP6 service.

24.4 PXE Base Code Callback Protocol

This protocol is a specific instance of the PXE Base Code Callback Protocol that is invoked when the PXE Base Code Protocol is about to transmit, has received, or is waiting to receive a packet. The PXE Base Code Callback Protocol must be on the same handle as the PXE Base Code Protocol.

24.4.1 EFI_PXE_BASE_CODE_CALLBACK_PROTOCOL

Summary

Protocol that is invoked when the PXE Base Code Protocol is about to transmit, has received, or is waiting to receive a packet.

GUID

```
#define EFI_PXE_BASE_CODE_CALLBACK_PROTOCOL_GUID \
  {0x245DCA21,0xFB7B,0x11d3,\
    {0x8F,0x01,0x00,0xA0, 0xC9,0x69,0x72,0x3B}}
```

`OPTION_VENDOR_CLASS`.

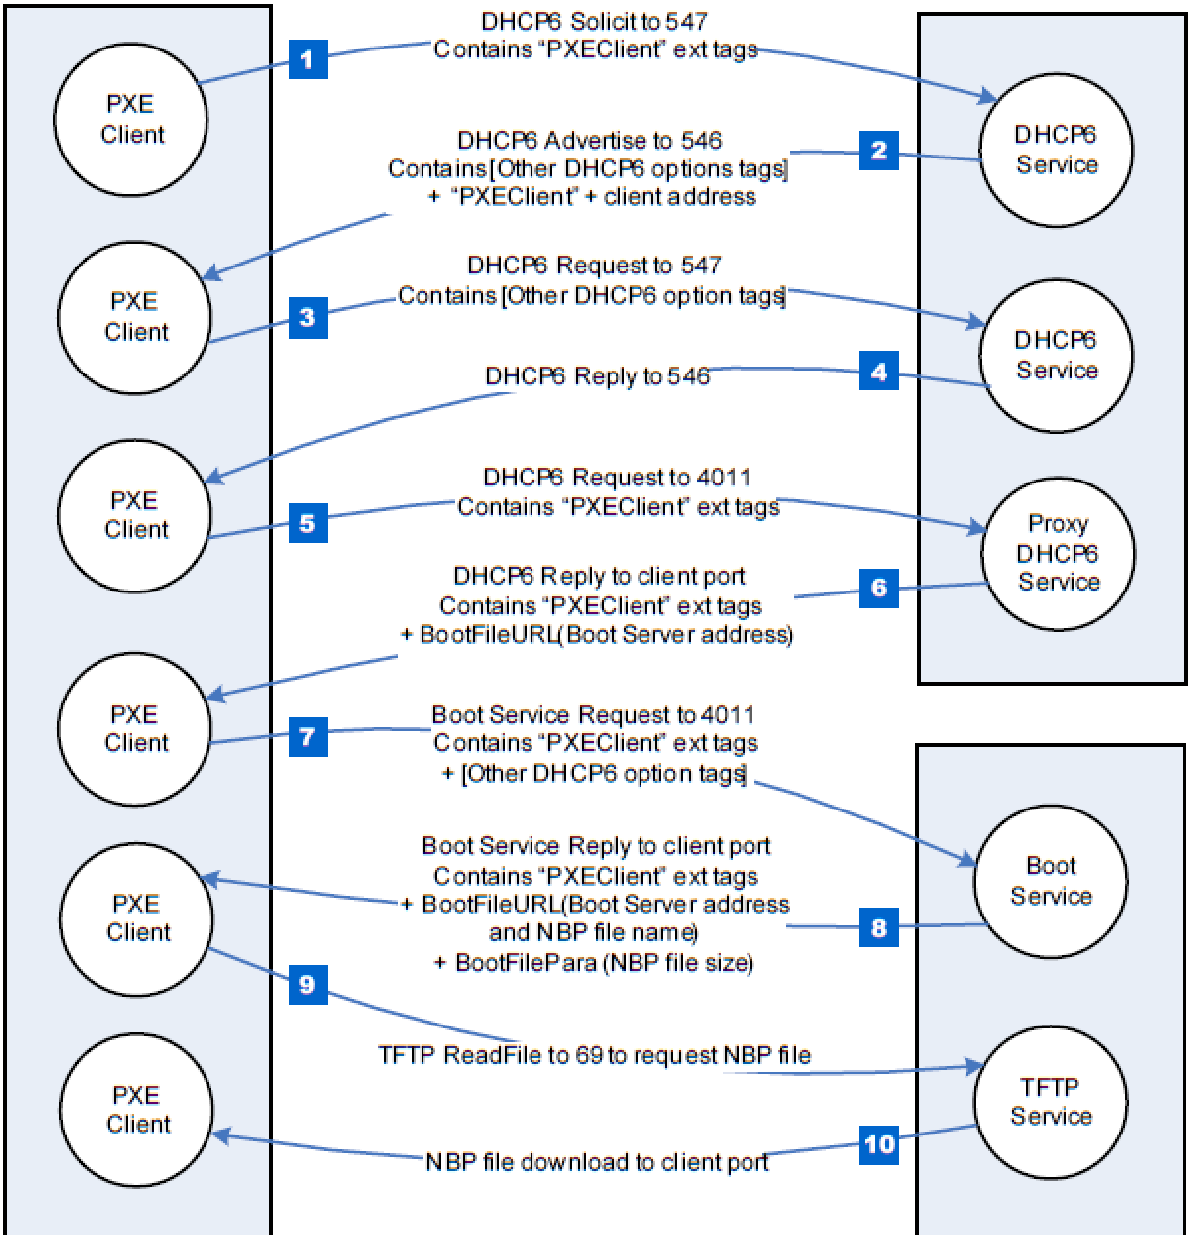

Fig. 24.2: Netboot6 (DHCP6 and ProxyDHCP6 reside on the same server)

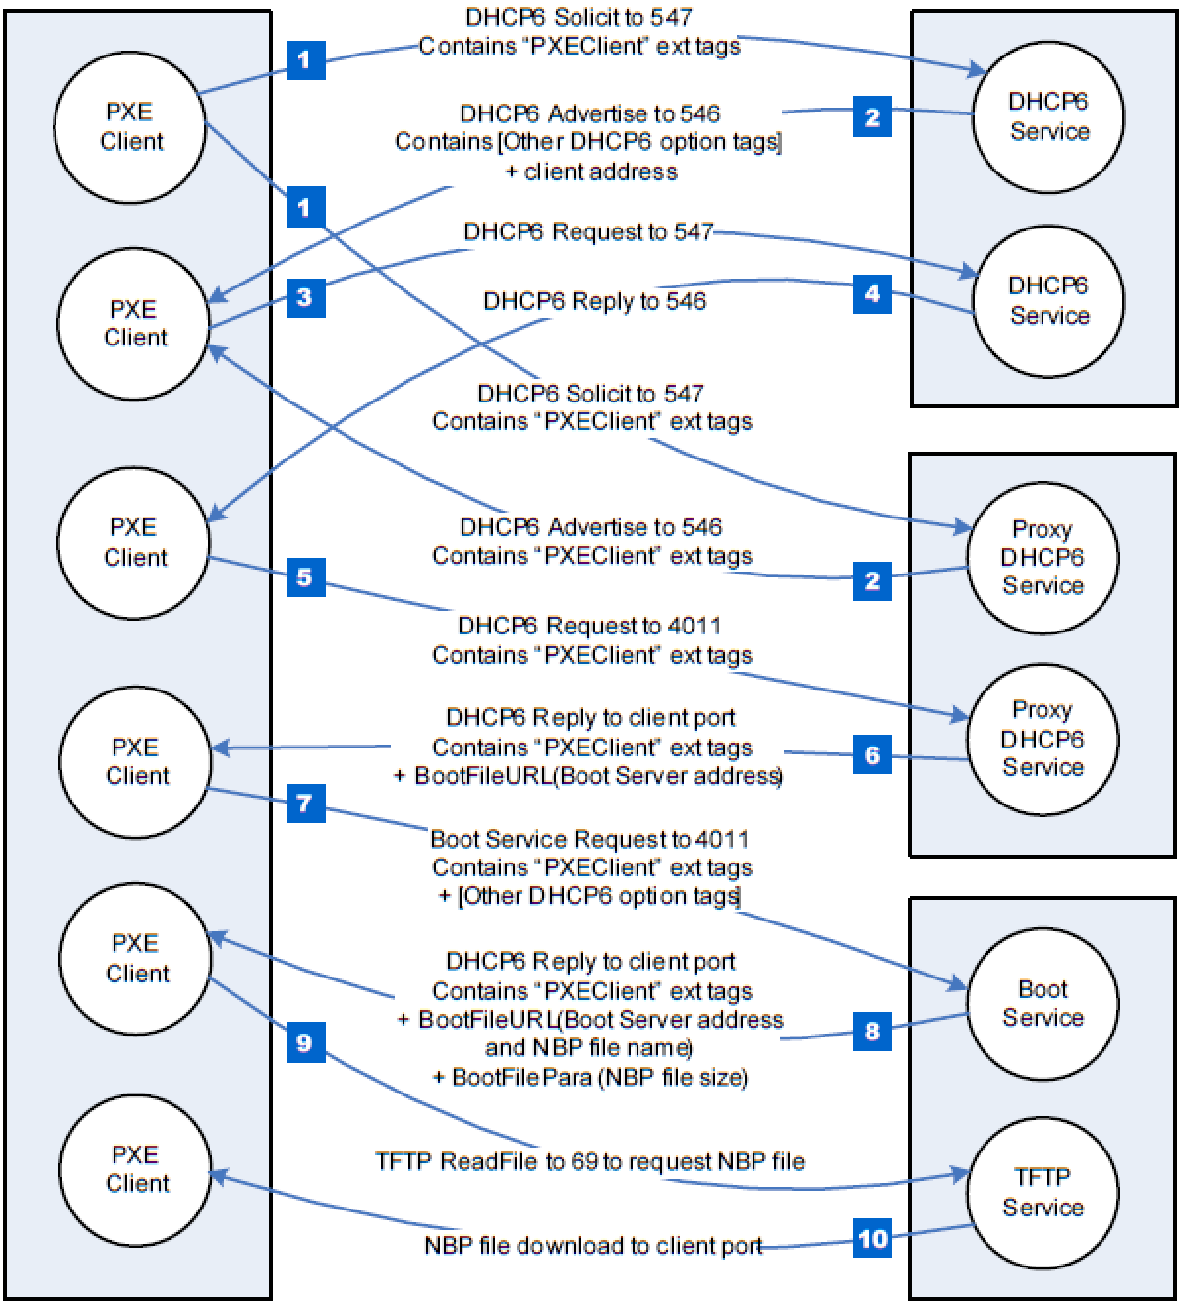

Fig. 24.3: IPv6-based PXE boot (DHCP6 and ProxyDHCP6reside on the different server)

Revision Number

```
#define EFI_PXE_BASE_CODE_CALLBACK_PROTOCOL_REVISION \\
0x00010000
```

Protocol Interface Structure

```
typedef struct {
  UINT64                Revision;
  EFI_PXE_CALLBACK      Callback;
}   EFI_PXE_BASE_CODE_CALLBACK_PROTOCOL;
```

Parameters

Revision
The revision of the EFI_PXE_BASE_CODE_CALLBACK_PROTOCOL. All future revisions must be backwards compatible. If a future revision is not backwards compatible, it is not the same GUID.

Callback
Callback routine used by the PXE Base Code *EFI_PXE_BASE_CODE_PROTOCOL.Dhcp()* , *EFI_PXE_BASE_CODE_PROTOCOL.Discover()* , *EFI_PXE_BASE_CODE_PROTOCOL.Mtftp()* , *EFI_PXE_BASE_CODE_PROTOCOL.UdpWrite()* , and *EFI_PXE_BASE_CODE_PROTOCOL.Arp()* functions.

24.4.2 EFI_PXE_BASE_CODE_CALLBACK.Callback()

Summary

Callback function that is invoked when the PXE Base Code Protocol is about to transmit, has received, or is waiting to receive a packet.

Prototype

```
typedef
EFI_PXE_BASE_CODE_CALLBACK_STATUS
(*EFI_PXE_CALLBACK) (
  IN EFI_PXE_BASE_CODE_CALLBACK_PROTOCOL        *This,
  IN EFI_PXE_BASE_CODE_FUNCTION                 Function,
  IN BOOLEAN                                    Received,
  IN UINT32                                     PacketLen,
  IN EFI_PXE_BASE_CODE_PACKET                   *Packet OPTIONAL
  );
```

Parameters

This
Pointer to the See *EFI_PXE_BASE_CODE_PROTOCOL* instance.

Function
The PXE Base Code Protocol function that is waiting for an event.

Received
TRUE if the callback is being invoked due to a receive event. **FALSE** if the callback is being invoked due to a transmit event.

PacketLen
The length, in bytes, of *Packet*. This field will have a value of zero if this is a wait for receive event.

Packet

If *Received* is **TRUE**, a pointer to the packet that was just received; otherwise a pointer to the packet that is about to be transmitted. This field will be NULL if this is not a packet event.

Related Definitions

```
//*******************************************************
// EFI_PXE_BASE_CODE_CALLBACK_STATUS
//*******************************************************
typedef enum {
EFI_PXE_BASE_CODE_CALLBACK_STATUS_FIRST,
EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE,
EFI_PXE_BASE_CODE_CALLBACK_STATUS_ABORT,
EFI_PXE_BASE_CODE_CALLBACK_STATUS_LAST
} EFI_PXE_BASE_CODE_CALLBACK_STATUS;

//*******************************************************
// EFI_PXE_BASE_CODE_FUNCTION
//*******************************************************
typedef enum {
EFI_PXE_BASE_CODE_FUNCTION_FIRST,
EFI_PXE_BASE_CODE_FUNCTION_DHCP,
EFI_PXE_BASE_CODE_FUNCTION_DISCOVER,
EFI_PXE_BASE_CODE_FUNCTION_MTFTP,
EFI_PXE_BASE_CODE_FUNCTION_UDP_WRITE,
EFI_PXE_BASE_CODE_FUNCTION_UDP_READ,
EFI_PXE_BASE_CODE_FUNCTION_ARP,
EFI_PXE_BASE_CODE_FUNCTION_IGMP,
EFI_PXE_BASE_CODE_PXE_FUNCTION_LAST
} EFI_PXE_BASE_CODE_FUNCTION;
```

Description

This function is invoked when the PXE Base Code Protocol is about to transmit, has received, or is waiting to receive a packet. Parameters *Function* and *Received* specify the type of event. Parameters *PacketLen* and *Packet* specify the packet that generated the event. If these fields are zero and NULL respectively, then this is a status update callback. If the operation specified by *Function* is to continue, then CALLBACK_STATUS_CONTINUE should be returned. If the operation specified by *Function* should be aborted, then CALLBACK_STATUS_ABORT should be returned. Due to the polling nature of UEFI device drivers, a callback function should not execute for more than 5 ms.

The *EFI_PXE_BASE_CODE_PROTOCOL.SetParameters()* function must be called after a Callback Protocol is installed to enable the use of callbacks.

24.5 Boot Integrity Services Protocol

This section defines the Boot Integrity Services (BIS) protocol, which is used to check a digital signature of a data block against a digital certificate for the purpose of an integrity and authorization check. BIS is primarily used by the Preboot Execution Environment (PXE) Base Code protocol See *EFI_PXE_BASE_CODE_PROTOCOL* to check downloaded network boot images before executing them. BIS is a UEFI Boot Service Driver, so its services are also available to applications written to this specification until the time of *EFI_BOOT_SERVICES.ExitBootServices()* . More information about BIS can be found in the Boot Integrity Services Application Programming Interface Version 1.0.

This section defines the Boot Integrity Services Protocol. This protocol is used to check a digital signature of a data block against a digital certificate for the purpose of an integrity and authorization check.

24.5.1 EFI_BIS_PROTOCOL

Summary

The *EFI_BIS_PROTOCOL* is used to check a digital signature of a data block against a digital certificate for the purpose of an integrity and authorization check.

GUID

```
#define EFI_BIS_PROTOCOL_GUID \
  {0x0b64aab0,0x5429,0x11d4,\
    {0x98,0x16,0x00,0xa0,0xc9,0x1f,0xad,0xcf}}
```

Protocol Interface Structure

```
typedef struct \_EFI_BIS_PROTOCOL {
  EFI_BIS_INITIALIZE                                  Initialize;
  EFI_BIS_SHUTDOWN                                    Shutdown;
  EFI_BIS_FREE                                        Free;
  EFI_BIS_GET_BOOT_OBJECT_AUTHORIZATION_CERTIFICATE  ␣
↪GetBootObjectAuthorizationCertificate;
  EFI_BIS_GET_BOOT_OBJECT_AUTHORIZATION_CHECKFLAG    ␣
↪GetBootObjectAuthorizationCheckFlag;
  EFI_BIS_GET_BOOT_OBJECT_AUTHORIZATION_UPDATE_TOKEN ␣
↪GetBootObjectAuthorizationUpdateToken;
  EFI_BIS_GET_SIGNATURE_INFO                          GetSignatureInfo;
  EFI_BIS_UPDATE_BOOT_OBJECT_AUTHORIZATION            UpdateBootObjectAuthorization;
  EFI_BIS_VERIFY_BOOT_OBJECT                          VerifyBootObject;
  EFI_BIS_VERIFY_OBJECT_WITH_CREDENTIAL               VerifyObjectWithCredential;
}    EFI_BIS_PROTOCOL;
```

Parameters

Initialize
Initializes an application instance of the *EFI_BIS* protocol, returning a handle for the application instance. Other functions in the *EFI_BIS* protocol require a valid application instance handle obtained from this function. See the *EFI_BIS_PROTOCOL.Initialize()* function description.

Shutdown
Ends the lifetime of an application instance of the *EFI_BIS* protocol, invalidating its application instance handle. The application instance handle may no longer be used in other functions in the *EFI_BIS* protocol. See the *EFI_BIS_PROTOCOL.Shutdown()* function description.

Free
Frees memory structures allocated and returned by other functions in the *EFI_BIS* protocol. See the *EFI_BIS_PROTOCOL.Free()* function description.

GetBootObjectAuthorizationCertificate
Retrieves the current digital certificate (if any) used by the *EFI_BIS* protocol as the source of authorization for verifying boot objects and altering configuration parameters. See the *EFI_BIS_PROTOCOL.GetBootObjectAuthorizationCertificate()* function description.

GetBootObjectAuthorizationCheckFlag
Retrieves the current setting of the authorization check flag that indicates whether or not authorization checks are required for boot objects. See the *EFI_BIS_PROTOCOL.GetBootObjectAuthorizationCheckFlag()* function description.

GetBootObjectAuthorizationUpdateToken
Retrieves an uninterpreted token whose value gets included and signed in a subsequent request to alter the configuration parameters, to protect against attempts to "replay" such a request. See the *EFI_BIS_PROTOCOL.GetBootObjectAuthorizationUpdateToken()* function description.

GetSignatureInfo
Retrieves information about the digital signature algorithms supported and the identity of the installed authorization certificate, if any. See the *EFI_BIS_PROTOCOL.GetSignatureInfo()* function description.

UpdateBootObjectAuthorization
Requests that the configuration parameters be altered by installing or removing an authorization certificate or changing the setting of the check flag. See the *EFI_BIS_PROTOCOL.UpdateBootObjectAuthorization()* function description.

VerifyBootObject
Verifies a boot object according to the supplied digital signature and the current authorization certificate and check flag setting. See the *EFI_BIS_PROTOCOL.VerifyBootObject()* function description.

VerifyObjectWithCredential
Verifies a data object according to a supplied digital signature and a supplied digital certificate. See the *EFI_BIS_PROTOCOL.VerifyObjectWithCredential()* function description.

Description

The EFI_BIS_PROTOCOL provides a set of functions as defined in this section. There is no physical device associated with these functions, however, in the context of UEFI every protocol operates on a device. Accordingly, BIS installs and operates on a single abstract device that has only a software representation.

24.5.2 EFI_BIS_PROTOCOL.Initialize()

Summary

Initializes the BIS service, checking that it is compatible with the version requested by the caller. After this call, other BIS functions may be invoked.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BIS_INITIALIZE)(
  IN EFI_BIS_PROTOCOL             *This,
  OUT BIS_APPLICATION_HANDLE      *AppHandle,
  IN OUT EFI_BIS_VERSION          *InterfaceVersion,
  IN EFI_BIS_DATA                 *TargetAddress
  );
```

Parameters

This
A pointer to the *EFI_BIS_PROTOCOL* object. The protocol implementation may rely on the actual pointer value and object location, so the caller must not copy the object to a new location.

AppHandle
The function writes the new BIS_APPLICATION_HANDLE if successful, otherwise it writes *NULL*. The caller must eventually destroy this handle by calling *EFI_BIS_PROTOCOL.Shutdown()* . Type *BIS_APPLICATION_HANDLE* is defined in "Related Definitions" below.

InterfaceVersion
On input, the caller supplies the major version number of the interface version desired. The minor version number

supplied on input is ignored since interface compatibility is determined solely by the major version number. On output, both the major and minor version numbers are updated with the major and minor version numbers of the interface (and underlying implementation). This update is done whether or not the initialization was successful. Type *EFI_BIS_VERSION* is defined in "Related Definitions" below.

TargetAddress

Indicates a network or device address of the BIS platform to connect to. Local-platform BIS implementations require that the caller sets *TargetAddress.Data* to *NULL,* but otherwise ignores this parameter. BIS implementations that redirect calls to an agent at a remote address must define their own format and interpretation of this parameter outside the scope of this document. For all implementations, if the *TargetAddress* is an unsupported value, the function fails with the error *EFI_UNSUPPORTED*. Type *EFI_BIS_DATA* is defined in "Related Definitions" below.

Related Definitions

```
//******************************************************
// BIS_APPLICATION_HANDLE
//******************************************************
typedef VOID   *BIS_APPLICATION_HANDLE;
```

This type is an opaque handle representing an initialized instance of the BIS interface. A *BIS_APPLICATION_HANDLE* value is returned by the *Initialize()* function as an "out" parameter. Other BIS functions take a *BIS_APPLICATION_HANDLE* as an "in" parameter to identify the BIS instance.

```
//******************************************************
// EFI_BIS_VERSION
//******************************************************
typedef struct \_EFI_BIS_VERSION {
  UINT32          Major;
  UINT32          Minor;
}   EFI_BIS_VERSION;
```

Major

This describes the major BIS version number. The major version number defines version compatibility. That is, when a new version of the BIS interface is created with new capabilities that are not available in the previous interface version, the major version number is increased.

Minor

This describes a minor BIS version number. This version number is increased whenever a new BIS implementation is built that is fully interface compatible with the previous BIS implementation. This number may be reset when the major version number is increased.

This type represents a version number of the BIS interface. This is used as an "in out" parameter of the *Initialize()* function for a simple form of negotiation of the BIS interface version between the caller and the BIS implementation.

```
//******************************************************
// EFI_BIS_VERSION predefined values
// Use these values to initialize EFI_BIS_VERSION.Major
// and to interpret results of Initialize.
//******************************************************
#define BIS_CURRENT_VERSION_MAJOR      BIS_VERSION_1
#define BIS_VERSION_1                  1
```

These C preprocessor macros supply values for the major version number of an *EFI_BIS_VERSION*. At the time of initialization, a caller supplies a value to request a BIS interface version. On return, the (IN OUT) parameter is overwritten with the actual version of the interface.

```
//*********************************************************
// EFI_BIS_DATA
//
// EFI_BIS_DATA instances obtained from BIS must be freed by
// calling `EFI_BIS_PROTOCOL.Free()`_.
//*********************************************************
typedef struct \_EFI_BIS_DATA {
  UINT32             Length;
  UINT8              *Data;
}   EFI_BIS_DATA;
```

Length
The length of the data buffer in bytes.

Data
A pointer to the raw data buffer.

This type defines a structure that describes a buffer. BIS uses this type to pass back and forth most large objects such as digital certificates, strings, etc. Several of the BIS functions allocate a *EFI_BIS_DATA** and return it as an "out" parameter. The caller must eventually free any allocated *EFI_BIS_DATA** using the *EFI_BIS_PROTOCOL.Free()* function.

Description

This function must be the first BIS function invoked by an application. It passes back a BIS_APPLICATION_HANDLE value that must be used in subsequent BIS functions. The handle must be eventually destroyed by a call to the *EFI_BIS_PROTOCOL.Shutdown()* function, thus ending that handle's lifetime. After the handle is destroyed, BIS functions may no longer be called with that handle value. Thus all other BIS functions may only be called between a pair of *EFI_BIS_PROTOCOL.Initialize()* and *Shutdown()* functions.

There is no penalty for calling *Initialize()* multiple times. Each call passes back a distinct handle value. Each distinct handle must be destroyed by a distinct call to *Shutdown()*. The lifetimes of handles created and destroyed with these functions may be overlapped in any way.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_INCOMPATIBLE_VERSION	The *InterfaceVersion.Major* requested by the caller was not compatible with the interface version of the implementation. The *InterfaceVersion.Major* has been updated with the current interface version.
EFI_UNSUPPORTED	This is a local-platform implementation and *TargetAddress.Data* was not *NULL*, or *TargetAddress.Data* was any other value that was not supported by the implementation.
EFI_OUT_OF_RESOURCES	The function failed due to lack of memory or other resources.
EFI_DEVICE_ERROR	The function encountered an unexpected internal failure while initializing a cryptographic software module, or No cryptographic software module with compatible version was found, or A resource limitation was encountered while using a cryptographic software module.

continues on next page

Table 24.30 – continued from previous page

EFI_INVALID_PARAMETER	The *This* parameter supplied by the caller is *NULL* or does not reference a valid *EFI_BIS_PROTOCOL* object, or The *AppHandle* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *InterfaceVersion* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *TargetAddress* parameter supplied by the caller is *NULL* or an invalid memory reference.

24.5.3 EFI_BIS_PROTOCOL.Shutdown()

Summary

Shuts down an application's instance of the BIS service, invalidating the application handle. After this call, other BIS functions may no longer be invoked using the application handle value.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BIS_SHUTDOWN)(
  IN BIS_APPLICATION_HANDLE    AppHandle
  );
```

Parameters

AppHandle
An opaque handle that identifies the caller's instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the *EFI_BIS_PROTOCOL.Initialize()* function description.

Description

This function shuts down an application's instance of the BIS service, invalidating the application handle. After this call, other BIS functions may no longer be invoked using the application handle value.

This function must be paired with a preceding successful call to the *Initialize()* function. The lifetime of an application handle extends from the time the handle was returned from *Initialize()* until the time the handle is passed to *Shutdown()*. If there are other remaining handles whose lifetime is still active, they may still be used in calling BIS functions.

The caller must free all memory resources associated with this *AppHandle* that were allocated and returned from other BIS functions before calling *Shutdown()*. Memory resources are freed using the *EFI_BIS_PROTOCOL.Free()* function. Failure to free such memory resources is a caller error, however, this function does not return an error code under this circumstance. Further attempts to access the outstanding memory resources cause unspecified results.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_NO_MAPPING	The *AppHandle* parameter is not or is no longer a valid application instance handle associated with the EFI_BIS protocol.

continues on next page

Table 24.31 – continued from previous page

EFI_DEVICE_ERROR	The function encountered an unexpected internal error while returning resources associated with a cryptographic software module, or The function encountered an internal error while trying to shut down a cryptographic software module.
EFI_OUT_OF_RESOURCES	The function failed due to lack of memory or other resources.

24.5.4 EFI_BIS_PROTOCOL.Free()

Summary

Frees memory structures allocated and returned by other functions in the *EFI_BIS* protocol.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BIS_FREE)(
  IN BIS_APPLICATION_HANDLE   AppHandle,
  IN EFI_BIS_DATA             *ToFree
);
```

Parameters

AppHandle

An opaque handle that identifies the caller's instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the *EFI_BIS_PROTOCOL.Initialize()* function description.

ToFree

An *EFI_BIS_DATA** and associated memory block to be freed. This *EFI_BIS_DATA** must have been allocated by one of the other BIS functions. Type EFI_BIS_DATA is defined in the *Initialize()* function description.

Description

This function deallocates an *EFI_BIS_DATA** and associated memory allocated by one of the other BIS functions.

Callers of other BIS functions that allocate memory in the form of an *EFI_BIS_DATA** must eventually call this function to deallocate the memory before calling the *EFI_BIS_PROTOCOL.Shutdown()* function for the application handle under which the memory was allocated. Failure to do so causes unspecified results, and the continued correct operation of the BIS service cannot be guaranteed.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_NO_MAPPING	The *AppHandle* parameter is not or is no longer a valid application instance handle associated with the EFI_BIS protocol.
EFI_INVALID_PARAMETER	The *ToFree* parameter is not or is no longer a memory resource associated with this *AppHandle*.
EFI_OUT_OF_RESOURCES	The function failed due to lack of memory or other resources.

24.5.5 EFI_BIS_PROTOCOL.GetBootObjectAuthorizationCertificate()

Summary

Retrieves the certificate that has been configured as the identity of the organization designated as the source of authorization for signatures of boot objects.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BIS_GET_BOOT_OBJECT_AUTHORIZATION_CERTIFICATE)(
  IN BIS_APPLICATION_HANDLE         AppHandle,
  OUT EFI_BIS_DATA                  **Certificate
  );
```

Parameters

AppHandle

An opaque handle that identifies the caller's instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the *EFI_BIS_PROTOCOL.Initialize()* function description.

Certificate

The function writes an allocated *EFI_BIS_DATA** containing the Boot Object Authorization Certificate object. The caller must eventually free the memory allocated by this function using the function *EFI_BIS_PROTOCOL.Free()* . Type EFI_BIS_DATA is defined in the *Initialize()* function description.

Description

This function retrieves the certificate that has been configured as the identity of the organization designated as the source of authorization for signatures of boot objects.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_NO_MAPPING	The *AppHandle* parameter is not or is no longer a valid application instance handle associated with the EFI_BIS protocol.
EFI_NOT_FOUND	There is no Boot Object Authorization Certificate currently installed.
EFI_OUT_OF_RESOURCES	The function failed due to lack of memory or other resources.
EFI_INVALID_PARAMETER	The *Certificate* parameter supplied by the caller is *NULL* or an invalid memory reference.

24.5.6 EFI_BIS_PROTOCOL.GetBootObjectAuthorizationCheckFlag()

Summary

Retrieves the current status of the Boot Authorization Check Flag.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BIS_GET_BOOT_OBJECT_AUTHORIZATION_CHECKFLAG)(
  IN BIS_APPLICATION_HANDLE         AppHandle,
```

(continues on next page)

(continued from previous page)

```
  OUT BOOLEAN                       *CheckIsRequired
  );
```

Parameters

AppHandle

An opaque handle that identifies the caller's instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the *EFI_BIS_PROTOCOL.Initialize()* function description.

CheckIsRequired

The function writes the value *TRUE* if a Boot Authorization Check is currently required on this platform, otherwise the function writes *FALSE*.

Description

This function retrieves the current status of the Boot Authorization Check Flag (in other words, whether or not a Boot Authorization Check is currently required on this platform).

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_NO_MAPPING	The *AppHandle* parameter is not or is no longer a valid application instance handle associated with the EFI_BIS protocol.
EFI_OUT_OF_RESOURCES	The function failed due to lack of memory or other resources.
EFI_INVALID_PARAMETER	The *CheckIsRequired* parameter supplied by the caller is *NULL* or an invalid memory reference.

24.5.7 EFI_BIS_PROTOCOL.GetBootObjectAuthorizationUpdateToken()

Summary

Retrieves a unique token value to be included in the request credential for the next update of any parameter in the Boot Object Authorization set (Boot Object Authorization Certificate and Boot Authorization Check Flag).

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BIS_GET_BOOT_OBJECT_AUTHORIZATION_UPDATE_TOKEN)(
  IN BIS_APPLICATION_HANDLE            AppHandle,
  OUT EFI_BIS_DATA                     **UpdateToken
  );
```

Parameters

AppHandle

An opaque handle that identifies the caller's instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the *EFI_BIS_PROTOCOL.Initialize()* function description.

UpdateToken

The function writes an allocated *EFI_BIS_DATA** containing the new unique update token value. The caller must eventually free the memory allocated by this function using the function *EFI_BIS_PROTOCOL.Free()* . Type EFI_BIS_DATA is defined in the *Initialize()* function description.

Description

This function retrieves a unique token value to be included in the request credential for the next update of any parameter in the Boot Object Authorization set (Boot Object Authorization Certificate and Boot Authorization Check Flag). The token value is unique to this platform, parameter set, and instance of parameter values. In particular, the token changes to a new unique value whenever any parameter in this set is changed.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_NO_MAPPING	The *AppHandle* parameter is not or is no longer a valid application instance handle associated with the EFI_BIS protocol.
EFI_OUT_OF_RESOURCES	The function failed due to lack of memory or other resources.
EFI_DEVICE_ERROR	The function encountered an unexpected internal error in a cryptographic software module.
EFI_INVALID_PARAMETER	The *UpdateToken* parameter supplied by the caller is *NULL* or an invalid memory reference.

24.5.8 EFI_BIS_PROTOCOL.GetSignatureInfo()

Summary

Retrieves a list of digital certificate identifier, digital signature algorithm, hash algorithm, and key-length combinations that the platform supports.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BIS_GET_SIGNATURE_INFO)(
  IN BIS_APPLICATION_HANDLE            AppHandle,
  OUT EFI_BIS_DATA                     **SignatureInfo
  );
```

Parameters

AppHandle

An opaque handle that identifies the caller's instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the *EFI_BIS_PROTOCOL.Initialize()* function description.

SignatureInfo

The function writes an allocated *EFI_BIS_DATA** containing the array of *EFI_BIS_SIGNATURE_INFO* structures representing the supported digital certificate identifier, algorithm, and key length combinations. The caller must eventually free the memory allocated by this function using the function *EFI_BIS_PROTOCOL.Free()* . Type EFI_BIS_DATA is defined in the *Initialize()* function description. Type *EFI_BIS_SIGNATURE_INFO* is defined in "Related Definitions" below.

Related Definitions

```
//*********************************************************
// EFI_BIS_SIGNATURE_INFO
//*********************************************************
typedef struct \_EFI_BIS_SIGNATURE_INFO {
  BIS_CERT_ID           CertificateID;
  BIS_ALG_ID            AlgorithmID;
  UINT16                KeyLength;
}   EFI_BIS_SIGNATURE_INFO;
```

CertificateID

A shortened value identifying the platform's currently configured Boot Object Authorization Certificate, if one is currently configured. The shortened value is derived from the certificate as defined in the Related Definition for *BIS_CERT_ID* below. If there is no certificate currently configured, the value is one of the reserved *BIS_CERT_ID_XXX* values defined below. Type *BIS_CERT_ID* and its predefined reserved values are defined in "Related Definitions" below.

AlgorithmID

A predefined constant representing a particular digital signature algorithm. Often this represents a combination of hash algorithm and encryption algorithm, however, it may also represent a standalone digital signature algorithm. Type *BIS_ALG_ID* and its permitted values are defined in "Related Definitions" below.

KeyLength

The length of the public key, in bits, supported by this digital signature algorithm.

This type defines a digital certificate, digital signature algorithm, and key-length combination that may be supported by the BIS implementation. This type is returned by *GetSignatureInfo()* to describe the combination(s) supported by the implementation.

```
//******************************************************
// BIS_GET_SIGINFO_COUNT macro
//   Tells how many EFI_BIS_SIGNATURE_INFO elements are contained
//   in a EFI_BIS_DATA struct pointed to by the provided
//   EFI_BIS_DATA*.
//******************************************************
#define BIS_GET_SIGINFO_COUNT(BisDataPtr) \
  ((BisDataPtr)->Length/sizeof(EFI_BIS_SIGNATURE_INFO))
```

BisDataPtr

Supplies the pointer to the target *EFI_BIS_DATA* structure.

(return value)

The number of *EFI_BIS_SIGNATURE_INFO* elements contained in the array.

This macro computes how many *EFI_BIS_SIGNATURE_INFO* elements are contained in an *EFI_BIS_DATA* structure returned from *GetSignatureInfo()*. The number returned is the count of items in the list of supported digital certificate, digital signature algorithm, and key-length combinations.

```
//*******************************************************
// BIS_GET_SIGINFO_ARRAY macro
//   Produces a EFI_BIS_SIGNATURE_INFO* from a given
//   EFI_BIS_DATA.*
//*******************************************************
#define BIS_GET_SIGINFO_ARRAY(BisDataPtr) \
  ((EFI_BIS_SIGNATURE_INFO*)(BisDataPtr)->Data)
```

BisDataPtr

Supplies the pointer to the target *EFI_BIS_DATA* structure.

(return value)

The pointer to the *EFI_BIS_SIGNATURE_INFO* array, cast as an *EFI_BIS_SIGNATURE_INFO**.

This macro returns a pointer to the *EFI_BIS_SIGNATURE_INFO* array contained in an *EFI_BIS_DATA* structure returned from *GetSignatureInfo()* representing the list of supported digital certificate, digital signature algorithm, and key-length combinations.

```
//*******************************************************
// BIS_CERT_ID
//*******************************************************
typedef UINT32      BIS_CERT_ID;
```

This type represents a shortened value that identifies the platform's currently configured Boot Object Authorization Certificate. The value is the first four bytes, in "little-endian" order, of the SHA-1 hash of the certificate, except that the most-significant bits of the second and third bytes are reserved, and must be set to zero regardless of the outcome of the hash function. This type is included in the array of values returned from the *GetSignatureInfo()* function to indicate the required source of a signature for a boot object or a configuration update request. There are a few predefined reserved values with special meanings as described below.

```
//*******************************************************
// BIS_CERT_ID predefined values
//   Currently defined values for EFI_BIS_SIGNATURE_INFO.
//   CertificateId.
//*******************************************************
#define BIS_CERT_ID_DSA   BIS_ALG_DSA   //CSSM_ALGID_DSA
#define BIS_CERT_ID_RSA_MD5  BIS_ALG_RSA_MD5   //CSSM_ALGID_MD5_WITH_RSA
```

These C preprocessor symbols provide values for the *BIS_CERT_ID* type. These values are used when the platform has no configured Boot Object Authorization Certificate. They indicate the signature algorithm that is supported by the platform. Users must be careful to avoid constructing Boot Object Authorization Certificates that transform to *BIS_CERT_ID* values that collide with these predefined values or with the *BIS_CERT_ID* values of other Boot Object Authorization Certificates they use.

```
//*******************************************************
// BIS_CERT_ID_MASK
//   The following is a mask value that gets applied to the
//   truncated hash of a platform Boot Object Authorization
//   Certificate to create the CertificateId. A CertificateId
//   must not have any bits set to the value 1 other than bits in
//   this mask.
//*******************************************************
#define BIS_CERT_ID_MASK (0xFF7F7FFF)
```

This C preprocessor symbol may be used as a bit-wise "AND" value to transform the first four bytes (in little-endian order) of a SHA-1 hash of a certificate into a certificate ID with the "reserved" bits properly set to zero.

```
//*******************************************************
// BIS_ALG_ID
//*******************************************************
typedef UINT16 BIS_ALG_ID;
```

This type represents a digital signature algorithm. A digital signature algorithm is often composed of a particular combination of secure hash algorithm and encryption algorithm. This type also allows for digital signature algorithms that cannot be decomposed. Predefined values for this type are as defined below.

```
//*******************************************************
// BIS_ALG_ID predefined values
//  Currently defined values for EFI_BIS_SIGNATURE_INFO.
//  AlgorithmID. The exact numeric values come from "Common
//  Data Security Architecture (CDSA) Specification."
```

(continues on next page)

(continued from previous page)

```
//*******************************************************
#define BIS_ALG_DSA   (41)   //CSSM_ALGID_DSA
#define BIS_ALG_RSA_MD5  (42)   //CSSM_ALGID_MD5_WITH_RSA
```

These values represent the two digital signature algorithms predefined for BIS. Each implementation of BIS must support at least one of these digital signature algorithms. Values for the digital signature algorithms are chosen by an industry group known as The Open Group. Developers planning to support additional digital signature algorithms or define new digital signature algorithms should refer to The Open Group for interoperable values to use.

Description

This function retrieves a list of digital certificate identifier, digital signature algorithm, hash algorithm, and key-length combinations that the platform supports. The list is an array of (certificate id, algorithm id, key length) triples, where the certificate id is derived from the platform's Boot Object Authorization Certificate as described in the Related Definition for *BIS_CERT_ID* above, the algorithm id represents the combination of signature algorithm and hash algorithm, and the key length is expressed in bits. The number of array elements can be computed using the *Length* field of the retrieved *EFI_BIS_DATA**.

The retrieved list is in order of preference. A digital signature algorithm for which the platform has a currently configured Boot Object Authorization Certificate is preferred over any digital signature algorithm for which there is not a currently configured Boot Object Authorization Certificate. Thus the first element in the list has a *CertificateID* representing a Boot Object Authorization Certificate if the platform has one configured. Otherwise the *CertificateID* of the first element in the list is one of the reserved values representing a digital signature algorithm.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_NO_MAPPING	The *AppHandle* parameter is not or is no longer a valid application instance handle associated with the EFI_BIS protocol.
EFI_OUT_OF_RESOURCES	The function failed due to lack of memory or other resources.
EFI_DEVICE_ERROR	The function encountered an unexpected internal error in a cryptographic software module, or The function encountered an unexpected internal consistency check failure (possible corruption of stored Boot Object Authorization Certificate).
EFI_INVALID_PARAMETER	The *SignatureInfo* parameter supplied by the caller is *NULL* or an invalid memory reference.

24.5.9 EFI_BIS_PROTOCOL.UpdateBootObjectAuthorization()

Summary

Updates one of the configurable parameters of the Boot Object Authorization set (Boot Object Authorization Certificate or Boot Authorization Check Flag).

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BIS_UPDATE_BOOT_OBJECT_AUTHORIZATION)(
  IN BIS_APPLICATION_HANDLE      AppHandle,
  IN EFI_BIS_DATA                *RequestCredential,
```

(continues on next page)

(continued from previous page)

```
  OUT EFI_BIS_DATA                **NewUpdateToken
  );
```

Parameters

AppHandle
An opaque handle that identifies the caller's instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the *EFI_BIS_PROTOCOL.Initialize()* function description.

RequestCredential
This is a Signed Manifest with embedded attributes that carry the details of the requested update. The required syntax of the Signed Manifest is described in the Related Definition for Manifest Syntax below. The key used to sign the request credential must be the private key corresponding to the public key in the platform's configured Boot Object Authorization Certificate. Authority to update parameters in the Boot Object Authorization set cannot be delegated.

If there is no Boot Object Authorization Certificate, the request credential may be signed with any private key. In this case, this function interacts with the user in a platform-specific way to determine whether the operation should succeed. Type EFI_BIS_DATA is defined in the *Initialize()* function description.

NewUpdateToken
The function writes an allocated *EFI_BIS_DATA** containing the new unique update token value. The caller must eventually free the memory allocated by this function using the function *EFI_BIS_PROTOCOL.Free()* . Type EFI_BIS_DATA is defined in the *Initialize()* function description.

Related Definitions

```
//************************************************************
// Manifest Syntax

//************************************************************
```

The Signed Manifest consists of three parts grouped together into an Electronic Shrink Wrap archive as described in [SM spec]: a manifest file, a signer's information file, and a signature block file. These three parts, along with examples are described in the following sections. In these examples, text in parentheses is a description of the text that would appear in the signed manifest. Text outside of parentheses must appear exactly as shown. Also note that manifest files and signer's information files must conform to a 72-byte line-length limit. Continuation lines (lines beginning with a single "space" character) are used for lines longer than 72 bytes. The examples given here follow this rule for continuation lines.

Note that the manifest file and signer's information file parts of a Signed Manifest are ASCII text files. In cases where these files contain a base-64 encoded string, the string is an ASCII string before base-64 encoding.

```
//************************************************************
// Manifest File Example
//************************************************************
```

The manifest file must include a section referring to a memory-type data object with the reserved name as shown in the example below. This data object is a zero-length object whose sole purpose in the manifest is to serve as a named collection point for the attributes that carry the details of the requested update. The attributes are also contained in the manifest file. An example manifest file is shown below.

```
Manifest-Version: 2.0
ManifestPersistentId: (base-64 representation of a unique GUID)

```

(continues on next page)

(continued from previous page)

```
Name: memory:UpdateRequestParameters
Digest-Algorithms: SHA-1
SHA-1-Digest: (base-64 representation of a SHA-1 digest of zero-length buffer)
X-Intel-BIS-ParameterSet: (base-64 representation of BootObjectAuthorizationSetGUID)
X-Intel-BIS-ParameterSetToken: (base-64 representation of the current update token)
X-Intel-BIS-ParameterId: (base-64 representation of
"BootObjectAuthorizationCertificate" or
"BootAuthorizationCheckFlag")
X-Intel-BIS-ParameterValue: (base-64 representation of certificate or
single-byte boolean flag)
```

A line-by-line description of this manifest file is as follows.

```
Manifest-Version: 2.0
```

This is a standard header line that all signed manifests have. It must appear exactly as shown.

```
ManifestPersistentId: (base-64 representation of a unique GUID)
```

The left-hand string must appear exactly as shown. The right-hand string must be a unique GUID for every manifest file created. The Win32 function UuidCreate() can be used for this on Win32 systems. The GUID is a binary value that must be base-64 encoded. Base-64 is a simple encoding scheme for representing binary values that uses only printing characters. Base-64 encoding is described in [BASE-64].

```
Name: memory:UpdateRequestParameters
```

This identifies the manifest section that carries a dummy zero-length data object serving as the collection point for the attribute values appearing later in this manifest section (lines prefixed with " *X-Intel-BIS-* “). The string " *memory:UpdateRequestParameters* " must appear exactly as shown.

```
Digest-Algorithms: SHA-1
```

This enumerates the digest algorithms for which integrity data is included for the data object. These are required even though the data object is zero-length. For systems with DSA signing, SHA-1 hash, and 1024-bit key length, the digest algorithm must be " *SHA-1*." For systems with RSA signing, MD5 hash, and 512-bit key length, the digest algorithm must be " *MD5*." Multiple algorithms can be specified as a whitespace-separated list. For every digest algorithm *XXX* listed, there must also be a corresponding *XXX-Digest* line.

```
SHA-1-Digest: (base-64 representation of a SHA-1 digest of zero-length buffer)
```

Gives the corresponding digest value for the dummy zero-length data object. The value is base-64 encoded. Note that for both MD5 and SHA-1, the digest value for a zero-length data object is not zero.

```
X-Intel-BIS-ParameterSet: (base-64 representation of BootObjectAuthorizationSetGUID)
```

A named attribute value that distinguishes updates of BIS parameters from updates of other parameters. The left-hand attribute-name keyword must appear exactly as shown. The GUID value for the right-hand side is always the same, and can be found under the preprocessor symbol *BOOT_OBJECT_AUTHORIZATION_PARMSET_GUIDVALUE*. The representation inserted into the manifest is base-64 encoded.

Note the " *X-Intel-BIS-* " prefix on this and the following attributes. The " *X-* " part of the prefix was chosen to avoid collisions with future reserved keywords defined by future versions of the signed manifest specification. The " *Intel-BIS-* " part of the prefix was chosen to avoid collisions with other user-defined attribute names within the user-defined attribute name space.

```
X-Intel-BIS-ParameterSetToken: (base-64 representation of the current update token)
```

A named attribute value that makes this update of BIS parameters different from any other on the same target platform. The left-hand attribute-name keyword must appear exactly as shown. The value for the right-hand side is generally different for each update-request manifest generated. The value to be base-64 encoded is retrieved through the functions *EFI_BIS_PROTOCOL.GetBootObjectAuthorizationUpdateToken()* or *EFI_BIS_PROTOCOL.UpdateBootObjectAuthorization()* .

```
X-Intel-BIS-ParameterId: (base-64 representation of
"BootObjectAuthorizationCertificate" or
"BootAuthorizationCheckFlag")
```

A named attribute value that indicates which BIS parameter is to be updated. The left-hand attribute-name keyword must appear exactly as shown. The value for the right-hand side is the base-64 encoded representation of one of the two strings shown.

```
X-Intel-BIS-ParameterValue: (base-64 representation of
certificate or
single-byte boolean flag)
```

A named attribute value that indicates the new value to be set for the indicated parameter. The left-hand attribute-name keyword must appear exactly as shown. The value for the right-hand side is the appropriate base-64 encoded new value to be set. In the case of the Boot Object Authorization Certificate, the value is the new digital certificate raw data. A zero-length value removes the certificate altogether. In the case of the Boot Authorization Check Flag, the value is a single-byte Boolean value, where a nonzero value "turns on" the check and a zero value "turns off" the check.

```
//************************************************************
// Signer's Information File Example
//************************************************************
```

The signer's information file must include a section whose name matches the reserved data object section name of the section in the Manifest file. This section in the signer's information file carries the integrity data for the attributes in the corresponding section in the manifest file. An example signer's information file is shown below.

```
Signature-Version: 2.0
SignerInformationPersistentId: (base-64 representation of a unique GUID)
SignerInformationName: BIS_UpdateManifestSignerInfoName

Name: memory:UpdateRequestParameters
Digest-Algorithms: SHA-1
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the
corresponding manifest section)
```

A line-by-line description of this signer's information file is as follows.

```
Signature-Version: 2.0
```

This is a standard header line that all signed manifests have. It must appear exactly as shown.

```
SignerInformationPersistentId: (base-64 representation of a unique GUID)
```

The left-hand string must appear exactly as shown. The right-hand string must be a unique GUID for every signer's information file created. The Win32 function UuidCreate() can be used for this on Win32 systems. The GUID is a binary value that must be base-64 encoded. Base-64 is a simple encoding scheme for representing binary values that uses only printing characters. Base-64 encoding is described in [BASE-64].

```
SignerInformationName: BIS_UpdateManifestSignerInfoName
```

The left-hand string must appear exactly as shown. The right-hand string must appear exactly as shown.

```
Name: memory:UpdateRequestParameters
```

This identifies the section in the signer's information file corresponding to the section with the same name in the manifest file described earlier. The string " *memory:UpdateRequestParameters* " must appear exactly as shown.

```
Digest-Algorithms: SHA-1
```

This enumerates the digest algorithms for which integrity data is included for the corresponding manifest section. Strings identifying digest algorithms are the same as in the manifest file. The digest algorithms specified here must match those specified in the manifest file. For every digest algorithm *XXX* listed, there must also be a corresponding *XXX-Digest* line.

```
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the corresponding manifest␣
↪section)
```

Gives the corresponding digest value for the corresponding manifest section. The value is base-64 encoded. Note that for the purpose of computing the hash of the manifest section, the manifest section starts at the beginning of the opening " *Name:* " keyword and continues up to, but not including, the next section's " *Name:* " keyword or the end-of-file. Thus the hash includes the blank line(s) at the end of a section and any newline(s) preceding the next " *Name:* " keyword or end-of-file.

```
//************************************************************
// Signature Block File Example
//************************************************************
```

A signature block file is a raw binary file (not base-64 encoded) that is a PKCS#7 defined format signature block. The signature block covers exactly the contents of the signer's information file. There must be a correspondence between the name of the signer's information file and the signature block file. The base name matches, and the three-character extension is modified to reflect the signature algorithm used according to the following rules:

- DSA signature algorithm (which uses SHA-1 hash): extension is DSA.
- RSA signature algorithm with MD5 hash: extension is RSA.

So for example with a signer's information file name of "myinfo.SF," the corresponding DSA signature block file name would be "myinfo.DSA."

The format of a signature block file is defined in [PKCS].

```
//************************************************************
// "X-Intel-BIS-ParameterSet" Attribute value
// Binary Value of "X-Intel-BIS-ParameterSet" Attribute.
// (Value is Base-64 encoded in actual signed manifest).
//************************************************************

#define BOOT_OBJECT_AUTHORIZATION_PARMSET_GUID \
  {0xedd35e31,0x7b9,0x11d2,{0x83,0xa3,0x0,0xa0,0xc9,0x1f,0xad,0xcf}}
```

This preprocessor symbol gives the value for an attribute inserted in signed manifests to distinguish updates of BIS parameters from updates of other parameters. The representation inserted into the manifest is base-64 encoded.

Description

This function updates one of the configurable parameters of the Boot Object Authorization set (Boot Object Authorization Certificate or Boot Authorization Check Flag). It passes back a new unique update token that must be included in the request credential for the next update of any parameter in the Boot Object Authorization set. The token value is unique to this platform, parameter set, and instance of parameter values. In particular, the token changes to a new unique value whenever any parameter in this set is changed.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_NO_MAPPING	The *AppHandle* parameter is not or is no longer a valid application instance handle associated with the EFI_BIS protocol.
EFI_OUT_OF_RESOURCES	The function failed due to lack of memory or other resources.
EFI_DEVICE_ERROR	The function encountered an unexpected internal error in a cryptographic software module.

continues on next page

Table 24.37 – continued from previous page

EFI_SECURITY_VIOLATION	The signed manifest supplied as the *RequestCredential* parameter was invalid (could not be parsed), or The signed manifest supplied as the *RequestCredential* parameter failed to verify using the installed Boot Object Authorization Certificate or the signer's Certificate in *RequestCredential,* or Platform-specific authorization failed, or The signed manifest supplied as the *RequestCredential* parameter did not include the *X-Intel-BIS-ParameterSet* attribute value, or The *X-Intel-BIS-ParameterSet* attribute value supplied did not match the required GUID value, or The signed manifest supplied as the *RequestCredential* parameter did not include the *X-Intel-BIS-ParameterSetToken* attribute value, or The *X-Intel-BIS-ParameterSetToken* attribute value supplied did not match the platform's current update-token value, or The signed manifest supplied as the *RequestCredential* parameter did not include the *X-Intel-BIS-ParameterId* attribute value, or The *X-Intel-BIS-ParameterId* attribute value supplied did not match one of the permitted values, or The signed manifest supplied as the *RequestCredential* parameter did not include the *X-Intel-BIS-ParameterValue* attribute value, or Any other required attribute value was missing, or The new certificate supplied was too big to store, or The new certificate supplied was invalid (could not be parsed), or The new certificate supplied had an unsupported combination of key algorithm and key length, or The new check flag value supplied is the wrong length (1 byte), or The signed manifest supplied as the *RequestCredential* parameter did not include a signer certificate, or The signed manifest supplied as the *RequestCredential* parameter did not include the manifest section named " *memory:UpdateRequestParameters,*" or The signed manifest supplied as the *RequestCredential* parameter had a signing certificate with an unsupported public-key algorithm, or The manifest section named "*memory:UpdateRequestParameters* " did not include a digest with a digest algorithm corresponding to the signing certificate's public key algorithm, or The zero-length data object referenced by the manifest section named "*memory:UpdateRequestParameters*" did not verify with the digest supplied in that manifest section, or The signed manifest supplied as the *RequestCredential* parameter did not include a signer's information file with the *SignerInformationName* identifying attribute value " * BIS_UpdateManifestSignerInfoName,*" or There were no signers associated with the identified signer's information file, or There was more than one signer associated with the identified signer's information file, or Any other unspecified security violation occurred.

continues on next page

Table 24.37 – continued from previous page

EFI_DEVICE_ERROR	An unexpected internal error occurred while analyzing the new certificate's key algorithm, or An unexpected internal error occurred while attempting to retrieve the public key algorithm of the manifest's signer's certificate, or An unexpected internal error occurred in a cryptographic software module.
EFI_INVALID_PARAMETER	The *RequestCredential* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *RequestCredential.Data* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *NewUpdateToken* parameter supplied by the caller is *NULL* or an invalid memory reference.

24.5.10 EFI_BIS_PROTOCOL.VerifyBootObject()

Summary

Verifies the integrity and authorization of the indicated data object according to the indicated credentials.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BIS_VERIFY_BOOT_OBJECT)(
  IN BIS_APPLICATION_HANDLE      AppHandle,
  IN EFI_BIS_DATA                *Credentials,
  IN EFI_BIS_DATA                *DataObject,
  OUT BOOLEAN                    *IsVerified
  );
```

Parameters

AppHandle

An opaque handle that identifies the caller's instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the *EFI_BIS_PROTOCOL.Initialize()* function description.

Credentials

A Signed Manifest containing verification information for the indicated data object. The Manifest signature itself must meet the requirements described below. This parameter is optional if a Boot Authorization Check is currently not required on this platform (*Credentials.Data* may be *NULL*), otherwise this parameter is required. The required syntax of the Signed Manifest is described in the Related Definition for Manifest Syntax below. Type EFI_BIS_DATA is defined in the *Initialize()* function description.

DataObject

An in-memory copy of the raw data object to be verified. Type EFI_BIS_DATA is defined in the *Initialize()* function description.

IsVerified

The function writes *TRUE* if the verification succeeded, otherwise *FALSE*.

Related Definitions

```
//************************************************************
// Manifest Syntax
//************************************************************
```

The Signed Manifest consists of three parts grouped together into an Electronic Shrink Wrap archive as described in [SM spec]: a manifest file, a signer's information file, and a signature block file. These three parts along with examples are described in the following sections. In these examples, text in parentheses is a description of the text that would appear in the signed manifest. Text outside of parentheses must appear exactly as shown. Also note that manifest files and signer's information files must conform to a 72-byte line-length limit. Continuation lines (lines beginning with a single "space" character) are used for lines longer than 72 bytes. The examples given here follow this rule for continuation lines.

Note that the manifest file and signer's information file parts of a Signed Manifest are ASCII text files. In cases where these files contain a base-64 encoded string, the string is an ASCII string before base-64 encoding.

```
//************************************************************
// Manifest File Example
//************************************************************
```

The manifest file must include a section referring to a memory-type data object with the reserved name as shown in the example below. This data object is the Boot Object to be verified. An example manifest file is shown below.

```
Manifest-Version: 2.0
ManifestPersistentId: (base-64 representation of a unique GUID)

Name: memory:BootObject
Digest-Algorithms: SHA-1
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the boot object)
```

A line-by-line description of this manifest file is as follows.

```
Manifest-Version: 2.0
```

This is a standard header line that all signed manifests have. It must appear exactly as shown.

```
ManifestPersistentId: (base-64 representation of a unique GUID)
```

The left-hand string must appear exactly as shown. The right-hand string must be a unique GUID for every manifest file created. The Win32 function UuidCreate() can be used for this on Win32 systems. The GUID is a binary value that must be base-64 encoded. Base-64 is a simple encoding scheme for representing binary values that uses only printing characters. Base-64 encoding is described in [BASE-64].

```
Name: memory:BootObject
```

This identifies the section that carries the integrity data for the Boot Object. The string " *memory:BootObject* " must appear exactly as shown. Note that the Boot Object cannot be found directly from this manifest. A caller verifying the Boot Object integrity must load the Boot Object into memory and specify its memory location explicitly to this verification function through the *DataObject* parameter.

```
Digest-Algorithms: SHA-1
```

This enumerates the digest algorithms for which integrity data is included for the data object. For systems with DSA signing, SHA-1 hash, and 1024-bit key length, the digest algorithm must be " *SHA-1*." For systems with RSA signing, MD5 hash, and 512-bit key length, the digest algorithm must be " *MD5*." Multiple algorithms can be specified as a whitespace-separated list. For every digest algorithm *XXX* listed, there must also be a corresponding *XXX-Digest* line.

```
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the boot object)
```

Gives the corresponding digest value for the data object. The value is base-64 encoded.

```
//************************************************************
// Signer's Information File Example
//************************************************************
```

The signer's information file must include a section whose name matches the reserved data object section name of the section in the Manifest file. This section in the signer's information file carries the integrity data for the corresponding section in the manifest file. An example signer's information file is shown below.

```
Signature-Version: 2.0
SignerInformationPersistentId: (base-64 representation of a unique GUID)
SignerInformationName: BIS_VerifiableObjectSignerInfoName

Name: memory:BootObject
Digest-Algorithms: SHA-1
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the corresponding manifest␣
↪section)
```

A line-by-line description of this signer's information file is as follows.

```
Signature-Version: 2.0
```

This is a standard header line that all signed manifests have. It must appear exactly as shown.

```
SignerInformationPersistentId: (base-64 representation of a unique GUID)
```

The left-hand string must appear exactly as shown. The right-hand string must be a unique GUID for every signer's information file created. The Win32 function UuidCreate() can be used for this on Win32 systems. The GUID is a binary value that must be base-64 encoded. Base-64 is a simple encoding scheme for representing binary values that uses only printing characters. Base-64 encoding is described in [BASE-64].

```
SignerInformationName: BIS_VerifiableObjectSignerInfoName
```

The left-hand string must appear exactly as shown. The right-hand string must appear exactly as shown.

```
Name: memory:BootObject
```

This identifies the section in the signer's information file corresponding to the section with the same name in the manifest file described earlier. The string " *memory:BootObject* " must appear exactly as shown.

```
Digest-Algorithms: SHA-1
```

This enumerates the digest algorithms for which integrity data is included for the corresponding manifest section. Strings identifying digest algorithms are the same as in the manifest file. The digest algorithms specified here must match those specified in the manifest file. For every digest algorithm *XXX* listed, there must also be a corresponding *XXX-Digest* line.

```
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the corresponding manifest␣
↪section)
```

Gives the corresponding digest value for the corresponding manifest section. The value is base-64 encoded. Note that for the purpose of computing the hash of the manifest section, the manifest section starts at the beginning of the opening

" *Name:* " keyword and continues up to, but not including, the next section's " *Name:* " keyword or the end-of-file. Thus the hash includes the blank line(s) at the end of a section and any newline(s) preceding the next " *Name:* " keyword or end-of-file.

```
//**********************************************************
// Signature Block File Example
//**********************************************************
```

A signature block file is a raw binary file (not base-64 encoded) that is a PKCS#7 defined format signature block. The signature block covers exactly the contents of the signer's information file. There must be a correspondence between the name of the signer's information file and the signature block file. The base name matches, and the three-character extension is modified to reflect the signature algorithm used according to the following rules:

- DSA signature algorithm (which uses SHA-1 hash): extension is DSA.
- RSA signature algorithm with MD5 hash: extension is RSA.

So for example with a signer's information file name of "myinfo.SF," the corresponding DSA signature block file name would be "myinfo.DSA."

The format of a signature block file is defined in [PKCS].

Description

This function verifies the integrity and authorization of the indicated data object according to the indicated credentials. The rules for successful verification depend on whether or not a Boot Authorization Check is currently required on this platform.

If a Boot Authorization Check is not currently required on this platform, no authorization check is performed. However, the following rules are applied for an integrity check:

- In this case, the credentials are optional. If they are not supplied (*Credentials.Data* is *NULL*), no integrity check is performed, and the function returns immediately with a "success" indication and *IsVerified* is *TRUE*.
- If the credentials are supplied (*Credentials.Data* is other than *NULL*), integrity checks are performed as follows:
  - Verify the credentials - The credentials parameter is a valid signed Manifest, with a single signer. The signer's identity is included in the credential as a certificate.
  - Verify the data object - The Manifest must contain a section named " *memory:BootObject,*" with associated verification information (in other words, hash value). The hash value from this Manifest section must match the hash value computed over the specified *DataObject* data.
  - If these checks succeed, the function returns with a "success" indication and * IsVerified* is *TRUE*. Otherwise, *IsVerified* is *FALSE* and the function returns with a "security violation" indication.

If a Boot Authorization Check is currently required on this platform, authorization and integrity checks are performed. The integrity check is the same as in the case above, except that it is required. The following rules are applied:

- Verify the credentials - The credentials parameter is required in this case (*Credentials.Data* must be other than *NULL*). The credentials parameter is a valid Signed Manifest, with a single signer. The signer's identity is included in the credential as a certificate.
- Verify the data object - The Manifest must contain a section named " *memory:BootObject,*" with associated verification information (in other words, hash value). The hash value from this Manifest section must match the hash value computed over the specified *DataObject* data.
- Do Authorization check — This happens one of two ways depending on whether or not the platform currently has a Boot Object Authorization Certificate configured.
  - If a Boot Object Authorization Certificate is not currently configured, this function interacts with the user in a platform-specific way to determine whether the operation should succeed.

  - If a Boot Object Authorization Certificate is currently configured, this function uses the Boot Object Authorization Certificate to determine whether the operation should succeed. The public key certified by the signer's certificate must match the public key in the Boot Object Authorization Certificate configured for this platform. The match must be direct, that is, the signature authority cannot be delegated along a certificate chain.
  - If these checks succeed, the function returns with a "success" indication and *IsVerified* is *TRUE*. Otherwise, *IsVerified* is *FALSE* and the function returns with a "security violation" indication.

Note that if a Boot Authorization Check is currently required on this platform this function always performs an authorization check, either through platform-specific user interaction or through a signature generated with the private key corresponding to the public key in the platform's Boot Object Authorization Certificate.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_NO_MAPPING	The *AppHandle* parameter is not or is no longer a valid application instance handle associated with the EFI_BIS protocol.
EFI_INVALID_PARAMETER	The *Credentials* parameter supplied by the caller is *NULL* or an invalid memory reference, or The Boot Authorization Check is currently required on this platform and the *Credentials.Data* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *DataObject* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *DataObject.Data* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *IsVerified* parameter supplied by the caller is *NULL* or an invalid memory reference.
EFI_OUT_OF_RESOURCES	The function failed due to lack of memory or other resources.
EFI_SECURITY_VIOLATION	The signed manifest supplied as the *Credentials* parameter was invalid (could not be parsed), or The signed manifest supplied as the *Credentials* parameter failed to verify using the installed Boot Object Authorization Certificate or the signer's Certificate in *Credentials,* or Platform-specific authorization failed, or Any other required attribute value was missing, or The signed manifest supplied as the *Credentials* parameter did not include a signer certificate, or

continues on next page

Table 24.38 – continued from previous page

EFI_SECURITY_VIOLATION	The signed manifest supplied as the *Credentials* parameter did not include the manifest section named " *memory:BootObject,*" or The signed manifest supplied as the *Credentials* parameter had a signing certificate with an unsupported public-key algorithm, or The manifest section named " *memory:BootObject* " did not include a digest with a digest algorithm corresponding to the signing certificate's public key algorithm, or The data object supplied as the *DataObject* parameter and referenced by the manifest section named " *memory:BootObject* " did not verify with the digest supplied in that manifest section, or The signed manifest supplied as the *Credentials* parameter did not include a signer's information file with the *SignerInformationName* identifying attribute value " *BI S_VerifiableObjectSignerInfoName,*" or There were no signers associated with the identified signer's information file, or There was more than one signer associated with the identified signer's information file, or The platform's check flag is "on" (requiring authorization checks) but the *Credentials.Data* supplied by the caller is *NULL,* or Any other unspecified security violation occurred.
EFI_DEVICE_ERROR	An unexpected internal error occurred while attempting to retrieve the public key algorithm of the manifest's signer's certificate, or An unexpected internal error occurred in a cryptographic software module.

24.5.11 EFI_BIS_PROTOCOL.VerifyObjectWithCredential()

Summary

Verifies the integrity and authorization of the indicated data object according to the indicated credentials and authority certificate.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BIS_VERIFY_OBJECT_WITH_CREDENTIAL)(
  IN BIS_APPLICATION_HANDLE         AppHandle,
  IN EFI_BIS_DATA                   *Credentials,
```

(continues on next page)

(continued from previous page)

```
IN EFI_BIS_DATA                  *DataObject,
IN EFI_BIS_DATA                  *SectionName,
IN EFI_BIS_DATA                  *AuthorityCertificate,
OUT BOOLEAN                      *IsVerified
);
```

Parameters

AppHandle
An opaque handle that identifies the caller's instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the *EFI_BIS_PROTOCOL.Initialize()* function description.

Credentials
A Signed Manifest containing verification information for the indicated data object. The Manifest signature itself must meet the requirements described below. The required syntax of the Signed Manifest is described in the Related Definition of Manifest Syntax below. Type EFI_BIS_DATA is defined in the *Initialize()* function description.

DataObject
An in-memory copy of the raw data object to be verified. Type EFI_BIS_DATA is defined in the *Initialize()* function description.

SectionName
An ASCII string giving the section name in the manifest holding the verification information (in other words, hash value) that corresponds to *DataObject*. Type EFI_BIS_DATA is defined in the *Initialize()* function description.

AuthorityCertificate
A digital certificate whose public key must match the signer's public key which is found in the credentials. This parameter is optional (*AuthorityCertificate.Data* may be *NULL*). Type EFI_BIS_DATA is defined in the *EFI_BIS_PROTOCOL.Initialize()* function description.

IsVerified
The function writes *TRUE* if the verification was successful. Otherwise, the function writes *FALSE*.

Related Definitions

```
//************************************************************
// Manifest Syntax
//************************************************************
```

The Signed Manifest consists of three parts grouped together into an Electronic Shrink Wrap archive as described in [SM spec]: a manifest file, a signer's information file, and a signature block file. These three parts along with examples are described in the following sections. In these examples, text in parentheses is a description of the text that would appear in the signed manifest. Text outside of parentheses must appear exactly as shown. Also note that manifest files and signer's information files must conform to a 72-byte line-length limit. Continuation lines (lines beginning with a single "space" character) are used for lines longer than 72 bytes. The examples given here follow this rule for continuation lines.

Note that the manifest file and signer's information file parts of a Signed Manifest are ASCII text files. In cases where these files contain a base-64 encoded string, the string is an ASCII string before base-64 encoding.

```
//************************************************************
// Manifest File Example
//************************************************************
```

The manifest file must include a section referring to a memory-type data object with the caller-chosen name as shown in the example below. This data object is the Data Object to be verified. An example manifest file is shown below.

```
Manifest-Version: 2.0
ManifestPersistentId: (base-64 representation of a unique GUID)

Name: (a memory-type data object name)
Digest-Algorithms: SHA-1
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the data object)
```

A line-by-line description of this manifest file is as follows.

```
Manifest-Version: 2.0
```

This is a standard header line that all signed manifests have. It must appear exactly as shown.

```
ManifestPersistentId: (base-64 representation of a unique GUID)
```

The left-hand string must appear exactly as shown. The right-hand string must be a unique GUID for every manifest file created. The Win32 function UuidCreate() can be used for this on Win32 systems. The GUID is a binary value that must be base-64 encoded. Base-64 is a simple encoding scheme for representing binary values that uses only printing characters. Base-64 encoding is described in [BASE-64].

```
Name: (a memory-type data object name)
```

This identifies the section that carries the integrity data for the target Data Object. The right-hand string must obey the syntax for memory-type references, that is, it is of the form " *memory:SomeUniqueName*." The " *memory:* " part of this string must appear exactly. The " *SomeUniqueName* " part is chosen by the caller. It must be unique within the section names in this manifest file. The entire " *memory:SomeUniqueName* " string must match exactly the corresponding string in the signer's information file described below. Furthermore, this entire string must match the value given for the *SectionName* parameter to this function. Note that the target Data Object cannot be found directly from this manifest. A caller verifying the Data Object integrity must load the Data Object into memory and specify its memory location explicitly to this verification function through the *DataObject* parameter.

```
Digest-Algorithms: SHA-1
```

This enumerates the digest algorithms for which integrity data is included for the data object. For systems with DSA signing, SHA-1 hash, and 1024-bit key length, the digest algorithm must be " *SHA-1*." For systems with RSA signing, MD5 hash, and 512-bit key length, the digest algorithm must be " *MD5*." Multiple algorithms can be specified as a whitespace-separated list. For every digest algorithm *XXX* listed, there must also be a corresponding *XXX-Digest* line.

```
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the data object)
```

Gives the corresponding digest value for the data object. The value is base-64 encoded.

```
//************************************************************
// Signer's Information File Example
//************************************************************
```

The signer's information file must include a section whose name matches the reserved data object section name of the section in the Manifest file. This section in the signer's information file carries the integrity data for the corresponding section in the manifest file. An example signer's information file is shown below.

```
Signature-Version: 2.0
SignerInformationPersistentId: (base-64 representation of a unique GUID)
SignerInformationName: BIS_VerifiableObjectSignerInfoName

```

(continues on next page)

(continued from previous page)

```
Name: (a memory-type data object name)
Digest-Algorithms: SHA-1
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the corresponding manifest␣
↪section)
```

A line-by-line description of this signer's information file is as follows.

```
Signature-Version: 2.0
```

This is a standard header line that all signed manifests have. It must appear exactly as shown.

```
SignerInformationPersistentId: (base-64 representation of a unique GUID)
```

The left-hand string must appear exactly as shown. The right-hand string must be a unique GUID for every signer's information file created. The Win32 function UuidCreate() can be used for this on Win32 systems. The GUID is a binary value that must be base-64 encoded. Base-64 is a simple encoding scheme for representing binary values that uses only printing characters. Base-64 encoding is described in [BASE-64].

```
SignerInformationName: BIS_VerifiableObjectSignerInfoName
```

The left-hand string must appear exactly as shown. The right-hand string must appear exactly as shown.

```
Name: (a memory-type data object name)
```

This identifies the section in the signer's information file corresponding to the section with the same name in the manifest file described earlier. The right-hand string must match exactly the corresponding string in the manifest file described above.

```
Digest-Algorithms: SHA-1
```

This enumerates the digest algorithms for which integrity data is included for the corresponding manifest section. Strings identifying digest algorithms are the same as in the manifest file. The digest algorithms specified here must match those specified in the manifest file. For every digest algorithm *XXX* listed, there must also be a corresponding *XXX-Digest* line.

```
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the corresponding manifest␣
↪section)
```

Gives the corresponding digest value for the corresponding manifest section. The value is base-64 encoded. Note that for the purpose of computing the hash of the manifest section, the manifest section starts at the beginning of the opening " *Name:* " keyword and continues up to, but not including, the next section's " *Name:* " keyword or the end-of-file. Thus the hash includes the blank line(s) at the end of a section and any newline(s) preceding the next " *Name:* " keyword or end-of-file.

```
//*********************************************************
// Signature Block File Example
//*********************************************************
```

A signature block file is a raw binary file (not base-64 encoded) that is a PKCS#7 defined format signature block. The signature block covers exactly the contents of the signer's information file. There must be a correspondence between the name of the signer's information file and the signature block file. The base name matches, and the three-character extension is modified to reflect the signature algorithm used according to the following rules:

- DSA signature algorithm (which uses SHA-1 hash): extension is DSA.

- RSA signature algorithm with MD5 hash: extension is RSA.

So for example with a signer's information file name of "myinfo.SF," the corresponding DSA signature block file name would be "myinfo.DSA."

The format of a signature block file is defined in [PKCS].

Description

This function verifies the integrity and authorization of the indicated data object according to the indicated credentials and authority certificate. Both an integrity check and an authorization check are performed. The rules for a successful integrity check are:

- Verify the credentials - The credentials parameter is a valid Signed Manifest, with a single signer. The signer's identity is included in the credential as a certificate.
- Verify the data object - The Manifest must contain a section with the name as specified by the *SectionName* parameter, with associated verification information (in other words, hash value). The hash value from this Manifest section must match the hash value computed over the data specified by the *DataObject* parameter of this function.

The authorization check is optional. It is performed only if the *AuthorityCertificate.Data* parameter is other than *NULL* . If it is other than *NULL,* the rules for a successful authorization check are:

- The *AuthorityCertificate* parameter is a valid digital certificate. There is no requirement regarding the signer (issuer) of this certificate.
- The public key certified by the signer's certificate must match the public key in the *AuthorityCertificate*. The match must be direct, that is, the signature authority cannot be delegated along a certificate chain.

If all of the integrity and authorization check rules are met, the function returns with a "success" indication and *IsVerified* is *TRUE*. Otherwise, it returns with a nonzero specific error code and *IsVerified* is *FALSE*.

Status Codes Returned

EFI_SUCCESS	The function completed successfully.
EFI_NO_MAPPING	The *AppHandle* parameter is not or is no longer a valid application instance handle associated with the EFI_BIS protocol.
EFI_INVALID_PARAMETER	The *Credentials* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *Credentials.Data* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *Credentials.Length* supplied by the caller is zero, or The *DataObject* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *DataObject.Data* parameter supplied by the caller is *NULL* or an invalid memory reference, or

Table 24.39 – continued from previous page

EFI_INVALID_PARAMETER	The *SectionName* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *SectionName.Data* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *SectionName.Length* supplied by the caller is zero, or The *AuthorityCertificate* parameter supplied by the caller is *NULL* or an invalid memory reference, or The *IsVerified* parameter supplied by the caller is *NULL* or an invalid memory reference.
EFI_OUT_OF_RESOURCES	The function failed due to lack of memory or other resources.
EFI_SECURITY_VIOLATION	The *Credentials.Data* supplied by the caller is *NULL,* or The *AuthorityCertificate* supplied by the caller was invalid (could not be parsed), or The signed manifest supplied as *Credentials* failed to verify using the *AuthorityCertificate* supplied by the caller or the manifest's signer's certificate, or Any other required attribute value was missing, or The signed manifest supplied as the *Credentials* parameter did not include a signer certificate, or The signed manifest supplied as the *Credentials* parameter did not include the manifest section named according to *SectionName,* or The signed manifest supplied as the *Credentials* parameter had a signing certificate with an unsupported public-key algorithm, or The manifest section named according to *SectionName* did not include a digest with a digest algorithm corresponding to the signing certificate's public key algorithm, or The data object supplied as the *DataObject* parameter and referenced by the manifest section named according to *SectionName* did not verify with the digest supplied in that manifest section, or
EFI_SECURITY_VIOLATION	The signed manifest supplied as the *Credentials* parameter did not include a signer's information file with the *SignerInformationName* identifying attribute value " *BI S_VerifiableObjectSignerInfoName,*" or There were no signers associated with the identified signer's information file, or There was more than one signer associated with the identified signer's information file, or Any other unspecified security violation occurred.
EFI_DEVICE_ERROR	An unexpected internal error occurred while attempting to retrieve the public key algorithm of the manifest's signer's certificate, or An unexpected internal error occurred in a cryptographic software module.

24.6 DHCP options for ISCSI on IPV6

Option 59 is the iSCSI Root path

The format of the root path is “iscsi:”<servername>”:”<protocol>”:”<port>”:”<LUN>”:”<targetname>

This is per the description in IETF RFC 4173. See https://uefi.org/uefi#RFC4173 for a link to this document.

Option 60 is the DHCP Server address.

This is formatted the same as parameter 1 in OPT_BOOTFILE_PARAM (60) of the IPv6 address of the DHCP server (IETF RFC 5970). See ` <https://uefi.org/uefi>__` a link to this document.*

24.7 HTTP Boot

24.7.1 Boot from URL

Elsewhere in this specification there is defined a discoverable network boot using DHCP as a control channel allowing a firmware client machine export its architecture type, and then have the boot server response with a binary image. For the UEFI architecture types defined in “Links to UEFI-Related Documents” (*http://uefi.org/uefi)* under the heading “IANA DHCPv6 parameters”, the binary image on the boot service is a UEFI-formatted executable with a machine subsystem type that corresponds to the UEFI firmware on the client machine, or it could be mounted as a RAM disk which contains a UEFI-compliant file system (See *File System Format*). This binary image is often referred to as a “Network Boot Program” (NBP). The UEFI client machine that downloads the NBP uses the IPV4 or IPV6 TFTP protocol to address the indicated server, depending upon if DHCP4 or DHCP6 was used initially, in order to download images such as 64-bit UEFI (type 0x07).

This section defines a related method indicated by other codes in the DHCP options, in which the name and path of the NBP are specified as a URI string in one of several formats specifying protocol and unique name identifying the NBP for the specified protocol. In this method the NBP will be downloaded via IPV4 or IPV6 HTTP protocol if the tag indicates x64 UEFI HTTP Boot (type code 0x0f for x86 and 0x10 for x64).

In the future other protocols such as FTP or NFS could be encoded with both new tag types and corresponding URIs (e.g., ‘ftp://nbp.efi or nfs://nbp.efi, respectively). However, assignment of these type codes has not yet occurred.

The rest of this section will describe ‘HTTP Boot’ as one example of ‘boot from URI’. It is expected that the procedure can be extended as additional protocol type codes are defined.

Please reference the definitions of *EFI_DNS4_PROTOCOL* and *EFI_DNS6_PROTOCOL* elsewhere in this document. In systems that also support one of both of these protocols, the target URI can be specified using Internet domain name format understood by DNS servers supporting the appropriate RFC specifications.

Also, elsewhere in this document, the PXE2.1 and UEFI2.4 netboot6 sections talk about the ‘boot from TFTP’ method of ‘boot from URI.’

The following RFC documents documents should be consulted for network message details related to the processes described in this chapter:

1. RFC1034 - “Domain Names - Concepts and Facilities”,
2. RFC 1035 - “Domain Names - Implementation and Specification”,
3. RFC 3513 - “Internet Protocol Version 6 (IPv6) Addressing Architecture”, , April 2003.
4. RFC 3596 - DNS Extensions to Support IP Version 6
5. RFC 2131 - Dynamic Host Configuration Protocol
6. RFC 2132 - DHCP options and BOOTP Vendor Extensions

7. RFC 5970 - DHCPv6 Options for Network Boot
8. RFC 4578 - Dynamic Host Configuration Protocol (DHCP) Options for the Intel Preboot eXecution Environment (PXE)
9. RFC 3986 - Uniform Resource Identifiers (URI): Generic Syntax, IETF, 2005
10. RFC 3004 - The User Class option
11. RFC3315 - Dynamic Host Configuration Protocol for IPv6 (DHCPv6)
12. RFC3646 - DNS Configuration options for Dynamic Host Configuration Protocol for IPv6 (DHCPv6)
13. RFC2246 - TLS protocol Version 1.0

24.7.2 Concept configuration for a typical HTTP Bootscenario

HTTP Boot is client-server communication based application. It combines the DHCP, DNS, and HTTP protocols to provide the capability for system deployment and configuration over the network. This new capability can be utilized as a higher-performance replacement for tftp-based PXE boot methods of network deployment.

24.7.2.1 Use in Corporate environment

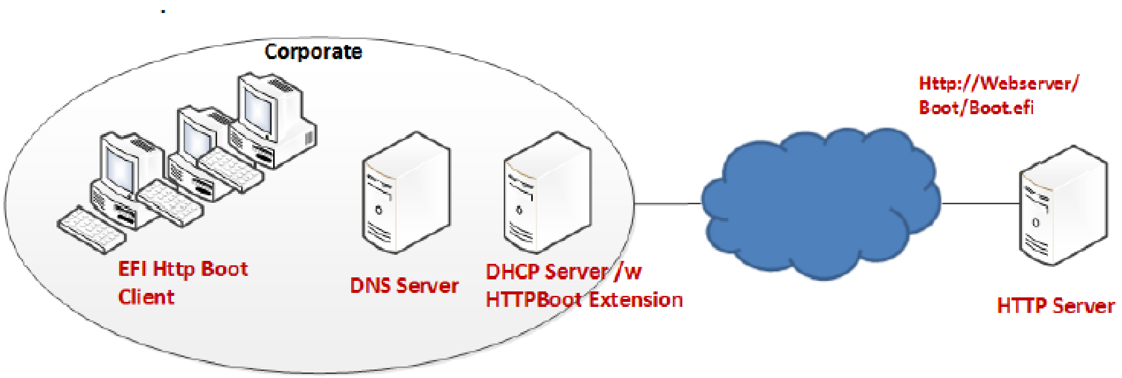

Fig. 24.4: HTTP Boot Network Topology Concept -Corporate Environment

A typical network configuration which supports UEFI HTTP Boot may involve one or more UEFI client systems, and several server systems. The Figure above show a typical HTTP Boot network topology for a corporate environment.

- **UEFI HTTP Boot Client** initiates the communication between the client and different server system.
- **DHCP server with HTTPBoot extension** for boot service discovery. Besides the standard host configuration information (such as address/subnet/gateway/name-server, etc. . .), the DHCP server with the extensions can also provide the discovery of URI locations for boot images on the HTTP server.
- **HTTP server** could be located either inside the corporate environment or across networks, such as on the Internet. The boot resource itself is deployed on the HTTP server. In this example, "http://webserver/boot/boot.efi" is used as the boot resource. Such an application is also called a Network Boot Program (NBP). NBPs are used to setup the client system, which may include installation of an operating system, or running a service OS for maintenance and recovery tasks.
- **DNS server** is optional; and provides standard domain name resolution service.

24.7.2.2 Use case in Home environment

In a corporate environment, a standard DHCP server can be enhanced to support the HTTPBoot extension. In a home network, generally only an optional standard DHCP server may be available for host configuration information assignment. The Figure, below, shows the concept network topology for a typical home PC environment.

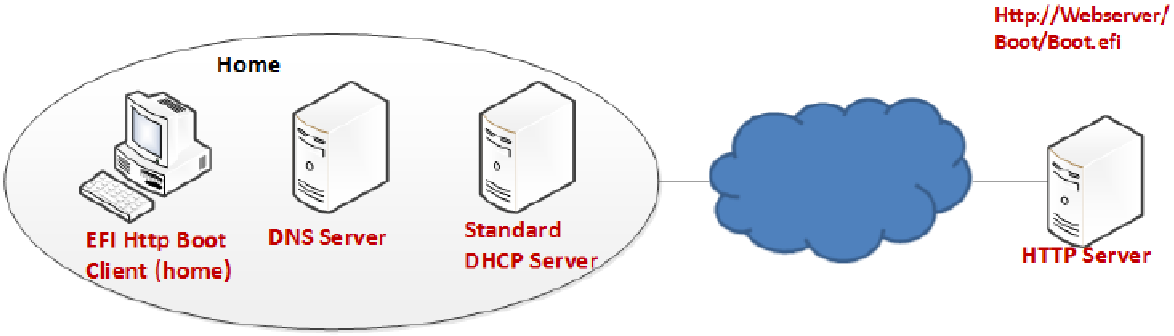

Fig. 24.5: HTTP Boot Network Topology Concept2 — Homeenvironments

UEFI HTTP Boot Client initiates the communication between the client and different servers. In the home configuration however, the client will expect the boot resource information to be available from a source other than the standard DHCP server, and that source does not typically have HTTPBoot extensions. Instead of DHCP, the boot URI could be created by a UEFI application or extracted from text entered by a user.

DHCP server is optional, and if available in the network,* provides the standard service to assign host configuration information to the UEFI Client (e.g. address/subnet/gateway/name-server/etc.). In case the standard DHCP server is not available, the same host configuration information should be provided by a UEFI application or extracted from text entered by a user prior to the client initiating the communication.

DNS Server is optional, and provides standard domain name resolution service.

24.7.3 Protocol Layout for UEFI HTTP Boot Clientconcept configuration for a typical HTTP Boot scenario

This figure illustrates the UEFI network layers related to how the HTTP Boot works.

The HTTP Boot driver is layered on top of a UEFI Network stack implementation. It consumes DHCP service to do the Boot service discovery, and DNS service to do domain name resolution if needed. It also consumes HTTP serviced to retrieve images from the HTTP server. The functionality needed in the HTTP Boot scenario is limited to client initiated requests to download the boot image.

TLS is consumed if HTTPS functionality is needed. The TLS design is covered in *EFI TLS Protocol*.

The HTTP Boot driver produces *LoadFile* protocol and device path protocol. BDS will provide the boot options for the HTTP Boot. Once a boot option for HTTP boot is executed, a particular network interface is selected. HTTP Boot driver will perform all steps on that interface and it is not required to use other interfaces.

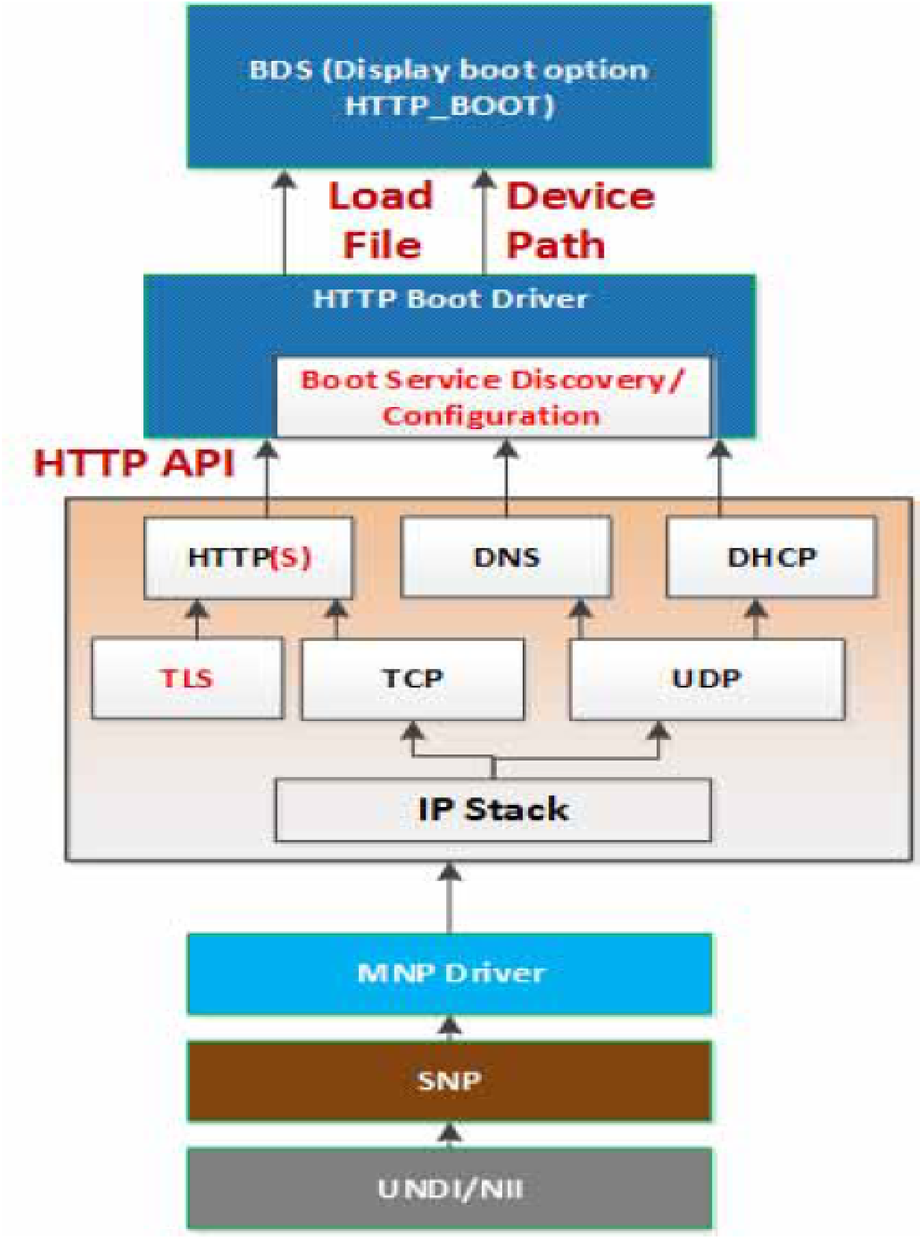

Fig. 24.6: UEFI HTTP Boot Protocol Layout

24.7.3.1 Device Path

If both IPv4 and IPv6 are supported, the HTTP Boot driver should create two child handles, with LoadFile and DevicePath installed on each child handle. For the device path, an IP device path node and a BootURI device path are appended to the parent device path, for example:

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv4(0.0.0.0, 0, DHCP, 0.0.0.0, 0.0.0.0, 0.0.0.0)/Uri()

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv6(::/128, 0, Static, ::/128, ::/128, 0)/Uri()

Also, after retrieving the boot resource information and IP address, the BootURI device path node will be updated to include the BootURI information. For example, if the NBP is a UEFI-formatted executable, the device patch will be updated to

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv4(192.168.1.100, TCP, DHCP, 192.168.1.5, 192.168.1.1, 255.255.255.0)/Uri(http://192.168.1.100/shell.efi)

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv6(2015::100, TCP, StatefulAutoConfigure, 2015::5, 2015::10, 64)/UriI(http://2015::100/shell.efi)

These two instances allow for the boot manager to decide a preference of IPv6 versus IPv4.

If the NBP is a binary image which could be mounted as a RAM disk, the device path will be updated to

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv4(192.168.1.100, TCP, DHCP, 192.168.1.5, 192.168.1.1, 255.255.255.0)/Uri(http://192.168.1.100/boot.iso [^])

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv6(2015::100, TCP, StatefulAutoConfigure, 2015::5, 2015::10, 64)/Uri (http://2015::100/boot.iso)

In this case, the HTTP Boot driver will register RAM disk with the downloaded NBP, by appending a RamDisk device node to the device path above, like

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv4(192.168.1.100, TCP, DHCP, 192.168.1.5, 192.168.1.1, 255.255.255.0)/Uri(http://192.168.1.100/boot.iso)/RamDisk(0x049EA000, 0x5DEA000, 0, 3D5ABD30-4175-87CE-6D64-D2ADE523C4BB)

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv6(2015::100, TCP, StatefulAutoConfigure, 2015::5, 2015::10, 64)/Uri (http://2015::100/boot.iso)/ RamDisk(0x049EA000, 0x5DEA000, 0, 3D5ABD30-4175-87CE-6D64-D2ADE523C4BB)

In some cases, Uri includes a host name and DNS become mandatory for translating the name to the IP address of the host. The HTTP Boot driver may append DNS device path node immediately before Uri device path node, for example:

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv4(192.168.1.100, TCP, DHCP, 192.168.1.5, 192.168.1.1, 255.255.255.0)/Dns(192.168.22.100, 192.168.22.101)/Uri(http://www.bootserver.com/boot.iso)/ RamDisk(0x049EA000, 0x5DEA000, 0, 3D5ABD30-4175-87CE-6D64-D2ADE523C4BB)

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv6(2015::100, TCP, StatefulAutoConfigure, 2015::5, 2015::10, 64)/Dns(2016::100, 2016::101)/Uri (http:// www.bootserver.com/ boot.iso)/ RamDisk(0x049EA000, 0x5DEA000, 0, 3D5ABD30-4175-87CE-6D64-D2ADE523C4BB)

If HTTP Boot driver cannot obtain the DNS server addresses, it should not append an empty DNS device path node.

The boot manager could use the example device paths to match the device which produces a device path protocol including a URI device path node in the system, without matching the Specific Device Path data in IP device path node and URI device path node, because the IP device path node and URI device path node might be updated by HTTP Boot driver in different scenarios.

The BootURI information could be retrieved from a DHCP server with HTTPBoot extension, or from a boot option which includes a short-form URI device path, or from a boot option which includes a URI device path node, or created by a UEFI application or extracted from text entered by a user.

Once the HTTP Boot driver retrieves the BootURI information from the short-form URI device path, it will perform all other steps for HTTP boot except retrieving the BootURI from DHCP server. Also, when the short-form URI device path is inputted to HTTP Boot driver via *LoadFile* protocol, the HTTP Boot driver should expand the short-form URI device path to above example device path after retrieving IP address configuration (address, subnet, gateway, and optionally the name-server) from the DHCP server. In case of the home environment with no DHCP server, the same information may be provisioned by OEM or input by the end user through Setup Options. The IP and optional DNS device path nodes, constructed with this information and prefixed to the short-form URI device path, can be inputted to the HTTP Boot driver via LoadFile protocol. The name server information in the form of DNS device path node is optional, and is used only when the BootURI contains the server name or FQDN. The HTTP Boot driver will then consume the information in the device path and initiate the necessary communication.

Once the HTTP Boot driver retrieves the BootURI information from a boot option which includes a URI device path node, it should retrieve the IP address configuration from the IP device path node of the same boot option. If the IP address configuration or BootURI information is empty, the HTTP Boot driver could retrieve the required information from DHCP server. If the IP address configuration or BootURI information is not empty but invalid, the HTTP boot process will fail.

The HTTP Boot block diagram (*UEFI HTTP Boot Protocol Layout*) describes a suggested implementation for HTTP Boot. Other implementation can create their own HTTP Netboot Driver which meets the requirements for their netboot methodology

24.7.4 Concept of Message Exchange in a typical HTTPBoot scenario (IPv4 in Corporate Environment)

In summary, the newly installed networked client machine (UEFI HTTP Boot Client) should be able to enter a heterogeneous network, acquire a network address from a DHCP server, and then download an NBP to set itself up.

The concept of HTTP Boot message exchange sequence is as follows. The client initiates the DHCPv4 D.O.R.A process by broadcasting a DHCPDISCOVER containing the extension that identifies the request as coming from a client that implements the HTTP Boot functionality. Assuming that a DHCP server or a Proxy DHCP server implementing this extension is available, after several intermediate steps, besides the standard configuration such as address/subnet/router/dns-server, boot resource location will be provided to the client system in the format of a URI. The URI points to the NBP which is appropriate for this client hardware configuration. A boot option is created, and if selected by the system logic the client then uses HTTP to download the NBP from the HTTP server into memory. Finally, the client executes the downloaded NBP image from memory. This image can then consume other UEFI interfaces for further system setup.

24.7.4.1 Message exchange between EFI Client and DHCPserver using DHCP Client Extensions

24.7.4.1.1 Client broadcast

The client broadcasts a DHCP Discover message to the standard DHCP port (67).

An option field in this packet contains the following:

- Fill DHCP option 55 - Parameter Requested List option
  - Address configuration, Server information, Name server, Vendor class identifier
- A DHCP option 97: UUID/GUID-based Client Identifier
- A DHCP option 94: Client Network Identifier Option
  - If support UNDI, fill this option (Refer RFC5970)
- A DHCP option 93: the client system architecture (Refer [Arch-Type])
  - 0x0F - x86 UEFI HTTP Boot

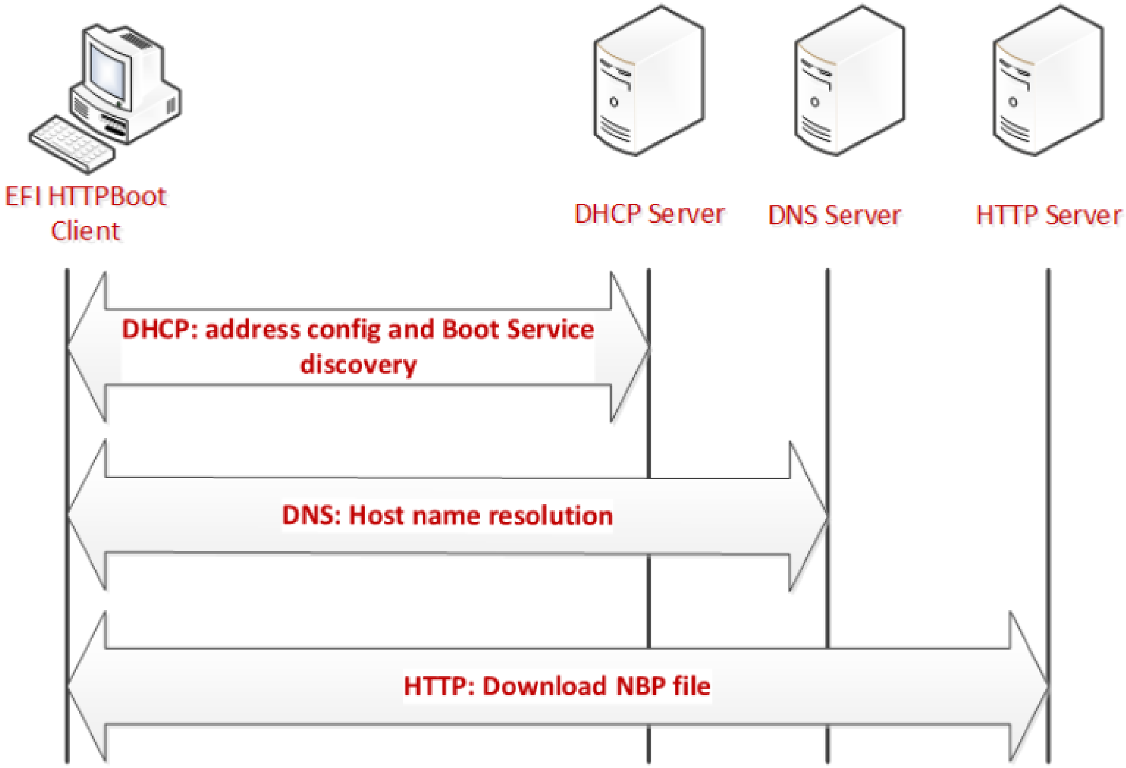

Fig. 24.7: HTTP Boot Overall Flow

  - 0x10 - x64 UEFI HTTP Boot
- A DHCP option 60, Vendor Class ID, set to “HTTPClient:Arch:XXXX:UNDI:YYYZZZ”

DHCP server response

The DHCP server responds by sending DHCPOFFER message on standard DHCP reply port (68).

The HTTP Boot Client may possibly receive multiple DHCPOFFER packets from different sources of DHCP Services, possibly from DHCP Services which recognize the HTTP extensions or from Standard DHCP Services.

A service recognizing HTTP extensions must respond with an offer that has Option 60 (Vendor class identifier) parameter set to “HTTPClient”, in response to the Vendor class identifier requested in option 55 in the DHCP Discover message.

Each message contains standard DHCP parameters: an IP address for the client and any other parameters that the administrator might have configured on the DHCP or Proxy DHCP Service. The DHCP service or Proxy DHCP which recognizes the HTTPBoot extension will provide DHCPOFFER with HTTPClient extensions. If this is a Proxy DHCP service, then the client IP address field is (0.0.0.0). If this is from a DHCP service, then the returned client IP address field is valid.

From the received DHCPOFFER(s), the client records the information as follows:

- Client IP address (and other parameters) offered by a standard DHCP/BOOTP services.
- If Boot URI information is provided thru ‘file’ field in DHCP Header or option 67, then the client will record the information as well.
- Optional Name-server information if URI is displayed using domain-name
  - **Timeout**: After Client sent out the DHCP Discover packet, the Client will wait for a timeout to collect enough DHCP Offers. If failed to retrieve all the required information, the DHCP Discover will be retried, at most four times. The four timeout mechanisms is 4, 8, 16 and 32 seconds respectively,
  - **Priority**: Among all the received DHCPOFFERs, the Priority is considered as follows:

24.7.5 Priority1

Choose the DHCPOFFER that provides all required information:

<IP address configuration, Boot URI configuration, Name-server configuration (if domain-name used in Boot URI)>

If Boot URI and IP address configuration provided in different DHCPOFFER, Using 5 DHCPOFFER as example for priority description

- Packet1 - DHCPOFFER, provide <IP address configuration, Name server>
- Packet2 - DHCPOFFER, provide <IP address configuration>
- Packet3 - DHCPOFFER, provide <domain-name expressed URI>
- Packet4 - DHCPOFFER, provide <IP address expressed URI>
- Packet5 - DHCPOFFER, provide <IP address, domain-name expressed URI>

Then,

24.7.6 Priority2

Choose the DHCPOFFER from different packet, firstly find out URI info represented in IP address mode, then choose DHCPOFFER which provide IP address configuration

In this example, the chosen DHCPOFFER packet is packet4 + packet1 / packet 2 (packet 1/2 take same priority, implementation can make its own implementation choice)

24.7.7 Priority3

Choose the DHCPOFFER from different packet, firstly find out URI info represented in domain-name mode, then choose DHCPOFFER which provide <IP address configuration, domain-name expressed URI>

In this example, the chosen DHCPOFFER packet is packet3 / packet5 + packet1

NOTE: *If packet5, then client IP address assigned by Packet5 will be override by IP address in packet1.*

24.7.8 Priority4

If failed to retrieve <Boot URI / IP address / (on-demand) Name-server> information through all received DHCPOFFERs, this is deemed as FAILED-CONFIGURATION

Assuming the boot image is in the boot subdirectory of the web server root, the supported URI could be one of below formats. [RFC3986] where '/boot/' is replaced by administrator-created directory, and 'image' is the file name of the NBP.

http://reg-name:port/boot/image

http://ipv4address:port/boot/image

http://ipv6address:port/boot/image

In the URL example, Port is optional if web service is provided through port 80 for the HTTP data transfer. Commonly, the reg-name use DNS as name registry mechanism.

After retrieving the boot URI through *Device Path* , if IP address (either IPv4 or IPv6 address) is provided, the HTTP Boot Client can directly use that address for next step HTTP transfer. If a reg-name is provided in the URI, the HTTP Boot Client driver need initiate DNS process (See *Message in DNS Query/Reply*) to resolve its IP address.

DHCP Request

The HTTP Boot Client selects an IP address offered by a DHCP Service, and then it completes the standard DHCP protocol by sending a DHCP Request packet for the address to the DHCP Server and waiting for acknowledgement from the DHCP server.

DHCP ACK

The server acknowledges the IP address by sending DHCP ACK packet to the client.

24.7.8.1 Message exchange between UEFI Client and DHCPserver not using DHCP Client Extensions

In a home environment, because the Boot URI Information will not be provided by the DHCP Offers, we need other channels to provide this information. The implementation suggestion is provisioning this information by OEM or input by end user through Setup Options, henceforth, the UEFI Boot Client already know the Boot URI before contacting the DHCP server.

The message exchange between the EFI Client and DHCP server will be standard DHCP D.O.R.A to obtain <IP address, Name-server>.

In the case of a home environment without a DHCP server, the above message exchange is not needed, and the UEFI HTTP Boot Client will have the <IP address, Name-server> provisioned by OEM or input by the end user through Setup Options.

24.7.8.2 Message in DNS Query/Reply

The DNS Query/Reply is a standard process defined in DNS Protocol [RFC 1034, RFC 1035]. Multiple IP address might be retrieved from the DNS process. It's the HTTP Boot Client driver's responsibility to select proper IP address automatically or expose user interface for customer to decide proper IP address.

24.7.8.3 Message in HTTP Download

In the HTTP Boot scenario, HTTP GET message is used to get image from the Web server.

24.7.9 Concept of Message Exchange in HTTP Bootscenario (IPv6)

24.7.9.1 Message exchange between EFI Client andDHCPv6 server with DHCP Client extensions

24.7.9.1.1 Client multicast a DHCPv6 Solicit messageto the standard DHCPv6 port (547)

Besides the options required for address auto-configuration, option field in this packet also contains the following:

- Fill DHCPv6 Option 6 - Option Request Option
  - Request server to supply option 59 (OPT_BOOTFILE_URL), option 60 (OPT_BOOTFILE_PARAM), option 23 (OPT_DNS_SERVERS), option 16 (OPTION_VENDOR_CLASS).
- A DHCPv6 option 1, Client identifier
- A DHCPv6 option 16, Vendor Class ID, set to "HTTPClient:Arch:XXXX:UNDI:YYYZZZ"
- A DHCPv6 option 61: the client system architecture (Refer [Arch-Type])
  - 0x0F - x86 UEFI HTTP Boot
  - 0x10 - x64 UEFI HTTP Boot
- A DHCPv6 option 62: Client Network Identifier Option
  - If support UNDI, fill this option (Refer RFC5970)

24.7.9.1.2 Server unicast DHCPv6 Advertisement to theClient to the DHCPv6 port (546)

The HTTP Boot Client will receive multiple advertisements from different sources of DHCPv6 Services, possibly from DHCPv6 Services which recognize the HTTP extensions or from Standard DHCPv6 Services.

A DHCPv6 service recognizing HTTP extensions must respond with an Advertisement that has Option 16 (OPTION_VENDOR_CLASS) parameter set to "HTTPClient", in response to the OPTION_VENDOR_CLASS requested in Option 6 in the DHCPv6 Solicit message.

Each message contains standard DHCP parameters: Identify Association (IA) option which conveys information including <IP address, lifetime, etc…>. Name server option conveys the DNS server address. The DHCP service or Proxy DHCP which recognizes the HTTPBoot extension will provide DHCPv6 Advertisement with HTTPClient extensions, including Boot URI and Optional Boot Parameters.

From the received DHCPOFFER(s), the client records the information as follows:

- Client IP address (and other parameters) provide through IA option
- Boot URI provided thru option 59
- Optional BootFile Parameter provided through option 60 (if no other parameter needed for this boot URI, this option can be eliminated)
- Optional Name-server information provided through option 23, if URI is displayed using domain-name.

24.7.9.1.3 Client multicast DHCPv6 Request to the selected DHCP Advertisement to confirm the IPaddress assigned by that server

This packet is the same with the DHCPv6 Solicit packet except for the message type is Request.

24.7.9.1.4 Server unicast the DHCPv6 Reply toacknowledge the Client IP address for the UEFI HTTP-Client

24.7.9.2 Message exchange between UEFI Client andDHCPv6 server not using DHCP Client Extensions

In a home environment, the Boot URI Information will not be provided by the DHCPv6 Offers, we need other channels to provide this information. Like what is described in *Message exchange between UEFI Client and DHCPserver not using DHCP Client Extensions* , the implementation suggestion is provisioning this information by OEM or input by end user through Setup Options, henceforth, the UEFI Boot Client already know the Boot URI before contacting the DHCP server.

The message exchange between the EFI Client and DHCP server will be standard DHCP S.A.R.R. to obtain <IP address, Name-server>.

In the case of a home environment without a DHCPv6 server, the above message exchange is not needed, and the UEFI HTTP Boot Client will have the <IP address, Name-server> provisioned by OEM or input by the end user through Setup Options.

24.7.9.3 Message exchange between UEFI Client and DNS6server

The DNS Query/Reply for domain name resolution is the same process as described in See *Message in DNS Query/Reply*.

24.7.9.4 Message in HTTP Download

HTTP Download process is the same process as described in *Message in HTTP Download* .

24.7.10 EFI HTTP Boot Callback Protocol

This section defines the EFI HTTP Boot Callback Protocol that is invoked when the HTTP Boot driver is about to transmit or has received a packet. The EFI HTTP Boot Callback Protocol must be installed on the same handle as the Load File Protocol for the HTTP Boot.

24.7.11 EFI_HTTP_BOOT_CALLBACK_PROTOCOL

Summary

Protocol that is invoked when the HTTP Boot driver is about to transmit or has received a packet.

GUID

```
#define EFI_HTTP_BOOT_CALLBACK_PROTOCOL_GUID \
 {0xba23b311, 0x343d, 0x11e6, {0x91, 0x85, 0x58,0x20, 0xb1, 0xd6, 0x52, 0x99}}
```

Protocol Interface Structure

```
typedef struct \_EFI_HTTP_BOOT_CALLBACK_PROTOCOL {
  EFI_HTTP_BOOT_CALLBACK         Callback;
}   EFI_HTTP_BOOT_CALLBACK_PROTOCOL;
```

Parameters

Callback
Callback routine used by the HTTP Boot driver.

24.7.12 EFI_HTTP_BOOT_CALLBACK_PROTOCOL.Callback()

Summary

Callback function that is invoked when the HTTP Boot driver is about to transmit or has received a packet.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HTTP_BOOT_CALLBACK) (
  IN EFI_HTTP_BOOT_CALLBACK_PROTOCOL   *This,
  IN EFI_HTTP_BOOT_CALLBACK_DATA_TYPE  DataType,
  IN BOOLEAN                           Received,
  IN UINT32                            DataLength,
```

(continues on next page)

(continued from previous page)

```
  IN VOID                               *Data OPTIONAL
  );
```

Parameters

This
Pointer to the EFI_HTTP_BOOT_CALLBACK_PROTOCOL instance.

DataType
The event that occurs in the current state. Type EFI_HTTP_BOOT_CALLBACK_DATA_TYPE is defined below.

Received
TRUE if the callback is being invoked due to a receive event. **FALSE** if the callback is being invoked due to a transmit event.

DataLength
The length in bytes of the buffer pointed to by *Data*.

Data
A pointer to the buffer of data, the data type is specified by *DataType*.

Related Definitions

```
//***********************************************
// EFI_HTTP_BOOT_CALLBACK_DATA_TYPE
//***********************************************
typedef enum {
  HttpBootDhcp4,
  HttpBootDhcp6,
  HttpBootHttpRequest,
  HttpBootHttpResponse,
  HttpBootHttpEntityBody,
  HttpBootTypeMax
}   EFI_HTTP_BOOT_CALLBACK_DATA_TYPE;
```

HttpBootDhcp4
Data points to a DHCP4 packet which is about to transmit or has received.

HttpBootDhcp6
Data points to a DHCP6 packet which is about to be transmit or has received.

HttpBootHttpRequest
Data points to an EFI_HTTP_MESSAGE structure, which contians a HTTP request message to be transmitted.

HttpBootHttpResponse
Data points to an EFI_HTTP_MESSAGE structure, which contians a received HTTP response message.

HttpBootHttpEntityBody
Part of the entity body has been received from the HTTP server. *Data* points to the buffer of the entity body data.

Description

This function is invoked when the HTTP Boot driver is about to transmit or has received packet. Parameters *DataType* and *Received* specify the type of event and the format of the buffer pointed to by *Data*. Due to the polling nature of UEFI device drivers, this callback function should not execute for more than 5 ms. The returned status code determines the behavior of the HTTP Boot driver.

Status Codes Returned

EFI_SUCCESS	Tells the HTTP Boot driver to continue the HTTP Boot process.
EFI_ABORTED	Tells the HTTP Boot driver to abort the current HTTP Boot process.

CHAPTER

TWENTYFIVE

NETWORK PROTOCOLS - MANAGED NETWORK

25.1 EFI Managed Network Protocol

This chapter defines the EFI Managed Network Protocol. It is split into the following two main sections:

- Managed Network Service Binding Protocol (MNSBP)
- Managed Network Protocol (MNP)

The MNP provides raw (unformatted) asynchronous network packet I/O services. These services make it possible for multiple-event-driven drivers and applications to access and use the system network interfaces at the same time.

25.1.1 EFI_MANAGED_NETWORK_SERVICE_BINDING_PROTOCOL

Summary

The MNSBP is used to locate communication devices that are supported by an MNP driver and to create and destroy instances of the MNP child protocol driver that can use the underlying communications device.

The EFI Service Binding Protocol in *EFI Services Binding* defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the MNP.

GUID

```
#define EFI_MANAGED_NETWORK_SERVICE_BINDING_PROTOCOL_GUID \
  {0xf36ff770,0xa7e1,0x42cf,\
    {0x9e,0xd2,0x56,0xf0,0xf2,0x71,0xf4,0x4c}}
```

Description

A network application (or driver) that requires shared network access can use one of the protocol handler services, such as *BS->LocateHandleBuffer()*, to search for devices that publish an MNSBP GUID. Each device with a published MNSBP GUID supports MNP and may be available for use.

After a successful call to the *EFI_MANAGED_NETWORK_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the child MNP driver instance is in an unconfigured state; it is not ready to send and receive data packets.

Before a network application terminates execution, every successful call to the EFI_MANAGED_NETWORK_SERVICE_BINDING_PROTOCOL.CreateChild() function must be matched with a call to the EFI_MANAGED_NETWORK_SERVICE_BINDING_PROTOCOL.DestroyChild() function.

25.1.2 EFI_MANAGED_NETWORK_PROTOCOL

Summary

The MNP is used by network applications (and drivers) to perform raw (unformatted) asynchronous network packet I/O.

GUID

```
#define EFI_MANAGED_NETWORK_PROTOCOL_GUID\
  {0x7ab33a91, 0xace5, 0x4326,\
    {0xb5, 0x72, 0xe7, 0xee, 0x33, 0xd3, 0x9f, 0x16}}
```

Protocol Interface Structure

```
typedef struct \_EFI_MANAGED_NETWORK_PROTOCOL {
  EFI_MANAGED_NETWORK_GET_MODE_DATA        GetModeData;
  EFI_MANAGED_NETWORK_CONFIGURE            Configure;
  EFI_MANAGED_NETWORK_MCAST_IP_TO_MAC      McastIpToMac;
  EFI_MANAGED_NETWORK_GROUPS               Groups;
  EFI_MANAGED_NETWORK_TRANSMIT             Transmit;
  EFI_MANAGED_NETWORK_RECEIVE              Receive;
  EFI_MANAGED_NETWORK_CANCEL               Cancel;
  EFI_MANAGED_NETWORK_POLL                 Poll;
}   EFI_MANAGED_NETWORK_PROTOCOL;
```

Parameters

GetModeData
Returns the current MNP child driver operational parameters. May also support returning underlying Simple Network Protocol (SNP) driver mode data. See the GetModeData() function description.

Configure
Sets the *Configure()* function description.

McastIpToMac
Translates a software (IP) multicast address to a hardware (MAC) multicast address. This function may be unsupported in some MNP implementations. See the *McastIpToMac()* function description.

Groups
Enables and disables receive filters for multicast addresses. This function may be unsupported in some MNP implementations. See the *Groups()* function description.

Transmit
Places asynchronous outgoing data packets into the transmit queue. See the *Transmit()* function description.

Receive
Places an asynchronous receiving request into the receiving queue. See the *Receive()* function description.

Cancel
Aborts a pending transmit or receive request. See the *Cancel()* function description.

Poll
Polls for incoming data packets and processes outgoing data packets. See the *Poll()* function description.

Description

The services that are provided by MNP child drivers make it possible for multiple drivers and applications to send and receive network traffic using the same network device.

Before any network traffic can be sent or received, the *EFI_MANAGED_NETWORK_PROTOCOL.Configure()* function must initialize the operational parameters for the MNP child driver instance. Once configured, data packets can be received and sent using the following functions:

- EFI_MANAGED_NETWORK_PROTOCOL.Transmit()
- EFI_MANAGED_NETWORK_PROTOCOL.Receive()
- EFI_MANAGED_NETWORK_PROTOCOL.Poll()

25.1.3 EFI_MANAGED_NETWORK_PROTOCOL.GetModeData()

Summary

Returns the operational parameters for the current MNP child driver. May also support returning the underlying SNP driver mode data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MANAGED_NETWORK_GET_MODE_DATA) (
  IN EFI_MANAGED_NETWORK_PROTOCOL              *This,
  OUT EFI_MANAGED_NETWORK_CONFIG_DATA          *MnpConfigData OPTIONAL,
  OUT EFI_SIMPLE_NETWORK_MODE                  *SnpModeData OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_MANAGED_NETWORK_PROTOCOL* instance.

MnpConfigData
Pointer to storage for MNP operational parameters. Type *EFI_MANAGED_NETWORK_CONFIG_DATA* is defined in “Related Definitions” below.

SnpModeData
Pointer to storage for SNP operational parameters. This feature may be unsupported. Type *EFI_SIMPLE_NETWORK_MODE* is defined in the *EFI_SIMPLE_NETWORK_PROTOCOL.*

Description

The *GetModeData()* function is used to read the current mode data (operational parameters) from the MNP or the underlying SNP.

Related Definitions

```
//****************************************************
// EFI_MANAGED_NETWORK_CONFIG_DATA
//****************************************************
typedef struct {
  UINT32        ReceivedQueueTimeoutValue;
  UINT32        TransmitQueueTimeoutValue;
  UINT16        ProtocolTypeFilter;
  BOOLEAN       EnableUnicastReceive;
  BOOLEAN       EnableMulticastReceive;
  BOOLEAN       EnableBroadcastReceive;
  BOOLEAN       EnablePromiscuousReceive;
```

(continues on next page)

(continued from previous page)

```
  BOOLEAN        FlushQueuesOnReset;
  BOOLEAN        EnableReceiveTimestamps;
  BOOLEAN        DisableBackgroundPolling;
}   EFI_MANAGED_NETWORK_CONFIG_DATA;
```

ReceivedQueueTimeoutValue
Timeout value for a UEFI one-shot timer event. A packet that has not been removed from the MNP receive queue by a call to *EFI_MANAGED_NETWORK_PROTOCOL.Poll()* will be dropped if its receive timeout expires. If this value is zero, then there is no receive queue timeout. If the receive queue fills up, then the device receive filters are disabled until there is room in the receive queue for more packets. The startup default value is 10,000,000 (10 seconds).

TransmitQueueTimeoutValue
Timeout value for a UEFI one-shot timer event. A packet that has not been removed from the MNP transmit queue by a call to *EFI_MANAGED_NETWORK_PROTOCOL.Poll()* will be dropped if its transmit timeout expires. If this value is zero, then there is no transmit queue timeout. If the transmit queue fills up, then the *EFI_MANAGED_NETWORK_PROTOCOL.Transmit()* function will return *EFI_NOT_READY* until there is room in the transmit queue for more packets. The startup default value is 10,000,000 (10 seconds).

ProtocolTypeFilter
Ethernet type II 16-bit protocol type in host byte order. Valid values are zero and 1,500 to 65,535. Set to zero to receive packets with any protocol type. The startup default value is zero.

EnableUnicastReceive
Set to *TRUE* to receive packets that are sent to the network device MAC address. The startup default value is *FALSE*.

EnableMulticastReceive
Set to *TRUE* to receive packets that are sent to any of the active multicast groups. The startup default value is *FALSE*.

EnableBroadcastReceive
Set to *TRUE* to receive packets that are sent to the network device broadcast address. The startup default value is *FALSE* .

EnablePromiscuousReceive
Set to *TRUE* to receive packets that are sent to any MAC address. Note that setting this field to *TRUE* may cause packet loss and degrade system performance on busy networks. The startup default value is *FALSE*.

FlushQueuesOnReset
Set to *TRUE* to drop queued packets when the configuration is changed. The startup default value is *FALSE*.

EnableReceiveTimestamps
Set to *TRUE* to timestamp all packets when they are received by the MNP. Note that timestamps may be unsupported in some MNP implementations. The startup default value is *FALSE*.

DisableBackgroundPolling
Set to *TRUE* to disable background polling in this MNP instance. Note that background polling may not be supported in all MNP implementations. The startup default value is *FALSE*, unless background polling is not supported.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	*This* is *NULL*.
EFI_UNSUPPORTED	The requested feature is unsupported in this MNP implementation.

continues on next page

Table 25.1 – continued from previous page

EFI_NOT_STARTED	This MNP child driver instance has not been configured. The default values are returned in *MnpConfigData* if it is not *NULL*.
Other	The mode data could not be read.

25.1.4 EFI_MANAGED_NETWORK_PROTOCOL.Configure()

Summary

Sets or clears the operational parameters for the MNP child driver.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MANAGED_NETWORK_CONFIGURE) (
  IN EFI_MANAGED_NETWORK_PROTOCOL        *This,
  IN EFI_MANAGED_NETWORK_CONFIG_DATA     *MnpConfigData OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_MANAGED_NETWORK_PROTOCOL* instance.

MnpConfigData

Pointer to configuration data that will be assigned to the MNP child driver instance. If *NULL*, the MNP child driver instance is reset to startup defaults and all pending transmit and receive requests are flushed. Type *EFI_MANAGED_NETWORK_CONFIG_DATA* is defined in *EFI_MANAGED_NETWORK_PROTOCOL.GetModeData()*.

Description

The *Configure()* function is used to set, change, or reset the operational parameters for the MNP child driver instance. Until the operational parameters have been set, no network traffic can be sent or received by this MNP child driver instance. Once the operational parameters have been reset, no more traffic can be sent or received until the operational parameters have been set again.

Each MNP child driver instance can be started and stopped independently of each other by setting or resetting their receive filter settings with the *Configure()* function.

After any successful call to *Configure()*, the MNP child driver instance is started. The internal periodic timer (if supported) is enabled. Data can be transmitted and may be received if the receive filters have also been enabled.

NOTE: *If multiple MNP child driver instances will receive the same packet because of overlapping receive filter settings, then the first MNP child driver instance will receive the original packet and additional instances will receive copies of the original packet.*

NOTE: WARNING: *Receive filter settings that overlap will consume extra processor and/or DMA resources and degrade system and network performance.*

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.

continues on next page

Table 25.2 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is *TRUE* : • *This* is *NULL*. • *MnpConfigData.ProtocolTypeFilter* is not valid. • The operational data for the MNP child driver instance is unchanged.
EFI_OUT_OF_RESOURCES	Required system resources (usually memory) could not be allocated. The MNP child driver instance has been reset to startup defaults.
EFI_UNSUPPORTED	The requested feature is unsupported in this [MNP] implementation. The operational data for the MNP child driver instance is unchanged.
EFI_DEVICE_ERROR	An unexpected network or system error occurred. The MNP child driver instance has been reset to startup defaults.
Other	The MNP child driver instance has been reset to startup defaults.

25.1.5 EFI_MANAGED_NETWORK_PROTOCOL.McastIpToMac()

Summary

Translates an IP multicast address to a hardware (MAC) multicast address. This function may be unsupported in some MNP implementations.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MANAGED_NETWORK_MCAST_IP_TO_MAC) (
  IN EFI_MANAGED_NETWORK_PROTOCOL         *This,
  IN BOOLEAN                              Ipv6Flag,
  IN EFI_IP_ADDRESS                       *IpAddress,
  OUT EFI_MAC_ADDRESS                     *MacAddress
  );
```

Parameters

This

Pointer to the *EFI_MANAGED_NETWORK_PROTOCOL* instance.

Ipv6Flag

Set to *TRUE* to if *IpAddress* is an IPv6 multicast address.

Set to *FALSE* if *IpAddress* is an IPv4 multicast address.

IpAddress

Pointer to the multicast IP address (in network byte order) to convert.

MacAddress

Pointer to the resulting multicast MAC address.

Description

The *McastIpToMac()* function translates an IP multicast address to a hardware (MAC) multicast address.

This function may be implemented by calling the underlying *EFI_SIMPLE_NETWORK.MCastIpToMac()* function, which may also be unsupported in some MNP implementations.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	One of the following conditions is *TRUE* : • *This* is *NULL.* • *IpAddress* is *NULL.* • * *IpAddress* is not a valid multicast IP address. • *MacAddress* is *NULL.*
EFI_NOT_STARTED	This MNP child driver instance has not been configured.
EFI_UNSUPPORTED	The requested feature is unsupported in this MNP implementation.
EFI_DEVICE_ERROR	An unexpected network or system error occurred.
Other	The address could not be converted.

25.1.6 EFI_MANAGED_NETWORK_PROTOCOL.Groups()

Summary

Enables and disables receive filters for multicast address. This function may be unsupported in some MNP implementations.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MANAGED_NETWORK_GROUPS) (
  IN EFI_MANAGED_NETWORK_PROTOCOL      *This,
  IN BOOLEAN                           JoinFlag,
  IN EFI_MAC_ADDRESS                   *MacAddress OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_MANAGED_NETWORK_PROTOCOL* instance.

JoinFlag

Set to *TRUE* to join this multicast group.

Set to *FALSE* to leave this multicast group.

MacAddress

Pointer to the multicast MAC group (address) to join or leave.

Description

The *Groups()* function only adds and removes multicast MAC addresses from the filter list. The MNP driver does not transmit or process Internet Group Management Protocol (IGMP) packets.

If *JoinFlag* is *FALSE* and *MacAddress* is *NULL*, then all joined groups are left.

Status Codes Returned

EFI_SUCCESS	The requested operation completed successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is *TRUE* : • *This* is *NULL*. • *JoinFlag* is *TRUE* and *MacAddress* is *NULL*. • * *MacAddress* is not a valid multicast MAC address. The MNP multicast group settings are unchanged.
EFI_NOT_STARTED	This MNP child driver instance has not been configured.
EFI_ALREADY_STARTED	The supplied multicast group is already joined.
EFI_NOT_FOUND	The supplied multicast group is not joined.
EFI_DEVICE_ERROR	An unexpected network or system error occurred. The MNP child driver instance has been reset to startup defaults.
EFI_UNSUPPORTED	The requested feature is unsupported in this MNP implementation.
Other	The requested operation could not be completed. The MNP multicast group settings are unchanged.

25.1.7 EFI_MANAGED_NETWORK_PROTOCOL.Transmit()

Summary

Places asynchronous outgoing data packets into the transmit queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MANAGED_NETWORK_TRANSMIT) (
  IN EFI_MANAGED_NETWORK_PROTOCOL            *This,
  IN EFI_MANAGED_NETWORK_COMPLETION_TOKEN    *Token
  );
```

Parameters

This

Pointer to the *EFI_MANAGED_NETWORK_PROTOCOL* instance.

Token

Pointer to a token associated with the transmit data descriptor. Type *EFI_MANAGED_NETWORK_COMPLETION_TOKEN* is defined in “Related Definitions” below.

Description

The *Transmit()* function places a completion token into the transmit packet queue. This function is always asynchronous.

The caller must fill in the *Token.Event* and *Token.TxData* fields in the completion token, and these fields cannot be *NULL*. When the transmit operation completes, the MNP updates the *Token.Status* field and the *Token.Event* is signaled.

NOTE *There may be a performance penalty if the packet needs to be defragmented before it can be transmitted by the network device. Systems in which performance is critical should review the requirements and features of the underlying communications device and drivers.*

Related Definitions

```
//*******************************************************
// EFI_MANAGED_NETWORK_COMPLETION_TOKEN
//*******************************************************
typedef struct {
  EFI_EVENT                            Event;
  EFI_STATUS                           Status;
  union {
    EFI_MANAGED_NETWORK_RECEIVE_DATA   *RxData;
    EFI_MANAGED_NETWORK_TRANSMIT_DATA  *TxData;
  }                                    Packet;
}  EFI_MANAGED_NETWORK_COMPLETION_TOKEN;
```

Event

This *Event* will be signaled after the *Status* field is updated by the MNP. The type of *Event* must be *EVT_NOTIFY_SIGNAL*. The Task Priority Level (TPL) of *Event* must be lower than or equal to TPL_CALLBACK.

Status

This field will be set to one of the following values:

EFI_SUCCESS: The receive or transmit completed successfully.

EFI_ABORTED: The receive or transmit was aborted.

EFI_TIMEOUT: The transmit timeout expired.

EFI_DEVICE_ERROR: There was an unexpected system or network error.

EFI_NO_MEDIA: There was a media error

RxData

When this token is used for receiving, *RxData* is a pointer to the *EFI_MANAGED_NETWORK_RECEIVE_DATA*.

TxData

When this token is used for transmitting, *TxData* is a pointer to the *EFI_MANAGED_NETWORK_TRANSMIT_DATA*.

The *EFI_MANAGED_NETWORK_COMPLETION_TOKEN* structure is used for both transmit and receive operations.

When it is used for transmitting, the *Event* and *TxData* fields must be filled in by the MNP client. After the transmit operation completes, the MNP updates the *Status* field and the *Event* is signaled.

When it is used for receiving, only the *Event* field must be filled in by the MNP client. After a packet is received, the MNP fills in the *RxData* and *Status* fields and the *Event* is signaled.

```
//*******************************************************
// EFI_MANAGED_NETWORK_RECEIVE_DATA
//*******************************************************
typedef struct {
  EFI_TIME     Timestamp;
  EFI_EVENT    RecycleEvent;
  UINT32       PacketLength;
  UINT32       HeaderLength;
  UINT32       AddressLength;
  UINT32       DataLength;
  BOOLEAN      roadcastFlag;
```

(continues on next page)

(continued from previous page)

```
  BOOLEAN      MulticastFlag;
  BOOLEAN      PromiscuousFlag;
  UINT16       ProtocolType;
  VOID         *DestinationAddress;
  VOID         *SourceAddress;
  VOID         *MediaHeader;
  VOID         *PacketData;
}  EFI_MANAGED_NETWORK_RECEIVE_DATA;
```

Timestamp
System time when the MNP received the packet. *Timestamp* is zero filled if receive timestamps are disabled or unsupported.

RecycleEvent
MNP clients must signal this event after the received data has been processed so that the receive queue storage can be reclaimed. Once *RecycleEvent* is signaled, this structure and the received data that is pointed to by this structure must not be accessed by the client.

PacketLength
Length of the entire received packet (media header plus the data).

HeaderLength
Length of the media header in this packet.

AddressLength
Length of a MAC address in this packet.

DataLength
Length of the data in this packet.

BroadcastFlag
Set to *TRUE* if this packet was received through the broadcast filter. (The destination MAC address is the broadcast MAC address.)

MulticastFlag
Set to *TRUE* if this packet was received through the multicast filter. (The destination MAC address is in the multicast filter list.)

PromiscuousFlag
Set to *TRUE* if this packet was received through the promiscuous filter. (The destination address does not match any of the other hardware or software filter lists.)

ProtocolType
16-bit protocol type in host byte order. Zero if there is no protocol type field in the packet header.

DestinationAddress
Pointer to the destination address in the media header.

SourceAddress
Pointer to the source address in the media header.

MediaHeader
Pointer to the first byte of the media header.

PacketData
Pointer to the first byte of the packet data (immediately following media header).

An *EFI_MANAGED_NETWORK_RECEIVE_DATA* structure is filled in for each packet that is received by the MNP.

If multiple instances of this MNP driver can receive a packet, then the receive data structure and the received packet are duplicated for each instance of the MNP driver that can receive the packet.

```
//******************************************************
// EFI_MANAGED_NETWORK_TRANSMIT_DATA
//******************************************************
typedef struct {
  EFI_MAC_ADDRESS                    *DestinationAddress OPTIONAL;
  EFI_MAC_ADDRESS                    *SourceAddress OPTIONAL;
  UINT16                             ProtocolType OPTIONAL;
  UINT32                             DataLength;
  UINT16                             HeaderLength OPTIONAL;
  UINT16                             FragmentCount;
  EFI_MANAGED_NETWORK_FRAGMENT_DATA  FragmentTable[1];
}   EFI_MANAGED_NETWORK_TRANSMIT_DATA;
```

DestinationAddress

Pointer to the destination MAC address if the media header is not included in *FragmentTable[]*. If *NULL*, then the media header is already filled in *FragmentTable[]*.

SourceAddress

Pointer to the source MAC address if the media header is not included in *FragmentTable[]*. Ignored if *DestinationAddress* is *NULL*.

ProtocolType

The protocol type of the media header in host byte order. Ignored if *DestinationAddress* is *NULL*.

DataLength

Sum of all *FragmentLength* fields in *FragmentTable[]* minus the media header length.

HeaderLength

Length of the media header if it is included in the *FragmentTable*. Must be zero if *DestinationAddress* is not *NULL*.

FragmentCount

Number of data fragments in *FragmentTable[]*. This field cannot be zero.

FragmentTable

Table of data fragments to be transmitted. The first byte of the first entry in *FragmentTable[]* is also the first byte of the media header or, if there is no media header, the first byte of payload. Type *EFI_MANAGED_NETWORK_FRAGMENT_DATA* is defined below.

The *EFI_MANAGED_NETWORK_TRANSMIT_DATA* structure describes a (possibly fragmented) packet to be transmitted.

The *DataLength* field plus the *HeaderLength* field must be equal to the sum of all of the *FragmentLength* fields in the *FragmentTable*.

If the media header is included in *FragmentTable[]*, then it cannot be split between fragments.

```
//******************************************************
// EFI_MANAGED_NETWORK_FRAGMENT_DATA
//******************************************************
typedef struct {
  UINT32       FragmentLength;
  VOID         *FragmentBuffer;
}   EFI_MANAGED_NETWORK_FRAGMENT_DATA;
```

FragmentLength

Number of bytes in the *FragmentBuffer*. This field may not be set to zero.

FragmentBuffer

Pointer to the fragment data. This field may not be set to *NULL*.

The *EFI_MANAGED_NETWORK_FRAGMENT_DATA* structure describes the location and length of a packet fragment to be transmitted.

Status Codes Returned

EFI_SUCCESS	The transmit completion token was cached.
EFI_NOT_STARTED	This MNP child driver instance has not been configured.
EFI_INVALID_PARAMETER	One or more of the following conditions is *TRUE* : • *This* is *NULL.* • *Token* is *NULL.* • *Token.Event* is *NULL.* • *Token.TxData is NULL.* • *Token.TxData.DestinationAddress is not NULL and Token.TxData.HeaderLength is zero.* • *Token.TxData.FragmentCount* is zero. • *(Token.TxData.HeaderLength + Token.TxData.DataLength)* is not equal to the sum of the *Token.TxDat a.FragmentTable[ ].FragmentLength* fields. • One or more of the *Token.TxDat a.FragmentTable[ ].FragmentLength* fields is zero. • One or more of the *Token.TxData.Frag mentTable[ ].FragmentBufferfields* is *NULL.* • *Token.TxData.DataLength is greater than MTU*
EFI_ACCESS_DENIED	The transmit completion token is already in the transmit queue.
EFI_OUT_OF_RESOURCES	The transmit data could not be queued due to a lack of system resources (usually memory).
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The MNP child driver instance has been reset to startup defaults.
EFI_NOT_READY	The transmit request could not be queued because the transmit queue is full.
EFI_NO_MEDIA	There was a media error.

25.1.8 EFI_MANAGED_NETWORK_PROTOCOL.Receive()

Summary

Places an asynchronous receiving request into the receiving queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MANAGED_NETWORK_RECEIVE) (
  IN EFI_MANAGED_NETWORK_PROTOCOL            *This,
```

(continues on next page)

(continued from previous page)

```
  IN EFI_MANAGED_NETWORK_COMPLETION_TOKEN    *Token
  );
```

Parameters

This

Pointer to the *EFI_MANAGED_NETWORK_PROTOCOL* instance.

Token

Pointer to a token associated with the receive data descriptor. Type *EFI_MANAGED_NETWORK_COMPLETION_TOKEN* is defined in *EFI_MANAGED_NETWORK_PROTOCOL .Transmit()*.

Description

The *Receive()* function places a completion token into the receive packet queue. This function is always asynchronous.

The caller must fill in the *Token.Event* field in the completion token, and this field cannot be *NULL*. When the receive operation completes, the MNP updates the *Token.Status* and *Token.RxData* fields and the *Token.Event* is signaled.

Status Codes Returned

EFI_SUCCESS	The receive completion token was cached.
EFI_NOT_STARTED	This MNP child driver instance has not been configured.
EFI_INVALID_PARAMETER	One or more of the following conditions is *TRUE* : • *This* is *NULL*. • *Token* is *NULL*. • *Token.Event* is *NULL*
EFI_OUT_OF_RESOURCES	The transmit data could not be queued due to a lack of system resources (usually memory).
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The MNP child driver instance has been reset to startup defaults.
EFI_ACCESS_DENIED	The receive completion token was already in the receive queue.
EFI_NOT_READY	The receive request could not be queued because the receive queue is full.
EFI_NO_MEDIA	There was a media error.

25.1.9 EFI_MANAGED_NETWORK_PROTOCOL.Cancel()

Summary

Aborts an asynchronous transmit or receive request.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MANAGED_NETWORK_CANCEL)(
  IN EFI_MANAGED_NETWORK_PROTOCOL            *This,
  IN EFI_MANAGED_NETWORK_COMPLETION_TOKEN    *Token OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_MANAGED_NETWORK_PROTOCOL* instance.

Token

Pointer to a token that has been issued by *EFI_MANAGED_NETWORK_PROTOCOL.Transmit()* or *EFI_MANAGED_NETWORK_PROTOCOL.Receive()*. If *NULL*, all pending tokens are aborted. Type *EFI_MANAGED_NETWORK_COMPLETION_TOKEN* is defined in *EFI_MANAGED_NETWORK_PROTOCOL.Transmit()*.

Description

The *Cancel()* function is used to abort a pending transmit or receive request. If the token is in the transmit or receive request queues, after calling this function, *Token.Status* will be set to *EFI_ABORTED* and then *Token.Event* will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, this function will not signal the token and *EFI_NOT_FOUND* is returned.

Status Codes Returned

EFI_SUCCESS	The asynchronous I/O request was aborted and *Token.Event* was signaled. When *Token* is *NULL*, all pending requests were aborted and their events were signaled.
EFI_NOT_STARTED	This MNP child driver instance has not been configured.
EFI_INVALID_PARAMETER	*This* is *NULL*.
EFI_NOT_FOUND	When *Token* is not *NULL*, the asynchronous I/O request was not found in the transmit or receive queue. It has either completed or was not issued by *Transmit()* and *Receive()*.

25.1.10 EFI_MANAGED_NETWORK_PROTOCOL.Poll()

Summary

Polls for incoming data packets and processes outgoing data packets.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MANAGED_NETWORK_POLL) (
  IN EFI_MANAGED_NETWORK_PROTOCOL      *This
  );
```

Parameters

This

Pointer to the *EFI_MANAGED_NETWORK_PROTOCOL* instance.

Description

The *Poll()* function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

Normally, a periodic timer event internally calls the *Poll()* function. But, in some systems, the periodic timer event may not call *Poll()* fast enough to transmit and/or receive all data packets without missing packets. Drivers and applications that are experiencing packet loss should try calling the *Poll()* function more often.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_NOT_STARTED	This MNP child driver instance has not been configured.
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The MNP child driver instance has been reset to startup defaults.
EFI_NOT_READY	No incoming or outgoing data was processed. Consider increasing the polling rate.
EFI_TIMEOUT	Data was dropped out of the transmit and/or receive queue. Consider increasing the polling rate.

CHAPTER

TWENTYSIX

NETWORK PROTOCOLS — BLUETOOTH

26.1 EFI Bluetooth Host Controller Protocol

26.1.1 EFI_BLUETOOTH_HC_PROTOCOL

Summary

This protocol abstracts the Bluetooth host controller layer.message transmit and receive.

GUID

```
#define EFI_BLUETOOTH_HC_PROTOCOL_GUID \
  { 0xb3930571, 0xbeba, 0x4fc5,
    { 0x92, 0x3, 0x94, 0x27, 0x24, 0x2e, 0x6a, 0x43 }}
```

Protocol Interface Structure

```
typedef struct  _EFI_BLUETOOTH_HC_PROTOCOL {
  EFI_BLUETOOTH_HC_SEND_COMMAND              SendCommand;
  EFI_BLUETOOTH_HC_RECEIVE_EVENT             ReceiveEvent;
  EFI_BLUETOOTH_HC_ASYNC_RECEIVE_EVENT       AsyncReceiveEvent;
  EFI_BLUETOOTH_HC_SEND_ACL_DATA             SendACLData;
  EFI_BLUETOOTH_HC_RECEIVE_ACL_DATA          ReceiveACLData;
  EFI_BLUETOOTH_HC_ASYNC_RECEIVE_ACL_DATA    AsyncReceiveACLData;
  EFI_BLUETOOTH_HC_SEND_SCO_DATA             SendSCOData;
  EFI_BLUETOOTH_HC_RECEIVE_SCO_DATA          ReceiveSCOData;
  EFI_BLUETOOTH_HC_ASYNC_RECEIVE_SCO_DATA    AsyncReceiveSCOData;
}   EFI_BLUETOOTH_HC_PROTOCOL;
```

Parameters

SendCommand
Send HCI command packet. See the *SendCommand()* function description.

ReceiveEvent
Receive HCI event packets. See the *ReceiveEvent()* function description.

AsyncReceiveEvent
Non-blocking receive HCI event packets. See the *AsyncReceiveEvent()* function description.

SendACLData
Send HCI ACL (asynchronous connection-oriented) data packets. See the *SendACLData()* function description.

ReceiveACLData
Receive HCI ACL data packets. See the *ReceiveACLData()* function description.

AsyncReceiveACLData
Non-blocking receive HCI ACL data packets. See the *AsyncReceiveACLData()* function description.

SendSCOData
Send HCI synchronous (SCO and eSCO) data packets. See the *SendSCOData()* function description.

ReceiveSCOData
Receive HCI synchronous data packets. See the *ReceiveSCOData()* function description.

AsyncReceiveSCOData
Non-blocking receive HCI synchronous data packets. See the *AsyncReceiveSCOData()* function description.

Description

The EFI_BLUETOOTH_HC_PROTOCOL is used to transmit or receive HCI layer data packets. For detail of different HCI packet (command, event, ACL, SCO), please refer to Bluetooth specification.

26.1.2 BLUETOOTH_HC_PROTOCOL.SendCommand()

Summary

Send HCI command packet.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_HC_SEND_COMMAND)(
  IN EFI_BLUETOOTH_HC_PROTOCOL            *This,
  IN OUT UINTN                            *BufferSize,
  IN VOID                                 *Buffer,
  IN UINTN                                Timeout
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_HC_PROTOCOL* instance.

BufferSize
On input, indicates the size, in bytes, of the data buffer specified by *Buffer*. On output, indicates the amount of data actually transferred.

Buffer
A pointer to the buffer of data that will be transmitted to Bluetooth host controller.

Timeout
Indicating the transfer should be completed within this time frame. The units are in milliseconds. If *Timeout* is 0, then the caller must wait for the function to be completed until *EFI_SUCCESS* or *EFI_DEVICE_ERROR* is returned.

Description

The SendCommand() function sends HCI command packet. *Buffer* holds the whole HCI command packet, including OpCode, OCF, OGF, parameter length, and parameters. When this function is returned, it just means the HCI command packet is sent, it does not mean the command is success or complete. Caller might need to wait a command status event to know the command status, or wait a command complete event to know if the command is completed. (see in Bluetooth specification, HCI Command Packet for more detail).

Status Codes Returned

EFI_SUCCESS	The HCI command packet is sent successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: *BufferSize* is NULL. * *BufferSize* is 0. *Buffer* is NULL.
EFI_TIMEOUT	Sending HCI command packet fail due to timeout.
EFI_DEVICE_ERROR	Sending HCI command packet fail due to host controller or device error.

26.1.3 BLUETOOTH_HC_PROTOCOL.ReceiveEvent()

Summary

Receive HCI event packet.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_HC_RECEIVE_EVENT)(
  IN EFI_BLUETOOTH_HC_PROTOCOL          *This,
  IN OUT UINTN                          *BufferSize,
  OUT VOID                              *Buffer,
  IN UINTN                              Timeout
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_HC_PROTOCOL* instance.

BufferSize
On input, indicates the size, in bytes, of the data buffer specified by *Buffer*. On output, indicates the amount of data actually transferred.

Buffer
A pointer to the buffer of data that will be received from Bluetooth host controller.

Timeout
Indicating the transfer should be completed within this time frame. The units are in milliseconds. If *Timeout* is 0, then the caller must wait for the function to be completed until *EFI_SUCCESS* or *EFI_DEVICE_ERROR* is returned.

Description

The ReceiveEvent() function receives HCI event packet. *Buffer* holds the whole HCI event packet, including *EventCode*, parameter length, and parameters. (See in Bluetooth specification, HCI Event Packet for more detail.)

Status Codes Returned

EFI_SUCCESS	The HCI event packet is received successfully.

continues on next page

Table 26.2 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *BufferSize* is NULL. • * *BufferSize* is 0. • *Buffer* is NULL.
EFI_TIMEOUT	Receiving HCI event packet fail due to timeout.
EFI_DEVICE_ERROR	Receiving HCI event packet fail due to host controller or device error.

26.1.4 BLUETOOTH_HC_PROTOCOL.AsyncReceiveEvent()

Summary

Receive HCI event packet in non-blocking way.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_HC_ASYNC_RECEIVE_EVENT) (
  IN EFI_BLUETOOTH_HC_PROTOCOL              *This,
  IN BOOLEAN                                IsNewTransfer,
  IN UINTN                                  PollingInterval,
  IN UINTN                                  DataLength,
  IN EFI_BLUETOOTH_HC_ASYNC_FUNC_CALLBACK   Callback,
  IN VOID                                   *Context
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_HC_PROTOCOL* instance.

IsNewTransfer
If *TRUE,* a new transfer will be submitted. If *FALSE,* the request is deleted.

PollingInterval
Indicates the periodic rate, in milliseconds, that the transfer is to be executed.

DataLength
Specifies the length, in bytes, of the data to be received.

Callback
The callback function. This function is called if the asynchronous transfer is completed.

Context
Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The AsyncReceiveEvent() function receives HCI event packet in non-blocking way. *Data* in *Callback* function holds the whole HCI event packet, including *EventCode*, parameter length, and parameters. (See in Bluetooth specification, HCI Event Packet for more detail.)

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_HC_ASYNC_FUNC_CALLBACK) (
  IN VOID                      *Data,
  IN UINTN                     DataLength,
  IN VOID                      *Context
  );
```

Data

Data received via asynchronous transfer.

DataLength

The length of *Data* in bytes, received via asynchronous transfer.

Context

Context passed from asynchronous transfer request.

Status Codes Returned

EFI_SUCCESS	The HCI asynchronous receive request is submitted successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *DataLength* is 0. • If *IsNewTransfer* is *TRUE,* and an asynchronous receive request already exists.

26.1.5 BLUETOOTH_HC_PROTOCOL.SendACLData()

Summary

Send HCI ACL data packet.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_HC_SEND_ACL_DATA)(
  IN EFI_BLUETOOTH_HC_PROTOCOL   *This,
  IN OUT UINTN                   *BufferSize,
  IN VOID                        *Buffer,
  IN UINTN                       Timeout
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_HC_PROTOCOL* instance.

BufferSize

On input, indicates the size, in bytes, of the data buffer specified by *Buffer*. On output, indicates the amount of data actually transferred.

Buffer

A pointer to the buffer of data that will be transmitted to Bluetooth host controller.

Timeout

Indicating the transfer should be completed within this time frame. The units are in milliseconds. If *Timeout* is 0, then the caller must wait for the function to be completed until *EFI_SUCCESS* or *EFI_DEVICE_ERROR* is returned.

Description

The SendACLData() function sends HCI ACL data packet. *Buffer* holds the whole HCI ACL data packet, including Handle, PB flag, BC flag, data length, and data. (See in Bluetooth specification, HCI ACL Data Packet for more detail.)

The SendACLData() function and *ReceiveACLData()* function just send and receive data payload from application layer. In order to protect the payload data, the Bluetooth bus is required to call HCI_Set_Connection_Encryption command to enable hardware based encryption after authentication completed, according to pairing mode and host capability.

Status Codes Returned

EFI_SUCCESS	The HCI ACL data packet is sent successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *BufferSize* is NULL. • * *BufferSize* is 0. • *Buffer* is NULL.
EFI_TIMEOUT	Sending HCI ACL data packet fail due to timeout.
EFI_DEVICE_ERROR	Sending HCI ACL data packet fail due to host controller or device error.

26.1.6 BLUETOOTH_HC_PROTOCOL.ReceiveACLData()

Summary

Receive HCI ACL data packet.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_HC_RECEIVE_ACL_DATA)(
  IN EFI_BLUETOOTH_HC_PROTOCOL         *This,
  IN OUT UINTN                         *BufferSize,
  OUT VOID                             *Buffer,
  IN UINTN                             Timeout
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_HC_PROTOCOL* instance.

BufferSize

On input, indicates the size, in bytes, of the data buffer specified by *Buffer*. On output, indicates the amount of data actually transferred.

Buffer

A pointer to the buffer of data that will be received from Bluetooth host controller.

Timeout

Indicating the transfer should be completed within this time frame. The units are in milliseconds. If *Timeout* is 0, then the caller must wait for the function to be completed until *EFI_SUCCESS* or *EFI_DEVICE_ERROR* is returned.

Description

The ReceiveACLData() function receives HCI ACL data packet. *Buffer* holds the whole HCI ACL data packet, including Handle, PB flag, BC flag, data length, and data. (See in Bluetooth specification, HCI ACL Data Packet for more detail.)

Status Codes Returned

EFI_SUCCESS	The HCI ACL data packet is received successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *BufferSize* is NULL. • * *BufferSize* is 0. • *Buffer* is NULL.
EFI_TIMEOUT	Receiving HCI ACL data packet fail due to timeout.
EFI_DEVICE_ERROR	Receiving HCI ACL data packet fail due to host controller or device error.

26.1.7 BLUETOOTH_HC_PROTOCOL.AsyncReceiveACLData()

Summary

Receive HCI ACL data packet in non-blocking way.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_HC_ASYNC_RECEIVE_ACL_DATA) (
  IN EFI_BLUETOOTH_HC_PROTOCOL              *This,
  IN BOOLEAN                                IsNewTransfer,
  IN UINTN                                  PollingInterval,
  IN UINTN                                  DataLength,
  IN EFI_BLUETOOTH_HC_ASYNC_FUNC_CALLBACK   Callback,
  IN VOID                                   *Context
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_HC_PROTOCOL* instance.

IsNewTransfer

If *TRUE,* a new transfer will be submitted.

If *FALSE,* the request is deleted.

PollingInterval

Indicates the periodic rate, in milliseconds, that the transfer is to be executed.

DataLength

Specifies the length, in bytes, of the data to be received.

Callback

The callback function. This function is called if the asynchronous transfer is completed.

Context

Data passed into *Callback* function. This is optional parameter and may be NULL.

Description

The AsyncReceiveACLData() function receives HCI ACL data packet in non-blocking way. *Data* in *Callback* holds the whole HCI ACL data packet, including Handle, PB flag, BC flag, data length, and data. (See in Bluetooth specification, HCI ACL Data Packet for more detail.)

Status Codes Returned

EFI_SUCCESS	The HCI asynchronous receive request is submitted successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *DataLength* is 0. • If *IsNewTransfer* is *TRUE,* and an asynchronous receive request already exists.

26.1.8 BLUETOOTH_HC_PROTOCOL.SendSCOData()

Summary

Send HCI SCO data packet.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_HC_SEND_SCO_DATA)(
  IN EFI_BLUETOOTH_HC_PROTOCOL            *This,
  IN OUT UINTN                            *BufferSize,
  IN VOID                                 *Buffer,
  IN UINTN                                Timeout
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_HC_PROTOCOL* instance.

BufferSize

On input, indicates the size, in bytes, of the data buffer specified by *Buffer*. On output, indicates the amount of data actually transferred.

Buffer

A pointer to the buffer of data that will be transmitted to Bluetooth host controller.

Timeout

Indicating the transfer should be completed within this time frame. The units are in milliseconds. If *Timeout* is 0, then the caller must wait for the function to be completed until *EFI_SUCCESS* or *EFI_DEVICE_ERROR* is returned.

Description

The SendSCOData() function sends HCI SCO data packet. *Buffer* holds the whole HCI SCO data packet, including *ConnectionHandle*, *PacketStatus* flag, data length, and data. (See in Bluetooth specification, HCI Synchronous Data Packet for more detail.)

Status Codes Returned

EFI_SUCCESS	The HCI SCO data packet is sent successfully.
EFI_UNSUPPORTED	The implementation does not support HCI SCO transfer.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *BufferSize* is NULL. • * *BufferSize* is 0. • *Buffer* is NULL.
EFI_TIMEOUT	Sending HCI SCO data packet fail due to timeout.
EFI_DEVICE_ERROR	Sending HCI SCO data packet fail due to host controller or device error.

26.1.9 BLUETOOTH_HC_PROTOCOL.ReceiveSCOData()

Summary

Receive HCI SCO data packet.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_HC_RECEIVE_SCO_DATA)(
  IN EFI_BLUETOOTH_HC_PROTOCOL         *This,
  IN OUT UINTN                         *BufferSize,
  OUT VOID                             *Buffer,
  IN UINTN                             Timeout
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_HC_PROTOCOL* instance.

BufferSize
On input, indicates the size, in bytes, of the data buffer specified by *Buffer*. On output, indicates the amount of data actually transferred.

Buffer
A pointer to the buffer of data that will be received from Bluetooth host controller.

Timeout
Indicating the transfer should be completed within this time frame. The units are in milliseconds. If *Timeout* is 0, then the caller must wait for the function to be completed until *EFI_SUCCESS* or *EFI_DEVICE_ERROR* is returned.

Description

The ReceiveSCOData() function receives HCI SCO data packet. *Buffer* holds the whole HCI SCO data packet, including ConnectionHandle, PacketStatus flag, data length, and data. (See in Bluetooth specification, HCI Synchronous Data Packet for more detail.)

Status Codes Returned

EFI_SUCCESS	The HCI SCO data packet is received successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *BufferSize* is NULL. • * *BufferSize* is 0. • *Buffer* is NULL.
EFI_TIMEOUT	Receiving HCI SCO data packet fail due to timeout.
EFI_DEVICE_ERROR	Receiving HCI SCO data packet fail due to host controller or device error.

26.1.10 BLUETOOTH_HC_PROTOCOL.AsyncReceiveSCOData()

Summary

Receive HCI SCO data packet in non-blocking way.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_HC_ASYNC_RECEIVE_SCO_DATA) (
  IN EFI_BLUETOOTH_HC_PROTOCOL              *This,
  IN BOOLEAN                                IsNewTransfer,
  IN UINTN                                  PollingInterval,
  IN UINTN                                  DataLength,
  IN EFI_BLUETOOTH_HC_ASYNC_FUNC_CALLBACK   Callback,
  IN VOID                                   *Context
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_HC_PROTOCOL* instance.

IsNewTransfer
If *TRUE,* a new transfer will be submitted. If *FALSE,* the request is deleted.

PollingInterval
Indicates the periodic rate, in milliseconds, that the transfer is to be executed.

DataLength
Specifies the length, in bytes, of the data to be received.

Callback
The callback function. This function is called if the asynchronous transfer is completed.

Context
Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The AsyncReceiveSCOData() function receives HCI SCO data packet in non-blocking way. *Data* in *Callback* holds the whole HCI SCO data packet, including *ConnectionHandle*, *PacketStatus* flag, data length, and data. (See in Bluetooth specification, HCI SCO Data Packet for more detail.)

Status Codes Returned

EFI_SUCCESS	The HCI asynchronous receive request is submitted successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *DataLength* is 0. • If *IsNewTransfer* is *TRUE,* and an asynchronous receive request already exists.

26.2 EFI Bluetooth Bus Protocol

26.2.1 EFI_BLUETOOTH_IO_SERVICE_BINDING_PROTOCOL

Summary

The EFI Bluetooth IO Service Binding Protocol is used to locate EFI Bluetooth IO Protocol drivers to create and destroy child of the driver to communicate with other Bluetooth device by using Bluetooth IO protocol.

GUID

```
#define EFI_BLUETOOTH_IO_SERVICE_BINDING_PROTOCOL_GUID \
  { 0x388278d3, 0x7b85, 0x42f0,\
    { 0xab, 0xa9, 0xfb, 0x4b, 0xfd, 0x69, 0xf5, 0xab }
```

Description

The Bluetooth IO consumer need locate *EFI_BLUETOOTH_IO_SERVICE_BINDING_PROTOCOL* and call *CreateChild()* to create a new child of *EFI_BLUETOOTH_IO_PROTOCOL* instance. Then use *EFI_BLUETOOTH_IO_PROTOCOL* for Bluetooth communication. After use, the Bluetooth IO consumer need call *DestroyChild()* to destroy it.

26.2.2 EFI_BLUETOOTH_IO_PROTOCOL

Summary

This protocol provides service for Bluetooth L2CAP (Logical Link Control and Adaptation Protocol) and SDP (Service Discovery Protocol).

GUID

```
#define EFI_BLUETOOTH_IO_PROTOCOL_GUID \
  { 0x467313de, 0x4e30, 0x43f1,\
    { 0x94, 0x3e, 0x32, 0x3f, 0x89, 0x84, 0x5d, 0xb5 }}
```

Protocol Interface Structure

```
typedef struct  _EFI_BLUETOOTH_IO_PROTOCOL {
  EFI_BLUETOOTH_IO_GET_DEVICE_INFO           GetDeviceInfo;
  EFI_BLUETOOTH_IO_GET_SDP_INFO              GetSdpInfo;
  EFI_BLUETOOTH_IO_L2CAP_RAW_SEND            L2CapRawSend;
  EFI_BLUETOOTH_IO_L2CAP_RAW_RECEIVE         L2CapRawReceive;
  EFI_BLUETOOTH_IO_L2CAP_RAW_ASYNC_RECEIVE\  L2CapRawAsyncReceive;
  EFI_BLUETOOTH_IO_L2CAP_SEND                L2CapSend;
  EFI_BLUETOOTH_IO_L2CAP_RECEIVE             L2CapReceive;
  EFI_BLUETOOTH_IO_L2CAP_ASYNC_RECEIVE       L2CapAsyncReceive;
  EFI_BLUETOOTH_IO_L2CAP_CONNECT             L2CapConnect;
  EFI_BLUETOOTH_IO_L2CAP_DISCONNECT          L2CapDisconnect;
  EFI_BLUETOOTH_IO_L2CAP_REGISTER_SERVICE\   L2CapRegisterService;
}   EFI_BLUETOOTH_IO_PROTOCOL;
```

Parameters

GetDeviceInfo
Get Bluetooth device Information. See theGetDeviceInfo()* function description.

GetSdpInfo
Get Bluetooth device SDP information. See the *GetSdpInfo()* function description.

L2CapRawSend
Send L2CAP message (including L2CAP header). See the *L2CapRawSend()* function description.

L2CapRawReceive
Receive L2CAP message (including L2CAP header). See the *L2CapRawReceive()* function description.

L2CapRawAsyncReceive
Non-blocking receive L2CAP message (including L2CAP header). See the *L2CapRawAsyncReceive()* function description.

L2CapSend
Send L2CAP message (excluding L2CAP header) to a specific channel. See the *L2CapSend()* function description.

L2CapReceive
Receive L2CAP message (excluding L2CAP header) from a specific channel. See the *L2CapRawReceive()* function description.

L2CapAsyncReceive
Non-blocking receive L2CAP message (excluding L2CAP header) from a specific channel. See the L2CapRawAsyncReceive() function description.

L2CapConnect
Do L2CAP connection. See the *L2CapConnect()* function description.

L2CapDisconnect
Do L2CAP disconnection. See the *L2CapDisconnect()* function description.

L2CapRegisterService
Register L2CAP callback function for special channel. See the *L2CapRegisterService()* function description.

Description

The *EFI_BLUETOOTH_IO_PROTOCOL* provides services in L2CAP protocol and SDP protocol. For detail of L2CAP packet format, and SDP service, please refer to Bluetooth specification.

26.2.3 BLUETOOTH_IO_PROTOCOL.GetDeviceInfo

Summary

Get Bluetooth device information.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_GET_DEVICE_INFO)(
  IN EFI_BLUETOOTH_IO_PROTOCOL         *This,
  OUT UINTN                            *DeviceInfoSize,
  OUT VOID                             **DeviceInfo
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_IO_PROTOCOL* instance.

DeviceInfoSize
A pointer to the size, in bytes, of the *DeviceInfo* buffer.

DeviceInfo
A pointer to a callee allocated buffer that returns Bluetooth device information. Callee allocates this buffer by using EFI Boot Service *AllocatePool()*.

Description

The GetDeviceInfo() function returns Bluetooth device information. The size of *DeviceInfo* structure should never be assumed and the value of *DeviceInfoSize* is the only valid way to know the size of *DeviceInfo*.

Related Definitions

```
typedef struct {
  UINT32                     Version;
  BLUETOOTH_ADDRESS          BD_ADDR;
  UINT8                      PageScanRepetitionMode;
  BLUETOOTH_CLASS_OF_DEVICE  ClassOfDevice;
  UINT16                     ClockOffset;
  UINT8                      RSSI;
  UINT8                      ExtendedInquiryResponse [240];
}  EFI_BLUETOOTH_DEVICE_INFO;
```

Version
The version of the structure. A value of zero represents the *EFI_BLUETOOTH_DEVICE_INFO* structure as defined here. Future version of this specification may extend this data structure in a backward compatible way and increase the value of *Version*.

BD_ADDR
48bit Bluetooth device address.

PageScanRepetitionMode*
Bluetooth PageScanRepetitionMode. See Bluetooth specification for detail.

ClassOfDevice
Bluetooth ClassOfDevice. See Bluetooth specification for detail.

ClockOffset

Bluetooth CloseOffset. See Bluetooth specification for detail.

RSSI

Bluetooth RSSI. See Bluetooth specification for detail.

ExtendedInquiryResponse

Bluetooth ExtendedInquiryResponse. See Bluetooth specification for detail.

```
typedef struct {
  UINT8              Address [6];
} BLUETOOTH_ADDRESS;

typedef struct {
  UINT8              FormatType:2;
  UINT8              MinorDeviceClass:6;
  UINT16             MajorDeviceClass:5;
  UINT16             MajorServiceClass:11;
}  BLUETOOTH_CLASS_OF_DEVICE;
```

Status Codes Returned

EFI_SUCCESS	The Bluetooth device information is returned successfully.
EFI_DEVICE_ERROR	A hardware error occurred trying to retrieve the Bluetooth device information.

26.2.4 BLUETOOTH_IO_PROTOCOL.GetSdpInfo

Summary

Get Bluetooth SDP information.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_GET_SDP_INFO)(
  IN EFI_BLUETOOTH_IO_PROTOCOL         *This,
  OUT UINTN                            *SdpInfoSize,
  OUT VOID                             **SdpInfo
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_IO_PROTOCOL* instance.

SdpInfoSize

A pointer to the size, in bytes, of the *SdpInfo* buffer.

SdpInfo

A pointer to a callee allocated buffer that returns Bluetooth SDP information. Callee allocates this buffer by using EFI Boot Service *AllocatePool()*.

Description

The GetSdpInfo() function returns Bluetooth SDP information. The size of *SdpInfo* structure should never be assumed and the value of *SdpInfoSize* is the only valid way to know the size of *SdpInfo*.

Status Codes Returned

EFI_SUCCESS	The Bluetooth SDP information is returned successfully.
EFI_DEVICE_ERROR	A hardware error occurred trying to retrieve the Bluetooth SDP information.

26.2.5 BLUETOOTH_IO_PROTOCOL.L2CapRawSend

Summary

Send L2CAP message (including L2CAP header).

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_RAW_SEND)(
  IN EFI_BLUETOOTH_IO_PROTOCOL         *This,
  IN OUT UINTN                         *BufferSize,
  IN VOID                              *Buffer,
  IN UINTN                             Timeout
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_IO_PROTOCOL* instance.

BufferSize
On input, indicates the size, in bytes, of the data buffer specified by *Buffer*. On output, indicates the amount of data actually transferred.

Buffer
A pointer to the buffer of data that will be transmitted to Bluetooth L2CAP layer.

Timeout
Indicating the transfer should be completed within this time frame. The units are in milliseconds. If Timeout is 0, then the caller must wait for the function to be completed until EFI_SUCCESS or EFI_DEVICE_ERROR is returned.

Description

EFI iSCSI Initiator Name Protocol sends L2CAP layer message (including L2CAP header). Buffer holds the whole L2CAP message, including Length, ChannelID, and information payload. (See the Bluetooth specification, L2CAP Data Packet Format for more details.)

Status Codes Returned

EFI_SUCCESS	The L2CAP message is sent successfully.

continues on next page

Table 26.12 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • BufferSize is NULL. • BufferSize is 0. • Buffer is NULL.
EFI_TIMEOUT	Sending L2CAP message fail due to timeout.
EFI_DEVICE_ERROR	Sending L2CAP message fail due to host controller or device error.

26.2.6 BLUETOOTH_IO_PROTOCOL.L2CapRawReceive

Summary

Receive L2CAP message (including L2CAP header).

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_RAW_RECEIVE)(
  IN EFI_BLUETOOTH_IO_PROTOCOL              *This,
  IN OUT UINTN                              *BufferSize,
  OUT VOID                                  *Buffer,
  IN UINTN                                  Timeout
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_IO_PROTOCOL* instance.

BufferSize
On input, indicates the size, in bytes, of the data buffer specified by *Buffer*. On output, indicates the amount of data actually transferred.

Buffer
A pointer to the buffer of data that will be received from Bluetooth L2CAP layer.

Timeout
Indicating the transfer should be completed within this time frame. The units are in milliseconds. If *Timeout* is 0, then the caller must wait for the function to be completed until *EFI_SUCCESS* or *EFI_DEVICE_ERROR* is returned.

Description

The L2CapRawReceive() function receives L2CAP layer message (including L2CAP header). *Buffer* holds the whole L2CAP message, including Length, ChannelID, and information payload. (See in Bluetooth specification, L2CAP Data Packet Format for more detail.)

Status Codes Returned

EFI_SUCCESS	The L2CAP message is received successfully.

continues on next page

Table 26.13 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *BufferSize* is NULL. • * *BufferSize* is 0. • *Buffer* is NULL.
EFI_TIMEOUT	Receiving L2CAP message fail due to timeout.
EFI_DEVICE_ERROR	Receiving L2CAP message fail due to host controller or device error.

26.2.7 BLUETOOTH_IO_PROTOCOL.L2CapRawAsyncReceive

Summary

Receive L2CAP message (including L2CAP header) in non-blocking way.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_RAW_ASYNC_RECEIVE)(
  IN EFI_BLUETOOTH_IO_PROTOCOL              *This,
  IN BOOLEAN                                IsNewTransfer,
  IN UINTN                                  PollingInterval,
  IN UINTN                                  DataLength,
  IN EFI_BLUETOOTH_IO_ASYNC_FUNC_CALLBACK    Callback,
  IN VOID                                   *Context
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_IO_PROTOCOL* instance.

IsNewTransfer

If *TRUE,* a new transfer will be submitted.

If *FALSE,* the request is deleted.

PollingInterval

Indicates the periodic rate, in milliseconds, that the transfer is to be executed.

DataLength

Specifies the length, in bytes, of the data to be received.

Callback

The callback function. This function is called if the asynchronous transfer is completed.

Context

Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The L2CapRawAsyncReceive() function receives L2CAP layer message (including L2CAP header) in non-blocking way. *Data* in *Callback* function holds the whole L2CAP message, including Length, ChannelID, and information payload. (See in Bluetooth specification, L2CAP Data Packet Format for more detail.)

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_ASYNC_FUNC_CALLBACK) (
  IN UINT16                          ChannelID,
  IN VOID                            *Data,
  IN UINTN                           DataLength,
  IN VOID                            *Context
  );
```

ChannelID
Bluetooth L2CAP message channel ID.

Data
Data received via asynchronous transfer.

DataLength
The length of *Data* in bytes, received via asynchronous transfer.

Context
Context passed from asynchronous transfer request.

Status Codes Returned

EFI_SUCCESS	The L2CAP asynchronous receive request is submitted successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *DataLength* is 0. • If *IsNewTransfer* is *TRUE,* and an asynchronous receive request already exists.

26.2.8 BLUETOOTH_IO_PROTOCOL.L2CapSend

Summary

Send L2CAP message (excluding L2CAP header) to a specific channel.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_SEND)(
  IN EFI_BLUETOOTH_IO_PROTOCOL          *This,
  IN EFI_HANDLE                         Handle,
  IN OUT UINTN                          *BufferSize,
  IN VOID                               *Buffer,
  IN UINTN                              Timeout
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_IO_PROTOCOL* instance.

Handle

A handle created by *EFI_BLUETOOTH_IO_PROTOCOL.L2CapConnect* indicates which channel to send.

BufferSize

On input, indicates the size, in bytes, of the data buffer specified by *Buffer*. On output, indicates the amount of data actually transferred.

Buffer

A pointer to the buffer of data that will be transmitted to Bluetooth L2CAP layer.

Timeout

Indicating the transfer should be completed within this time frame. The units are in milliseconds. If *Timeout* is 0, then the caller must wait for the function to be completed until *EFI_SUCCESS* or *EFI_DEVICE_ERROR* is returned.

Description

The L2CapSend() function sends L2CAP layer message (excluding L2CAP header) to Bluetooth channel indicated by *Handle*. *Buffer* only holds information payload. (See in Bluetooth specification, L2CAP Data Packet Format for more detail.) Handle

Status Codes Returned

EFI_SUCCESS	The L2CAP message is sent successfully.
EFI_NOT_FOUND	*Handle* is invalid or not found.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *BufferSize* is NULL. • * *BufferSize* is 0. • *Buffer* is NULL.
EFI_TIMEOUT	Sending L2CAP message fail due to timeout.
EFI_DEVICE_ERROR	Sending L2CAP message fail due to host controller or device error.

26.2.9 BLUETOOTH_IO_PROTOCOL.L2CapReceive

Summary

Receive L2CAP message (excluding L2CAP header) from a specific channel.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_RECEIVE)(
  IN EFI_BLUETOOTH_IO_PROTOCOL         *This,
  IN EFI_HANDLE                        Handle,
  OUT UINTN                            *BufferSize,
  OUT VOID                             **Buffer,
  IN UINTN                             Timeout
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_IO_PROTOCOL* instance.

Handle

A handle created by *EFI_BLUETOOTH_IO_PROTOCOL.L2CapConnect* indicates which channel to receive.

BufferSize

Indicates the size, in bytes, of the data buffer specified by *Buffer*.

Buffer

A pointer to the buffer of data that will be received from Bluetooth L2CAP layer. Callee allocates this buffer by using EFI Boot Service *AllocatePool()*.

Timeout

Indicating the transfer should be completed within this time frame. The units are in milliseconds. If *Timeout* is 0, then the caller must wait for the function to be completed until *EFI_SUCCESS* or *EFI_DEVICE_ERROR* is returned.

Description

The L2CapReceive() function receives L2CAP layer message (excluding L2CAP header) from Bluetooth channel indicated by *Handle*. *Buffer* only holds information payload. (See in Bluetooth specification, L2CAP Data Packet Format for more detail.)

Status Codes Returned

EFI_SUCCESS	The L2CAP message is received successfully.
EFI_NOT_FOUND	*Handle* is invalid or not found.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *BufferSize* is NULL. • * *BufferSize* is 0. • *Buffer* is NULL.
EFI_TIMEOUT	Receiving L2CAP message fail due to timeout.
EFI_DEVICE_ERROR	Receiving L2CAP message fail due to host controller or device error.

26.2.10 BLUETOOTH_IO_PROTOCOL.L2CapAsyncReceive

Summary

Receive L2CAP message (including L2CAP header) in non-blocking way from a specific channel.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_ASYNC_RECEIVE)(
  IN EFI_BLUETOOTH_IO_PROTOCOL                 *This,
  IN EFI_HANDLE                                Handle,
  IN EFI_BLUETOOTH_IO_CHANNEL_SERVICE_CALLBACK  Callback,
  IN VOID                                      *Context
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_IO_PROTOCOL* instance.

Handle

A handle created by *EFI_BLUETOOTH_IO_PROTOCOL.L2CapConnect* indicates which channel to receive.

Callback

The callback function. This function is called if the asynchronous transfer is completed.

Context

Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The L2CapAsyncReceive() function receives L2CAP layer message (excluding L2CAP header) in non-blocking way from Bluetooth channel indicated by *Handle*. *Data* in *Callback* function only holds information payload. (See in Bluetooth specification, L2CAP Data Packet Format for more detail.)

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_CHANNEL_SERVICE_CALLBACK) (
  IN VOID                     *Data,
  IN UINTN                    DataLength,
  IN VOID                     *Context
  );
```

Data

Data received via asynchronous transfer.

DataLength

The length of *Data* in bytes, received via asynchronous transfer.

Context

Context passed from asynchronous transfer request.

Status Codes Returned

EFI_SUCCESS	The L2CAP asynchronous receive request is submitted successfully.
EFI_NOT_FOUND	*Handle* is invalid or not found.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *DataLength* is 0. • If an asynchronous receive request already exists on same *Handle*.

26.2.11 BLUETOOTH_IO_PROTOCOL.L2CapConnect

Summary

Do L2CAP connection.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_CONNECT)(
  IN EFI_BLUETOOTH_IO_PROTOCOL                  *This,
  OUT EFI_HANDLE                                *Handle,
  IN UINT16                                     Psm,
  IN UINT16                                     Mtu,
```

(continues on next page)

(continued from previous page)

```
  IN EFI_BLUETOOTH_IO_CHANNEL_SERVICE_CALLBACK  Callback,
  IN VOID                                       *Context
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_IO_PROTOCOL* instance.

Handle
A handle to indicate this L2CAP connection.

Psm
Bluetooth PSM. See Bluetooth specification for detail.

Mtu
Bluetooth MTU. See Bluetooth specification for detail.

Callback
The callback function. This function is called whenever there is message received in this channel.

Context
Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The L2CapConnect() function does all necessary steps for Bluetooth L2CAP layer connection in blocking way. It might take long time. Once this function is returned *Handle* is created to indicate the connection.

Status Codes Returned

EFI_SUCCESS	The Bluetooth L2CAP layer connection is created successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *Handle* is NULL.
EFI_DEVICE_ERROR	A hardware error occurred trying to do Bluetooth L2CAP connection.

26.2.12 BLUETOOTH_IO_PROTOCOL.L2CapDisconnect

Summary

Do L2CAP disconnection.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_DISCONNECT)(
  IN EFI_BLUETOOTH_IO_PROTOCOL     *This,
  IN EFI_HANDLE                    Handle
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_IO_PROTOCOL* instance.

Handle

A handle to indicate this L2CAP connection.

Description

The L2CapDisconnect() function does all necessary steps for Bluetooth L2CAP layer disconnection in blocking way. It might take long time. Once this function is returned *Handle* is no longer valid.

Status Codes Returned

EFI_SUCCESS	The Bluetooth L2CAP layer disconnection is created successfully.
EFI_NOT_FOUND	*Handle* is invalid or not found.
EFI_DEVICE_ERROR	A hardware error occurred trying to do Bluetooth L2CAP disconnection.

26.2.13 BLUETOOTH_IO_PROTOCOL.L2CapRegisterService

Summary

Register L2CAP callback function for special channel.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_REGISTER_SERVICE)(
  IN EFI_BLUETOOTH_IO_PROTOCOL                   *This,
  OUT EFI_HANDLE                                 *Handle,
  IN UINT16                                      Psm,
  IN UINT16                                      Mtu,
  IN EFI_BLUETOOTH_IO_CHANNEL_SERVICE_CALLBACK  Callback,
  IN VOID                                        *Context
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_IO_PROTOCOL* instance.

Handle

Psm

Bluetooth PSM. See Bluetooth specification for detail.

Mtu

Bluetooth MTU. See Bluetooth specification for detail.

Callback

The callback function. This function is called whenever there is message received in this channel. *NULL* means unregister.

Context

Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The L2CapRegisterService() function registers L2CAP callback function for a special channel. Once this function is returned *Handle* is created to indicate the connection.

Status Codes Returned

EFI_SUCCESS	The Bluetooth L2CAP callback function is registered successfully.
EFI_ALREADY_STARTED	The callback function already exists when register.
EFI_NOT_FOUND	The callback function does not exist when unregister.

26.3 EFI Bluetooth Configuration Protocol

26.3.1 EFI_BLUETOOTH_CONFIG_PROTOCOL

Summary

This protocol abstracts user interface configuration for Bluetooth device.

GUID

```
#define EFI_BLUETOOTH_CONFIG_PROTOCOL_GUID \
  { 0x62960cf3, 0x40ff, 0x4263,\
    { 0xa7, 0x7c, 0xdf, 0xde, 0xbd, 0x19, 0x1b, 0x4b }}
```

Protocol Interface Structure

```
typedef struct  _EFI_BLUETOOTH_CONFIG_PROTOCOL {
  EFI_BLUETOOTH_CONFIG_INIT                  Init;
  EFI_BLUETOOTH_CONFIG_SCAN                  Scan;
  EFI_BLUETOOTH_CONFIG_CONNECT               Connect;
  EFI_BLUETOOTH_CONFIG_DISCONNECT            Disconnect;
  EFI_BLUETOOTH_CONFIG_GET_DATA              GetData;
  EFI_BLUETOOTH_CONFIG_SET_DATA              SetData;
  EFI_BLUETOOTH_CONFIG_GET_REMOTE_DATA       GetRemoteData;
EFI_BLUETOOTH_CONFIG_REGISTER_PIN_CALLBACK                   RegisterPinCallback;
EFI_BLUETOOTH_CONFIG_REGISTER_GET_LINK_KEY_CALLBACK        RegisterGetLinkKeyCallback;
EFI_BLUETOOTH_CONFIG_REGISTER_SET_LINK_KEY_CALLBACK        RegisterSetLinkKeyCallback;
EFI_BLUETOOTH_CONFIG_REGISTER_CONNECT_COMPLETE_CALLBACK   ␣
↪RegisterLinkConnectCompleteCallback;
} EFI_BLUETOOTH_CONFIG_PROTOCOL;
```

Parameters

Init
Initialize Bluetooth host controller and local device. See the *Init()* function description.

Scan
Scan Bluetooth device. See the *Scan()* function description.

Connect
Connect one Bluetooth device. See the *Connect()* function description.

Disconnect
Disconnect one Bluetooth device. See the *Disconnect()* function description.

GetData
Get Bluetooth configuration data. See the *GetData()* function description.

SetData
Set Bluetooth configuration data. See the *SetData()* function description.

GetRemoteData
Get remote Bluetooth device data. See the *GetRemoteData()* function description.

RegisterPinCallback
Register PIN callback function. See the *RegisterPinCallback()* function description.

RegisterGetLinkKeyCallback
Register get link key callback function. See the *RegisterGetLinkKeyCallback()* function description.

RegisterSetLinkKeyCallback
Register set link key callback function. See the *RegisterSetLinkKeyCallback()* function description.

RegisterLinkConnectCompleteCallback
Register link connect complete callback function. See the *RegisterLinkConnectCompleteCallback()* function description.

Description

The EFI_BLUETOOTH_CONFIG_PROTOCOL abstracts the Bluetooth configuration. User can use Bluetooth configuration to interactive with Bluetooth bus driver.

26.3.2 BLUETOOTH_CONFIG_PROTOCOL.Init

Summary

Initialize Bluetooth host controller and local device.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_INIT)(
  IN EFI_BLUETOOTH_CONFIG_PROTOCOL     *This
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

Description

The *Init()* function initializes Bluetooth host controller and local device.

Status Codes Returned

EFI_SUCCESS	The Bluetooth host controller and local device is initialized successfully.
EFI_DEVICE_ERROR	A hardware error occurred trying to initialize the Bluetooth host controller and local device.

26.3.3 BLUETOOTH_CONFIG_PROTOCOL.Scan

Summary

Scan Bluetooth device.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_SCAN)(
  IN EFI_BLUETOOTH_CONFIG_PROTOCOL                 *This,
  IN BOOLEAN                                       ReScan,
  IN UINT8                                         ScanType,
  IN EFI_BLUETOOTH_CONFIG_SCAN_CALLBACK_FUNCTION   Callback
  IN VOID                                          *Context
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

ReScan

If *TRUE,* a new scan request is submitted no matter there is scan result before. If *FALSE* and there is scan result, the previous scan result is returned and no scan request is submitted.

ScanType

Bluetooth scan type, Inquiry and/or Page. See Bluetooth specification for detail.

Callback

The callback function. This function is called if a Bluetooth device is found during scan process.

Context

Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The Scan() function scans Bluetooth device. When this function is returned, it just means scan request is submitted. It does not mean scan process is started or finished. Whenever there is a Bluetooth device is found, the *Callback* function will be called. *Callback* function might be called before this function returns or after this function returns.

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_SCAN_CALLBACK_FUNCTION) (
IN EFI_BLUETOOTH_CONFIG_PROTOCOL               *This,
IN VOID                                        *Context,
IN EFI_BLUETOOTH_SCAN_CALLBACK_INFORMATION     *CallbackInfo
);
```

This

Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

Context

Context passed from scan request.

CallbackInfo

Data related to scan result. *NULL CallbackInfo* means scan complete.

```
typedef
typedef struct{
  BLUETOOTH_ADDRESS                     BDAddr;
  UINT8                                 RemoteDeviceState;
  BLUETOOTH_CLASS_OF_DEVICE             ClassOfDevice;
  UINT8                                 RemoteDeviceName[BLUETOOTH_HCI_COMMAND_LOCAL_
↪READABLE_NAME_MAX_SIZE];
}  EFI_BLUETOOTH_SCAN_CALLBACK_INFORMATION;

#define BLUETOOTH_HCI_COMMAND_LOCAL_READABLE_NAME_MAX_SIZE 248
```

Status Codes Returned

EFI_SUCCESS	The Bluetooth scan request is submitted.
EFI_DEVICE_ERROR	A hardware error occurred trying to scan the Bluetooth device.

26.3.4 BLUETOOTH_CONFIG_PROTOCOL.Connect

Summary

Connect a Bluetooth device.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_CONNECT)(
  IN EFI_BLUETOOTH_CONFIG_PROTOCOL     *This,
  IN BLUETOOTH_ADDRESS                 *BD_ADDR
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

BD_ADDR

The address of Bluetooth device to be connected.

Description

The Connect() function connects a Bluetooth device. When this function is returned successfully, a new *EFI_BLUETOOTH_IO_PROTOCOL* is created.

Status Codes Returned

EFI_SUCCESS	The Bluetooth device is connected successfully.
EFI_ALREADY_STARTED	The Bluetooth device is already connected.
EFI_NOT_FOUND	The Bluetooth device is not found.
EFI_DEVICE_ERROR	A hardware error occurred trying to connect the Bluetooth device.

26.3.5 BLUETOOTH_CONFIG_PROTOCOL.Disconnect

Summary

Disconnect a Bluetooth device.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_DISCONNECT)(
  IN EFI_BLUETOOTH_CONFIG_PROTOCOL        *This,
  IN BLUETOOTH_ADDRESS                    *BD_ADDR,
  IN UINT8 *Reason
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

BD_ADDR
The address of Bluetooth device to be connected.

Reason
Bluetooth disconnect reason. See Bluetooth specification for detail.

Description

The Disconnect() function disconnects a Bluetooth device. When this function is returned successfully, the *EFI_BLUETOOTH_IO_PROTOCOL* associated with this device is destroyed and all services associated are stopped.

Status Codes Returned

EFI_SUCCESS	The Bluetooth device is disconnected successfully.
EFI_NOT_STARTED	The Bluetooth device is not connected.
EFI_NOT_FOUND	The Bluetooth device is not found.
EFI_DEVICE_ERROR	A hardware error occurred trying to disconnect the Bluetooth device.

26.3.6 BLUETOOTH_CONFIG_PROTOCOL.GetData

Summary

Get Bluetooth configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_GET_DATA) (
  IN EFI_BLUETOOTH_CONFIG_PROTOCOL           *This,
  IN EFI_BLUETOOTH_CONFIG_DATA_TYPE          DataType,
  IN OUT UINTN                               *DataSize,
  IN OUT VOID                                *Data
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

DataType

Configuration data type.

DataSize

On input, indicates the size, in bytes, of the data buffer specified by *Data*. On output, indicates the amount of data actually returned.

Data

A pointer to the buffer of data that will be returned.

Description

The GetData() function returns Bluetooth configuration data. For remote Bluetooth device configuration data, please use *GetRemoteData()* function with valid BD_ADDR.

Related Definitions

  EfiBluetoothConfigDataTypeMax,
}   EFI_BLUETOOTH_CONFIG_DATA_TYPE;
```

EfiBluetoothConfigDataTypeAdvertisementDataReport Advertisement report. Data structure is *UNIT8[]*.

EfiBluetoothConfigDataTypeKeyType

KeyType of Authentication Requirements flag of local device as *UINT8,* indicating requested security properties. See Bluetooth specification 3.H.3.5.1. BIT0: MITM, BIT1: SC.

EfiBluetoothConfigDataTypeDeviceName

Local/Remote Bluetooth device name. Data structure is zero terminated *CHAR8[]*.

EfiBluetoothConfigDataTypeClassOfDevice

nLocal/Remote Bluetooth device ClassOfDevice. Data structure is *BLUETOOTH_CLASS_OF_DEVICE*.

EfiBluetoothConfigDataTypeRemoteDeviceState

Remove Bluetooth device state. Data structure is *EFI_BLUETOOTH_CONFIG_REMOTE_DEVICE_STATE_TYPE*.

EfiBluetoothConfigDataTypeSdpInfo

Local/Remote Bluetooth device SDP information. Data structure is *UINT8[]*.

EfiBluetoothConfigDataTypeBDADDR

Local Bluetooth device address. Data structure is *BLUETOOTH_ADDRESS*.

EfiBluetoothConfigDataTypeDiscoverable
Local Bluetooth discoverable state. Data structure is *UINT8*. (Page scan and/or Inquiry scan)

EfiBluetoothConfigDataTypeControllerStoredPairedDeviceList
Local Bluetooth controller stored paired device list. Data structure is *BLUETOOTH_ADDRESS[]*.

EfiBluetoothConfigDataTypeAvailableDeviceList
Local available device list. Data structure is *BLUETOOTH_ADDRESS[]*.

```
typedef EFI_BLUETOOTH_CONFIG_REMOTE_DEVICE_STATE_TYPE UINT32;
#define EFI_BLUETOOTH_CONFIG_REMOTE_DEVICE_STATE_CONNECTED 0x1
#define EFI_BLUETOOTH_CONFIG_REMOTE_DEVICE_STATE_PAIRED 0x2

#define BLUETOOTH_HCI_LINK_KEY_SIZE 16
```

Status Codes Returned

EFI_SUCCESS	The Bluetooth configuration data is returned successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • DataSize is NULL. • * DataSize is not 0 and Data is NULL
EFI_UNSUPPORTED	The DataType is unsupported.
EFI_NOT_FOUND	The DataType is not found.
EFI_BUFFER_TOO_SMALL	The buffer is too small to hold the buffer. DataSize has been updated with the size needed to complete the request.

26.3.7 BLUETOOTH_CONFIG_PROTOCOL.SetData

Summary

Set Bluetooth configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_SET_DATA) (
  IN EFI_BLUETOOTH_CONFIG_PROTOCOL        *This,
  IN EFI_BLUETOOTH_CONFIG_DATA_TYPE       DataType,
  IN UINTN                                DataSize,
  IN VOID                                 *Data
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

DataType
Configuration data type.

DataSize
Indicates the size, in bytes, of the data buffer specified by *Data*.

Data

A pointer to the buffer of data that will be set.

Description

The SetData() function sets local Bluetooth device configuration data. Not all DataType can be set.

Status Codes Returned

EFI_SUCCESS	The Bluetooth configuration data is set successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *DataSize* is 0. • *Data* is NULL.
EFI_UNSUPPORTED	The *DataType* is unsupported.
EFI_WRITE_PROTECTED	Cannot set configuration data.

26.3.8 BLUETOOTH_CONFIG_PROTOCOL.GetRemoteData

Summary

Get remove Bluetooth device configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_GET_REMOTE_DATA) (
  IN EFI_BLUETOOTH_CONFIG_PROTOCOL          *This,
  IN EFI_BLUETOOTH_CONFIG_DATA_TYPE         DataType,
  IN BLUETOOTH_ADDRESS                      *BDAddr,
  IN OUT UINTN                              *DataSize,
  IN OUT VOID                               *Data
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

DataType

Configuration data type.

BDAddr

Remote Bluetooth device address.

DataSize

On input, indicates the size, in bytes, of the data buffer specified by *Data*. On output, indicates the amount of data actually returned.

Data

A pointer to the buffer of data that will be returned.

Description

The GetRemoteData() function returns remote Bluetooth device configuration data.

Status Codes Returned

EFI_SUCCESS	The remote Bluetooth device configuration data is returned successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • DataSize is NULL. • * DataSize is not 0 and Data is NULL
EFI_UNSUPPORTED	The DataType is unsupported.
EFI_NOT_FOUND	The DataType is not found.
EFI_BUFFER_TOO_SMALL	The buffer is too small to hold the buffer. DataSize has been updated with the size needed to complete the request.

26.3.9 BLUETOOTH_CONFIG_PROTOCOL.RegisterPinCallback

Summary

Register PIN callback function.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_REGISTER_PIN_CALLBACK) (
  IN EFI_BLUETOOTH_CONFIG_PROTOCOL                       *This,
  IN EFI_BLUETOOTH_CONFIG_REGISTER_PIN_CALLBACK_FUNCTION *Callback,
  IN VOID                                                *Context
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

Callback
The callback function. *NULL* means unregister.

Context
Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The RegisterPinCallback() function registers Bluetooth PIN callback function. The Bluetooth configuration driver must call *RegisterPinCallback()* to register a callback function. During pairing, Bluetooth bus driver must trigger this callback function, and Bluetooth configuration driver must handle callback function according to *CallbackType* during pairing. Both Legacy pairing and SSP (secure simple pairing) are required to be supported. See EFI_BLUETOOTH_PIN_CALLBACK_TYPE below for detail of each pairing mode.

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_REGISTER_PIN_CALLBACK_FUNCTION)   (
  IN EFI_BLUETOOTH_CONFIG_PROTOCOL * *This,
  IN VOID * *Context,

  IN VOID * *InputBuffer,
```

(continues on next page)

(continued from previous page)

```
  IN UINTN *InputBufferSize,
  OUT VOID ** *OutputBuffer,
  OUT UINTN * *OutputBufferSize
);
```

This
Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

Context
Context passed from registration.

CallbackType* Callback type in *EFI_BLUETOOTH_PIN_CALLBACK_TYPE*.

InBuffer
A pointer to the buffer of data that is input from callback caller.

InputBufferSize
Indicates the size, in bytes, of the data buffer specified by *InBuffer*.

OutputBuffer
A pointer to the buffer of data that will be output from callback callee. Callee allocates this buffer by using EFI Boot Service *AllocatePool()*.

OutputBufferSize*
Indicates the size, in bytes, of the data buffer specified by *OutputBuffer*.

```
typedef enum {
  EfiBluetoothCallbackTypeUserPasskeyNotification,
  EfiBluetoothCallbackTypeUserConfirmationRequest,
  EfiBluetoothCallbackTypeOOBDataRequest,
  EfiBluetoothCallbackTypePinCodeRequest,
  EfiBluetoothCallbackTypeMax,
} EFI_BLUETOOTH_PIN_CALLBACK_TYPE;
```

EfiBluetoothCallbackTypeUserPasskeyNotification
For SSP - passkey entry. Input buffer is Passkey (4 bytes). No output buffer. See Bluetooth HCI command for detail.

EfiBluetoothCallbackTypeUserConfirmationRequest
For SSP - just work and numeric comparison. Input buffer is numeric value (4 bytes). Output buffer is BOOLEAN (1 byte). See Bluetooth HCI command for detail.

EfiBluetoothCallbackTypeOOBDataRequest
For SSP - OOB. See Bluetooth HCI command for detail.

EfiBluetoothCallbackTypePinCodeRequest
For legacy paring. No input buffer. Output buffer is PIN code (<= 16 bytes). See Bluetooth HCI command for detail.

Status Codes Returned

EFI_SUCCESS	The PIN callback function is registered successfully.

26.3.10 BLUETOOTH_CONFIG_PROTOCOL.RegisterGetLinkKeyCallback

Summary

Register get link key callback function.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_REGISTER_GET_LINK_KEY_CALLBACK) (
  IN EFI_BLUETOOTH_CONFIG_PROTOCOL                            *This,
  IN EFI_BLUETOOTH_CONFIG_REGISTER_GET_LINK_KEY_CALLBACK_FUNCTION    Callback,
  IN VOID                                                     *Context
);
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

Callback
The callback function. *NULL* means unregister.

Context
Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The RegisterGetLinkKeyCallback() function registers Bluetooth get link key callback function. The Bluetooth configuration driver may call *RegisterGetLinkKeyCallback()* to register a callback function. When Bluetooth bus driver get Link_Key_Request_Event, Bluetooth bus driver must trigger this callback function if it is registered. Then the callback function in Bluetooth configuration driver must pass link key to Bluetooth bus driver. When the callback function is returned Bluetooth bus driver gets link key and must send HCI_Link_Key_Request_Reply to remote device. If this *GetLinkKey* callback function is not registered or Bluetooth configuration driver fails to return a valid link key, the Bluetooth bus driver must send HCI_Link_Key_Request_Negative_Reply to remote device. The original link key is passed by Bluetooth bus driver to Bluetooth configuration driver by using *EFI_BLUETOOTH_CONFIG_REGISTER_SET_LINK_KEY_CALLBACK_FUNCTION* . The Bluetooth configuration driver need save link key to a non-volatile safe place. (See Bluetooth specification, HCI_Link_Key_Request_Reply)

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI    *EFI_BLUETOOTH_CONFIG_REGISTER_GET_LINK_KEY_CALLBACK_FUNCTION) (

IN VOID                                         *Context,
IN BLUETOOTH_ADDRESS                            *BDAddr,
  OUT UINT8                                     LinkKey[BLUETOOTH_HCI_LINK_KEY_SIZE]
  );
```

This
Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

Context
Context passed from registration.

CallbackType
Callback type in *EFI_BLUETOOTH_PIN_CALLBACK_TYPE*.

BDAddr
A pointer to Bluetooth device address.

LinkKey
A pointer to the buffer of link key.

Status Codes Returned

EFI_SUCCESS	The link key callback function is registered successfully.

26.3.11 BLUETOOTH_CONFIG_PROTOCOL.RegisterSetLinkKeyCallback

Summary

Register set link key callback function.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_REGISTER_SET_LINK_KEY_CALLBACK) (
  IN EFI_BLUETOOTH_CONFIG_PROTOCOL       *This,
  IN EFI_BLUETOOTH_CONFIG_REGISTER_SET_LINK_KEY_CALLBACK_FUNCTION    *Callback,
  IN VOID                                *Context
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

Callback
The callback function. *NULL* means unregister.

Context
Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The RegisterSetLinkKeyCallback() function registers Bluetooth link key callback function. The Bluetooth configuration driver may call *RegisterSetLinkKeyCallback()* to register a callback function to get link key from Bluetooth bus driver. When Bluetooth bus driver gets Link_Key_Notification_Event, Bluetooth bus driver must call this callback function if it is registered. Then the callback function in Bluetooth configuration driver must save link key to a safe place. This link key will be used by *EFI_BLUETOOTH_CONFIG_REGISTER_GET_LINK_KEY_CALLBACK_FUNCTION* later. (See Bluetooth specification, Link_Key_Notification_Event)

Related Definitions

  );
```

This
Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

Context
Context passed from registration.

CallbackType
Callback type in *EFI_BLUETOOTH_PIN_CALLBACK_TYPE*.

BDAddr
A pointer to Bluetooth device address.

LinkKey
A pointer to the buffer of link key.

Status Codes Returned

EFI_SUCCESS	The link key callback function is registered successfully.

26.3.12 BLUETOOTH_CONFIG_PROTOCOL.RegisterLinkConnectCompleteCallback

Summary

Register link connect complete callback function.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_REGISTER_CONNECT_COMPLETE_CALLBACK) (
  IN EFI_BLUETOOTH_CONFIG_PROTOCOL                                  *This,
  IN EFI_BLUETOOTH_CONFIG_REGISTER_CONNECT_COMPLETE_CALLBACK_FUNCTION  Callback,
  IN VOID                                                           *Context
);
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

Callback
The callback function. *NULL* means unregister. to *CallbackType* defined by *EFI_BLUETOOTH_CONNECT_COMPLETE_CALLBACK_TYPE*.

Context
Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The RegisterLinkConnectCompleteCallback() function registers Bluetooth link connect complete callback function. The Bluetooth Configuration driver may call *RegisterLinkConnectCompleteCallback()* to register a callback function. During pairing, Bluetooth bus driver must trigger this callback function to report device state, if it is registered. Then Bluetooth Configuration driver will get information on device connection, according

  IN VOID                                           *InputBuffer,
  IN UINTN                                          InputBufferSize
  );
```

This

Pointer to the *EFI_BLUETOOTH_CONFIG_PROTOCOL* instance.

Context

Context passed from registration.

CallbackType

Callback type in *EFI_BLUETOOTH_CONNECT_COMPLETE_CALLBACK_TYPE*.

BDAddr

A pointer to Bluetooth device address.

InputBuffer

A pointer to the buffer of data that is input from callback caller.

InputBufferSize

Indicates the size, in bytes, of the data buffer specified by *InputBuffer*.

```
typedef enum {
  EfiBluetoothConnCallbackTypeDisconnected,
  EfiBluetoothConnCallbackTypeConnected,
  EfiBluetoothConnCallbackTypeAuthenticated,
  EfiBluetoothConnCallbackTypeEncrypted,
} EFI_BLUETOOTH_CONNECT_COMPLETE_CALLBACK_TYPE;
```

EfiBluetoothConnCallbackTypeDisconnected

This callback is called when Bluetooth receive Disconnection_Complete event. Input buffer is Event Parameters of Disconnection_Complete Event defined in Bluetooth specification.

EfiBluetoothConnCallbackTypeConnected

This callback is called when Bluetooth receive Connection_Complete event. Input buffer is Event Parameters of Connection_Complete Event defined in Bluetooth specification.

EfiBluetoothConnCallbackTypeAuthenticated

This callback is called when Bluetooth receive Authentication_Complete event. Input buffer is Event Parameters of Authentication_Complete Event defined in Bluetooth specification.

EfiBluetoothConnCallbackTypeEncrypted

This callback is called when Bluetooth receive Encryption_Change event. Input buffer is Event Parameters of Encryption_Change Event defined in Bluetooth specification.

Status Codes Returned

EFI_SUCCESS	The link connect complete callback function is registered successfully.

26.4 EFI Bluetooth Attribute Protocol

26.4.1 EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL

Summary

This protocol provides service for Bluetooth ATT (Attribute Protocol) and GATT (Generic Attribute Profile) based protocol interfaces.

GUID

```
#define EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL_GUID \
  { 0x898890e9, 0x84b2, 0x4f3a, { 0x8c, 0x58, 0xd8, 0x57, 0x78, 0x13, 0xe0, 0xac }}
```

Protocol Interface Structure

„ code-block:

```
typedef struct  _EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL {
  EFI_BLUETOOTH_ATTRIBUTE_SEND_REQUEST          SendRequest;
  EFI_BLUETOOTH_ATTRIBUTE_REGISTER_FOR_SERVER_NOTIFICATION RegisterForServerNotification;
  EFI_BLUETOOTH_ATTRIBUTE_GET_SERVICE_INFO      GetServiceInfo;
  EFI_BLUETOOTH_ATTRIBUTE_GET_DEVICE_INFO       GetDeviceInfo;
} EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL;
```

Parameters

SendRequest
Send a “REQUEST” or “COMMAND” message to remote server and receive a “RESPONSE” message for “REQUEST” from remote server according to Bluetooth attribute protocol data unit (PDU). See the SendRequest() function description.

RegisterForServerNotification
Register or unregister a server initiated PDU, such as “NOTIFICATION” or “INDICATION” on a characteristic value on remote server. See the RegisterForServerInitiatedMessage() function description.

GetServiceInfo
Get discovered service data information from connected remote device. See GetServiceInfo() function description.

GetDeviceInfo
Get the device information. See GetDeviceInfo() function description.

Description

The EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL provides services in ATT protocol and GATT profile. For detail of ATT protocol, and GATT profile, please refer to Bluetooth specification.

26.4.2 BLUETOOTH_ATTRIBUTE_PROTOCOL.SendRequest

Summary

Send a “REQUEST” or “COMMAND” message to remote server and receive a “RESPONSE” message for “REQUEST” from remote server according to Bluetooth attribute protocol data unit (PDU).

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_ATTRIBUTE_SEND_REQUEST)(
  IN EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL             *This,
  IN VOID                                         *Data,
  IN UINTN                                        DataLength,
  IN EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_FUNCTION    Callback,
  IN VOID                                         *Context
  );
```

Parameters

This
Pointer to the EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL instance.

Data
Data of a REQUEST or COMMAND message. The first byte is the attribute PDU related opcode, followed by opcode specific fields. See Bluetooth specification, Vol 3, Part F, Attribute Protocol.

DataLength
The length of Data in bytes.

Callback
Callback function to notify the RESPONSE is received to the caller, with the response buffer. Caller must check the response buffer content to know if the request action is success or fail. It may be NULL if the data is a COMMAND.

Context
Data passed into Callback function. It is optional parameter and may be NULL.

Description

The SendRequest() function sends a “REQUEST” or “COMMAND” message to remote server and receive a “RESPONSE” message for “REQUEST” from remote server according to Bluetooth attribute protocol data unit (PDU). In most cases, this interface is used to read attributes from remote device, or write attributes to remote device.

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_FUNCTION) (
IN EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL       *This,
IN VOID                                   *Data,
IN UINTN                                  DataLength,
IN VOID                                   *Context
);
```

This
Pointer to the EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL instance.

Data

Data received. The first byte is the attribute opcode, followed by opcode specific fields. See Bluetooth specification, Vol 3, Part F, Attribute Protocol. It might be a normal RESPONSE message, or ERROR RESPONSE message.

DataLength

The length of* Data *in bytes.*

Context

The context passed from the callback registration request.*

Status Codes Returned

EFI_SUCCESS	The request is sent successfully.
EFI_INVALID_PARAMETER	One or more parameters are invalid due to following conditions: • The Buffer is NULL. • The BufferLength is 0. • The opcode in Buffer is not a valid OPCODE according to Bluetooth specification. • The Callback is NULL.
EFI_DEVICE_ERROR	Sending the request failed due to the host controller or the device error.
EFI_NOT_READY	A GATT operation is already underway for this device
EFI_UNSUPPORTED	The attribute does not support the corresponding operation

26.4.3 BLUETOOTH_ATTRIBUTE_PROTOCOL.RegisterForServerNotification

Summary Register or unregister a server initiated message, such as NOTIFICATION or INDICATION, on a characteristic value on remote server.

Prototype

code-block:

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_ATTRIBUTE_REGISTER_FOR_SERVER_NOTIFICATION)(
IN EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL             *This,
IN EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_PARAMETER   *CallbackParameter,
IN EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_FUNCTION    Callback,
IN VOID                                         *Context
);
```

Parameters

This

Pointer to the EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL instance.

CallbackParameter

The parameter of the callback.

Callback

Callback function for server initiated attribute protocol. NULL callback function means unregister the server initiated callback.

Context

Data passed into Callback function. It is optional parameter and may be NULL.

Description

The RegisterForServerNotification() function can be issued to request Bluetooth to register or unregister a server initiated message, such as notification or indication, on a characteristic value on remote server. It can only be done if the characteristic supports that operation.

Related Definitions

```
typedef struct {
  UINT16               AttributeHandle;
} EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_PARAMETER_NOTIFICATION;
typedef struct {
  UINT16               AttributeHandle;
} EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_PARAMETER_INDICATION;
typedef struct {
  UINT32               Version;
  UINT8                AttributeOpCode;
 union {
 EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_PARAMETER_NOTIFICATION    Notification;
 EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_PARAMETER_INDICATION    Indication;
 } Parameter;
} EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_PARAMETER;
```

Todo: check above code, indents barely discernable

Version

The version of the structure. A value of zero represents the EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_PARAMETER structure as defined here. Future version of this specification may extend this data structure in a backward compatible way and increase the value of Version.

AttributeOpCode

The attribute opcode for server initiated attribute protocol. See Bluetooth specification, Vol 3, Part F, Attribute Protocol.

AttributeHandle

The attribute handle for notification or indication.

Status Codes Returned

EFI_SUCCESS	The callback function is registered or unregistered successfully
EFI_INVALID_PARAMETER	The attribute opcode is not server initiated message opcode. See Bluetooth specification, Vol 3, Part F, Attribute Protocol.
EFI_ALREADY_STARTED	A callback function is already registered on the same attribute opcode and attribute handle, when the Callback is not NULL.
EFI_NOT_STARTED	A callback function is not registered on the same attribute opcode and attribute handle, when the Callback is NULL.
EFI_NOT_READY	A GATT operation is already underway for this device
EFI_UNSUPPORTED	The attribute does not support notification

26.4.4 BLUETOOTH_ATTRIBUTE_PROTOCOL.GetServiceInfo

Summary

Get Bluetooth discovered service information.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_ATTRIBUTE_GET_SERVICE_INFO)(
  IN EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL        *This,
  OUT UINTN                                  *ServiceInfoSize,
  OUT VOID                                   **ServiceInfo
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL* instance.

ServiceInfoSize

A pointer to the size, in bytes, of the *ServiceInfo* buffer.

ServiceInfo

A pointer to a callee allocated buffer that returns Bluetooth discovered service information. Callee allocates this buffer by using EFI Boot Service *AllocatePool()*.

Description

The GetServiceInfo() function returns Bluetooth discovered service information. The size of *ServiceInfo* structure should never be assumed and the value of *ServiceInfoSize* is the only valid way to know the size of *ServiceInfo*. The *ServiceInfo* buffer is a list Bluetooth service information structures defined below.

Related Definitions

```
typedef struct {
  UINT8           Length;
  union {
    UINT16        Uuid16;
    UINT32        Uuid32;
    UINT8         Uuid128[16];
  } Data;
} EFI_BLUETOOTH_UUID;
```

Length

The length of Bluetooth UUID data. The valid value is 2, 4, or 16.

Uuid16

The 16-bit Bluetooth UUID data.

Uuid32

The 32-bit Bluetooth UUID data.

Uuid128

The 128-bit Bluetooth UUID data.

```
typedef struct {
  EFI_BLUETOOTH_UUID                  Type;
  UINT16                              Length;
  UINT16                              AttributeHandle;
  EFI_BLUETOOTH_ATTRIBUTE_PERMISSION  AttributePermission;
}  EFI_BLUETOOTH_ATTRIBUTE_HEADER;
```

Type

The type of this structure. It must be EFI_BLUETOOTH_UUID. See Bluetooth GATT definition. Primary Service is 0x2800. Secondary Service is 0x2801. Include Service is 0x2802. Characteristic is 0x2803. Characteristic Descriptor is 0x2900.

Length

The length of this structure.

AttributeHandle

The handle of the service declaration. See Bluetooth specification.

AttributePermission

The permission of the attribute. This field is only valid for the attribute of the local device. This field should be ignored for the attribute of the remote device.

```
//
// Bluetooth Attribute Permission
//
typedef union {
 struct {
    UINT16     Readable : 1;
    UINT16     ReadEncryption : 1;
    UINT16     ReadAuthentication : 1;
    UINT16     ReadAuthorization : 1;
    UINT16     ReadKeySize : 5;
    UINT16     Reserved1 : 7;
    UINT16     Writeable : 1;
    UINT16     WriteEncryption : 1;
    UINT16     WriteAuthentication : 1;
    UINT16     WriteAuthorization : 1;
    UINT16     WriteKeySize : 5;
    UINT16     Reserved2 : 7;
 } Permission;
 UINT32 Data32;
} EFI_BLUETOOTH_ATTRIBUTE_PERMISSION;
```

Readable

The attribute is readable.

ReadEncryption

The encryption is required on read.

ReadAuthentication

The authentication is required on read.

ReadAuthorization

The authorization is required on read.

ReadKeySize

The size of key in bytes on read.

Writeable
The attribute is writeable.

WriteEncryption
The encryption is required on write.

WriteAuthentication
The authentication is required on write.

WriteAuthorization
The authorization is required on write.

WriteKeySize
The size of key in bytes on write.

```
typedef struct {
   EFI_BLUETOOTH_ATTRIBUTE_HEADER  Header;
   UINT16                          EndGroupHandle;
   EFI_BLUETOOTH_UUID              ServiceUuid;
}   EFI_BLUETOOTH_GATT_PRIMARY_SERVICE_INFO;
```

EndGroupHandle
The handle of the last attribute within the service definition. See Bluetooth specification.

Header
The header of this structure.

```
typedef struct {
  EFI_BLUETOOTH_ATTRIBUTE_HEADER     Header;
  UINT16                             StartGroupHandle;
  UINT16                             EndGroupHandle;
  EFI_BLUETOOTH_UUID                 ServiceUuid;
}  EFI_BLUETOOTH_GATT_INCLUDE_SERVICE_INFO;
```

Header
The header of this structure.

```
typedef struct {
 EFI_BLUETOOTH_ATTRIBUTE_HEADER       Header;
 UINT8                                CharacteristicProperties;
 UINT16                               CharacteristicValueHandle;
 EFI_BLUETOOTH_UUID                   CharacteristicUuid;
} EFI_BLUETOOTH_GATT_CHARACTERISTIC_INFO;
```

Header
The header of this structure.

```
typedef struct {
  EFI_BLUETOOTH_ATTRIBUTE_HEADER         Header;
  EFI_BLUETOOTH_UUID                     CharacteristicDescriptorUuid;
}  EFI_BLUETOOTH_GATT_CHARACTERISTIC_DESCRIPTOR_INFO;
```

Header
The header of this structure.

Status Codes Returned

EFI_SUCCESS	The Bluetooth discovered service information is returned successfully.
EFI_DEVICE_ERROR	A hardware error occurred trying to retrieve the Bluetooth discovered service information.

26.4.5 BLUETOOTH_ATTRIBUTE_PROTOCOL.GetDeviceInfo

Summary

Get Bluetooth device information.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_ATTRIBUTE_GET_DEVICE_INFO)(
  IN EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL      *This,
  OUT UINTN                                *DeviceInfoSize,
  OUT VOID                                 **DeviceInfo
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL* instance.

DeviceInfoSize

A pointer to the size, in bytes, of the *DeviceInfo* buffer.

DeviceInfo

A pointer to a callee allocated buffer that returns Bluetooth device information. Callee allocates this buffer by using EFI Boot Service *AllocatePool()*. If this device is Bluetooth classic device, EFI_BLUETOOTH_DEVICE_INFO should be used. If this device is Bluetooth LE device, EFI_BLUETOOTH_LE_DEVICE_INFO should be used.

Description

The GetDeviceInfo() function returns Bluetooth device information. The size of *DeviceInfo* structure should never be assumed and the value of *DeviceInfoSize* is the only valid way to know the size of *DeviceInfo*.

Related Definitions

```
typedef struct {
  UINT8                Address[6];
  UINT8                Type;
} BLUETOOTH_LE_ADDRESS;

typedef struct {
  UINT32                 Version;
  BLUETOOTH_LE_ADDRESS BD_ADDR;
  BLUETOOTH_LE_ADDRESS   DirectAddress;
  UINT8                  RSSI;
  UINTN                  AdvertismentDataSize;
  VOID                   *AdvertismentData;
}   EFI_BLUETOOTH_LE_DEVICE_INFO;
```

Version

The version of the structure. A value of zero represents th* e EFI_BLUETOOTH_LE_DEVICE_INFO structure as defined here. Future version of this specification may extend this data structure in a backward compatible way and increase the value of *Version*.

BD_ADDR

48bit Bluetooth device address and 1byte address type.

DirectAddress

48bit random device address and 1byte address type.

RSSI

Bluetooth RSSI. See Bluetooth specification for detail.

AdvertisementDataSize

The size of *AdvertisementData* in bytes.

AdvertisementData

Bluetooth LE advertisement data. See Bluetooth specification for detail.

Status Codes Returned

EFI_SUCCESS	The Bluetooth device information is returned successfully.
EFI_DEVICE_ERROR	A hardware error occurred trying to retrieve the Bluetooth device information.

26.4.6 EFI_BLUETOOTH_ATTRIBUTE_SERVICE_BINDING_PROTOCOL

Summary

The EFI Bluetooth ATTRIBUTE Service Binding Protocol is used to locate EFI Bluetooth ATTRIBUTE Protocol drivers to create and destroy child of the driver to communicate with other Bluetooth device by using Bluetooth ATTRIBUTE protocol.

GUID

```
#define EFI_BLUETOOTH_ATTRIBUTE_SERVICE_BINDING_PROTOCOL_GUID \
  { \
0x5639867a, 0x8c8e, 0x408d, 0xac, 0x2f, 0x4b, 0x61, 0xbd, 0xc0, 0xbb, 0xbb \
}
```

Description

The Bluetooth ATTRIBUTE consumer need locate EFI_BLUETOOTH_ATTRIBUTE_SERVICE_BINDING_PROTOCOL and call CreateChild() to create a new child of EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL instance. Then use EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL for Bluetooth communication. After use, the Bluetooth ATTRIBUTE consumer need call DestroyChild() to destroy it.

26.5 EFI Bluetooth LE Configuration Protocol

26.5.1 EFI_BLUETOOTH_LE_CONFIG_PROTOCOL

Summary

This protocol abstracts user interface configuration for BluetoothLe device.

GUID

```
#define EFI_BLUETOOTH_LE_CONFIG_PROTOCOL_GUID \
{ 0x8f76da58, 0x1f99, 0x4275, { 0xa4, 0xec, 0x47, 0x56, 0x51, 0x5b, 0x1c, 0xe8 }}
```

Protocol Interface Structure

```
typedef struct  _EFI_BLUETOOTH_LE_CONFIG_PROTOCOL {
  EFI_BLUETOOTH_LE_CONFIG_INIT Init;
  EFI_BLUETOOTH_LE_CONFIG_SCAN Scan;
  EFI_BLUETOOTH_LE_CONFIG_CONNECT Connect;
  EFI_BLUETOOTH_LE_CONFIG_DISCONNECT Disconnect;
  EFI_BLUETOOTH_LE_CONFIG_GET_DATA GetData;
  EFI_BLUETOOTH_LE_CONFIG_SET_DATA SetData;
  EFI_BLUETOOTH_LE_CONFIG_GET_REMOTE_DATA GetRemoteData;
EFI_BLUETOOTH_LE_CONFIG_REGISTER_SMP_AUTH_CALLBACK RegisterSmpAuthCallback;
  EFI_BLUETOOTH_LE_CONFIG_SEND_SMP_AUTH_DATA SendSmpAuthData;
  EFI_BLUETOOTH_LE_CONFIG_REGISTER_SMP_GET_DATA_CALLBACK    RegisterSmpGetDataCallback;
  EFI_BLUETOOTH_LE_CONFIG_REGISTER_SMP_SET_DATA_CALLBACK    RegisterSmpSetDataCallback;
EFI_BLUETOOTH_LE_CONFIG_REGISTER_CONNECT_COMPLETE_CALLBACK
RegisterLinkConnectCompleteCallback;
} EFI_BLUETOOTH_LE_CONFIG_PROTOCOL;
```

Parameters

Init
Initialize BluetoothLE host controller and local device. See the *Init()* function description.

Scan
Scan BluetoothLE device. See the *Scan()* function description.

Connect
Connect one BluetoothLE device. See the *Connect()* function description.

Disconnect
Disconnect one BluetoothLE device. See the *Disconnect()* function description.

GetData
Get BluetoothLE configuration data. See the *GetData()* function description.

SetData
Set BluetoothLE configuration data. See the *SetData()* function description.

GetRemoteData
Get remote BluetoothLE device data. See the *GetRemoteData()* function description.

RegisterSmpAuthCallback
Register Security Manager Callback function. This function will be called from Bluetooth BUS driver whenever user interaction is required for security protocol authorization/authentication. See the *RegisterSmpAuthCallback()* function description.

SendSmpAuthData

Send user input (Authentication/Authorization) such as passkey, confirmation (yes/no) in response to pairing request. See the *SendSmpAuthData()* function description.

RegisterSmpGetDataCallback

Register a callback function to get SMP related data. See the *RegisterSmpGetDataCallback()* function description.

RegisterSmpSetDataCallback

Register a callback function to set SMP related data. See the *RegisterSmpGetDataCallback()* function description.

RegisterLinkConnectCompleteCallback

Register link connect complete callback function. See the *RegisterLinkConnectCompleteCallback()* function description.

Description

The EFI_BLUETOOTH_LE_CONFIG_PROTOCOL abstracts the BluetoothLE configuration. User can use BluetoothLE configuration to interactive with BluetoothLE bus driver.

26.5.2 BLUETOOTH_LE_CONFIG_PROTOCOL.Init

Summary

Initialize BluetoothLE host controller and local device.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_CONFIG_INIT)(
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL *This
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

Description

The *Init()* function initializes BluetoothLE host controller and local device.

Status Codes Returned

EFI_SUCCESS	The BluetoothLE host controller and local device is initialized successfully.
EFI_DEVICE_ERROR	A hardware error occurred trying to initialize the BluetoothLE host controller and local device.

26.5.3 BLUETOOTH_LE_CONFIG_PROTOCOL.Scan

Summary

Scan BluetoothLE device.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_CONFIG_SCAN)(
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL               *This,
  IN BOOLEAN                                        ReScan,
    IN UIN32                                        Timeout;
  IN EFI_BLUETOOTH_LE_CONFIG_SCAN_PARAMETER         *ScanParameter, OPTIONAL
  IN EFI_BLUETOOTH_LE_CONFIG_SCAN_CALLBACK_FUNCTION Callback,
  IN VOID                                           *Context
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

ReScan
If *TRUE,* a new scan request is submitted no matter there is scan result before. If *FALSE* and there is scan result, the previous scan result is returned and no scan request is submitted.

Timeout
Duration in milliseconds for which to scan.

ScanParameter
If it is not *NULL,* the ScanParameter is used to perform a scan by the BluetoothLE bus driver. If it is NULL, the default parameter is used.

Callback
The callback function. This function is called if a BluetoothLE device is found during scan process.

Context
Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The Scan() function scans BluetoothLE device. When this function is returned, it just means scan request is submitted. It does not mean scan process is started or finished. Whenever there is a BluetoothLE device is found, the *Callback* function will be called. *Callback* function might be called before this function returns or after this function returns.

Related Definitions

```
typedef struct {
// Scan parameter

  UINT16               ScanWindow;
  UINT8                ScanningFilterPolicy;
```

(continues on next page)

(continued from previous page)

```
// Scan result filter
  UINT8                 AdvertisementFlagFilter;
}   EFI_BLUETOOTH_LE_CONFIG_SCAN_PARAMETER;
```

Version
The version of the structure. A value of zero represents the EFI_BLUETOOTH_LE_CONFIG_SCAN_PARAMETER structure as defined here. Future version of this specification may extend this data structure in a backward compatible way and increase the value of Version.

ScanType
Passive scanning or active scanning. See Bluetooth specification.

ScanInterval
Recommended scan interval to be used while performing scan.

ScanWindow
Recommended scan window to be used while performing a scan.

ScanningFilterPolicy
Recommended scanning filter policy to be used while performing a scan.

AdvertisementFlagFilter
This is one byte flag to serve as a filter to remove unneeded scan result. For example, set BIT0 means scan in LE Limited Discoverable Mode. Set BIT1 means scan in LE General Discoverable Mode. See Supplement to Bluetooth Core Specification.

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_CONFIG_SCAN_CALLBACK_FUNCTION) (
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL             *This,

  IN EFI_BLUETOOTH_LE_SCAN_CALLBACK_INFORMATION    *CallbackInfo
  );
```

This
Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

Context
Context passed from scan request.

CallbackInfo
Data related to scan result. *NULL* CallbackInfo means scan complete.

```
typedef struct{
  BLUETOOTH_LE_ADDRESS              BDAddr;
  BLUETOOTH_LE_ADDRESS              DirectAddress;
  UINT8                             RemoteDeviceState;
  INT8                              RSSI;
  UINTN                             AdvertisementDataSize;
  VOID                              *AdvertisementData;
}   EFI_BLUETOOTH_LE_SCAN_CALLBACK_INFORMATION;
```

Status Codes Returned

EFI_SUCCESS	The Bluetooth scan request is submitted.

continues on next page

Table 26.33 – continued from previous page

EFI_DEVICE_ERROR	A hardware error occurred trying to scan the Bluetooth device.

26.5.4 BLUETOOTH_LE_CONFIG_PROTOCOL.Connect

Summary

Connect a BluetoothLE device.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_CONFIG_CONNECT)(
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL           *This,
  IN BOOLEAN                                    AutoReconnect,
  IN BOOLEAN                                    DoBonding;
  IN EFI_BLUETOOTH_LE_CONFIG_CONNECT_PARAMETER  *ConnectParameter, OPTIONAL
  IN BLUETOOTH_LE_ADDRESS                       *BD_ADDR
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

AutoReconnect

If *TRUE*. the BluetoothLE host controller needs to do an auto reconnect. If *FALSE,* the BluetoothLE host controller does not do an auto reconnect.

DoBonding

If *TRUE,* the BluetoothLE host controller needs to do a bonding. If *FALSE,* the BluetoothLE host controller does not do a bonding.

ConnectParameter

If it is not *NULL,* the ConnectParameter is used to perform a scan by the BluetoothLE bus driver. If it is NULL, the default parameter is used.

BD_ADDR

The address of the BluetoothLE device to be connected.

Description

The *Connect()* function connects a Bluetooth device. When this function is returned successfully, a new *EFI_BLUETOOTH_IO_PROTOCOL* is created.

Related Definitions

```
typedef struct {
  UINT32       Version;
  UINT16       ScanInterval;
  UINT16       ScanWindow;
  UINT16       ConnIntervalMin;
  UINT16       ConnIntervalMax;
  UINT16       ConnLatency;
  UINT16       SupervisionTimeout;
}   EFI_BLUETOOTH_LE_CONFIG_CONNECT_PARAMETER;
```

Version

The version of the structure. A value of zero represents the EFI_BLUETOOTH_LE_CONFIG_CONNECT_PARAMETER structure as defined here. Future version of this specification may extend this data structure in a backward compatible way and increase the value of Version.

ScanInterval

Recommended scan interval to be used while performing scan before connect.

ScanWindow

Recommended scan window to be used while performing a connection.

ConnIntervalMin

Minimum allowed connection interval. Shall be less than or equal to ConnIntervalMax.

ConnIntervalMax

Maximum allowed connection interval. Shall be greater than or equal to ConnIntervalMin.

ConnLatency

Slave latency for the connection in number of connection events.

SupervisionTimeout

Link supervision timeout for the connection.

Status Codes Returned

EFI_SUCCESS	The BluetoothLE device is connected successfully.
EFI_ALREADY_STARTED	The BluetoothLE device is already connected.
EFI_NOT_FOUND	The BluetoothLE device is not found.
EFI_DEVICE_ERROR	A hardware error occurred trying to connect the BluetoothLE device.

26.5.5 BLUETOOTH_LE_CONFIG_PROTOCOL.Disconnect

Summary

Disconnect a BluetoothLE device.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_CONFIG_DISCONNECT)(
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL  *This,
  IN BLUETOOTH_LE_ADDRESS              *BD_ADDR,
  IN UINT8                             Reason
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

BD_ADDR

The address of BluetoothLE device to be connected.

Reason

BluetoothLE disconnect reason. See Bluetooth specification for detail.

Description

The Disconnect() function disconnects a BluetoothLE device. When this function is returned successfully, the *EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL* associated with this device is destroyed and all services associated are stopped.

Status Codes Returned

EFI_SUCCESS	The BluetoothLE device is disconnected successfully.
EFI_NOT_STARTED	The BluetoothLE device is not connected.
EFI_NOT_FOUND	The BluetoothLE device is not found.
EFI_DEVICE_ERROR	A hardware error occurred trying to disconnect the BluetoothLE device.

26.5.6 BLUETOOTH_LE_CONFIG_PROTOCOL.GetData

Summary

Get BluetoothLE configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_CONFIG_GET_DATA) (
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL     *This,
  IN EFI_BLUETOOTH_CONFIG_DATA_TYPE       DataType,
  IN OUT UINTN                            *DataSize,
  IN OUT VOID                             *Data
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

DataType
Configuration data type.

DataSize
On input, indicates the size, in bytes, of the data buffer specified by *Data*. On output, indicates the amount of data actually returned.

Data
A pointer to the buffer of data that will be returned.

Description

The GetData() function returns BluetoothLE configuration data. For remote BluetoothLE device configuration data, please use *GetRemoteData()* function with valid BD_ADDR.

Status Codes Returned

EFI_SUCCESS	The BluetoothLE configuration data is returned successfully.

continues on next page

Table 26.36 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *DataSize* is NULL. • * *DataSize* is 0. • *Data* is NULL.
EFI_UNSUPPORTED	The *DataType* is unsupported.
EFI_NOT_FOUND	The *DataType* is not found.
EFI_BUFFER_TOO_SMALL	The buffer is too small to hold the buffer.

26.5.7 BLUETOOTH_LE_CONFIG_PROTOCOL.SetData

Summary

Set BluetoothLE configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_CONFIG_SET_DATA) (
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL        *This,
  IN EFI_BLUETOOTH_CONFIG_DATA_TYPE          DataType,
  IN UINTN                                   DataSize,
  IN VOID                                    *Data
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

DataType

Configuration data type.

DataSize

Indicates the size, in bytes, of the data buffer specified by *Data*.

Data

A pointer to the buffer of data that will be set.

Description

The SetData() function sets local BluetoothLE device configuration data. Not all DataType can be set.

Status Codes Returned

EFI_SUCCESS	The BluetoothLE configuration data is set successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *DataSize* is 0. • *Data* is NULL.
EFI_UNSUPPORTED	The *DataType* is unsupported.

continues on next page

Table 26.37 – continued from previous page

EFI_WRITE_PROTECTED	Cannot set configuration data.

26.5.8 BLUETOOTH_LE_CONFIG_PROTOCOL.GetRemoteData

Summary

Get remove BluetoothLE device configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_CONFIG_GET_REMOTE_DATA) (
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL     *This,
  IN EFI_BLUETOOTH_CONFIG_DATA_TYPE       DataType,
  IN BLUETOOTH_LE_ADDRESS                 *BDAddr,
  IN OUT UINTN                            *DataSize,
  IN OUT VOID                             *Data
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

DataType

Configuration data type.

BDAddr

Remote BluetoothLE device address.

DataSize

On input, indicates the size, in bytes, of the data buffer specified by *Data*. On output, indicates the amount of data actually returned.

Data

A pointer to the buffer of data that will be returned.

Description

The GetRemoteData() function returns remote BluetoothLE device configuration data.

Status Codes Returned

EFI_SUCCESS	The remote BluetoothLE device configuration data is returned successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *DataSize* is NULL. • * *DataSize* is 0. • *Data* is NULL.
EFI_UNSUPPORTED	The *DataType* is unsupported.
EFI_NOT_FOUND	The *DataType* is not found.
EFI_BUFFER_TOO_SMALL	The buffer is too small to hold the buffer.

26.5.9 BLUETOOTH_LE_CONFIG_PROTOCOL.RegisterSmpAuthCallback

Summary

Register Security Manager Protocol callback function for user authentication/authorization.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_REGISTER_SMP_AUTH_CALLBACK)(
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL        *This,
  IN EFI_BLUETOOTH_LE_SMP_CALLBACK           Callback,
  IN VOID                                    *Context
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

Callback
Callback function for user authentication/authorization.

Context
Data passed into callback function. This is optional parameter and may be NULL.

Description

The RegisterSmpAuthCallback() function register Security Manager Protocol callback function for user authentication/authorization.

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_SMP_CALLBACK) (
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL        *This,
  IN VOID                                    *Context,
  IN BLUETOOTH_LE_ADDRESS                    *BDAddr,
  IN EFI_BLUETOOTH_LE_SMP_EVENT_DATA_TYPE    EventDataType,
  IN UINTN                                   DataSize,
  IN VOID                                    *Data
  );
```

This
Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

Context
Data passed into callback function. This is optional parameter and may be NULL.

BDAddr
Remote BluetoothLE device address.

EventDataType
Event data type in *EFI_BLUETOOTH_LE_SMP_EVENT_DATA_TYPE*.

DataSize
Indicates the size, in bytes, of the data buffer specified by *Data*.

Data

A pointer to the buffer of data.

```
typedef enum {
  EfiBlutoothSmpAuthorizationRequestEvent,
  EfiBlutoothSmpPasskeyReadyEvent,
  EfiBlutoothSmpPasskeyRequestEvent,
  EfiBlutoothSmpOOBDataRequestEvent,
  EfiBlutoothSmpNumericComparisonEvent,
}   EFI_BLUETOOTH_LE_SMP_EVENT_DATA_TYPE;
```

EfiBlutoothSmpAuthorizationRequestEvent

It indicates an authorization request. No data is associated with the callback input. In the output data, the application should return the authorization value. The data structure is BOOLEAN. **TRUE** means YES. **FALSE** means NO.

EfiBlutoothSmpPasskeyReadyEvent

It indicates that a passkey has been generated locally by the driver, and the same passkey should be entered at the remote device. The callback input data is the passkey of type UINT32, to be displayed by the application. No output data should be returned.

EfiBlutoothSmpPasskeyRequestEvent

It indicates that the driver is requesting for the passkey has been generated at the remote device. No data is associated with the callback input. The output data is the passkey of type UINT32, to be entered by the user.

EfiBlutoothSmpOOBDataRequestEvent

It indicates that the driver is requesting for the passkey that has been pre-shared out-of-band with the remote device. No data is associated with the callback input. The output data is the stored OOB data of type UINT8[16].

EfiBlutoothSmpNumericComparisonEvent

In indicates that a number have been generated locally by the bus driver, and also at the remote device, and the bus driver wants to know if the two numbers match. The callback input data is the number of type UINT32. The output data is confirmation value of type BOOLEAN. **TRUE** means comparison pass. **FALSE** means comparison fail.

Status Codes Returned

EFI_SUCCESS	The SMP callback function is registered successfully.
EFI_ALREADY_STARTED	A callback function is already registered on the same attribute opcode and attribute handle, when the Callback is not NULL.
EFI_NOT_STARTED	A callback function is not registered on the same attribute opcode and attribute handle, when the Callback is NULL.

26.5.10 BLUETOOTH_LE_CONFIG_PROTOCOL.SendSmpAuthData

Summary

Send user authentication/authorization to remote device.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_SEND_SMP_AUTH_DATA)(
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL        *This,
  IN BLUETOOTH_LE_ADDRESS                    *BDAddr,
```

(continues on next page)

(continued from previous page)

```
  IN EFI_BLUETOOTH_LE_SMP_EVENT_DATA_TYPE    EventDataType,
  IN UINTN                                   DataSize,
  IN VOID                                    *Data
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

BDAddr

Remote BluetoothLE device address.

EventDataType

Event data type in *EFI_BLUETOOTH_LE_SMP_EVENT_DATA_TYPE*.

DataSize

The size of *Data* in bytes, of the data buffer specified by *Data*.

Data

A pointer to the buffer of data that will be sent. The data format depends on the type of SMP event data being responded to. See *EFI_BLUETOOTH_LE_SMP_EVENT_DATA_TYPE*.

Description

The SendSmpAuthData() function sends user authentication/authorization to remote device. It should be used to send these information after the caller gets the request data from the callback function by RegisterSmpAuthCallback ().

Status Codes Returned

EFI_SUCCESS	The SMP authorization data is sent successfully.
EFI_NOT_READY	SMP is not in the correct state to receive the auth data

26.5.11 BLUETOOTH_LE_CONFIG_PROTOCOL.RegisterSmpGetDataCallback

Summary

Register a callback function to get SMP related data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI * EFI_BLUETOOTH_LE_CONFIG_REGISTER_SMP_GET_DATA_CALLBACK )(
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL                *This,
  IN EFI_BLUETOOTH_LE_CONFIG_SMP_GET_DATA_CALLBACK   Callback,
  IN VOID                                            *Context
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

Callback

Callback function for SMP get data.

Context

Data passed into callback function. This is optional parameter and may be NULL.

Description

The RegisterSmpGetDataCallback() function registers a callback function to get SMP related data.

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI * EFI_BLUETOOTH_LE_CONFIG_SMP_GET_DATA_CALLBACK) (
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL            *This,
  IN VOID                                        *Context,
  IN BLUETOOTH_LE_ADDRESS                        *BDAddr,
  IN EFI_BLUETOOTH_LE_SMP_DATA_TYPE              DataType,
  IN OUT UINTN                                   *DataSize,
  OUT VOID                                       *Data
  );
```

This

Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

Context

Data passed into callback function. This is optional parameter and may be NULL.

BDAddr

Remote BluetoothLE device address. For Local device setting, it should be NULL.

DataType

Data type in *EFI_BLUETOOTH_LE_SMP_DATA_TYPE*.

DataSize

On input, indicates the size, in bytes, of the data buffer specified by *Data*. On output, indicates the amount of data actually returned.

Data

A pointer to the buffer of data that will be returned.

```
typedef enum {
  // For local device only
  EfiBluetoothSmpLocalIR, /* If Key hierarchy is supported   */
  EfiBluetoothSmpLocalER, /* If Key hierarchy is supported   */
  EfiBluetoothSmpLocalDHK, /* If Key hierarchy is supported.  OPTIONAL */

  // For peer specific
  EfiBluetoothSmpKeysDistributed = 0x1000,
  EfiBluetoothSmpKeySize,
  EfiBluetoothSmpKeyType,
  EfiBluetoothSmpPeerLTK,
  EfiBluetoothSmpPeerIRK,
  EfiBluetoothSmpPeerCSRK,
  EfiBluetoothSmpPeerRand,
  EfiBluetoothSmpPeerEDIV,
  EfiBluetoothSmpPeerSignCounter,
  EfiBluetoothSmpLocalLTK, /* If Key hierarchy not supported   */
  EfiBluetoothSmpLocalIRK, /* If Key hierarchy not supported   */
  EfiBluetoothSmpLocalCSRK, /* If Key hierarchy not supported   */
```

(continues on next page)

(continued from previous page)

```
  EfiBluetoothSmpLocalSignCounter,
  EfiBluetoothSmpLocalDIV,
  EfiBluetoothSmpPeerAddressList,
  EfiBluetoothSmpMax,
}   EFI_BLUETOOTH_LE_SMP_DATA_TYPE;
```

EfiBlutoothSmpLocalIR

It is a 128-bit Identity Root (IR) key to generate IRK. Data structure is UINT8[16]. See Bluetooth specification. This is only required when Bluetooth key hierarchy is supported. This type is for the local device only.

EfiBlutoothSmpLocalER

It is a 128-bit Encryption Root (ER) key to generate LTK and CSRK. Data structure is UINT8[16]. See Bluetooth specification. This is only required when Bluetooth key hierarchy is supported. This type is for the local device only.

EfiBlutoothSmpLocalDHK

It is a 128-bit Diversifier Hiding Key (DHK) to generate EDIV. Data structure is UINT8[16].See Bluetooth specification. This is only required when Bluetooth key hierarchy is supported. This type is for the local device only.

EfiBlutoothSmpKeysDistributed

It is LE Key Distribution Format. Data structure is UINT8. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpKeySize

It indicates the size of keys in bytes. It is the negotiated key size between local device and peer device. Data structure is UINTN. This is the peer device specific information.

EfiBlutoothSmpKeyType

Indicates support for MITM/Secure connection. It is the negotiated Authentication Requirements between local device and peer device. See Bluetooth Spec 3.H.3.5.1. Data structure is UINT8. BIT0: MITM, BIT1: SC. This is the peer device specific information.

EfiBlutoothSmpPeerLTK

It is a 128-bit Long-Term Key (LTK) to generate the contributory session key for an encrypted connection. Data structure is UINT8[16]. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpPeerIRK

It is a 128-bit Identity Resolving Key (IRK) to generate and resolve random addresses. Data structure is UINT8[16]. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpPeerCSRK

It is a 128-bit Connection-Signature Resolving Key (CSRK) to sign data and verify signatures on the receiving device. Data structure is UINT8[16]. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpPeerRand

It is a 64-bit Random number (Rand) to identify the LTK distributed during LE legacy pairing. Data structure is UINT64. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpPeerEDIV

It is a 16-bit Encrypted Diversifier (EDIV) to identify the LTK distributed during LE legacy pairing. Data structure is UINT16. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpPeerSignCounter

It is a 32-bit Sign Counter to assist MAC generation. Data structure is UINT32. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpLocakLTK

It is a 128-bit Long-Term Key (LTK) to generate the contributory session key for an encrypted connection. Data structure is UINT8[16]. See Bluetooth specification. This is only required when Bluetooth key hierarchy is not supported. This is the peer specific local device information.

EfiBlutoothSmpLocalIRK

It is a 128-bit Identity Resolving Key (IRK) to generate and resolve random addresses. Data structure is UINT8[16]. See Bluetooth specification. This is only required when Bluetooth key hierarchy is not supported. This is the peer specific local device information.

EfiBlutoothSmpLocalCSRK

It is a 128-bit Connection-Signature Resolving Key (CSRK) to sign data and verify signatures on the receiving device. Data structure is UINT8[16]. See Bluetooth specification. This is only required when Bluetooth key hierarchy is not supported. This is the peer specific local device information.

EfiBlutoothSmpLocalSignCounter

It is a 32-bit Sign Counter to assist MAC generation. Data structure is UINT32. See Bluetooth specification. This is the peer specific local device information.

EfiBlutoothSmpLocalDIV

It is a 16-bit Diversifier (DIV) to be used as index to recover LTK. Data structure is UINT16. See Bluetooth specification. This is the peer specific local device information.

EfiBluetoothSmpPeerAddressList

A list of Bluetooth peer addresses that have been connected before. The data structure is BLUETOOTH_LE_ADDRESS[]. The data size must be a multiple of sizeof(BLUETOOTH_LE_ADDRESS).

Status Codes Returned

EFI_SUCCESS	The SMP get data callback function is registered successfully.
EFI_ALREADY_STARTED	A callback function is already registered on the same attribute opcode and attribute handle, when the Callback is not NULL.
EFI_NOT_STARTED	A callback function is not registered on the same attribute opcode and attribute handle, when the Callback is NULL.

26.5.12 BLUETOOTH_LE_CONFIG_PROTOCOL.RegisterSmpSetDataCallback

Summary

Register a callback function to set SMP related data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI * EFI_BLUETOOTH_LE_CONFIG_REGISTER_SMP_SET_DATA_CALLBACK  )(
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL                   *This,
  IN EFI_BLUETOOTH_LE_CONFIG_SMP_SET_DATA_CALLBACK      Callback,
  IN VOID                                               *Context
  );
```

Parameters

This

Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

Callback

Callback function for SMP set data.

Context

Data passed into callback function. This is optional parameter and may be NULL.

Description

The RegisterSmpSetDataCallback() function registers a callback function to set SMP related data.

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI * EFI_BLUETOOTH_LE_CONFIG_SMP_SET_DATA_CALLBACK) (
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL                *This,
  IN VOID                                            *Context,
  IN BLUETOOTH_LE_ADDRESS                            *BDAddr,
  IN EFI_BLUETOOTH_LE_SMP_DATA_TYPE                  Type,
  IN UINTN                                           DataSize,
  IN VOID                                            *Data
  );
```

This

Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

Context

Data passed into callback function. This is optional parameter and may be NULL.

BDAddr

Remote BluetoothLE device address.

DataType

Data type in *EFI_BLUETOOTH_LE_SMP_DATA_TYPE*.

DataSize

Indicates the size, in bytes, of the data buffer specified by *Data*.

Data

A pointer to the buffer of data.

Status Codes Returned

EFI_SUCCESS	The SMP get data callback function is registered successfully.
EFI_ALREADY_STARTED	A callback function is already registered on the same attribute opcode and attribute handle, when the Callback is not NULL.
EFI_NOT_STARTED	A callback function is not registered on the same attribute opcode and attribute handle, when the Callback is NULL.

26.5.13 BLUETOOTH_LE_CONFIG_PROTOCOL.RegisterLinkConnectCompleteCallback

Summary

Register link connect complete callback function.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_CONFIG_REGISTER_CONNECT_COMPLETE_CALLBACK) (
```

(continues on next page)

(continued from previous page)

```
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL                       *This,
  IN EFI_BLUETOOTH_LE_CONFIG_CONNECT_COMPLETE_CALLBACK     Callback,
  IN VOID                                                   *Context
  );
```

Parameters

This
Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

Callback
The callback function. *NULL* means unregister.

Context
Data passed into *Callback* function. This is optional parameter and may be *NULL*.

Description

The RegisterLinkConnectCompleteCallback() function registers Bluetooth link connect complete callback function. The Bluetooth Configuration driver may call *RegisterLinkConnectCompleteCallback()* to register a callback function. During pairing, Bluetooth bus driver must trigger this callback function to report device state, if it is registered. Then Bluetooth Configuration driver will get information on device connection, according to *CallbackType* defined by EFI_BLUETOOTH_CONNECT_COMPLETE_CALLBACK_TYPE.

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_CONFIG_CONNECT_COMPLETE_CALLBACK) (
  IN  EFI_BLUETOOTH_LE_CONFIG_PROTOCOL              *This,
  IN  VOID                                          *Context,
  IN  EFI_BLUETOOTH_CONNECT_COMPLETE_CALLBACK_TYPE   CallbackType,
  IN  BLUETOOTH_LE_ADDRESS                          *BDAddr,
  IN  VOID                                          *InputBuffer,
  IN  UINTN                                         InputBufferSize
  );
```

This
Pointer to the *EFI_BLUETOOTH_LE_CONFIG_PROTOCOL* instance.

Context
Context passed from registration.

CallbackType
Callback type in *EFI_BLUETOOTH_CONNECT_COMPLETE_CALLBACK_TYPE*.

BDAddr
A pointer to BluetoothLE device address.

InputBuffer
A pointer to the buffer of data that is input from callback caller.

InputBufferSize
Indicates the size, in bytes, of the data buffer specified by *InputBuffer*.

Status Codes Returned

EFI_SUCCESS	The link connect complete callback function is registered successfully.
EFI_ALREADY_STARTED	A callback function is already registered on the same attribute opcode and attribute handle, when the Callback is not NULL.
EFI_NOT_STARTED	A callback function is not registered on the same attribute opcode and attribute handle, when the Callback is NULL.

CHAPTER

TWENTYSEVEN

NETWORK PROTOCOLS — VLAN, EAP, WI-FI AND SUPPLICANT

27.1 VLAN Configuration Protocol

27.1.1 EFI_VLAN_CONFIG_PROTOCOL

Summary

This protocol is to provide manageability interface for VLAN configuration.

GUID

```
#define EFI_VLAN_CONFIG_PROTOCOL_GUID \
  {0x9e23d768, 0xd2f3, 0x4366, \
    {0x9f, 0xc3, 0x3a, 0x7a, 0xba, 0x86, 0x43, 0x74}}
```

Protocol Interface Structure

```
typedef struct _EFI_VLAN_CONFIG_PROTOCOL {
  EFI_VLAN_CONFIG_SET                 Set;
  EFI_VLAN_CONFIG_FIND                Find;
  EFI_VLAN_CONFIG_REMOVE              Remove;
}   EFI_VLAN_CONFIG_PROTOCOL;
```

Parameters

Set

Create new VLAN device or modify configuration parameter of an already-configured VLAN

Find

Find configuration information for specified VLAN or all configured VLANs.

Remove

Remove a VLAN device.

Description

This protocol is to provide manageability interface for VLAN setting. The intended VLAN tagging implementation is IEEE802.1Q.

27.1.2 EFI_VLAN_CONFIG_PROTOCOL.Set()

Summary

Create a VLAN device or modify the configuration parameter of an already-configured VLAN

Prototype

```
typedef
EFI_STATUS
(EFIAPI * EFI_VLAN_CONFIG_SET) (
  IN EFI_VLAN_CONFIG_PROTOCOL         *This,
  IN UINT16                           VlanId,
  IN UINT8                            Priority
);
```

Parameters

This

Pointer to EFI_VLAN_CONFIG_PROTOCOL instance.

VlanId

A unique identifier (1-4094) of the VLAN which is being created or modified, or zero (0).

Priority

3 bit priority in VLAN header. Priority 0 is default value. If VlanId is zero (0), Priority is ignored.

Description

The *Set()* function is used to create a new VLAN device or change the VLAN configuration parameters. If the *VlanId* hasn't been configured in the physical Ethernet device, a new VLAN device will be created. If a VLAN with this *VlanId* is already configured, then related configuration will be updated as the input parameters.

If *VlanId* is zero, the VLAN device will send and receive untagged frames. Otherwise, the VLAN device will send and receive VLAN-tagged frames containing the *VlanId.*

If *VlanId* is out of scope of (0-4094), *EFI_INVALID_PARAMETER* is returned

If *Priority* is out of the scope of (0-7), then *EFI_INVALID_PARAMETER* is returned.

If there is not enough system memory to perform the registration, then *EFI_OUT_OF_RESOURCES* is returned.

Status Codes Returned

EFI_SUCCESS	The VLAN is successfully configured
EFI_INVALID_PARAMETER	One or more of following conditions is TRUE • This is NULL • VlanId is an invalid VLAN Identifier • Priority is invalid
EFI_OUT_OF_RESOURCES	There is not enough system memory to perform the registration.

27.1.3 EFI_VLAN_CONFIG_PROTOCOL.Find()

Summary

Find configuration information for specified VLAN or all configured VLANs.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_VLAN_CONFIG_FIND) (
  IN EFI_VLAN_CONFIG_PROTOCOL          *This,
  IN UINT16                            *VlanId, OPTIONAL
  OUT UINT16                           *NumberOfVlan,
  OUT EFI_VLAN_FIND_DATA               **Entries
  );
```

Parameters

This
Pointer to *EFI_VLAN_CONFIG_PROTOCOL* instance.

VlanId
Pointer to VLAN identifier. Set to *NULL* to find all configured VLANs

NumberOfVlan
The number of VLANs which is found by the specified criteria

Entries
The buffer which receive the VLAN configuration. Type *EFI_VLAN_FIND_DATA* is defined below.

Description

The *Find()* function is used to find the configuration information for matching VLAN and allocate a buffer into which those entries are copied.

Related Definitions

```
//**********************************************
// EFI_VLAN_FIND_DATA
//**********************************************
typedef struct {
  UINT16               VlanId;
  UINT8                Priority;
}   EFI_VLAN_FIND_DATA;
```

VlanId
Vlan Identifier

Priority
Priority of this VLAN

Status Codes Returned

EFI_SUCCESS	The VLAN is successfully found

continues on next page

Table 27.2 – continued from previous page

EFI_INVALID_PARAMETER	One or more of following conditions is *TRUE* • *This* is *NULL* • Specified *VlanId* is invalid
EFI_NOT_FOUND	No matching VLAN is found

27.1.4 EFI_VLAN_CONFIG_PROTOCOL.Remove()

Summary

Remove the configured VLAN device

Prototype

```
typedef
EFI_STATUS
(EFIAPI * EFI_VLAN_CONFIG_REMOVE) (
  IN EFI_VLAN_CONFIG_PROTOCOL            *This,
  IN UINT16                              VlanId
  );
```

Parameters

This

Pointer to EFI_VLAN_CONFIG_PROTOCOL instance.

VlanId

Identifier (0-4094) of the VLAN to be removed.

Description

The *Remove()* function is used to remove the specified VLAN device. If the VlanId is out of the scope of (0-4094), *EFI_INVALID_PARAMETER* is returned. If specified VLAN hasn't been previously configured, *EFI_NOT_FOUND* is returned.

Status Codes Returned

EFI_SUCCESS	The VLAN is successfully removed
EFI_INVALID_PARAMETER	One or more of following conditions is *TRUE* • *This* is *NULL* • *VlanId* is an invalid parameter.
EFI_NOT_FOUND	The to-be-removed VLAN does not exist

27.2 EAP Protocol

This section defines the EAP protocol. This protocol is designed to make the EAP framework configurable and extensible. It is intended for the supplicant side.

27.2.1 EFI_EAP_PROTOCOL

Summary

This protocol is used to abstract the ability to configure and extend the EAP framework.

GUID

```
#define EFI_EAP_PROTOCOL_GUID \
  { 0x5d9f96db, 0xe731, 0x4caa,\
    {0xa0, 0x0d, 0x72, 0xe1, 0x87, 0xcd, 0x77, 0x62 }}
```

Protocol Interface Structure

```
typedef struct _EFI_EAP_PROTOCOL {
  EFI_EAP_SET_DESIRED_AUTHENTICATION_METHOD    SetDesiredAuthMethod;
  EFI_EAP_REGISTER_AUTHENTICATION_METHOD       RegisterAuthMethod;
}   EFI_EAP_PROTOCOL;
```

Parameters

SetDesiredAuthMethod
Set the desired EAP authentication method for the Port. See the *SetDesiredAuthMethod()* function description.

RegisterAuthMethod
Register an EAP authentication method. See the *RegisterAuthMethod()* function description.

Description

EFI_EAP_PROTOCOL is used to configure the desired EAP authentication method for the EAP framework and extend the EAP framework by registering new EAP authentication method on a Port. The EAP framework is built on a per-Port basis. Herein, a Port means a NIC. For the details of EAP protocol, please refer to RFC 2284.

Related Definitions

```
//
// Type for the identification number assigned to the Port by the
// System in which the Port resides.
//
typedef VOID * EFI_PORT_HANDLE;
```

27.2.2 EFI_EAP.SetDesiredAuthMethod()

Summary

Set the desired EAP authentication method for the Port.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_SET_DESIRED_AUTHENTICATION_METHOD) (
  IN struct _EFI_EAP_PROTOCOL          *This,
  IN UINT8                             EapAuthType
  );
```

Parameters

This

A pointer to the *EFI_EAP_PROTOCOL* instance that indicates the calling context. Type *EFI_EAP_PROTOCOL* is defined in Section 1.1.

EapAuthType

The type of the desired EAP authentication method for the Port. It should be the type value defined by RFC. See RFC 2284 for details. Current valid values are defined in “Related Definitions”.

Related Definitions

```
//
// EAP Authentication Method Type (RFC 3748)
//
#define EFI_EAP_TYPE_TLS 13 /* REQUIRED - RFC 5216 */
```

Description

The *SetDesiredAuthMethod()* function sets the desired EAP authentication method indicated by *EapAuthType* for the Port.

If *EapAuthType* is an invalid EAP authentication type, then *EFI_INVALID_PARAMETER* is returned.

If the EAP authentication method of *EapAuthType* is unsupported, then it will return *EFI_UNSUPPORTED*.

The cryptographic strength of *EFI_EAP_TYPE_TLS* shall be at least of hash strength SHA-256 and RSA key length of at least 2048 bits.

Status Codes Returned

EFI_SUCCESS	The desired EAP authentication method is set successfully.
EFI_INVALID_PARAMETER	EapAuthType is an invalid EAP authentication type.
EFI_UNSUPPORTED	The EAP authentication method of EapAuthType is unsupported by the Port.

27.2.3 EFI_EAP.RegisterAuthMethod()

Summary

Register an EAP authentication method.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_REGISTER_AUTHENTICATION_METHOD) (
  IN struct _EFI_EAP_PROTOCOL          *This,
  IN UINT8                             EapAuthType,
  IN EFI_EAP_BUILD_RESPONSE_PACKET     Handler
  );
```

Parameters

This

A pointer to the *EFI_EAP_PROTOCOL* instance that indicates the calling context. Type *EFI_EAP_PROTOCOL* is defined in Section 1.1.

EapAuthType

The type of the EAP authentication method to register. It should be the type value defined by RFC. See RFC 2284 for details. Current valid values are defined in the *SetDesiredAuthMethod()* function description.

Handler

The handler of the EAP authentication method to register. Type *EFI_EAP_BUILD_RESPONSE_PACKET* is defined in "Related Definitions".

Related Definitions

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_BUILD_RESPONSE_PACKET) (
  IN EFI_PORT_HANDLE         PortNumber
  IN UINT8                   *RequestBuffer,
  IN UINTN                   RequestSize,
  IN UINT8                   *Buffer,
  IN OUT UINTN               *BufferSize
  );
```

Routine Description:

Build EAP response packet in response to the EAP request packet specified by (RequestBuffer, RequestSize).

Arguments

PortNumber — Specified the Port where the EAP request packet comes.
RequestBuffer — Pointer to the most recently received EAP-Request packet.
RequestSize — Packet size in bytes for the most recently received EAP-Request packet.
Buffer — Pointer to the buffer to hold the built packet.
BufferSize — Pointer to the buffer size in bytes. On input, it is the
buffer size provided by the caller. On output, it is the buffer size
in fact needed to contain the packet.

Returns:

EFI_SUCCESS — The required EAP response packet is built successfully. Others — Failures are encountered during the packet building process.

Description

The *RegisterAuthMethod()* function registers the user provided EAP authentication method, the type of which is *EapAuthType* and the handler of which is *Handler.*

If *EapAuthType* is an invalid EAP authentication type, then *EFI_INVALID_PARAMETER* is returned.

If there is not enough system memory to perform the registration, then *EFI_OUT_OF_RESOURCES* is returned.

Status Codes Returned

EFI_SUCCESS	The EAP authentication method of *EapAuthType* is registered successfully.
EFI_INVALID_PARAMETER	*EapAuthType* is an invalid EAP authentication type.
EFI_OUT_OF_RESOURCES	There is not enough system memory to perform the registration.

27.2.4 EAPManagement Protocol

This section defines the EAP management protocol. This protocol is designed to provide ease of management and ease of test for EAPOL state machine. It is intended for the supplicant side. It conforms to IEEE 802.1x specification.

27.2.5 EFI_EAP_MANAGEMENT_PROTOCOL

Summary

This protocol provides the ability to configure and control EAPOL state machine, and retrieve the status and the statistics information of EAPOL state machine.

GUID

```
#define EFI_EAP_MANAGEMENT_PROTOCOL_GUID \
  { 0xbb62e663, 0x625d, 0x40b2, \
    { 0xa0, 0x88, 0xbb, 0xe8, 0x36, 0x23, 0xa2, 0x45 }
```

Protocol Interface Structure

```
typedef struct _EFI_EAP_MANAGEMENT_PROTOCOL {
  EFI_EAP_GET_SYSTEM_CONFIGURATION        GetSystemConfiguration;
  EFI_EAP_SET_SYSTEM_CONFIGURATION        SetSystemConfiguration;
  EFI_EAP_INITIALIZE_PORT                 InitializePort;
  EFI_EAP_USER_LOGON                      UserLogon;
  EFI_EAP_USER_LOGOFF                     UserLogoff;
  EFI_EAP_GET_SUPPLICANT_STATUS           GetSupplicantStatus;
  EFI_EAP_SET_SUPPLICANT_CONFIGURATION    SetSupplicantConfiguration;
  EFI_EAP_GET_SUPPLICANT_STATISTICS       GetSupplicantStatistics;
}   EFI_EAP_MANAGEMENT_PROTOCOL;
```

Parameters

GetSystemConfiguration

Read the system configuration information associated with the Port. See the GetSystemConfiguration() function description.

SetSystemConfiguration
Set the system configuration information associated with the Port. See the *SetSystemConfiguration()* function description.

InitializePort
Cause the EAPOL state machines for the Port to be initialized. See the *InitializePort()* function description.

UserLogon
Notify the EAPOL state machines for the Port that the user of the System has logged on. See the *UserLogon()* function description.

UserLogoff
Notify the EAPOL state machines for the Port that the user of the System has logged off. See the *UserLogoff()* function description.

GetSupplicantStatus
Read the status of the Supplicant PAE state machine for the Port, including the current state and the configuration of the operational parameters. See the *GetSupplicantStatus()* function description.

SetSupplicantConfiguration
Set the configuration of the operational parameter of the Supplicant PAE state machine for the Port. See the *SetSupplicantConfiguration()* function description.

GetSupplicantStatistics
Read the statistical information regarding the operation of the Supplicant associated with the Port. See the *GetSupplicantStatistics()* function description.

Description

The *EFI_EAP_MANAGEMENT* protocol is used to control, configure and monitor EAPOL state machine on a Port. EAPOL state machine is built on a per-Port basis. Herein, a Port means a NIC. For the details of EAPOL, please refer to IEEE 802.1x specification.

27.2.6 EFI_EAP_MANAGEMENT.GetSystemConfiguration()

Summary

Read the system configuration information associated with the Port.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_GET_SYSTEM_CONFIGURATION) (
  IN struct _EFI_EAP_MANAGEMENT_PROTOCOL  *This,
  OUT BOOLEAN                             *SystemAuthControl,
  OUT EFI_EAPOL_PORT_INFO                 *PortInfo OPTIONAL
  );
```

Parameters

This
A pointer to the *EFI_EAP_MANAGEMENT_PROTOCOL* instance that indicates the calling context. Type *EFI_EAP_MANAGEMENT_PROTOCOL* is defined in *EAPManagement Protocol* .

SystemAuthControl
Returns the value of the SystemAuthControl parameter of the System. *TRUE* means Enabled. *FALSE* means Disabled.

PortInfo

Returns *EFI_EAPOL_PORT_INFO* structure to describe the Port's information. This parameter can be NULL to ignore reading the Port's information. Type *EFI_EAPOL_PORT_INFO* is defined in "Related Definitions".

Related Definitions

```
//
// PAE Capabilities
//
#define PAE_SUPPORT_AUTHENTICATOR   0x01
#define PAE_SUPPORT_SUPPLICANT      0x02

typedef struct _EFI_EAPOL_PORT_INFO {
  EFI_PORT_HANDLE                  PortNumber;
  UINT8                            ProtocolVersion;
  UINT8                            PaeCapabilities;
}   EFI_EAPOL_PORT_INFO;
```

PortNumber

The identification number assigned to the Port by the System in which the Port resides.

ProtocolVersion

The protocol version number of the EAPOL implementation supported by the Port.

PaeCapabilities

The capabilities of the PAE associated with the Port. This field indicates whether Authenticator functionality, Supplicant functionality, both, or neither, is supported by the Port's PAE.

Description

The *GetSystemConfiguration()* function reads the system configuration information associated with the Port, including the value of the SystemAuthControl parameter of the System is returned in *SystemAuthControl* and the Port's information is returned in the buffer pointed to by PortInfo. The Port's information is optional. If P *ortInfo* is *NULL,* then reading the Port's information is ignored.

If *SystemAuthControl* is *NULL,* then *EFI_INVALID_PARAMETER* is returned.

Status Codes Returned

EFI_SUCCESS	The system configuration information of the Port is read successfully.
EFI_INVALID_PARAMETER	SystemAuthControl is NULL.

27.2.7 EFI_EAP_MANAGEMENT.SetSystemConfiguration()

Summary

Set the system configuration information associated with the Port.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_SET_SYSTEM_CONFIGURATION) (
  IN struct _EFI_EAP_MANAGEMENT_PROTOCOL    *This,
  IN BOOLEAN                                SystemAuthControl
  );
```

Parameters

This

A pointer to the *EFI_EAP_MANAGEMENT_PROTOCOL* instance that indicates the calling context. Type *EFI_EAP_MANAGEMENT_PROTOCOL* is defined in *EAPManagement Protocol* .

SystemAuthControl

The desired value of the SystemAuthControl parameter of the System. *TRUE* means Enabled. *FALSE* means Disabled.

Description

The *SetSystemConfiguration()* function sets the value of the SystemAuthControl parameter of the System to *SystemAuthControl*.

Status Codes Returned

EFI_SUCCESS	The system configuration information of the Port is set successfully.

27.2.8 EFI_EAP_MANAGEMENT.InitializePort()

Summary

Cause the EAPOL state machines for the Port to be initialized.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_INITIALIZE_PORT) (
  IN struct _EFI_EAP_MANAGEMENT_PROTOCOL  *This
  );
```

Parameters

This

A pointer to the *EFI_EAP_MANAGEMENT_PROTOCOL* instance that indicates the calling context. Type *EFI_EAP_MANAGEMENT_PROTOCOL* is defined in *EAPManagement Protocol* .

Description

The InitializePort() function causes the EAPOL state machines for the Port.

Status Codes Returned

EFI_SUCCESS	The Port is initialized successfully.

27.2.9 EFI_EAP_MANAGEMENT.UserLogon()

Summary

Notify the EAPOL state machines for the Port that the user of the System has logged on.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_USER_LOGON) (
  IN struct _EFI_EAP_MANAGEMENT_PROTOCOL     *This,
  );
```

Parameters

This

A pointer to the E *FI_EAP_MANAGEMENT_PROTOCOL* instance that indicates the calling context. Type *EFI_EAP_MANAGEMENT_PROTOCOL* is defined in *EAPManagement Protocol* .

Description

The UserLogon() function notifies the EAPOL state machines for the Port.

Status Codes Returned

EFI_SUCCESS	The Port is notified successfully.

27.2.10 EFI_EAP_MANAGEMENT.UserLogoff()

Summary

Notify the EAPOL state machines for the Port that the user of the System has logged off.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_USER_LOGOFF) (
  IN struct _EFI_EAP_MANAGEMENT_PROTOCOL  *This,
  );
```

Parameters

This

A pointer to the *EFI_EAP_MANAGEMENT_PROTOCOL* instance that indicates the calling context. Type *EFI_EAP_MANAGEMENT_PROTOCOL* is defined in *EAPManagement Protocol* .

Description

The UserLogoff() function notifies the EAPOL state machines for the Port.

Status Codes Returned

EFI_SUCCESS	The Port is notified successfully.

27.2.11 EFI_EAP_MANAGEMENT.GetSupplicantStatus()

Summary

Read the status of the Supplicant PAE state machine for the Port, including the current state and the configuration of the operational parameters.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_GET_SUPPLICANT_STATUS) (
  IN struct _EFI_EAP_MANAGEMENT_PROTOCOL           *This,
  OUT EFI_EAPOL_SUPPLICANT_PAE_STATE               *CurrentState,
  IN OUT EFI_EAPOL_SUPPLICANT_PAE_CONFIGURATION    *Configuration OPTIONAL
  );
```

Parameters

This

A pointer to the *EFI_EAP_MANAGEMENT_PROTOCOL* instance that indicates the calling context. Type *EFI_EAP_MANAGEMENT_PROTOCOL* is defined in *EAPManagement Protocol* .

CurrentState

Returns the current state of the Supplicant PAE state machine for the Port. Type *EFI_EAPOL_SUPPLICANT_PAE_STATE* is defined in "Related Definitions".

Configuration

Returns the configuration of the operational parameters of the Supplicant PAE state machine for the Port as required. This parameter can be *NULL* to ignore reading the configuration. On input, *Configuration. ValidFieldMask* specifies the operational parameters to be read. On output, *Configuration* returns the configuration of the required operational parameters. Type *EFI_EAPOL_SUPPLICANT_PAE_CONFIGURATION* is defined in "Related Definitions".

Related Definitions

```
//
// Supplicant PAE state machine (IEEE Std 802.1X Section 8.5.10)
//
typedef enum _EFI_EAPOL_SUPPLICANT_PAE_STATE {
  Logoff,
  Disconnected,
  Connecting,
  Acquired,
  Authenticating,
  Held,
  Authenticated,
  MaxSupplicantPaeState
}   EFI_EAPOL_SUPPLICANT_PAE_STATE;

//
// Definitions for ValidFieldMask
//
#define AUTH_PERIOD_FIELD_VALID       0x01
#define HELD_PERIOD_FIELD_VALID       0x02
#define START_PERIOD_FIELD_VALID      0x04
```

(continues on next page)

(continued from previous page)

```
#define MAX_START_FIELD_VALID        0x08

typedef struct _EFI_EAPOL_SUPPLICANT_PAE_CONFIGURATION {
  UINT8                              ValidFieldMask;
  UINTN                              AuthPeriod;
  UINTN                              HeldPeriod;
  UINTN                              StartPeriod;
  UINTN                              MaxStart;
}   EFI_EAPOL_SUPPLICANT_PAE_CONFIGURATION;
```

ValidFieldMask

Indicates which of the following fields are valid.

AuthPeriod

The initial value for the authWhile timer. Its default value is 30 s.

HeldPeriod

The initial value for the heldWhile timer. Its default value is 60 s.

StartPeriod

The initial value for the startWhen timer. Its default value is 30 s.

MaxStart

The maximum number of successive EAPOL-Start messages will be sent before the Supplicant assumes that there is no Authenticator present. Its default value is 3.

Description

The *GetSupplicantStatus()* function reads the status of the Supplicant PAE state machine for the Port, including the current state *CurrentState* and the configuration of the operational parameters *Configuration.* The configuration of the operational parameters is optional. If *Configuration* is *NULL,* then reading the configuration is ignored. The operational parameters in *Configuration* to be read can also be specified by *Configuration. ValidFieldMask*.

If *CurrentState* is *NULL,* then *EFI_INVALID_PARAMETER* is returned.

Status Codes Returned

EFI_SUCCESS	The status of the Supplicant PAE state machine for the Port is read successfully.
EFI_INVALID_PARAMETER	*CurrentState* is *NULL.*

27.2.12 EFI_EAP_MANAGEMENT.SetSupplicantConfiguration()

Summary

Set the configuration of the operational parameter of the Supplicant PAE state machine for the Port.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_SET_SUPPLICANT_CONFIGURATION) (
  IN struct _EFI_EAP_MANAGEMENT_PROTOCOL        *This,
  IN EFI_EAPOL_SUPPLICANT_PAE_CONFIGURATION     *Configuration
  );
```

Parameters

This

A pointer to the *EFI_EAP_MANAGEMENT_PROTOCOL* instance that indicates the calling context. Type *EFI_EAP_MANAGEMENT_PROTOCOL* is defined in *EAPManagement Protocol* .

Configuration

The desired configuration of the operational parameters of the Supplicant PAE state machine for the Port as required. Type *EFI_EAPOL_SUPPLICANT_PAE_CONFIGURATION* is defined in the *GetSupplicantStatus()* function description.

Description

The SetSupplicantConfiguration() function sets the configuration of the operational parameter of the Supplicant PAE state machine for the Port to Configuration. The operational parameters in Configuration to be set can be specified by Configuration.ValidFieldMask.

If Configuration is NULL, then EFI_INVALID_PARAMETER is returned.

Status Codes Returned

EFI_SUCCESS	The configuration of the operational parameter of the Supplicant PAE state machine for the Port is set successfully.
EFI_INVALID_PARAMETER	*Configuration* is *NULL*.

27.2.13 EFI_EAP_MANAGEMENT.GetSupplicantStatistics()

Summary

Read the statistical information regarding the operation of the Supplicant associated with the Port.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_GET_SUPPLICANT_STATISTICS) (
  IN struct _EFI_EAP_MANAGEMENT_PROTOCOL        *This,
  OUT EFI_EAPOL_SUPPLICANT_PAE_STATISTICS       *Statistics
  );
```

Parameters

This

A pointer to the *EFI_EAP_MANAGEMENT_PROTOCOL* instance that indicates the calling context. Type *EFI_EAP_MANAGEMENT_PROTOCOL* is defined in *EAPManagement Protocol* .

Statistics

Returns the statistical information regarding the operation of the Supplicant for the Port. Type *EFI_EAPOL_SUPPLICANT_PAE_STATISTICS* is defined in “Related Definitions”.

Related Definitions

```
//
// Supplicant Statistics (IEEE Std 802.1X Section 9.5.2)
//
typedef struct _EFI_EAPOL_SUPPLICANT_PAE_STATISTICS {
  UINTN  EapolFramesReceived;
  UINTN  EapolFramesTransmitted;
```

(continues on next page)

(continued from previous page)

```
  UINTN  EapolStartFramesTransmitted;
  UINTN  EapolLogoffFramesTransmitted;
  UINTN  EapRespIdFramesTransmitted;
  UINTN  EapResponseFramesTransmitted;
  UINTN  EapReqIdFramesReceived;
  UINTN  EapRequestFramesReceived;
  UINTN  InvalidEapolFramesReceived;
  UINTN  EapLengthErrorFramesReceived;
  UINTN  LastEapolFrameVersion;
  UINTN  LastEapolFrameSource;
}   EFI_EAPOL_SUPPLICANT_PAE_STATISTICS;
```

EapolFramesReceived
The number of EAPOL frames of any type that have been received by this Supplicant.

EapolFramesTransmitted
The number of EAPOL frames of any type that have been transmitted by this Supplicant.

EapolStartFramesTransmitted
The number of EAPOL Start frames that have been transmitted by this Supplicant.

EapolLogoffFramesTransmitted
The number of EAPOL Logoff frames that have been transmitted bythis Supplicant.

EapRespIdFramesTransmitted
The number of EAP Resp/Id frames that have been transmitted by this Supplicant.

EapResponseFramesTransmitted
The number of valid EAP Response frames (other than Resp/Id frames) that have been transmitted by this Supplicant.

EapReqIdFramesReceived
The number of EAP Req/Id frames that have been received by this Supplicant.

EapRequestFramesReceived
The number of EAP Request frames (other than Rq/Id frames) that have been received by this Supplicant.

InvalidEapolFramesReceived
The number of EAPOL frames that have been received by this Supplicant in which the frame type is not recognized.

EapLengthErrorFramesReceived
The number of EAPOL frames that have been received by this Supplicant in which the Packet Body Length field (7.5.5) is invalid.

LastEapolFrameVersion
The protocol version number carried in the most recently received EAPOL frame.

LastEapolFrameSource
The source MAC address carried in the most recently received EAPOL frame.

Description

The *GetSupplicantStatistics()* function reads the statistical information *Statistics* regarding the operation of the Supplicant associated with the Port.

If *Statistics* is *NULL,* then *EFI_INVALID_PARAMETER* is returned.

Status Codes Returned

EFI_SUCCESS	The statistical information regarding the operation of the Supplicant for the Port is read successfully.
EFI_INVALID_PARAMETER	*Statistics* is *NULL*.

27.2.14 EFI EAP Management2 Protocol

27.2.14.1 EFI_EAP_MANAGEMENT2_PROTOCOL

Summary

This protocol provides the ability to configure and control EAPOL state machine, and retrieve the information, status and the statistics information of EAPOL state machine.

GUID

```
#define EFI_EAP_MANAGEMENT2_PROTOCOL_GUID \
  { 0x5e93c847, 0x456d, 0x40b3, \
    { 0xa6, 0xb4, 0x78, 0xb0, 0xc9, 0xcf, 0x7f, 0x20 }}
```

Protocol Interface Structure

```
typedef struct _EFI_EAP_MANAGEMENT2_PROTOCOL {
  ...... // Same as EFI_EAP_MANAGEMENT_PROTOCOL
  EFI_EAP_GET_KEY                       GetKey;
}   EFI_EAP_MANAGMENT2_PROTOCOL;
```

Parameters

GetKey
Provide Key information parsed from EAP packet. See the *GetKey()* function description.

Description

The *EFI_EAP_MANAGEMENT2_PROTOCOL* is used to control, configure and monitor EAPOL state machine on a Port, and return information of the Port. EAPOL state machine is built on a per-Port basis. Herein, a Port means a NIC. For the details of EAPOL, please refer to IEEE 802.1x specification.

27.2.15 EFI_EAP_MANAGEMENT2_PROTOCOL.GetKey()

Summary

Return key generated through EAP process.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_GET_KEY)(
  IN EFI_EAP_MANAGEMENT2_PROTOCOL    *This,
  IN OUT UINT8                       *Msk,
  IN OUT UINTN                       *MskSize,
  IN OUT UINT8                       *Emsk,
  IN OUT UINT8                       *EmskSize
  );
```

Parameters

This
Pointer to the *EFI_EAP_MANAGEMENT2_PROTOCOL* instance.

Msk
Pointer to MSK (Master Session Key) buffer.

MskSize
MSK buffer size.

Emsk
Pointer to EMSK (Extended Master Session Key) buffer.

EmskSize
EMSK buffer size.

Description

The *GetKey()* function return the key generated through EAP process, so that the 802.11 MAC layer driver can use MSK to derive more keys, e.g. PMK (Pairwise Master Key).

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • *Msk* is NULL. • *MskSize* is NULL. • *Emsk* is NULL. • *EmskSize* is NULL.
EFI_NOT_READY	MSK and EMSK are not generated in current session yet.

27.2.16 EFI EAP Configuration Protocol

27.2.16.1 EFI_EAP_CONFIGURATION_PROTOCOL

Summary

This protocol provides a way to set and get EAP configuration.

GUID

```
#define EFI_EAP_CONFIGURATION_PROTOCOL_GUID \
  { 0xe5b58dbb, 0x7688, 0x44b4, \
    { 0x97, 0xbf, 0x5f, 0x1d, 0x4b, 0x7c, 0xc8, 0xdb }}
```

Protocol Interface Structure

```
typedef struct _EFI_EAP_CONFIGURATION_PROTOCOL {
  EFI_EAP_CONFIGURATION_SET_DATA          SetData;
  EFI_EAP_CONFIGURATION_GET_DATA          GetData;
}   EFI_EAP_CONFIGURATION_PROTOCOL;
```

Parameters

SetData

Set EAP configuration data. See the *SetData()* function description.

GetData

Get EAP configuration data. See the *GetData()* function description.

Description

The *EFI_EAP_CONFIGURATION_PROTOCOL* is designed to provide a way to set and get EAP configuration, such as Certificate, private key file.

27.2.17 EFI_EAP_CONFIGURATION_PROTOCOL.SetData()

Summary

Set EAP configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_CONFIGURATION_SET_DATA)(
  IN EFI_EAP_CONFIGURATION_PROTOCOL    *This,
  IN EFI_EAP_TYPE                      EapType,
  IN EFI_EAP_CONFIG_DATA_TYPE          DataType,
  IN VOID                              *Data,
  IN UINTN                             DataSize
  );
```

Parameters

This

Pointer to the *EFI_EAP_CONFIGURATION_PROTOCOL* instance.

EapType

EAP type. See EFI_EAP_TYPE.

DataType

Configuration data type. See EFI_EAP_CONFIG_DATA_TYPE

Data

Pointer to configuration data.

DataSize

Total size of configuration data.

Description

The *SetData()* function sets EAP configuration to non-volatile storage or volatile storage.

Related Definitions

```
//
// Make sure it not conflict with any real EapTypeXXX
//
#define EFI_EAP_TYPE_ATTRIBUTE 0

typedef enum {

#define EFI_EAP_TYPE_MSCHAPV2      26
#define EFI_EAP_TYPE_EAP_EXTENSION 33
......
```

Status Codes Returned

EFI_SUCCESS	The EAP configuration data is set successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • *Data* is NULL. • *DataSize* is 0.
EFI_UNSUPPORTED	The *EapType* or *DataType* is unsupported.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.

27.2.18 EFI_EAP_CONFIGURATION_PROTOCOL.GetData()

Summary

Get EAP configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_CONFIGURATION_GET_DATA)(
  IN EFI_EAP_CONFIGURATION_PROTOCOL      *This,
  IN EFI_EAP_TYPE                         EapType,
  IN EFI_EAP_CONFIG_DATA_TYPE             DataType,
  IN OUT VOID                             *Data,
  IN OUT UINTN                            *DataSize
  );
```

Parameters

This
Pointer to the *EFI_EAP_CONFIGURATION_PROTOCOL* instance.

EapType
EAP type. See EFI_EAP_TYPE.

DataType
Configuration data type. See EFI_EAP_CONFIG_DATA_TYPE

Data
Pointer to configuration data.

DataSize
Total size of configuration data. On input, it means the size of *Data * buffer. On output, it means the size of copied *Data* buffer if *EFI_SUCCESS,* and means the size of desired *Data* buffer if *EFI_BUFFER_TOO_SMALL.*

Description

The *GetData()* function gets EAP configuration.

Status Codes Returned

EFI_SUCCESS	The EAP configuration data is got successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • *Data* is NULL. • *DataSize* is NULL.
EFI_UNSUPPORTED	The *EapType* or *DataType* is unsupported.
EFI_NOT_FOUND	The EAP configuration data is not found.
EFI_BUFFER_TOO_SMALL	The buffer is too small to hold the buffer.

27.3 EFI Wireless MAC Connection Protocol

27.3.1 EFI_WIRELESS_MAC_CONNECTION_PROTOCOL

Summary

This protocol provides management service interfaces of 802.11 MAC layer. It is used by network applications (and drivers) to establish wireless connection with an access point (AP).

GUID

```
#define EFI_WIRELESS_MAC_CONNECTION_PROTOCOL_GUID \
  { 0xda55bc9, 0x45f8, 0x4bb4, \
    { 0x87, 0x19, 0x52, 0x24, 0xf1, 0x8a, 0x4d, 0x45 }}
```

Protocol Interface Structure

```
typedef struct _EFI_WIRELESS_MAC_CONNECTION_PROTOCOL {
  EFI_WIRELESS_MAC_CONNECTION_SCAN              Scan;
  EFI_WIRELESS_MAC_CONNECTION_ASSOCIATE         Associate;
  EFI_WIRELESS_MAC_CONNECTION_DISASSOCIATE      Disassociate;
  EFI_WIRELESS_MAC_CONNECTION_AUTHENTICATE      Authenticate;
  EFI_WIRELESS_MAC_CONNECTION_DEAUTHENTICATE    Deauthenticate;
}   EFI_WIRELESS_MAC_CONNECTION_PROTOCOL;
```

Parameters

Scan
Determine the characteristics of the available BSSs. See the *Scan()* function description.

Associate
Places an association request with a specific peer MAC entity. See the *Associate()* function description.

Disassociate
Reports a disassociation with a specific peer MAC entity. See the *Disassociate()* function description.

Authenticate
Requests authentication with a specific peer MAC entity. See the *Authenticate()* function description.

Deauthenticate
Invalidates an authentication relationship with a peer MAC entity. See the *Deauthenticate()* function description.

Description

The *EFI_WIRELESS_MAC_CONNECTION_PROTOCOL* is designed to provide management service interfaces for the EFI wireless network stack to establish wireless connection with AP. An EFI Wireless MAC Connection Protocol instance will be installed on each communication device that the EFI wireless network stack runs on.

27.3.2 EFI_WIRELESS_MAC_CONNECTION_PROTOCOL.Scan()

Summary

Request a survey of potential BSSs that administrator can later elect to try to join.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_WIRELESS_MAC_CONNECTION_SCAN)(
  IN EFI_WIRELESS_MAC_CONNECTION_PROTOCOL       *This,
  IN EFI_80211_SCAN_DATA_TOKEN                  *Data
  );
```

Parameters

This

Pointer to the *EFI_WIRELESS_MAC_CONNECTION_PROTOCOL*

Data

Pointer to the scan token. Type EFI_80211_SCAN_DATA_TOKEN is defined in "Related Definitions" below.

Description

The *Scan()* function returns the description of the set of BSSs detected by the scan process. Passive scan operation is performed by default.

Related Definitions

```
//**********************************************
// EFI_80211_SCAN_DATA_TOKEN
//**********************************************
typedef struct {
  EFI_EVENT                  Event;
  EFI_STATUS                 Status;
  EFI_80211_SCAN_DATA        *Data;
  EFI_80211_SCAN_RESULT_CODE  ResultCode;
  EFI_80211_SCAN_RESULT      *Result;
}   EFI_80211_SCAN_DATA_TOKEN;
```

Event

This *Event* will be signaled after the *Status* field is updated by the EFI Wireless MAC Connection Protocol driver. The type of *Event* must be *EFI_NOTIFY_SIGNAL.*

Status

Will be set to one of the following values:

EFI_SUCCESS: Scan operation completed successfully.

EFI_NOT_FOUND: Failed to find available BSS.

EFI_DEVICE_ERROR: An unexpected network or system error occurred.

EFI_ACCESS_DENIED: The scan operation is not completed due to some underlying hardware or software state.

EFI_NOT_READY: The scan operation is started but not yet completed.

Data

Pointer to the scan data. Type *EFI_80211_SCAN_DATA* is defined below.

ResultCode

Indicates the scan state. Type *EFI_80211_SCAN_RESULT_CODE* is defined below.

Result

Indicates the scan result. It is caller's responsibility to free this buffer. Type *EFI_80211_SCAN_RESULT* is defined below.

The *EFI_80211_SCAN_DATA_TOKEN* structure is defined to support the process of determining the characteristics of the available BSSs. As input, the *Data* field must be filled in by the caller of EFI Wireless MAC Connection Protocol. After the scan operation completes, the EFI Wireless MAC Connection Protocol driver updates the *Status, ResultCode* and *Result* field and the *Event* is signaled.

```
//**********************************************
// EFI_80211_SCAN_DATA
//**********************************************

typedef struct {
  EFI_80211_BSS_TYPE            BSSType;
  EFI_80211_MAC_ADDRESS         BSSId;
  UINT8                         SSIdLen;
  UINT8                         *SSId;
  BOOLEAN                       PassiveMode;
  UINT32                        ProbeDelay;
  UINT32                        *ChannelList;
  UINT32                        MinChannelTime;
  UINT32                        MaxChannelTime;
  EFI_80211_ELEMENT_REQ         *RequestInformation;
  EFI_80211_ELEMENT_SSID        *SSIDList;
  EFI_80211_ACC_NET_TYPE        AccessNetworkType;
  UINT8                         *VendorSpecificInfo;
}   EFI_80211_SCAN_DATA;
```

BSSType

Determines whether infrastructure BSS, IBSS, MBSS, or all, are included in the scan. Type EFI_80211_BSS_TYPE is defined below.

BSSId

Indicates a specific or wildcard BSSID. Use all binary 1s to represent all SSIDs. Type EFI_80211_MAC_ADDRESS is defined below.

SSIdLen

Length in bytes of the SSId. If zero, ignore the SSId field.

SSId

Specifies the desired SSID or the wildcard SSID. Use NULL to represent all SSIDs.

PassiveMode

Indicates passive scanning if TRUE.

ProbeDelay

The delay in microseconds to be used prior to transmitting a Probe frame during active scanning. If zero, the value can be overridden by an implementation-dependent default value.

ChannelList

Specifies a list of channels that are examined when scanning for a BSS. If set to NULL, all valid channels will be scanned.

MinChannelTime

Indicates the minimum time in TU to spend on each channel when scanning. If zero, the value can be overridden by an implementation-dependent default value.

MaxChannelTime

Indicates the maximum time in TU to spend on each channel when scanning. If zero, the value can be overridden by an implementation-dependent default value.

RequestInformation

Points to an optionally present element. This is an optional parameter and may be NULL. Type EFI_80211_ELEMENT_REQ is defined below.

SSIDList

Indicates one or more SSID elements that are optionally present. This is an optional parameter and may be NULL. Type EFI_80211_ELEMENT_SSID is defined below.

AccessNetworkType

Specifies a desired specific access network type or the wildcard access network type. Use 15 as wildcard access network type. Type EFI_80211_ACC_NET_TYPE is defined below.

VendorSpecificInfo

Specifies zero or more elements. This is an optional parameter and may be NULL.

```
//**********************************************
// EFI_80211_BSS_TYPE
//**********************************************
typedef enum {
  IeeeInfrastructureBSS,
  IeeeIndependentBSS,
  IeeeMeshBSS,
  IeeeAnyBss
}  EFI_80211_BSS_TYPE;
```

The EFI_80211_BSS_TYPE is defined to enumerate BSS type.

```
//**********************************************
// EFI_80211_MAC_ADDRESS
//**********************************************
typedef struct {
  UINT8 Addr[6];
}   EFI_80211_MAC_ADDRESS;
```

The EFI_80211_MAC_ADDRESS is defined to record a 48-bit MAC address.

```
//**********************************************
// EFI_80211_ELEMENT_REQ
//**********************************************
typedef struct {
  EFI_80211_ELEMENT_HEADER          Hdr;
  UINT8                             RequestIDs[1];
  } EFI_80211_ELEMENT_REQ;
```

Hdr

Common header of an element. Type EFI_80211_ELEMENT_HEADER is defined below.

RequestIDs

Start of elements that are requested to be included in the Probe Response frame. The elements are listed in order of increasing element ID.

```
//**********************************************
// EFI_80211_ELEMENT_HEADER
//**********************************************
typedef struct {
  UINT8             ElementID;
  UINT8             Length;
}   EFI_80211_ELEMENT_HEADER;
```

ElementID
A unique element ID defined in IEEE 802.11 specification.

Length
Specifies the number of octets in the element body.

```
//**********************************************
// EFI_80211_ELEMENT_SSID
//**********************************************
typedef struct {
  EFI_80211_ELEMENT_HEADER   Hdr;
  UINT8                      SSId [32];
}   EFI_80211_ELEMENT_SSID;
```

Hdr
Common header of an element.

SSId
Service set identifier. If Hdr.Length is zero, this field is ignored.

```
//**********************************************
// EFI_80211_ACC_NET_TYPE
//**********************************************
typedef enum {
  IeeePrivate = 0,
  IeeePrivatewithGuest = 1,
  IeeeChargeablePublic = 2,
  IeeeFreePublic = 3,
  IeeePersonal = 4,
  IeeeEmergencyServOnly = 5,
  IeeeTestOrExp = 14,
  IeeeWildcard = 15
} EFI_80211_ACC_NET_TYPE;
```

The *EFI_80211_ACC_NET_TYPE* records access network types defined in IEEE 802.11 specification.

```
//**********************************************
// EFI_80211_SCAN_RESULT_CODE
//**********************************************
typedef enum {
  ScanSuccess,
  ScanNotSupported
}  EFI_80211_SCAN_RESULT_CODE;
```

ScanSuccess
The scan operation finished successfully.

ScanNotSupported
The scan operation is not supported in current implementation.

```
//**********************************************
// EFI_80211_SCAN_RESULT
//**********************************************
typedef struct {
  UINTN                      NumOfBSSDesp;
  EFI_80211_BSS_DESCRIPTION  **BSSDespSet;
  UINTN                      NumofBSSDespFromPilot;
  EFI_80211_BSS_DESP_PILOT   **BSSDespFromPilotSet;
  UINT8                      *VendorSpecificInfo;
}  EFI_80211_SCAN_RESULT;
```

NumOfBSSDesp
The number of EFI_80211_BSS_DESCRIPTION in BSSDespSet. If zero, BSSDespSet should be ignored.

BSSDespSet
Points to zero or more instances of EFI_80211_BSS_DESCRIPTION. Type EFI_80211_BSS_DESCRIPTION is defined below.

NumOfBSSDespFromPilot
The number of EFI_80211_BSS_DESP_PILOT in BSSDespFromPilotSet. If zero, BSSDespFromPilotSet should be ignored.

BSSDespFromPilotSet
Points to zero or more instances of EFI_80211_BSS_DESP_PILOT. Type EFI_80211_BSS_DESP_PILOT is defined below.

VendorSpecificInfo
Specifies zero or more elements. This is an optional parameter and may be NULL.

```
//**********************************************
// EFI_80211_BSS_DESCRIPTION
//**********************************************
typedef struct {
  EFI_80211_MAC_ADDRESS *BSSId;
  UINT8                        *SSId;
  UINT8                        SSIdLen;
  EFI_80211_BSS_TYPE           BSSType;
  UINT16                       BeaconPeriod;
  UINT64                       Timestamp;
  UINT16                       CapabilityInfo;
  UINT8                        *BSSBasicRateSet;
  UINT8                        *OperationalRateSet;
  EFI_80211_ELEMENT_COUNTRY    *Country;
  EFI_80211_ELEMENT_RSN        RSN;
  UINT8                        RSSI;
  UINT8                        RCPIMeasurement;
  UINT8                        RSNIMeasurement;
  UINT8                        *RequestedElements;
  UINT8                        *BSSMembershipSelectorSet;
  EFI_80211_ELEMENT_EXT_CAP    *ExtCapElement;
}  EFI_80211_BSS_DESCRIPTION;
```

BSSId

Indicates a specific BSSID of the found BSS.

SSId
Specifies the SSID of the found BSS. If NULL, ignore SSIdLen field.

SSIdLen
Length in bytes of the SSId. If zero, ignore SSId field.

BSSType
Specifies the type of the found BSS.

BeaconPeriod
The beacon period in TU of the found BSS.

Timestamp
The timestamp of the received frame from the found BSS.

CapabilityInfo
The advertised capabilities of the BSS.

BSSBasicRateSet
The set of data rates that shall be supported by all STAs that desire to join this BSS.

OperationalRateSet
The set of data rates that the peer STA desires to use for communication within the BSS.

Country
The information required to identify the regulatory domain in which the peer STA is located. Type EFI_80211_ELEMENT_COUNTRY is defined below.

RSN
The cipher suites and AKM suites supported in the BSS. Type EFI_80211_ELEMENT_RSN is defined below.

RSSI
Specifies the RSSI of the received frame.

RCPIMeasurement
Specifies the RCPI of the received frame.

RSNIMeasurement
Specifies the RSNI of the received frame.

RequestedElements
Specifies the elements requested by the request element of the Probe Request frame. This is an optional parameter and may be NULL.

BSSMembershipSelectorSet
Specifies the BSS membership selectors that represent the set of features that shall be supported by all STAs to join this BSS.

ExtCapElement
Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity. This is an optional parameter and may be NULL. Type EFI_80211_ELEMENT_EXT_CAP is defined below.

```
//************************************************
// EFI_80211_ELEMENT_COUNTRY
//************************************************
typedef struct {
  EFI_80211_ELEMENT_HEADER       Hdr;
  UINT8                          CountryStr [3];
  EFI_80211_COUNTRY_TRIPLET      CountryTriplet[1];
}   EFI_80211_ELEMENT_COUNTRY;
```

Hdr

Common header of an element.

CountryStr

Specifies country strings in 3 octets.

CountryTriplet

Indicates a triplet that repeated in country element. The number of triplets is determined by the Hdr.Length field.

```
//************************************************
// EFI_80211_COUNTRY_TRIPLET
//************************************************
typedef union {
  EFI_80211_COUNTRY_TRIPLET_SUBBAND    Subband;
  EFI_80211_COUNTRY_TRIPLET_OPERATE    Operating;
}   EFI_80211_COUNTRY_TRIPLET;
```

Subband

The subband triplet.

Operating

The operating triplet.

```
//************************************************
// EFI_80211_COUNTRY_TRIPLET_SUBBAND
//************************************************
typedef struct {
  UINT8                     FirstChannelNum;
  UINT8                     NumOfChannels;
  UINT8                     MaxTxPowerLevel;
}   EFI_80211_COUNTRY_TRIPLET_SUBBAND;
```

FirstChannelNum

Indicates the lowest channel number in the subband. It has a positive integer value less than 201.

NumOfChannels

Indicates the number of channels in the subband.

MaxTxPowerLevel

Indicates the maximum power in dBm allowed to be transmitted.

```
//************************************************
// EFI_80211_COUNTRY_TRIPLET_OPERATE
//************************************************
typedef struct {
  UINT8                    OperatingExtId;
  UINT8                    OperatingClass;
  UINT8                    CoverageClass;
}   EFI_80211_COUNTRY_TRIPLET_OPERATE;
```

OperatingExtId

Indicates the operating extension identifier. It has a positive integer value of 201 or greater.

OperatingClass

Index into a set of values for radio equipment set of rules.

CoverageClass

Specifies an AirPropagationTime characteristics used in BSS operation. Refer the definition of an AirPropagationTime in IEEE 802.11 specification.

```
//**********************************************
// EFI_80211_ELEMENT_RSN
//**********************************************
typedef struct {
  EFI_80211_ELEMENT_HEADER    Hdr;
  EFI_80211_ELEMENT_DATA_RSN  *Data;
}   EFI_80211_ELEMENT_RSN;
```

Hdr

Common header of an element.

Data

Points to RSN element. Type EFI_80211_ELEMENT_DATA_RSN is defined below. The size of a RSN element is limited to 255 octets.

```
//**********************************************
// EFI_80211_ELEMENT_DATA_RSN
//**********************************************
typedef struct {
  UINT16          Version;
  UINT32          GroupDataCipherSuite;
//UINT16          PairwiseCipherSuiteCount;
//UINT32          PairwiseCipherSuiteList [PairwiseCipherSuiteCount];
//UINT16          AKMSuiteCount;
//UINT32          AKMSuiteList [AKMSuiteCount];
//UINT16          RSNCapabilities;
//UINT16          PMKIDCount;
//UINT8           PMKIDList [PMKIDCount][16];
//UINT32          GroupManagementCipherSuite;
} EFI_80211_ELEMENT_DATA_RSN;
```

Version

Indicates the version number of the RSNA protocol. Value 1 is defined in current IEEE 802.11 specification.

GroupDataCipherSuite

Specifies the cipher suite selector used by the BSS to protect group address frames.

PairwiseCipherSuiteCount

Indicates the number of pairwise cipher suite selectors that are contained in PairwiseCipherSuiteList.

PairwiseCipherSuiteList

Contains a series of cipher suite selectors that indicate the pairwise cipher suites contained in this element.

AKMSuiteCount

Indicates the number of AKM suite selectors that are contained in AKMSuiteList.

AKMSuiteList

Contains a series of AKM suite selectors that indicate the AKM suites contained in this element.

RSNCapabilities

Indicates requested or advertised capabilities.

PMKIDCount

Indicates the number of PKMIDs in the PMKIDList.

PMKIDList
Contains zero or more PKMIDs that the STA believes to be valid for the destination AP.

GroupManagementCipherSuite
Specifies the cipher suite selector used by the BSS to protect group addressed robust management frames.

```
//**********************************************
// EFI_80211_ELEMENT_EXT_CAP
//**********************************************
typedef struct {
  EFI_80211_ELEMENT_HEADER       Hdr;
  UINT8                          Capabilities[1];
}   EFI_80211_ELEMENT_EXT_CAP;
```

Hdr
Common header of an element.

Capabilities
Indicates the capabilities being advertised by the STA transmitting the element. This is a bit field with variable length. Refer to IEEE 802.11 specification for bit value.

```
//**********************************************
// EFI_80211_BSS_DESP_PILOT
//**********************************************
typedef struct {
  EFI_80211_MAC_ADDRESS    BSSId;
  EFI_80211_BSS_TYPE       BSSType;
  UINT8                    ConCapInfo;
  UINT8                    ConCountryStr[2];
  UINT8                    OperatingClass;
  UINT8                    Channel;
  UINT8                    Interval;
  EFI_80211_MULTIPLE_BSSID *MultipleBSSID;
  UINT8                    RCPIMeasurement;
  UINT8                    RSNIMeasurement;
}   EFI_80211_BSS_DESP_PILOT;
```

BSSId
Indicates a specific BSSID of the found BSS.

BSSType
Specifies the type of the found BSS.

ConCapInfo
One octet field to report condensed capability information.

ConCountryStr
Two octet’s field to report condensed country string.

OperatingClass
Indicates the operating class value for the operating channel.

Channel
Indicates the operating channel.

Interval
Indicates the measurement pilot interval in TU.

MultipleBSSID
Indicates that the BSS is within a multiple BSSID set.

RCPIMeasurement
Specifies the RCPI of the received frame.

RSNIMeasurement
Specifies the RSNI of the received frame.

```
//**********************************************
// EFI_80211_MULTIPLE_BSSID
//**********************************************
  typedef struct {
  EFI_80211_ELEMENT_HEADER     Hdr;
  UINT8                        Indicator;
  EFI_80211_SUBELEMENT_INFO    SubElement[1];
}   EFI_80211_MULTIPLE_BSSID;
```

Hdr
Common header of an element.

Indicator
Indicates the maximum number of BSSIDs in the multiple BSSID set. When Indicator is set to n, 2n is the maximum number.

SubElement
Contains zero or more sub-elements. Type EFI_80211_SUBELEMENT_INFO is defined below.

```
//**********************************************
// EFI_80211_SUBELEMENT_INFO
//**********************************************
typedef struct {
  UINT8        SubElementID;
  UINT8        Length;
  UINT8        Data[1];
}   EFI_80211_SUBELEMENT_INFO;
```

SubElementID
Indicates the unique identifier within the containing element or sub-element.

Length
Specifies the number of octets in the Data field.

Data
A variable length data buffer.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • *This* is NULL. • *Data* is NULL. • *Data* -> *Data* is NULL.

continues on next page

Table 27.13 – continued from previous page

EFI_UNSUPPORTED	One or more of the input parameters are not supported by this implementation.
EFI_ALREADY_STARTED	The scan operation is already started.

27.3.3 EFI_WIRELESS_MAC_CONNECTION_PROTOCOL.Associate()

Summary

Request an association with a specified peer MAC entity that is within an AP.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_WIRELESS_MAC_CONNECTION_ASSOCIATE)(
  IN EFI_WIRELESS_MAC_CONNECTION_PROTOCOL         *This,
  IN EFI_80211_ASSOCIATE_DATA_TOKEN               *Data
  );
```

Parameters

This

Pointer to the *EFI_WIRELESS_MAC_CONNECTION_PROTOCOL* instance.

Data

Pointer to the association token. Type EFI_80211_ASSOCIATE_DATA_TOKEN is defined in Related Definitions below.

Description

The *Associate()* function provides the capability for MAC layer to become associated with an AP.

Related Definitions

```
//**********************************************
// EFI_80211_ASSOCIATE_DATA_TOKEN
//**********************************************
typedef struct {
  EFI_EVENT                         Event;
  EFI_STATUS                        Status;
  EFI_80211_ASSOCIATE_DATA          Data;
  EFI_80211_ASSOCIATE_RESULT_CODE   ResultCode;
  EFI_80211_ASSOCIATE_RESULT        Result;
} EFI_80211_ASSOCIATE_DATA_TOKEN;
```

Event

This Event will be signaled after the Status field is updated by the EFI Wireless MAC Connection Protocol driver. The type of Event must be EFI_NOTIFY_SIGNAL.

Status

Will be set to one of the following values: EFI_SUCCESS: Association operation completed successfully. EFI_DEVICE_ERROR: An unexpected network or system error occurred.

Data

Pointer to the association data. Type EFI_80211_ASSOCIATE_DATA is defined below.

ResultCode
Indicates the association state. Type EFI_80211_ASSOCIATE_RESULT_CODE is defined below.

Result
Indicates the association result. It is caller's responsibility to free this buffer. Type EFI_80211_ASSOCIATE_RESULT* is defined below.

The EFI_80211_ASSOCIATE_DATA_TOKEN structure is defined to support the process of association with a specified AP. As input, the *Data* field must be filled in by the caller of EFI Wireless MAC Connection Protocol. After the association operation completes, the EFI Wireless MAC Connection Protocol driver updates the *Status, ResultCode* and *Result* field and the *Event* is signaled.

```
//************************************************
// EFI_80211_ASSOCIATE_DATA
//************************************************
typedef struct {
  EFI_80211_MAC_ADDRESS           BSSId;
  UINT16                          CapabilityInfo;
  UINT32                          FailureTimeout;
  UINT32                          ListenInterval;
  EFI_80211_ELEMENT_SUPP_CHANNEL  *Channels;
  EFI_80211_ELEMENT_RSN           RSN;
  EFI_80211_ELEMENT_EXT_CAP       ExtCapElement;
  UINT8                           *VendorSpecificInfo;
}  EFI_80211_ASSOCIATE_DATA;
```

BSSId
Specifies the address of the peer MAC entity to associate with.

CapabilityInfo
Specifies the requested operational capabilities to the AP in 2 octets.

FailureTimeout
Specifies a time limit in TU, after which the associate procedure is terminated.

ListenInterval
Specifies if in power save mode, how often the STA awakes and listens for the next beacon frame in TU.

Channels
Indicates a list of channels in which the STA is capable of operating. Type EFI_80211_ELEMENT_SUPP_CHANNEL is defined below.

RSN
The cipher suites and AKM suites selected by the STA.

ExtCapElement
Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity. This is an optional parameter and may be NULL.

VendorSpecificInfo
Specifies zero or more elements. This is an optional parameter and may be NULL.

```
//************************************************
// EFI_80211_ELEMENT_SUPP_CHANNEL
//************************************************
typedef struct {
  EFI_80211_ELEMENT_HEADER              Hdr;
```

(continues on next page)

(continued from previous page)

```
  EFI_80211_ELEMENT_SUPP_CHANNEL_TUPLE   Subband[1];
}   EFI_80211_ELEMENT_SUPP_CHANNEL;
```

Hdr
Common header of an element.

Subband
Indicates one or more tuples of (first channel, number of channels). Type EFI_80211_ELEMENT_SUPP_CHANNEL_TUPLE is defined below.

```
//*************************************************
// EFI_80211_ELEMENT_SUPP_CHANNEL_TUPLE
//*************************************************
typedef struct {
  UINT8        FirstChannelNumber;
  UINT8        NumberOfChannels;
}   EFI_80211_ELEMENT_SUPP_CHANNEL_TUPLE;
```

FirstChannelNumber
The first channel number in a subband of supported channels.

NumberOfChannels
The number of channels in a subband of supported channels.

```
//*************************************************
// EFI_80211_ASSOCIATE_RESULT_CODE
//*************************************************
typedef enum {
  AssociateSuccess,
  AssociateRefusedReasonUnspecified,
  AssociateRefusedCapsMismatch,
  AssociateRefusedExtReason,
  AssociateRefusedAPOutOfMemory,
  AssociateRefusedBasicRatesMismatch,
  AssociateRejectedEmergencyServicesNotSupported,
  AssociateRefusedTemporarily
}   EFI_80211_ASSOCIATE_RESULT_CODE;
```

The *EFI_80211_ASSOCIATE_RESULT_CODE* records the result responses to the association request, which are defined in IEEE 802.11 specification.

```
//*************************************************
// EFI_80211_ASSOCIATE_RESULT
//*************************************************
typedef struct {
  EFI_80211_MAC_ADDRESS          BSSId;
  UINT16                         CapabilityInfo;
  UINT16                         AssociationID;
  UINT8                          RCPIValue;
  UINT8                          RSNIValue;
  EFI_80211_ELEMENT_EXT_CAP      *ExtCapElement;
  EFI_80211_ELEMENT_TIMEOUT_VAL  TimeoutInterval;
  UINT8                          *VendorSpecificInfo;
}  EFI_80211_ASSOCIATE_RESULT;
```

BSSId

Specifies the address of the peer MAC entity from which the association request was received.

CapabilityInfo

Specifies the operational capabilities advertised by the AP.

AssociationID

Specifies the association ID value assigned by the AP.

RCPIValue

Indicates the measured RCPI of the corresponding association request frame. It is an optional parameter and is set to zero if unavailable.

RSNIValue

Indicates the measured RSNI at the time the corresponding association request frame was received. It is an optional parameter and is set to zero if unavailable.

ExtCapElement

Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity. This is an optional parameter and may be NULL.

TimeoutInterval

Specifies the timeout interval when the result code is AssociateRefusedTemporarily .

VendorSpecificInfo

Specifies zero or more elements. This is an optional parameter and may be NULL.

```
//************************************************
// EFI_80211_ELEMENT_TIMEOUT_VAL
//************************************************
typedef struct {
  EFI_80211_ELEMENT_HEADER       Hdr;
  UINT8                          Type;
  UINT32                         Value;
}   EFI_80211_ELEMENT_TIMEOUT_VAL;
```

Hdr

Common header of an element.

Type

Specifies the timeout interval type.

Value

Specifies the timeout interval value.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • *This* is NULL. • *Data* is NULL. • *Data* -> *Data* is NULL.
EFI_UNSUPPORTED	One or more of the input parameters are not supported by this implementation.
EFI_ALREADY_STARTED	The association process is already started.

continues on next page

Table 27.14 – continued from previous page

EFI_NOT_READY	Authentication is not performed before this association process.
EFI_NOT_FOUND	The specified peer MAC entity is not found.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.

27.3.4 EFI_WIRELESS_MAC_CONNECTION_PROTOCOL.Disassociate()

Summary

Request a disassociation with a specified peer MAC entity.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_WIRELESS_MAC_CONNECTION_DISASSOCIATE)(
  IN EFI_WIRELESS_MAC_CONNECTION_PROTOCOL        *This,
  IN EFI_80211_DISASSOCIATE_DATA_TOKEN           *Data
  );
```

Parameters

This

Pointer to the *EFI_WIRELESS_MAC_CONNECTION_PROTOCOL* instance.

Data

Pointer to the disassociation token. Type EFI_80211_DISASSOCIATE_DATA_TOKEN is defined in Related Definitions below.

Description

The *Disassociate()* function is invoked to terminate an existing association. Disassociation is a notification and cannot be refused by the receiving peer except when management frame protection is negotiated and the message integrity check fails.

Related Definitions

```
//**********************************************
// EFI_80211_DISASSOCIATE_DATA_TOKEN
//**********************************************
typedef struct {
  EFI_EVENT                          Event;
  EFI_STATUS                         Status;
  EFI_80211_DISASSOCIATE_DATA        *Data;
  EFI_80211_DISASSOCIATE_RESULT_CODE  ResultCode;
}   EFI_80211_DISASSOCIATE_DATA_TOKEN;
```

Event

This Event will be signaled after the Status field is updated by the EFI Wireless MAC Connection Protocol driver. The type of Event must be EFI_NOTIFY_SIGNAL.

Status

Will be set to one of the following values:

EFI_SUCCESS: Disassociation operation completed successfully.

EFI_DEVICE_ERROR: An unexpected network or system error occurred.

EFI_ACCESS_DENIED: The disassociation operation is not completed due to some underlying hardware or software state.

EFI_NOT_READY: The disassociation operation is started but not yet completed.

Data

Pointer to the disassociation data. Type EFI_80211_DISASSOCIATE_DATA is defined below.

ResultCode

Indicates the disassociation state. Type EFI_80211_DISASSOCIATE_RESULT_CODE is defined below.

```
//**********************************************
// EFI_80211_DISASSOCIATE_DATA
//**********************************************
typedef struct {
  EFI_80211_MAC_ADDRESS          BSSId;
  EFI_80211_REASON_CODE          ReasonCode;
  UINT8                          *VendorSpecificInfo;
}   EFI_80211_DISASSOCIATE_DATA;
```

BSSId

Specifies the address of the peer MAC entity with which to perform the disassociation process.

ReasonCode

Specifies the reason for initiating the disassociation process.

VendorSpecificInfo

Zero or more elements, may be NULL.

```
//**********************************************
// EFI_80211_REASON_CODE
//**********************************************
typedef enum {
  Ieee80211UnspecifiedReason = 1,
  Ieee80211PreviousAuthenticateInvalid = 2,
  Ieee80211DeauthenticatedSinceLeaving = 3,
  Ieee80211DisassociatedDueToInactive = 4,
  Ieee80211DisassociatedSinceApUnable = 5,
  Ieee80211Class2FrameNonauthenticated = 6,
  Ieee80211Class3FrameNonassociated = 7,
  Ieee80211DisassociatedSinceLeaving = 8,
  // ...
}   EFI_80211_REASON_CODE;
```

Note: *The reason codes are defined in chapter 8.4.1.7 Reason Code field, IEEE 802.11-2012.*

```
//**********************************************
// EFI_80211_DISASSOCIATE_RESULT_CODE
//**********************************************
typedef enum {
  DisassociateSuccess,
  DisassociateInvalidParameters
}   EFI_80211_DISASSOCIATE_RESULT_CODE;
```

DisassociateSuccess

Disassociation process completed successfully.

DisassociateInvalidParameters

Disassociation failed due to any input parameter is invalid.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • *This* is NULL. • *Data* is NULL.
EFI_ALREADY_STARTED	The disassociation process is already started.
EFI_NOT_READY	The disassociation service is invoked to a nonexistent association relationship.
EFI_NOT_FOUND	The specified peer MAC entity is not found.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.

27.3.5 EFI_WIRELESS_MAC_CONNECTION_PROTOCOL.Authenticate()

Summary

Request the process of establishing an authentication relationship with a peer MAC entity.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_WIRELESS_MAC_CONNECTION_AUTHENTICATE)(
  IN EFI_WIRELESS_MAC_CONNECTION_PROTOCOL      *This,
  IN EFI_80211_AUTHENTICATE_DATA_TOKEN         *Data
  );
```

Parameters

This

Pointer to the *EFI_WIRELESS_MAC_CONNECTION_PROTOCOL* instance.

Data

Pointer to the authentication token. Type EFI_80211_AUTHENTICATE_DATA_TOKEN is defined in Related Definitions below.

Description

The Authenticate() function requests authentication with a specified peer MAC entity. This service might be time-consuming thus is designed to be invoked independently of the association service.

Related Definitions

```
//************************************************
// EFI_80211_AUTHENTICATE_DATA_TOKEN
//************************************************
typedef struct {
  EFI_EVENT                          Event;
  EFI_STATUS                         Status;
  EFI_80211_AUTHENTICATE_DATA        *Data;
  EFI_80211_AUTHENTICATE_RESULT_CODE ResultCode;
```

(continues on next page)

(continued from previous page)

```
  EFI_80211_AUTHENTICATE_RESULT      Result;
}   EFI_80211_AUTHENTICATE_DATA_TOKEN;
```

Event

This Event will be signaled after the Status field is updated by the EFI Wireless MAC Connection Protocol driver. The type of Event must be EFI_NOTIFY_SIGNAL.

Status

Will be set to one of the following values:

EFI_PROTOCOL_ERROR: Peer MAC entity rejects the authentication.

EFI_NO_RESPONSE: Peer MAC entity does not response the authentication request.

EFI_DEVICE_ERROR: An unexpected network or system error occurred.

EFI_ACCESS_DENIED: The authentication operation is not completed due to some underlying hardware or software state.

EFI_NOT_READY: The authentication operation is started but not yet completed.

Data

Pointer to the authentication data. Type EFI_80211_AUTHENTICATE_DATA is defined below.

ResultCode

Indicates the association state. Type EFI_80211_AUTHENTICATE_RESULT_CODE is defined below.

Result

Indicates the association result. It is caller's responsibility to free this buffer. Type EFI_80211_AUTHENTICATE_RESULT is defined below.

```
//************************************************
// EFI_80211_AUTHENTICATION_DATA
//************************************************
typedef struct {
  EFI_80211_MAC_ADDRESS            BSSId;
  EFI_80211_AUTHENTICATION_TYPE    AuthType;
  UINT32                           FailureTimeout;
  UINT8                            *FTContent;
  UINT8                            *SAEContent;
  UINT8                            *VendorSpecificInfo;
}   EFI_80211_AUTHENTICATE_DATA;
```

BSSId

Specifies the address of the peer MAC entity with which to perform the authentication process.

AuthType

Specifies the type of authentication algorithm to use during the authentication process.

FailureTimeout

Specifies a time limit in TU after which the authentication procedure is terminated.

FTContent

Specifies the set of elements to be included in the first message of the FT authentication sequence, may be NULL.

SAEContent

Specifies the set of elements to be included in the SAE Commit Message or SAE Confirm Message, may be NULL.

VendorSpecificInfo

Zero or more elements, may be NULL.

```
//**********************************************
// EFI_80211_AUTHENTICATION_TYPE
//**********************************************
typedef enum {
  OpenSystem,
  SharedKey,
  FastBSSTransition,
  SAE
}   EFI_80211_AUTHENTICATION_TYPE;
```

OpenSystem

Open system authentication, admits any STA to the DS.

SharedKey

Shared Key authentication relies on WEP to demonstrate knowledge of a WEP encryption key.

FastBSSTransition

FT authentication relies on keys derived during the initial mobility domain association to authenticate the stations.

SAE

SAE authentication uses finite field cryptography to prove knowledge of a shared password.

```
//**********************************************
// EFI_80211_AUTHENTICATION_RESULT_CODE
//**********************************************
typedef enum {
  AuthenticateSuccess,
  AuthenticateRefused,
  AuthenticateAnticLoggingTokenRequired,
  AuthenticateFiniteCyclicGroupNotSupported,
  AuthenticationRejected,
  AuthenticateInvalidParameter
}   EFI_80211_AUTHENTICATE_RESULT_CODE;
```

The result code indicates the result response to the authentication request from the peer MAC entity.

```
//**********************************************
// EFI_80211_AUTHENTICATION_RESULT
//**********************************************
typedef struct {
  EFI_80211_MAC_ADDRESS    BSSId;
  UINT8                    *FTContent;
  UINT8                    *SAEContent;
  UINT8                    *VendorSpecificInfo;
}   EFI_80211_AUTHENTICATE_RESULT;
```

BSSId

Specifies the address of the peer MAC entity from which the authentication request was received.

FTContent

Specifies the set of elements to be included in the second message of the FT authentication sequence, may be NULL.

SAEContent

Specifies the set of elements to be included in the SAE Commit Message or SAE Confirm Message, may be NULL.

VendorSpecificInfo
Zero or more elements, may be NULL.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • *This* is NULL. • *Data* is NULL. • *Data Data* is NULL.
EFI_UNSUPPORTED	One or more of the input parameters are not supported by this implementation.
EFI_ALREADY_STARTED	The authentication process is already started.
EFI_NOT_FOUND	The specified peer MAC entity is not found.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.

27.3.6 EFI_WIRELESS_MAC_CONNECTION_PROTOCOL.Deauthenticate()

Summary

Invalidate the authentication relationship with a peer MAC entity.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_WIRELESS_MAC_CONNECTION_DEAUTHENTICATE)(
  IN EFI_WIRELESS_MAC_CONNECTION_PROTOCOL      *This,
  IN EFI_80211_DEAUTHENTICATE_DATA_TOKEN       *Data
);
```

Parameters

This
Pointer to the *EFI_WIRELESS_MAC_CONNECTION _PROTOCOL* instance.

Data
Pointer to the deauthentication token. Type EFI_80211_DEAUTHENTICATE_DATA_TOKEN is defined in Related Definitions below.

Description

The *Deauthenticate()* function requests that the authentication relationship with a specified peer MAC entity be invalidated. Deauthentication is a notification and when it is sent out the association at the transmitting station is terminated.

Related Definitions

```
//**********************************************
// EFI_80211_DEAUTHENTICATE_DATA_TOKEN
//**********************************************
typedef struct {
```

(continues on next page)

(continued from previous page)

```
  EFI_EVENT                        Event;
  EFI_STATUS                       Status;
  EFI_80211_DEAUTHENTICATE_DATA    *Data;
}   EFI_80211_DEAUTHENTICATE_DATA_TOKEN;
```

Event

This Event will be signaled after the Status field is updated by the EFI Wireless MAC Connection Protocol driver. The type of Event must be EFI_NOTIFY_SIGNAL.

Status

Will be set to one of the following values:

EFI_SUCCESS: Deauthentication operation completed successfully.

EFI_DEVICE_ERROR: An unexpected network or system error occurred.

EFI_ACCESS_DENIED:The deauthentication operation is not completed due to some underlying hardware or software state.

EFI_NOT_READY: The deauthentication operation is started but not yet completed.

Data

Pointer to the deauthentication data. Type EFI_80211_DEAUTHENTICATE_DATA is defined below.

```
//**********************************************
// EFI_80211_DEAUTHENTICATE_DATA
//**********************************************
typedef struct {
  EFI_80211_MAC_ADDRESS    BSSId;
  EFI_80211_REASON_CODE    ReasonCode;
  UINT8                    *VendorSpecificInfo;
}   EFI_80211_DEAUTHENTICATE_DATA;
```

BSSId

Specifies the address of the peer MAC entity with which to perform the deauthentication process.

ReasonCode

Specifies the reason for initiating the deauthentication process.

VendorSpecificInfo

Zero or more elements, may be NULL.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • *This* is NULL. • *Data* is NULL. • *Data Data* is NULL.
EFI_ALREADY_STARTED	The deauthentication process is already started.
EFI_NOT_READY	The deauthentication service is invoked to a nonexistent association or authentication relationship.

continues on next page

Table 27.17 – continued from previous page

EFI_NOT_FOUND	The specified peer MAC entity is not found.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.

27.4 EFI Wireless MAC Connection II Protocol

This section provides a detailed description of EFI Wireless MAC Connection II Protocol.

27.4.1 EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL

Summary

The *EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL* provides network management service interfaces for 802.11 network stack. It is used by network applications (and drivers) to establish wireless connection with a wireless network.

GUID

```
#define EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL_GUID \
  { 0x1b0fb9bf, 0x699d, 0x4fdd, \
    { 0xa7, 0xc3, 0x25, 0x46, 0x68, 0x1b, 0xf6, 0x3b }}
```

Protocol Interface Structure

```
typedef struct _EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL {
  EFI_WIRELESS_MAC_CONNECTION_II_GET_NETWORKS        GetNetworks;
  EFI_WIRELESS_MAC_CONNECTION_II_CONNECT_NETWORK     ConnectNetwork;
  EFI_WIRELESS_MAC_CONNECTION_II_DISCONNECT_NETWORK  DisconnectNetwork;
}   EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL;
```

Parameters

GetNetworks
Get a list of nearby detectable wireless network. See the *GetNetworks()* function description.

ConnectNetwork
Places a connection request with a specific wireless network. See the *ConnectNetwork()* function description.

DisconnectNetwork
Places a disconnection request with a specific wireless network. See the *DisconnectNetwork()* function description.

Description

The *EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL* is designed to provide management service interfaces for the EFI wireless network stack to establish relationship with a wireless network (identified by *EFI_80211_NETWORK* defined below). An EFI Wireless MAC Connection II Protocol instance will be installed on each communication device that the EFI wireless network stack runs on.

27.4.2 EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL.GetNetworks()

Summary

Request a survey of potential wireless networks that administrator can later elect to try to join.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_WIRELESS_MAC_CONNECTION_II_GET_NETWORKS)(
  IN EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL     *This,
  IN EFI_80211_GET_NETWORKS_TOKEN                *Token
  );
```

Parameters

This

Pointer to the *EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL* instance.

Token

Pointer to the token for getting wireless network. Type EFI_80211_GET_NETWORKS_TOKEN is defined in Related Definitions below.

Description

The *GetNetworks()* function returns the description of a list of wireless networks detected by wireless UNDI driver. This function is always non-blocking. If the operation succeeds or fails due to any error, the *Token->Event* will be signaled and *Token->Status* will be updated accordingly. The caller of this function is responsible for inputting SSIDs in case of searching hidden networks.

Related Definitions

```
//**********************************************
// EFI_80211_GET_NETWORKS_TOKEN
//**********************************************
typedef struct {
  EFI_EVENT                    Event;
  EFI_STATUS                   Status;
  EFI_80211_GET_NETWORKS_DATA   *Data;
  EFI_80211_GET_NETWORKS_RESULT *Result;
}   EFI_80211_GET_NETWORKS_TOKEN;
```

Event

If the status code returned by GetNetworks() is EFI_SUCCESS, then this Event will be signaled after the Status field is updated by the EFI Wireless MAC Connection Protocol II driver. The type of Event must be EFI_NOTIFY_SIGNAL.

Status

Will be set to one of the following values:

EFI_SUCCESS: The operation completed successfully.

EFI_NOT_FOUND: Failed to find available wireless networks.

EFI_DEVICE_ERROR: An unexpected network or system error occurred.

EFI_ACCESS_DENIED: The operation is not completed due to some underlying hardware or software state.

EFI_NOT_READY: The operation is started but not yet completed.

Data

Pointer to the input data for getting networks. Type EFI_80211_GET_NETWORKS_DATA is defined below.

Result

Indicates the scan result. It is caller's responsibility to free this buffer. Type EFI_80211_GET_NETWORKS_RESULT is defined below.

```
//**********************************************
// EFI_80211_GET_NETWORKS_DATA
//**********************************************
typedef struct {
  UINT32            NumOfSSID;
  EFI_80211_SSID    SSIDList[1];
}   EFI_80211_GET_NETWORKS_DATA;
```

NumOfSSID

The number of EFI_80211_SSID in SSIDList. If zero, SSIDList should be ignored.

SSIDList

The SSIDList is a pointer to an array of EFI_80211_SSID instances. The number of entries is specified by NumOfSSID. The array should only include SSIDs of hidden networks. It is suggested that the caller inputs less than 10 elements in the SSIDList. It is the caller's responsibility to free this buffer. Type EFI_80211_SSID is defined below.

```
#define EFI_MAX_SSID_LEN 32

//**********************************************
// EFI_80211_SSID
//**********************************************
typedef struct {
  UINT8       SSIdLen;
  UINT8       SSId[EFI_MAX_SSID_LEN];
}   EFI_80211_SSID;
```

SSIdLen

Length in bytes of the SSId. If zero, ignore SSId field.

SSId

Specifies the service set identifier.

```
//**********************************************
// EFI_80211_GET_NETWORKS_RESULT
//**********************************************
typedef struct {
  UINT8                           NumOfNetworkDesc;
  EFI_80211_NETWORK_DESCRIPTION   NetworkDesc[1];
}   EFI_80211_GET_NETWORKS_RESULT;
```

NumOfNetworkDesc

The number of elements in NetworkDesc. If zero, NetworkDesc should be ignored.

NetworkDesc

The NetworkDesc is a variable-length array of elements of type EFI_80211_NETWORK_DESCRIPTION. Type EFI_80211_NETWORK_DESCRIPTION is defined below.

```
//**********************************************
// EFI_80211_NETWORK_DESCRIPTION
//**********************************************
typedef struct {
  EFI_80211_NETWORK       Network;
  UINT8                   NetworkQuality;
}   EFI_80211_NETWORK_DESCRIPTION;
```

Network
Specifies the found wireless network. Type EFI_80211_NETWORK is defined below.

NetworkQuality
Indicates the network quality as a value between 0 to 100, where 100 indicates the highest network quality.

```
//**********************************************
// EFI_80211_NETWORK
//**********************************************
typedef struct {
  EFI_80211_BSS_TYPE               BSSType;
  EFI_80211_SSID                   SSId;
  EFI_80211_AKM_SUITE_SELECTOR     *AKMSuite;
  EFI_80211_CIPHER_SUITE_SELECTOR *CipherSuite;
}   EFI_80211_NETWORK;
```

BSSType
Specifies the type of the BSS. Type EFI_80211_BSS_TYPE is defined below.

SSId
Specifies the SSID of the BSS. Type EFI_80211_SSID is defined above.

AKMSuite
Pointer to the AKM suites supported in the wireless network. Type EFI_80211_AKM_SUITE_SELECTOR is defined below.

CipherSuite
Pointer to the cipher suites supported in the wireless network. Type EFI_80211_CIPHER_SUITE_SELECTOR is defined below.

```
//**********************************************
// EFI_80211_BSS_TYPE
//**********************************************
typedef enum {
  IeeeInfrastructureBSS,
  IeeeIndependentBSS,
  IeeeMeshBSS,
  IeeeAnyBss
}   EFI_80211_BSS_TYPE;
```

The *EFI_80211_BSS_TYPE* is defined to enumerate BSS type.

```
//**********************************************
// EFI_80211_SUITE_SELECTOR
//**********************************************
typedef struct {
 UINT8          Oui[3];
```

(continues on next page)

(continued from previous page)

```
 UINT8          SuiteType;
}  EFI_80211_SUITE_SELECTOR;
```

Oui

Organization Unique Identifier, as defined in IEEE 802.11 standard, usually set to 00-0F-AC.

SuiteType

Suites types, as defined in IEEE 802.11 standard.

```
//***********************************************************
// EFI_80211_AKM_SUITE_SELECTOR
//************************************************************
typedef struct {
  UINT16                    AKMSuiteCount;
  EFI_80211_SUITE_SELECTOR  AKMSuiteList[1];
}   EFI_80211_AKM_SUITE_SELECTOR;
```

AKMSuiteCount

Indicates the number of AKM suite selectors that are contained in AKMSuiteList. If zero, the AKMSuiteList is ignored.

AKMSuiteList

A variable-length array of AKM suites, as defined in IEEE 802.11 standard, Table 8-101. The number of entries is specified by AKMSuiteCount.

```
//************************************************************
// EFI_80211_CIPHER_SUITE_SELECTOR
//************************************************************
typedef struct {
  UINT16                    CipherSuiteCount;
  EFI_80211_SUITE_SELECTOR  CipherSuiteList[1];
}   EFI_80211_CIPHER_SUITE_SELECTOR;
```

CipherSuiteCount

Indicates the number of cipher suites that are contained in CipherSuiteList. If zero, the CipherSuiteList is ignored.

CipherSuiteList

A variable-length array of cipher suites, as defined in IEEE 802.11 standard, Table 8-99. The number of entries is specified by CipherSuiteCount.

Status Codes Returned

EFI_SUCCESS	The operation started, and an event will eventually be raised for the caller.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: This is NULL. Token is NULL.
EFI_UNSUPPORTED	One or more of the input parameters is not supported by this implementation.
EFI_ALREADY_STARTED	The operation of getting wireless network is already started.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.

27.4.3 EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL.ConnectNetwork()

Summary

Connect a wireless network specified by a particular SSID, BSS type and Security type.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_WIRELESS_MAC_CONNECTION_II_CONNECT_NETWORK)(
 IN EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL      *This,
 IN EFI_80211_CONNECT_NETWORK_TOKEN              *Token
 );
```

Parameters

This

Pointer to the *EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL* instance.

Token

Pointer to the token for connecting wireless network. Type *EFI_80211_CONNECT_NETWORK_TOKEN* is defined in Related Definitions below.

Description

The *ConnectNetwork()* function places a request to wireless UNDI driver to connect a wireless network specified by a particular SSID, BSS type, Authentication method and cipher. This function will trigger wireless UNDI driver to perform authentication and association process to establish connection with a particular Access Point for the specified network. This function is always non-blocking. If the connection succeeds or fails due to any error, the *Token->Event* will be signaled and *Token->Status* will be updated accordingly.

After having signaled a successful connection completion, the UNDI driver will update the network connection state using the network media state information type in the *EFI_ADAPTER_INFORMATION_PROTOCOL*. If needed, the caller should use *EFI_ADAPTER_INFORMATION_PROTOCOL* to regularly get the network media state to find if the UNDI driver is still connected to the wireless network (*EFI_SUCCESS*) or not (*EFI_NO_MEDIA*).

Generally a driver or application in WiFi stack would provide user interface to end user to manage profiles for selecting which wireless network to join and other state management. This module should prompt the user to select a network and input WiFi security data such as certificate, private key file, password, etc. Then the module should deploy WiFi security data through EFI Supplicant Protocol and/ or EFI EAP Configuration Protocol before calling *ConnectNetwork()* function.

Related Definitions

```
//**********************************************
// EFI_80211_CONNECT_NETWORK_TOKEN
//**********************************************
typedef struct {
  EFI_EVENT                             Event;
  EFI_STATUS                            Status;
  EFI_80211_CONNECT_NETWORK_DATA        *Data;
  EFI_80211_CONNECT_NETWORK_RESULT_CODE ResultCode;
}  EFI_80211_CONNECT_NETWORK_TOKEN;
```

Event

If the status code returned by ConnectNetwork() is EFI_SUCCESS, then this Event will be signaled after the Status field is updated by the EFI Wireless MAC Connection Protocol II driver. The type of Event must be EFI_NOTIFY_SIGNAL.

Status

Will be set to one of the following values:

EFI_SUCCESS: The operation completed successfully.

EFI_DEVICE_ERROR: An unexpected network or system error occurred.

EFI_ACCESS_DENIED: The operation is not completed due to some underlying hardware or software state.

EFI_NOT_READY: The operation is started but not yet completed.

Data

Pointer to the connection data. Type EFI_80211_CONNECT_NETWORK_DATA is defined below.

ResultCode

Indicates the connection state. Type EFI_80211_CONNECT_NETWORK_RESULT_CODE is defined below.

The *EFI_80211_CONNECT_NETWORK_TOKEN* structure is defined to support the process of determining the characteristics of the available networks. As input, the *Data* field must be filled in by the caller of EFI Wireless MAC Connection II Protocol. After the operation completes, the EFI Wireless MAC Connection II Protocol driver updates the *Status* and *ResultCode* field and the *Event* is signaled.

```
//***********************************************
// EFI_80211_CONNECT_NETWORK_DATA
//***********************************************
typedef struct {
  EFI_80211_NETWORK         *Network;
  UINT32                    FailureTimeout;
}   EFI_80211_CONNECT_NETWORK_DATA;
```

Network

Specifies the wireless network to connect to. Type EFI_80211_NETWORK is defined above.

FailureTimeout

Specifies a time limit in seconds that is optionally present, after which the connection establishment procedure is terminated by the UNDI driver. This is an optional parameter and may be 0. Values of 5 seconds or higher are recommended.

```
//***********************************************
// EFI_80211_CONNECT_NETWORK_RESULT_CODE
//***********************************************
typedef enum {
  ConnectSuccess,
  ConnectRefused,
  ConnectFailed,
  ConnectFailureTimeout,
  ConnectFailedReasonUnspecified
}   EFI_80211_CONNECT_NETWORK_RESULT_CODE;
```

ConnectSuccess

The connection establishment operation finished successfully.

ConnectRefused
The connection was refused by the Network.

ConnectFailed
The connection establishment operation failed (i.e, Network is not detected).

ConnectFailureTimeout
The connection establishment operation was terminated on timeout.

ConnectFailedReasonUnspecified
The connection establishment operation failed on other reason.

Status Codes Returned

EFI_SUCCESS	The operation started successfully. Results will be notified eventually.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: This is NULL. Token is NULL.
EFI_UNSUPPORTED	One or more of the input parameters are not supported by this implementation.
EFI_ALREADY_STARTED	The connection process is already started.
EFI_NOT_FOUND	The specified wireless network is not found.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.

27.4.4 EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL.DisconnectNetwork()

Summary

```
Request a disconnection with current connected wireless network.
Prototype
typedef
EFI_STATUS
(EFIAPI *EFI_WIRELESS_MAC_CONNECTION_II_DISCONNECT_NETWORK)(
  IN EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL    *This,
  IN EFI_80211_DISCONNECT_NETWORK_TOKEN         *Token

  );
```

Parameters

This
Pointer to the *EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL* instance.

Token
Pointer to the token for disconnecting wireless network. Type *EFI_80211_DISCONNECT_NETWORK_TOKEN* is defined in Related Definitions below.

Description

The *DisconnectNetwork()* function places a request to wireless UNDI driver to disconnect from the wireless network it is connected to. This function will trigger the wireless UNDI driver to perform disassociation and deauthentication process to terminate an existing connection. This function is always non-blocking. After wireless UNDI driver received acknowledgment frame from AP and freed up corresponding resources, the *Token->Event* will be signaled and *Token->Status* will be updated accordingly.

Related Definitions

```
//**********************************************
// EFI_80211_DISCONNECT_NETWORK_TOKEN
//**********************************************
typedef struct {
  EFI_EVENT          Event;
  EFI_STATUS         Status;
}   EFI_80211_DISCONNECT_NETWORK_TOKEN;
```

Event

If the status code returned by DisconnectNetwork() is EFI_SUCCESS, then this Event will be signaled after the Status field is updated by the EFI Wireless MAC Connection Protocol II driver. The type of Event must be EFI_NOTIFY_SIGNAL.

Status

Will be set to one of the following values:

EFI_SUCCESS: The operation completed successfully

EFI_DEVICE_ERROR: An unexpected network or system error occurred.

EFI_ACCESS_DENIED: The operation is not completed due to some underlying hardware or software state.

Status Codes Returned

EFI_SUCCESS	The operation started successfully. Results will be notified eventually.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: This is NULL. Token is NULL.
EFI_UNSUPPORTED	One or more of the input parameters are not supported by this implementation.
EFI_NOT_FOUND	Not connected to a wireless network.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.

27.5 EFI Supplicant Protocol

This section defines the EFI Supplicant Protocol.

27.5.1 Supplicant Service Binding Protocol

27.5.2 EFI_SUPPLICANT_SERVICE_BINDING_PROTOCOL

Summary

The EFI Supplicant Service Binding Protocol is used to locate EFI Supplicant Protocol drivers to create and destroy child of the driver to communicate with other host using Supplicant protocol.

GUID

```
#define EFI_SUPPLICANT_SERVICE_BINDING_PROTOCOL_GUID \
  { 0x45bcd98e, 0x59ad, 0x4174, \
    { 0x95, 0x46, 0x34, 0x4a, 0x7, 0x48, 0x58, 0x98 }}
```

Description

A module that requires supplicant services can call one of the protocol handler services, such as *BS->LocateHandleBuffer()*, to search devices that publish an EFI Supplicant Service Binding Protocol GUID. Such device supports the EFI Supplicant Protocol and may be available for use. After a successful call to the *EFI_SUPPLICANT_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the newly created child EFI Supplicant Protocol driver is in an un-configured state; it is not ready to do any operation until configured via SetData(). Every successful call to the *EFI_SUPPLICANT_SERVICE_BINDING_PROTOCOL.CreateChild()* function must be matched with a call to the *EFI_SUPPLICANT_SERVICE_BINDING_PROTOCOL.DestroyChild()* function to release the protocol driver.

27.5.3 Supplicant Protocol

27.5.4 EFI_SUPPLICANT_PROTOCOL

Summary

This protocol provides services to process authentication and data encryption/decryption for security management.

GUID

```
#define EFI_SUPPLICANT_PROTOCOL_GUID \
  { 0x54fcc43e, 0xaa89, 0x4333, \
    { 0x9a, 0x85, 0xcd, 0xea, 0x24, 0x5, 0x1e, 0x9e }}
```

Protocol Interface Structure

```
typedef struct _EFI_SUPPLICANT_PROTOCOL {
  EFI_SUPPLICANT_BUILD_RESPONSE_PACKET     BuildResponsePacket;
  EFI_SUPPLICANT_PROCESS_PACKET            ProcessPacket;
  EFI_SUPPLICANT_SET_DATA                  SetData;
  EFI_SUPPLICANT_GET_DATA                  GetData;
}   EFI_SUPPLICANT_PROTOCOL;
```

Parameters

BuildResponsePacket
This API processes security data for handling key management. See the *BuildResponsePacket()* function description.

ProcessPacket
This API processes frame for encryption or decryption. See the *ProcessPacket()* function description.

SetData
This API sets the information needed during key generated in handshake. See the *SetData()* function description.

GetData
This API gets the information generated in handshake. See the *GetData()* function description.

Description

The *EFI_SUPPLICANT_PROTOCOL* is designed to provide unified place for WIFI and EAP security management. Both PSK authentication and 802.1X EAP authentication can be managed via this protocol and driver or application as a consumer can only focus on about packet transmitting or receiving. For 802.1X EAP authentication, an instance of *EFI_EAP_CONFIGURATION_PROTOCOL* must be installed to the same handle as the EFI Supplicant Protocol.

27.5.5 EFI_SUPPLICANT_PROTOCOL.BuildResponsePacket()

Summary

BuildResponsePacket() is called during STA and AP authentication is in progress. Supplicant derives the PTK or session keys depend on type of authentication is being employed.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SUPPLICANT_BUILD_RESPONSE_PACKET)(
  IN EFI_SUPPLICANT_PROTOCOL           *This,
  IN UINT8                             *RequestBuffer, OPTIONAL
  IN UINTN                             RequestBufferSize, OPTIONAL
  OUT UINT8                            *Buffer,
  IN OUT UINTN                         *BufferSize
  );
```

Parameters

This
Pointer to the *EFI_SUPPLICANT_PROTOCOL* instance.

RequestBuffer
Pointer to the most recently received EAPOL packet. *NULL* means the supplicant need initiate the EAP authentication session and send EAPOL-Start message.

RequestSize
Packet size in bytes for the most recently received EAPOL packet. 0 is only valid when *RequestBuffer* is *NULL*.

Buffer
Pointer to the buffer to hold the built packet.

BufferSize
Pointer to the buffer size in bytes. On input, it is the buffer size provided by the caller. On output, it is the buffer size in fact needed to contain the packet.

Description

The consumer calls *BuildResponsePacket()* when it receives the security frame. It simply passes the data to supplicant to process the data. It could be WPA-PSK which starts the 4-way handshake, or WPA-EAP first starts with Authentication process and then 4-way handshake, or 2-way group key handshake. In process of authentication, 4-way handshake or group key handshake, Supplicant needs to communicate with its peer (AP/AS) to fill the output buffer parameter. Once the 4 way handshake or group key handshake is over, and PTK (Pairwise Transient keys) and GTK (Group Temporal Key) are generated.

Status Codes Returned

EFI_SUCCESS	The required EAPOL packet is built successfully.

continues on next page

Table 27.21 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • *RequestBuffer* is *NULL*, but *RequestSize* is NOT 0. • *RequestSize* is 0. • *Buffer* is *NULL*, but *RequestBuffer* is NOT 0. • *RequestSize* is 0. • *BufferSize* is *NULL*.
EFI_BUFFER_TOO_SMALL	*BufferSize* is too small to hold the response packet.
EFI_NOT_READY	Current EAPOL session state is NOT ready to build *ResponsePacket*.

27.5.6 EFI_SUPPLICANT_PROTOCOL.ProcessPacket()

Summary

ProcessPacket() is called to Supplicant driver to encrypt or decrypt the data depending type of authentication type.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SUPPLICANT_PROCESS_PACKET)(
  IN EFI_SUPPLICANT_PROTOCOL            *This,
  IN OUT EFI_SUPPLICANT_FRAGMENT_DATA   **FragmentTable,
  IN UINT32                             *FragmentCount,
  IN EFI_SUPPLICANT_CRYPT_MODE          CryptMode
  );
```

Parameters

This

Pointer to the *EFI_SUPPLICANT_PROTOCOL* instance.

FragmentTable

Pointer to a list of fragment. The caller will take responsible to handle the original *FragmentTable* while it may be reallocated in Supplicant driver.

FragmentCount

Number of fragment.

CryptMode

Crypt mode.

Description

ProcessPacket() is responsible for encrypting or decrypting the data traffic as per authentication type. The consumer routes the data frame as it is to Supplicant module and encrypts or decrypts packet with updated length comes as output parameter. Supplicant holds the derived PTK and GTKs and uses this key to encrypt or decrypt the network traffic.

If the Supplicant driver does not support any encryption and decryption algorithm, then *EFI_UNSUPPORTED* is returned.

Related Definitions

```
//************************************************************
// EFI_SUPPLICANT_FRAGMENT_DATA
//************************************************************
typedef struct {
  UINT32                FragmentLength;
  VOID                  *FragmentBuffer;
}   EFI_SUPPLICANT_FRAGMENT_DATA;
```

FragmentLength
Length of data buffer in the fragment.

FragmentBuffer
Pointer to the data buffer in the fragment.

```
//***********************************************************
// EFI_SUPPLICANT_CRYPT_MODE
//***********************************************************
typedef enum {
  EfiSupplicantEncrypt,
  EfiSupplicantDecrypt,
}   EFI_SUPPLICANT_CRYPT_MODE;
```

EfiSupplicantEncrypt
Encrypt data provided in the fragment buffers.

EfiSupplicantDecrypt
Decrypt data provided in the fragment buffers.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • *FragmentTable* is NULL. • *FragmentCount* is NULL. • *CryptMode* is invalid.
EFI_NOT_READY	Current supplicant state is NOT Authenticated.
EFI_ABORTED	Something wrong decryption the message.
EFI_UNSUPPORTED	This API is not supported.

27.5.7 EFI_SUPPLICANT_PROTOCOL.SetData()

Summary

Set Supplicant configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SUPPLICANT_SET_DATA)(
  IN EFI_SUPPLICANT_PROTOCOL        *This,
```

(continues on next page)

(continued from previous page)

```
  IN EFI_SUPPLICANT_DATA_TYPE       DataType,
  IN VOID                           *Data,
  IN UINTN                          DataSize
  );
```

Parameters

This
Pointer to the *EFI_* SUPPLICANT *_PROTOCOL* instance.

DataType
The type of data.

Data
Pointer to the buffer to hold the data.

DataSize
Pointer to the buffer size in bytes.

Description

The *SetData()* function sets Supplicant configuration. For example, Supplicant driver need to know Password and TargetSSIDName to calculate PSK. Supplicant driver need to know StationMac and TargetSSIDMac to calculate PTK. Then it can derive KCK(key confirmation key) which is needed to calculate MIC, and KEK(key encryption key) which is needed to unwrap GTK.

}   EFI_SUPPLICANT_DATA_TYPE;
```

EfiSupplicant80211AKMSuite
Current authentication type in use. The corresponding Data is of type EFI_80211_AKM_SUITE_SELECTOR.

EfiSupplicant80211GroupDataCipherSuite
Group data encryption type in use. The corresponding Data is of type EFI_80211_CIPHER_SUITE_SELECTOR.

EfiSupplicant80211PairwiseCipherSuite
Pairwise encryption type in use. The corresponding Data is of type EFI_80211_CIPHER_SUITE_SELECTOR.

EfiSupplicant80211PskPassword
PSK password. The corresponding Data is a NULL-terminated ASCII string.

EfiSupplicant80211TargetSSIDName
Target SSID name. The corresponding Data is of type EFI_80211_SSID.

EfiSupplicant80211StationMac
Station MAC address. The corresponding Data is of type EFI_80211_MAC_ADDRESS.

EfiSupplicant80211TargetSSIDMac
Target SSID MAC address. The corresponding Data is 6 bytes MAC address.

EfiSupplicant80211PTK
802.11 PTK. The corresponding Data is of type EFI_SUPPLICANT_KEY.

EfiSupplicant80211GTK
802.11 GTK. The corresponding Data is of type EFI_SUPPLICANT_GTK_LIST.

EfiSupplicantState
Supplicant state. The corresponding Data is EFI_EAPOL_SUPPLICANT_PAE_STATE.

EfiSupplicant80211LinkState
802.11 link state. The corresponding Data is EFI_80211_LINK_STATE.

EfiSupplicantKeyRefresh
Flag indicates key is refreshed. The corresponding Data is EFI_SUPPLICANT_KEY_REFRESH.

EfiSupplicant80211SupportedAKMSuites
Supported authentication types. The corresponding Data is of type EFI_80211_AKM_SUITE_SELECTOR.

EfiSupplicant80211SupportedSoftwareCipherSuites
Supported software encryption types provided by supplicant driver. The corresponding Data is of type EFI_80211_CIPHER_SUITE_SELECTOR.

EfiSupplicant80211SupportedHardwareCipherSuites
Supported hardware encryption types provided by wireless UNDI driver. The corresponding Data is of type EFI_80211_CIPHER_SUITE_SELECTOR.

EfiSupplicant80211IGTK
802.11 Integrity GTK. The corresponding Data is of type EFI_SUPPLICANT_GTK_LIST.

EfiSupplicant80211IPMK
802.11 PMK. The corresponding Data is 32 bytes pairwise master key.

```
//**********************************************
// EFI_80211_LINK_STATE
//**********************************************
typedef enum {
  Ieee80211UnauthenticatedUnassociated,
  Ieee80211AuthenticatedUnassociated,
  Ieee80211PendingRSNAuthentication,
  Ieee80211AuthenticatedAssociated
}   EFI_80211_LINK_STATE;
```

Ieee80211UnauthenticatedUnassociated
Indicates initial start state, unauthenticated, unassociated.

Ieee80211AuthenticatedUnassociated
Indicates authenticated, unassociated.

Ieee80211PendingRSNAuthentication
Indicates authenticated and associated, but pending RSN authentication.

Ieee80211AuthenticatedAssociated
Indicates authenticated and associated.

```
//**********************************************
// EFI_SUPPLICANT_KEY_REFRESH
//**********************************************
typedef struct {
  BOOLEAN                  GTKRefresh;
}   EFI_SUPPLICANT_KEY_REFRESH;
```

GTKRefresh
If TRUE, indicates GTK is just refreshed after a successful call to EFI_SUPPLICANT_PROTOCOL.BuildResponsePacket().

```
//**************************************************************
// EFI_SUPPLICANT_GTK_LIST
//**************************************************************
typedef struct {
 UINT8                     GTKCount;
 EFI_SUPPLICANT_KEY        GTKList[1];
} EFI_SUPPLICANT_GTK_LIST;
```

GTKCount
Indicates the number of GTKs that are contained in GTKList.

GTKList
A variable-length array of GTKs of type EFI_SUPPLICANT_KEY. The number of entries is specified by GTKCount

```
#define EFI_MAX_KEY_LEN 64
```

(continues on next page)

(continued from previous page)

```
//************************************************************
// EFI_SUPPLICANT_KEY
//************************************************************
typedef struct {
  UINT8                         Key[EFI_MAX_KEY_LEN];
  UINT8                         KeyLen;
  UINT8                         KeyId;
  EFI_SUPPLICANT_KEY_TYPE       KeyType;
  EFI_80211_MAC_ADDRESS         Addr;
  UINT8                         Rsc[8];

  BOOLEAN                       IsAuthenticator;
  EFI_80211_SUITE_SELECTOR      CipherSuite;
  EFI_SUPPLICANT_KEY_DIRECTION Direction;
}   EFI_SUPPLICANT_KEY;
```

The EFI_SUPPLICANT_KEY descriptor is defined in the IEEE 802.11 standard, section 6.3.19.1.2.

Key
The key value.

KeyLen
Length in bytes of the Key. Should be up to EFI_MAX_KEY_LEN.

KeyId
The key identifier.

KeyType
Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group.

Addr
The value is set according to the KeyType.

RSC
The Receive Sequence Count value.

RscLen
Length in bytes of the Rsc. Should be up to 8.

IsAuthenticator
Indicates whether the key is configured by the Authenticator or Supplicant. The value true indicates Authenticator.

CipherSuite
The cipher suite required for this association.

Direction
Indicates the direction for which the keys are to be installed.

```
//************************************************
// EFI_SUPPLICANT_KEY_TYPE (IEEE Std 802.11
//          Section 6.3.19.1.2)
//************************************************
typedef enum {
  Group,
  Pairwise,
  PeerKey,
```

(continues on next page)

(continued from previous page)

```
  IGTK
}   EFI_SUPPLICANT_KEY_TYPE;
```

The EFI_SUPPLICANT_KEY_TYPE is defined in the IEEE 802.11 specification.

```
//**********************************************
// EFI_SUPPLICANT_KEY_DIRECTION (IEEE Std 802.11
//       Section 6.3.19.1.2)
//**********************************************
typedef enum {
  Receive,
  Transmit,
  Both
}   EFI_SUPPLICANT_KEY_DIRECTION;
```

Receive
Indicates that the keys are being installed for the receive direction.

Transmit
Indicates that the keys are being installed for the transmit direction.

Both
Indicates that the keys are being installed for both the receive and transmit directions.

Status Codes Returned

EFI_SUCCESS	The Supplicant configuration data is set successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • *Data* is NULL. • *DataSize* is 0.
EFI_UNSUPPORTED	The *DataType* is unsupported.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.

27.5.8 EFI_SUPPLICANT_PROTOCOL.GetData()

Summary

Get Supplicant configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SUPPLICANT_GET_DATA)(
  IN EFI_SUPPLICANT_PROTOCOL        *This,
  IN EFI_SUPPLICANT_DATA_TYPE       DataType,
  OUT UINT8                         *Data, OPTIONAL
  IN OUT UINTN                      *DataSize
  );
```

Parameters

This
Pointer to the *EFI_SUPPLICANT_PROTOCOL* instance.

DataType
The type of data.

Data
Pointer to the buffer to hold the data. Ignored if *DataSize* is 0.

DataSize
Pointer to the buffer size in bytes. On input, it is the buffer size provided by the caller. On output, it is the buffer size in fact needed to contain the packet.

Description

The *GetData()* function gets Supplicant configuration. The typical example is PTK and GTK derived from handshake. The wireless NIC can support software encryption or hardware encryption. If the consumer uses software encryption, it can call *ProcessPacket()* to get result. If the consumer supports hardware encryption, it can get PTK and GTK via *GetData()* and program to hardware register.

Status Codes Returned

EFI_SUCCESS	The Supplicant configuration data is got successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • This is NULL. • DataSize is NULL. • Data is NULL if DataSize is not zero.
EFI_UNSUPPORTED	The *DataType* is unsupported.
EFI_NOT_FOUND	The Supplicant configuration data is not found.
EFI_BUFFER_TOO_SMALL	The size of *Data* is too small for the specified configuration data and the required size is returned in *DataSize*.

CHAPTER

TWENTYEIGHT

NETWORK PROTOCOLS — TCP, IP, IPSEC, FTP, TLS AND CONFIGURATIONS

28.1 EFI TCPv4 Protocol

This section defines the EFI TCPv4 (Transmission Control Protocol version 4) Protocol.

28.1.1 TCP4 Service Binding Protocol

28.1.2 EFI_TCP4_SERVICE_BINDING_PROTOCOL

Summary

The EFI TCPv4 Service Binding Protocol is used to locate EFI TCPv4 Protocol drivers to create and destroy child of the driver to communicate with other host using TCP protocol.

GUID

```
#define EFI_TCP4_SERVICE_BINDING_PROTOCOL_GUID \
  {0x00720665,0x67EB,0x4a99,\
    {0xBA,0xF7,0xD3,0xC3,0x3A,0x1C,0x7C,0xC9}}
```

Description

A network application that requires TCPv4 I/O services can call one of the protocol handler services, such as *BS->LocateHandleBuffer(),* to search devices that publish an EFI TCPv4 Service Binding Protocol GUID. Such device supports the EFI TCPv4 Protocol and may be available for use.

After a successful call to the *EFI_TCP4_SERVICE_BINDING_PROTOCOL .CreateChild()* function, the newly created child EFI TCPv4 Protocol driver is in an un-configured state; it is not ready to do any operation except *Poll()* send and receive data packets until configured as the purpose of the user and perhaps some other indispensable function belonged to TCPv4 Protocol driver is called properly.

Every successful call to the *EFI_TCP4_SERVICE_BINDING_PROTOCOL .CreateChild()* function must be matched with a call to the *EFI_TCP4_SERVICE_BINDING_PROTOCOL.DestroyChild()* function to release the protocol driver.

28.1.3 TCP4 Protocol

28.1.4 EFI_TCP4_PROTOCOL

Summary

The EFI TCPv4 Protocol provides services to send and receive data stream.

GUID

```
#define EFI_TCP4_PROTOCOL_GUID \
  {0x65530BC7,0xA359,0x410f,\
    {0xB0,0x10,0x5A,0xAD,0xC7,0xEC,0x2B,0x62}}
```

Protocol Interface Structure

```
typedef struct _EFI_TCP4_PROTOCOL {
  EFI_TCP4_GET_MODE_DATA         GetModeData;
  EFI_TCP4_CONFIGURE             Configure;
  EFI_TCP4_ROUTES                Routes;
  EFI_TCP4_CONNECT               Connect;
  EFI_TCP4_ACCEPT                Accept;
  EFI_TCP4_TRANSMIT              Transmit;
  EFI_TCP4_RECEIVE               Receive;
  EFI_TCP4_CLOSE                 Close;
  EFI_TCP4_CANCEL                Cancel;
  EFI_TCP4_POLL                  Poll;
}   EFI_TCP4_PROTOCOL;
```

Parameters

GetModeData
Get the current operational status. See the *GetModeData()* function description.

Configure
Initialize, change, or brutally reset operational settings of the EFI TCPv4 Protocol. See the *Configure()* function description.

Routes
Add or delete routing entries for this TCP4 instance. See the *Routes()* function description.

Connect
Initiate the TCP three-way handshake to connect to the remote peer configured in this TCP instance. The function is a nonblocking operation. See the *Connect()* function description.

Accept
Listen for incoming TCP connection request. This function is a nonblocking operation. See the *Accept()* function description.

Transmit
Queue outgoing data to the transmit queue. This function is a nonblocking operation. See the *Transmit()* function description.

Receive
Queue a receiving request token to the receive queue. This function is a nonblocking operation. See the *Receive()* function description.

Close

Gracefully disconnecting a TCP connection follow RFC 793 or reset a TCP connection. This function is a nonblocking operation. See the *Close()* function description.

Cancel

Abort a pending connect, listen, transmit or receive request. See the *Cancel()* function description.

Poll

Poll to receive incoming data and transmit outgoing TCP segments. See the *Poll()* function description.

Description

The *EFI_TCP4_PROTOCOL* defines the EFI TCPv4 Protocol child to be used by any network drivers or applications to send or receive data stream. It can either listen on a specified port as a service or actively connected to remote peer as a client. Each instance has its own independent settings, such as the routing table.

Note: *In this document, all IPv4 addresses and incoming/outgoing packets are stored in network byte order. All other parameters in the functions and data structures that are defined in this document are stored in host byte order unless explicitly specified.*

28.1.5 EFI_TCP4_PROTOCOL.GetModeData()

Summary

Get the current operational status.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP4_GET_MODE_DATA) (
  IN EFI_TCP4_PROTOCOL                 *This,
  OUT EFI_TCP4_CONNECTION_STATE        *Tcp4State OPTIONAL,
  OUT EFI_TCP4_CONFIG_DATA             *Tcp4ConfigData OPTIONAL,
  OUT EFI_IPv4_MODE_DATA               *Ip4ModeData OPTIONAL,
  OUT EFI_MANAGED_NETWORK_CONFIG_DATA  *MnpConfigData OPTIONAL,
  OUT EFI_SIMPLE_NETWORK_MODE          *SnpModeData OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_TCP4_PROTOCOL* instance.

Tcp4State

Pointer to the buffer to receive the current TCP state. Type *EFI_TCP4_CONNECTION_STATE* is defined in “Related Definitions” below.

Tcp4ConfigData

Pointer to the buffer to receive the current TCP configuration. Type *EFI_TCP4_CONFIG_DATA* is defined in “Related Definitions” below.

Ip4ModeData

Pointer to the buffer to receive the current IPv4 configuration data used by the TCPv4 instance. Type *EFI_IP4_MODE_DATA* is defined in *EFI_IP4_PROTOCOL .GetModeData()*.

MnpConfigData

Pointer to the buffer to receive the current MNP configuration data used indirectly by the TCPv4 instance. Type *EFI_MANAGED_NETWORK_CONFIG_DATA* is defined in *EFI_MANAGED_NETWORK_PROTOCOL.GetModeData()*.

SnpModeData
Pointer to the buffer to receive the current SNP configuration data used indirectly by the TCPv4 instance. Type *EFI_SIMPLE_NETWORK_MODE* is defined in the *EFI_SIMPLE_NETWORK_PROTOCOL*.

Description

The *GetModeData()* function copies the current operational settings of this EFI TCPv4 Protocol instance into user-supplied buffers. This function can also be used to retrieve the operational setting of underlying drivers such as IPv4, MNP, or SNP.

Related Definition

```
typedef struct {
  BOOLEAN               UseDefaultAddress;
  EFI_IPv4_ADDRESS      StationAddress;
  EFI_IPv4_ADDRESS      SubnetMask;
  UINT16                StationPort;
  EFI_IPv4_ADDRESS      RemoteAddress;
  UINT16                RemotePort;
  BOOLEAN               ActiveFlag;
}   EFI_TCP4_ACCESS_POINT;
```

UseDefaultAddress
Set to **TRUE** to use the default IP address and default routing table. If the default IP address is not available yet, then the underlying EFI IPv4 Protocol driver will use *EFI_IP4_CONFIG2_PROTOCOL* to retrieve the IP address and subnet information.

StationAddress
The local IP address assigned to this EFI TCPv4 Protocol instance. The EFI TCPv4 and EFI IPv4 Protocol drivers will only deliver incoming packets whose destination addresses exactly match the IP address. Not used when *UseDefaultAddress* is **TRUE**.

SubnetMask
The subnet mask associated with the station address. Not used when *UseDefaultAddress* is *TRUE*.

StationPort
The local port number to which this EFI TCPv4 Protocol instance is bound. If the instance doesn't care the local port number, set *StationPort* to zero to use an ephemeral port.

RemoteAddress
The remote IP address to which this EFI TCPv4 Protocol instance is connected. If *ActiveFlag* is **FALSE** (i.e., a passive TCPv4 instance), the instance only accepts connections from the *RemoteAddress*. If *ActiveFlag* is **TRUE** the instance is connected to the *RemoteAddress,* i.e., outgoing segments will be sent to this address and only segments from this address will be delivered to the application. When *ActiveFlag* is **FALSE** it can be set to zero and means that incoming connection request from any address will be accepted.

RemotePort
The remote port to which this EFI TCPv4 Protocol instance is connects or connection request from which is accepted by this EFI TCPv4 Protocol instance. If *ActiveFlag* is **FALSE** it can be zero and means that incoming connection request from any port will be accepted. Its value can not be zero when *ActiveFlag* is **TRUE**.

ActiveFlag
Set it to **TRUE** to initiate an active open. Set it to **FALSE** to initiate a passive open to act as a server.

```
typedef struct {
  UINT32             ReceiveBufferSize;
```

(continues on next page)

(continued from previous page)

```
  UINT32            SendBufferSize;
  UINT32            MaxSynBackLog;
  UINT32            ConnectionTimeout;
  UINT32            DataRetries;
  UINT32            FinTimeout;
  UINT32            TimeWaitTimeout;
  UINT32            KeepAliveProbes;
  UINT32            KeepAliveTime;
  UINT32            KeepAliveInterval;
  BOOLEAN           EnableNagle;
  BOOLEAN           EnableTimeStamp;
  BOOLEAN           EnableWindowScaling;
  BOOLEAN           EnableSelectiveAck;
  BOOLEAN           EnablePathMtuDiscovery;
}   EFI_TCP4_OPTION;
```

ReceiveBufferSize
The size of the TCP receive buffer.

SendBufferSize
The size of the TCP send buffer.

MaxSynBackLog
The length of incoming connect request queue for a passive instance. When set to zero, the value is implementation specific.

ConnectionTimeout
The maximum seconds a TCP instance will wait for before a TCP connection established. When set to zero, the value is implementation specific.

DataRetries
The number of times TCP will attempt to retransmit a packet on an established connection. When set to zero, the value is implementation specific.

FinTimeout
How many seconds to wait in the FIN_WAIT_2 states for a final FIN flag before the TCP instance is closed. This timeout is in effective only if the application has called *Close()* to disconnect the connection completely. It is also called FIN_WAIT_2 timer in other implementations. When set to zero, it should be disabled because the FIN_WAIT_2 timer itself is against the standard.

TimeWaitTimeout
How many seconds to wait in TIME_WAIT state before the TCP instance is closed. The timer is disabled completely to provide a method to close the TCP connection quickly if it is set to zero. It is against the related RFC documents.

KeepAliveProbes
The maximum number of TCP keep-alive probes to send before giving up and resetting the connection if no response from the other end. Set to zero to disable keep-alive probe.

KeepAliveTime
The number of seconds a connection needs to be idle before TCP sends out periodical keep-alive probes. When set to zero, the value is implementation specific. It should be ignored if keep-alive probe is disabled.

KeepAliveInterval
The number of seconds between TCP keep-alive probes after the periodical keep-alive probe if no response. When set to zero, the value is implementation specific. It should be ignored if keep-alive probe is disabled.

EnableNagle
Set it to **TRUE** to enable the Nagle algorithm as defined in RFC896. Set it to **FALSE** to disable it.

EnableTimeStamp
Set it to **TRUE** to enable TCP timestamps option as defined in RFC7323. Set to **FALSE** to disable it.

EnableWindowScaling
Set it to **TRUE** to enable TCP window scale option as defined in RFC7323. Set it to **FALSE** to disable it.

EnableSelectiveAck
Set it to **TRUE** to enable selective acknowledge mechanism described in RFC 2018. Set it to **FALSE** to disable it. Implementation that supports SACK can optionally support DSAK as defined in RFC 2883.

EnablePathMtudiscovery
Set it to **TRUE** to enable path MTU discovery as defined in RFC 1191. Set to **FALSE** to disable it.

Option setting with digital value will be modified by driver if it is set out of the implementation specific range and an implementation specific default value will be set accordingly.

```
//**************************************************
// EFI_TCP4_CONFIG_DATA
//**************************************************
typedef struct {
  // Receiving Filters
  // I/O parameters
  UINT8                    TypeOfService;
  UINT8                    TimeToLive;

  // Access Point
  EFI_TCP4_ACCESS_POINT    AccessPoint;

  // TCP Control Options
  EFI_TCP4_OPTION          ControlOption;

}   EFI_TCP4_CONFIG_DATA;
```

TypeOfService
TypeOfService field in transmitted IPv4 packets.

TimeToLive
TimeToLive field in transmitted IPv4 packets.

AccessPoint
Used to specify TCP communication end settings for a TCP instance.

ControlOption
Used to configure the advance TCP option for a connection. If set to *NULL,* implementation specific options for TCP connection will be used.

```
//*********************************************************
// EFI_TCP4_CONNECTION_STATE
//*********************************************************

   typedef enum {
     Tcp4StateClosed = 0,
     Tcp4StateListen = 1,
     Tcp4StateSynSent = 2,
     Tcp4StateSynReceived = 3,
```

(continues on next page)

(continued from previous page)

```
    Tcp4StateEstablished = 4,
    Tcp4StateFinWait1 = 5,
    Tcp4StateFinWait2 = 6,
    Tcp4StateClosing = 7,
    Tcp4StateTimeWait = 8,
    Tcp4StateCloseWait = 9,
    Tcp4StateLastAck = 10
  }   EFI_TCP4_CONNECTION_STATE;
```

Status Codes Returned

EFI_SUCCESS	The mode data was read.
EFI_NOT_STARTED	No configuration data is available because this instance hasn't been started.
EFI_INVALID_PARAMETER	*This* is **NULL**.

28.1.6 EFI_TCP4_PROTOCOL.Configure()

Summary

Initialize or brutally reset the operational parameters for this EFI TCPv4 instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP4_CONFIGURE) (
  IN EFI_TCP4_PROTOCOL           *This,
  IN EFI_TCP4_CONFIG_DATA        *TcpConfigData OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_TCP4_PROTOCOL* instance.

TcpConfigData

Pointer to the configure data to configure the instance.

Description

The *Configure()* function does the following:

- Initialize this EFI TCPv4 instance, i.e., initialize the communication end setting, specify active open or passive open for an instance.
- Reset this TCPv4 instance brutally, i.e., cancel all pending asynchronous tokens, flush transmission and receiving buffer directly without informing the communication peer.

No other TCPv4 Protocol operation can be executed by this instance until it is configured properly. For an active TCP4 instance, after a proper configuration it may call *Connect()* to initiates the three-way handshake. For a passive TCP4 instance, its state will transit to Tcp4StateListen after configuration, and *Accept()* may be called to listen the incoming TCP connection request. If *TcpConfigData* is set to *NULL,* the instance is reset. Resetting process will be done brutally, the state machine will be set to Tcp4StateClosed directly, the receive queue and transmit queue will be flushed, and no traffic is allowed through this instance.

Status Codes Returned

EFI_SUCCESS	The operational settings are set, changed, or reset successfully.
EFI_NO_MAPPING	When using a default address, configuration (through DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_INVALID_PARAMETER	One or more following conditions are TRUE: • This is NULL. • TcpConfigData -> AccessPoint.StationAddress isn't a valid unicast IPv4 address when TcpConfigData -> AccessPoint.UseDefaultAddress is FALSE. • TcpConfigData -> AccessPoint.SubnetMask isn't a valid IPv4 address mask when TcpConfigData -> AccessPoint.UseDefaultAddress is FALSE. The subnet mask must be contiguous. • TcpConfigData -> AccessPoint.RemoteAddress isn't a valid unicast IPv4 address. • TcpConfigData -> AccessPoint.RemoteAddress is zero or TcpConfigData -> AccessPoint.RemotePort is zero when TcpConfigData -> AccessPoint.ActiveFlag is TRUE. • A same access point has been configured in other TCP instance properly.
EFI_ACCESS_DENIED	Configuring TCP instance when it is configured without calling *Configure()* with **NULL** to reset it.
EFI_DEVICE_ERROR	An unexpected network or system error occurred.
EFI_UNSUPPORTED	One or more of the control options are not supported in the implementation.
EFI_OUT_OF_RESOURCES	Could not allocate enough system resources when executing *Configure()*.

28.1.7 EFI_TCP4_PROTOCOL.Routes()

Summary

Add or delete routing entries.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP4_ROUTES) (
  IN EFI_TCP4_PROTOCOL  *This,
  IN BOOLEAN            DeleteRoute,
  IN EFI_IPv4_ADDRESS   *SubnetAddress,
  IN EFI_IPv4_ADDRESS   *SubnetMask,
  IN EFI_IPv4_ADDRESS   *GatewayAddress
  );
```

Parameters

This

Pointer to the *EFI_TCP4_PROTOCOL* instance.

DeleteRoute

Set it to **TRUE** to delete this route from the routing table. Set it to **FALSE** to add this route to the routing table. *DestinationAddress* and *SubnetMask* are used as the keywords to search route entry.

SubnetAddress

The destination network.

SubnetMask

The subnet mask of the destination network.

GatewayAddress

The gateway address for this route. It must be on the same subnet with the station address unless a direct route is specified.

Description

The *Routes()* function adds or deletes a route from the instance's routing table.

The most specific route is selected by comparing the *SubnetAddress* with the destination IP address's arithmetical *AND* to the *SubnetMask*.

The default route is added with both *SubnetAddress* and *SubnetMask* set to 0.0.0.0. The default route matches all destination IP addresses if there is no more specific route.

Direct route is added with *GatewayAddress* set to 0.0.0.0. Packets are sent to the destination host if its address can be found in the Address Resolution Protocol (ARP) cache or it is on the local subnet. If the instance is configured to use default address, a direct route to the local network will be added automatically.

Each TCP instance has its own independent routing table. Instance that uses the default IP address will have a copy of the *EFI_IP4_CONFIG2_PROTOCOL* 's routing table. The copy will be updated automatically whenever the IP driver reconfigures its instance. As a result, the previous modification to the instance's local copy will be lost.

The priority of checking the route table is specific with IP implementation and every IP implementation must comply with RFC 1122.

Note: *There is no way to set up routes to other network interface cards (NICs) because each NIC has its own independent network stack that shares information only through* EFI TCP4 variable.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_NOT_STARTED	The EFI TCPv4 Protocol instance has not been configured.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *SubnetAddress* is **NULL**. • *SubnetMask* is **NULL**. • *GatewayAddress* is **NULL**. • *SubnetAddress* is not **NULL** a valid subnet address. • *SubnetMask* is not a valid subnet mask. • *GatewayAddress* is not a valid unicast IP address or it is not in the same subnet.
EFI_OUT_OF_RESOURCES	Could not allocate enough resources to add the entry to the routing table.
EFI_NOT_FOUND	This route is not in the routing table.

continues on next page

Table 28.3 – continued from previous page

EFI_ACCESS_DENIED	The route is already defined in the routing table.
EFI_UNSUPPORTED	The TCP driver does not support this operation.

28.1.8 EFI_TCP4_PROTOCOL.Connect()

Summary

Initiate a nonblocking TCP connection request for an active TCP instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP4_CONNECT) (
  IN EFI_TCP4_PROTOCOL           *This,
  IN EFI_TCP4_CONNECTION_TOKEN   *ConnectionToken,
  );
```

Parameters

This

Pointer to the *EFI_TCP4_PROTOCOL* instance.

ConnectionToken

Pointer to the connection token to return when the TCP three way handshake finishes. Type *EFI_TCP4_CONNECTION_TOKEN* is defined in "Related Definition" below.

Description

The *Connect()* function will initiate an active open to the remote peer configured in current TCP instance if it is configured active. If the connection succeeds or fails due to any error, the *ConnectionToken->CompletionToken.Event* will be signaled and *ConnectionToken->CompletionToken.Status* will be updated accordingly. This function can only be called for the TCP instance in *Tcp4StateClosed* state. The instance will transfer into *Tcp4StateSynSent* if the function returns *EFI_SUCCESS.* If TCP three way handshake succeeds, its state will become *Tcp4StateEstablished,* otherwise, the state will return to *Tcp4StateClosed*.

Related Definition

```
//*******************************************************
// EFI_TCP4_COMPLETION_TOKEN
//*******************************************************
typedef struct {
  EFI_EVENT               Event;
  EFI_STATUS              Status;
}   EFI_TCP4_COMPLETION_TOKEN;
```

Event

The *Event* to signal after request is finished and *Status* field is updated by the EFI TCPv4 Protocol driver. The type of *Event* must be *EVT_NOTIFY_SIGNAL,* and its Task Priority Level (TPL) must be lower than or equal to *TPL_CALLBACK*.

Status

The variable to receive the result of the completed operation. *EFI_NO_MEDIA*. There was a media error

The EFI_TCP4_COMPLETION_TOKEN is used as a common header for various asynchronous tokens.

```
//*******************************************************
// EFI_TCP4_CONNECTION_TOKEN
//*******************************************************
typedef struct {
  EFI_TCP4_COMPLETION_TOKEN      CompletionToken;
}   EFI_TCP4_CONNECTION_TOKEN;
```

Status

The *Status* in the *CompletionToken* will be set to one of the following values if the active open succeeds or an unexpected error happens:

EFI_SUCCESS. The active open succeeds and the instance is in *Tcp4StateEstablished*.

EFI_CONNECTION_RESET. The connect fails because the connection is reset either by instance itself or communication peer.

EFI_CONNECTION_REFUSED: The connect fails because this connection is initiated with an active open and the connection is refused.

EFI_ABORTED. The active open was aborted.

EFI_TIMEOUT. The connection establishment timer expired and no more specific information is available.

EFI_NETWORK_UNREACHABLE. The active open fails because an ICMP network unreachable error is received.

EFI_HOST_UNREACHABLE. The active open fails because an ICMP host unreachable error is received.

EFI_PROTOCOL_UNREACHABLE. The active open fails because an ICMP protocol unreachable error is received.

EFI_PORT_UNREACHABLE. The connection establishment timer times out and an ICMP port unreachable error is received.

EFI_ICMP_ERROR. The connection establishment timer timeout and some other ICMP error is received.

EFI_DEVICE_ERROR. An unexpected system or network error occurred.

Status Codes Returned

EFI_SUCCESS	The connection request is successfully initiated and the state of this TCPv4 instance has been changed to *Tcp4StateSynSent*.
EFI_NOT_STARTED	This EFI TCPv4 Protocol instance has not been configured.
EFI_ACCESS_DENIED	One or more of the following conditions are **TRUE:** • This instance is not configured as an active one. • This instance is not in *Tcp4StateClosed* state.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE**: • *This* is **NULL**. • *ConnectionToken* is **NULL**. • *ConnectionToken* -> *CompletionToken*. *Event* is **NULL**.
EFI_OUT_OF_RESOURCES	The driver can't allocate enough resource to initiate the active open.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

28.1.9 EFI_TCP4_PROTOCOL.Accept()

Summary

Listen on the passive instance to accept an incoming connection request. This is a nonblocking operation.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP4_ACCEPT) (
  IN EFI_TCP4_PROTOCOL        *This,
  IN EFI_TCP4_LISTEN_TOKEN    *ListenToken
  );
```

Parameters

This

Pointer to the *EFI_TCP4_PROTOCOL* instance.

ListenToken

Pointer to the listen token to return when operation finishes. Type *EFI_TCP4_LISTEN_TOKEN* is defined in "Related Definition" below.

Related Definition

```
//********************************************************
// EFI_TCP4_LISTEN_TOKEN
//********************************************************
typedef struct {
  EFI_TCP4_COMPLETION_TOKEN      CompletionToken;
  EFI_HANDLE                     NewChildHandle;
}   EFI_TCP4_LISTEN_TOKEN;
```

Status

The *Status* in *CompletionToken* will be set to the following value if accept finishes:

EFI_SUCCESS. A remote peer has successfully established a connection to *this* instance. A new TCP instance has also been created for the connection.

EFI_CONNECTION_RESET. The accept fails because the connection is reset either by instance itself or communication peer.

EFI_ABORTED. The accept request has been aborted.

NewChildHandle

The new TCP instance handle created for the established connection.

Description

The *Accept()* function initiates an asynchronous accept request to wait for an incoming connection on the passive TCP instance. If a remote peer successfully establishes a connection with this instance, a new TCP instance will be created and its handle will be returned in *ListenToken->NewChildHandle*. The newly created instance is configured by inheriting the passive instance's configuration and is ready for use upon return. The instance is in the Tcp4StateEstablished state.

The *ListenToken->CompletionToken.Event* will be signaled when a new connection is accepted, user aborts the listen or connection is reset.

This function only can be called when current TCP instance is in Tcp4StateListen state.

Status Codes Returned

EFI_SUCCESS	The listen token has been queued successfully.
EFI_NOT_STARTED	This EFI TCPv4 Protocol instance has not been configured.
EFI_ACCESS_DENIED	One or more of the following are **TRUE**: • This instance is not a passive instance. • This instance is not in *Tcp4StateListen* state. • The same listen token has already existed in the listen token queue of this TCP instance.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE**: • *This* is **NULL**. • *ListenToken* is **NULL**. • *ListentToken->CompletionToken.Event* is **NULL**.
EFI_OUT_OF_RESOURCES	Could not allocate enough resource to finish the operation.
EFI_DEVICE_ERROR	Any unexpected and not belonged to above category error.

28.1.10 EFI_TCP4_PROTOCOL.Transmit()

Summary

Queues outgoing data into the transmit queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP4_TRANSMIT) (
  IN EFI_TCP4_PROTOCOL        *This,
  IN EFI_TCP4_IO_TOKEN        *Token
  );
```

Parameters

This

Pointer to the *EFI_TCP4_PROTOCOL* instance.

Token

Pointer to the completion token to queue to the transmit queue. Type *EFI_TCP4_IO_TOKEN* is defined in "Related Definitions" below.

Description

The *Transmit()* function queues a sending request to this TCPv4 instance along with the user data. The status of the token is updated and the event in the token will be signaled once the data is sent out or some error occurs.

Related Definition

```
//*******************************************************
// EFI_TCP4_IO_TOKEN
//*******************************************************
typedef struct {
  EFI_TCP4_COMPLETION_TOKEN    CompletionToken;
  union {
    EFI_TCP4_RECEIVE_DATA      *RxData;
    EFI_TCP4_TRANSMIT_DATA     *TxData;
  }                Packet;
} EFI_TCP4_IO_TOKEN;
```

Status

When transmission finishes or meets any unexpected error it will be set to one of the following values:

EFI_SUCCESS. The receiving or transmission operation completes successfully.

EFI_CONNECTION_FIN: The receiving operation fails because the communication peer has closed the connection and there is no more data in the receive buffer of the instance.

EFI_CONNECTION_RESET. The receiving or transmission operation fails because this connection is reset either by instance itself or communication peer.

EFI_ABORTED. The receiving or transmission is aborted.

EFI_TIMEOUT. The transmission timer expires and no more specific information is available.

EFI_NETWORK_UNREACHABLE. The transmission fails because an ICMP network unreachable error is received.

EFI_HOST_UNREACHABLE. The transmission fails because an ICMP host unreachable error is received.

EFI_PROTOCOL_UNREACHABLE. The transmission fails because an ICMP protocol unreachable error is received.

EFI_PORT_UNREACHABLE. The transmission fails and an ICMP port unreachable error is received.

EFI_ICMP_ERROR. The transmission fails and some other ICMP error is received.

EFI_DEVICE_ERROR. An unexpected system or network error occurs.

EFI_NO_MEDIA. There was a media error

RxData

When this token is used for receiving, *RxData* is a pointer to *EFI_TCP4_RECEIVE_DATA*. Type *EFI_TCP4_RECEIVE_DATA* is defined below.

TxData

When this token is used for transmitting, *TxData* is a pointer to *EFI_TCP4_TRANSMIT_DATA*. Type *EFI_TCP4_TRANSMIT_DATA* is defined below.

The *EFI_TCP4_IO_TOKEN* structures are used for both transmit and receive operations.

When used for transmitting, the *CompletionToken.Event* and *TxData* fields must be filled in by the user. After the transmit operation completes, the *CompletionToken.Status* field is updated by the instance and the *Event* is signaled.

- When used for receiving, the *CompletionToken.Event* and *RxData* fields must be filled in by the user. After a receive operation completes, *RxData* and *Status* are updated by the instance and the *Event* is signaled.

```
*******************************************************
// TCP4 Token Status definition
//
*******************************************************
#define EFI_CONNECTION_FIN EFIERR      (104)
#define EFI_CONNECTION_RESET EFIERR    (105)
#define EFI_CONNECTION_REFUSED EFIERR  (106)
```

NOTE: *EFIERR() sets the maximum bit. Similar to how error codes are described in Appendix D — Status Codes.*

```
//*******************************************************
// EFI_TCP4_RECEIVE_DATA
//********************************************************
typedef struct {
  BOOLEAN                    UrgentFlag;
  UINT32                     DataLength;
  UINT32                     FragmentCount;
  EFI_TCP4_FRAGMENT_DATA     FragmentTable[1];
}   EFI_TCP4_RECEIVE_DATA;
```

UrgentFlag
Whether those data are urgent. When this flag is set, the instance is in urgent mode. The implementations of this specification should follow RFC793 to process urgent data, and should NOT mix the data across the urgent point in one token.

DataLength
When calling Receive() function, it is the byte counts of all Fragmentbuffer in FragmentTable allocated by user. When the token is signaled by TCPv4 driver it is the length of received data in the fragments.

FragmentCount
Number of fragments.

FragmentTable
An array of fragment descriptors. Type *EFI_TCP4_FRAGMENT_DATA* is defined below.

When TCPv4 driver wants to deliver received data to the application, it will pick up the first queued receiving token, update its *Token->Packet.RxData* then signal the *Token->CompletionToken.Event*.

- The *FragmentBuffers* in *FragmentTable* are allocated by the application when calling *Receive()* function and received data will be copied to those buffers by the driver. *FragmentTable* may contain multiple buffers that are NOT in the continuous memory locations. The application should combine those buffers in the *FragmentTable* to process data if necessary.

```
//**********************************************************
// EFI_TCP4_FRAGMENT_DATA
//**********************************************************
typedef struct {
  UINT32               FragmentLength;
  VOID                 *FragmentBuffer;
}   EFI_TCP4_FRAGMENT_DATA;
```

FragmentLength
Length of data buffer in the fragment.

FragmentBuffer
Pointer to the data buffer in the fragment.

EFI_TCP4_FRAGMENT_DATA allows multiple receive or transmit buffers to be specified. The purpose of this structure is to provide scattered read and write.

```
//*********************************************************
// EFI_TCP4_TRANSMIT_DATA
//*********************************************************
typedef struct {
  BOOLEAN                     Push;
  BOOLEAN                     Urgent;
```

(continues on next page)

(continued from previous page)

```
  UINT32                     DataLength;
  UINT32                     FragmentCount;
  EFI_TCP4_FRAGMENT_DATA     FragmentTable[1];
}   EFI_TCP4_TRANSMIT_DATA;
```

Push

If *TRUE,* data must be transmitted promptly, and the PUSH bit in the last TCP segment created will be set. If *FALSE,* data transmission may be delay to combine with data from subsequent *Transmit()* s for efficiency.

Urgent

The data in the fragment table are urgent and urgent point is in effect if **TRUE**. Otherwise those data are NOT considered urgent.

DataLength

Length of the data in the fragments.

FragmentCount

Number of fragments.

FragmentTable

A array of fragment descriptors. Type *EFI_TCP4_FRAGMENT_DATA* is defined above.

The EFI TCPv4 Protocol user must fill this data structure before sending a packet. The packet may contain multiple buffers in non-continuous memory locations.

Status Codes Returned

EFI_SUCCESS	The data has been queued for transmission.
EFI_NOT_STARTED	This EFI TCPv4 Protocol instance has not been configured.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE**: • *This* is **NULL**. • *Token* is **NULL**. • *Token->CompletionToken.Event* is **NULL**. • *Token->Packet.TxData* is **NULL**. • *Token->Packet.FragmentCount* is zero. • *Token->Packet.DataLength* is not equal to the sum of fragment lengths.
EFI_ACCESS_DENIED	One or more of the following conditions is **TRUE**: • A transmit completion token with the same *Token-> CompletionToken.Event* was already in the transmission queue. • The current instance is in Tcp4StateClosed state. • The current instance is a passive one and it is in *Tcp4StateListen* state. • User has called *Close()* to disconnect this connection.
EFI_NOT_READY	The completion token could not be queued because the transmit queue is full.
EFI_OUT_OF_RESOURCES	Could not queue the transmit data because of resource shortage.
EFI_NETWORK_UNREACHABLE	There is no route to the destination network or address.
EFI_NO_MEDIA	There was a media error.

28.1.10.1 EFI_TCP4_PROTOCOL.Receive()

Summary

Places an asynchronous receive request into the receiving queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP4_RECEIVE) (
  IN EFI_TCP4_PROTOCOL        *This,
  IN EFI_TCP4_IO_TOKEN        *Token
  );
```

Parameters

This

Pointer to the *EFI_TCP4_PROTOCOL* instance.

Token

Pointer to a token that is associated with the receive data descriptor. Type *EFI_TCP4_IO_TOKEN* is defined in *EFI_TCP4_PROTOCOL .Transmit()*.

Description

The *Receive()* function places a completion token into the receive packet queue. This function is always asynchronous. The caller must allocate the *Token->CompletionToken.Event* and the *FragmentBuffer* used to receive data. He also must fill the *DataLength* which represents the whole length of all *FragmentBuffer*. When the receive operation completes, the EFI TCPv4 Protocol driver updates the *Token->CompletionToken.Status* and *Token->Packet.RxData* fields and the *Token->CompletionToken.Event* is signaled. If got data the data and its length will be copy into the *FragmentTable,* in the same time the full length of received data will be recorded in the *DataLength* fields. Providing a proper notification function and context for the event will enable the user to receive the notification and receiving status. That notification function is guaranteed to not be re-entered.

Status Codes Returned

EFI_SUCCESS	The receive completion token was cached.
EFI_NOT_STARTED	This EFI TCPv4 Protocol instance has not been configured.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *Token* is **NULL**. • *Token->CompletionToken.Event* is **NULL**. • *Token->Packet.RxData* is **NULL**. • *Token->Packet.RxData->DataLength* is *0.* • The *Token->Packet. RxData->DataLength* is not the sum of all *FragmentBuffer* length in *FragmentTable.*
EFI_OUT_OF_RESOURCES	The receive completion token could not be queued due to a lack of system resources (usually memory).
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI TCPv4 Protocol instance has been reset to startup defaults.

continues on next page

Table 28.7 – continued from previous page

EFI_ACCESS_DENIED	One or more of the following conditions is **TRUE**: • A receive completion token with the same *Token->CompletionToken.Event* was already in the receive queue. • The current instance is in Tcp4StateClosed state. • The current instance is a passive one and it is in *Tcp4StateListen* state. • User has called *Close()* to disconnect this connection.
EFI_CONNECTION_FIN	The communication peer has closed the connection and there is no any buffered data in the receive buffer of this instance.
EFI_NOT_READY	The receive request could not be queued because the receive queue is full.
EFI_NO_MEDIA	There was a media error.

28.1.11 EFI_TCP4_PROTOCOL.Close()

Summary

Disconnecting a TCP connection gracefully or reset a TCP connection. This function is a nonblocking operation.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP4_CLOSE)(
  IN EFI_TCP4_PROTOCOL            *This,
  IN EFI_TCP4_CLOSE_TOKEN         *CloseToken
  );
```

Parameters

This

Pointer to the *EFI_TCP4_PROTOCOL* instance.

CloseToken

Pointer to the close token to return when operation finishes. Type *EFI_TCP4_CLOSE_TOKEN* is defined in “Related Definition” below.

Related Definition

```
//**********************************************************
// EFI_TCP4_CLOSE_TOKEN
//**********************************************************
typedef struct {
  EFI_TCP4_COMPLETION_TOKEN         CompletionToken;
  BOOLEAN                           AbortOnClose;
}   EFI_TCP4_CLOSE_TOKEN;
```

Status

When close finishes or meets any unexpected error it will be set to one of the following values:

EFI_SUCCESS. The close operation completes successfully.

EFI_ABORTED. User called configure with NULL without close stopping.

AbortOnClose

Abort the TCP connection on close instead of the standard TCP close process when it is set to **TRUE**. This option can be used to satisfy a fast disconnect.

Description

Initiate an asynchronous close token to TCP driver. After *Close()* is called, any buffered transmission data will be sent by TCP driver and the current instance will have a graceful close working flow described as RFC 793 if *AbortOnClose* is set to *FALSE,* otherwise, a rest packet will be sent by TCP driver to fast disconnect this connection. When the close operation completes successfully the TCP instance is in Tcp4StateClosed state, all pending asynchronous operation is signaled and any buffers used for TCP network traffic is flushed.

Status Codes Returned

EFI_SUCCESS	The *Close()* is called successfully.
EFI_NOT_STARTED	This EFI TCPv4 Protocol instance has not been configured.
EFI_ACCESS_DENIED	One or more of the following are **TRUE**: • *Configure()* has been called with *TcpConfigData* set to **NULL** and this function has not returned. • Previous *Close()* call on this instance has not finished.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE**: • *This* is **NULL**. • *CloseToken* is **NULL**. • *CloseToken->CompletionToken. Event* is **NULL**.
EFI_OUT_OF_RESOURCES	Could not allocate enough resource to finish the operation.
EFI_DEVICE_ERROR	Any unexpected and not belonged to above category error.

28.1.12 EFI_TCP4_PROTOCOL.Cancel()

Summary

Abort an asynchronous connection, listen, transmission or receive request.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP4_CANCEL)(
  IN EFI_TCP4_PROTOCOL              *This,
  IN EFI_TCP4_COMPLETION_TOKEN      *Token OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_TCP4_PROTOCOL* instance.

Token

Pointer to a token that has been issued by

EFI_TCP4_PROTOCOL.Connect(),
EFI_TCP4_PROTOCOL.Accept(),
EFI_TCP4_PROTOCOL.Transmit() or
EFI_TCP4_PROTOCOL.Receive(). If **NULL**, all pending tokens issued by above four functions will be aborted. Type
EFI_TCP4_COMPLETION_TOKEN is defined in
EFI_TCP4_PROTOCOL.Connect().

Description

The *Cancel()* function aborts a pending connection, listen, transmit or receive request. If *Token* is not **NULL** and the token is in the connection, listen, transmission or receive queue when it is being cancelled, its *Token->Status* will be set to *EFI_ABORTED* and then *Token->Event* will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, *EFI_NOT_FOUND* is returned. If *Token* is **NULL** all asynchronous token issued by *Connect(), Accept(), Transmit()* and *Receive()* will be aborted.

Status Codes Returned

EFI_SUCCESS	The asynchronous I/O request is aborted and *Token->Event* is signaled.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NOT_STARTED	This instance hasn't been configured.
EFI_NO_MAPPING	When using the default address, configuration (DHCP, BOOTP, RARP, etc.) hasn't finished yet.
EFI_NOT_FOUND	The asynchronous I/O request isn't found in the transmission or receive queue. It has either completed or wasn't issued by *Transmit()* and *Receive()*.
EFI_UNSUPPORTED	The implementation does not support this function.

28.1.13 EFI_TCP4_PROTOCOL.Poll()

Summary

Poll to receive incoming data and transmit outgoing segments.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP4_POLL) (
  IN EFI_TCP4_PROTOCOL        *This
  );
```

Parameters

This

Pointer to the *EFI_TCP4_PROTOCOL* instance.

Description

The *Poll()* function increases the rate that data is moved between the network and application and can be called when the TCP instance is created successfully. Its use is optional.

In some implementations, the periodical timer in the MNP driver may not poll the underlying communications device fast enough to avoid drop packets. Drivers and applications that are experiencing packet loss should try calling the *Poll()* function in a high frequency.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_NOT_READY	No incoming or outgoing data is processed.
EFI_TIMEOUT	Data was dropped out of the transmission or receive queue. Consider increasing the polling rate.

28.2 EFI TCPv6 Protocol

This section defines the EFI TCPv6 (Transmission Control Protocol version 6) Protocol.

28.2.1 TCPv6 Service Binding Protocol

28.2.2 EFI_TCP6_SERVICE_BINDING_PROTOCOL

Summary

The EFI TCPv6 Service Binding Protocol is used to locate EFI TCPv6 Protocol drivers to create and destroy protocol child instance of the driver to communicate with other host using TCP protocol.

GUID

```
#define EFI_TCP6_SERVICE_BINDING_PROTOCOL_GUID \
  {0xec20eb79,0x6c1a,0x4664,\
    {0x9a,0x0d,0xd2,0xe4,0xcc,0x16,0xd6, 0x64}}
```

Description

A network application that requires TCPv6 I/O services can call one of the protocol handler services, such as *BS->LocateHandleBuffer()*, to search devices that publish an EFI TCPv6 Service Binding Protocol GUID. Such device supports the EFI TCPv6 Protocol and may be available for use.

After a successful call to the **EFI_TCP6_SERVICE_BINDING_PROTOCOL.CreateChild()** function, the newly created child EFI TCPv6 Protocol driver is in an un-configured state; it is not ready to do any operation except *Poll()* send and receive data packets until configured.

Every successful call to the **EFI_TCP6_SERVICE_BINDING_PROTOCOL.CreateChild()** function must be matched with a call to the **EFI_TCP6_SERVICE_BINDING_PROTOCOL.DestroyChild()** function to release the protocol driver.

28.2.3 TCPv6 Protocol

28.2.4 EFI_TCP6_PROTOCOL

Summary

The EFI TCPv6 Protocol provides services to send and receive data stream.

GUID

```
#define EFI_TCP6_PROTOCOL_GUID \
  {0x46e44855,0xbd60,0x4ab7,\
    {0xab,0x0d,0xa6,0x79,0xb9,0x44,0x7d,0x77}}
```

Protocol Interface Structure

```
typedef struct _EFI_TCP6_PROTOCOL {
  EFI_TCP6_GET_MODE_DATA      GetModeData;
  EFI_TCP6_CONFIGURE          Configure;
  EFI_TCP6_CONNECT            Connect;
  EFI_TCP6_ACCEPT             Accept;
  EFI_TCP6_TRANSMIT           Transmit;
  EFI_TCP6_RECEIVE            Receive;
  EFI_TCP6_CLOSE              Close;
  EFI_TCP6_CANCEL             Cancel;
  EFI_TCP6_POLL               Poll;
}   EFI_TCP6_PROTOCOL;
```

Parameters

GetModeData
Get the current operational status. See the *GetModeData()* function description.

Configure
Initialize, change, or brutally reset operational settings of the EFI TCPv6 Protocol. See the *Configure()* function description.

Connect
Initiate the TCP three-way handshake to connect to the remote peer configured in this TCP instance. The function is a nonblocking operation. See the *Connect()* function description.

Accept
Listen for incoming TCP connection requests. This function is a nonblocking operation. See the *Accept()* function description.

Transmit
Queue outgoing data to the transmit queue. This function is a nonblocking operation. See the *Transmit()* function description.

Receive
Queue a receiving request token to the receive queue. This function is a nonblocking operation. See the *Receive()* function description.

Close
Gracefully disconnect a TCP connection follow RFC 793 or reset a TCP connection. This function is a nonblocking operation. See the *Close()* function description.

Cancel
Abort a pending connect, listen, transmit or receive request. See the *Cancel()* function description.

Poll
Poll to receive incoming data and transmit outgoing TCP segments. See the *Poll()* function description.

Description

The *EFI_TCP6_PROTOCOL* defines the EFI TCPv6 Protocol child to be used by any network drivers or applications to send or receive data stream. It can either listen on a specified port as a service or actively connect to remote peer as a client. Each instance has its own independent settings.

Note: *Byte Order: In this document, all IPv6 addresses and incoming/outgoing packets are stored in network byte order. All other parameters in the functions and data structures that are defined in this document are stored in host byte order unless explicitly specified.*

28.2.5 EFI_TCP6_PROTOCOL.GetModeData()

Summary

Get the current operational status.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP6_GET_MODE_DATA) (
  IN EFI_TCP6_PROTOCOL                *This,
  OUT EFI_TCP6_CONNECTION_STATE       *Tcp6State OPTIONAL,
  OUT EFI_TCP6_CONFIG_DATA            *Tcp6ConfigData OPTIONAL,
  OUT EFI_IPv6_MODE_DATA              *Ip6ModeData OPTIONAL,
  OUT EFI_MANAGED_NETWORK_CONFIG_DATA  *MnpConfigData OPTIONAL,
  OUT EFI_SIMPLE_NETWORK_MODE         *SnpModeData OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_TCP6_PROTOCOL* instance.

Tcp6State
The buffer in which the current TCP state is returned. Type *EFI_TCP6_CONNECTION_STATE* is defined in “Related Definitions” below.

Tcp6ConfigData
The buffer in which the current TCP configuration is returned. Type *EFI_TCP6_CONFIG_DATA* is defined in “Related Definitions” below.

Ip6ModeData
The buffer in which the current IPv6 configuration data used by the TCP instance is returned. Type *EFI_IP6_MODE_DATA* is defined in *EFI_IP6_PROTOCOL.GetModeData()*.

MnpConfigData
The buffer in which the current MNP configuration data used indirectly by the TCP instance is returned. Type *EFI_MANAGED_NETWORK_CONFIG_DATA* is defined in *EFI_MANAGED_NETWORK_PROTOCOL.GetModeData()*.

SnpModeData
The buffer in which the current SNP mode data used indirectly by the TCP instance is returned. Type *EFI_SIMPLE_NETWORK_MODE* is defined in the *EFI_SIMPLE_NETWORK_PROTOCOL*.

Description

The GetModeData() function copies the current operational settings of this EFI TCPv6 Protocol instance into user-supplied buffers. This function can also be used to retrieve the operational setting of underlying drivers such as IPv6, MNP, or SNP.

Related Definition

```
typedef struct {
  EFI_IPv6_ADDRESS         StationAddress;
  UINT16                   StationPort;
  EFI_IPv6_ADDRESS         RemoteAddress;
  UINT16                   RemotePort;
  BOOLEAN                  ActiveFlag;
}   EFI_TCP6_ACCESS_POINT;
```

StationAddress
The local IP address assigned to this TCP instance. The EFI TCPv6 driver will only deliver incoming packets whose destination addresses exactly match the IP address. Set to zero to let the underlying IPv6 driver choose a source address. If not zero it must be one of the configured IP addresses in the underlying IPv6 driver.

StationPort
The local port number to which this EFI TCPv6 Protocol instance is bound. If the instance doesn't care the local port number, set StationPort to zero to use an ephemeral port.

RemoteAddress
The remote IP address to which this EFI TCPv6 Protocol instance is connected. If *ActiveFlag* is **FALSE** (i.e., a passive TCPv6 instance), the instance only accepts connections from the *RemoteAddress*. If *ActiveFlag* is **TRUE** the instance will connect to the *RemoteAddress,* i.e., outgoing segments will be sent to this address and only segments from this address will be delivered to the application. When *ActiveFlag* is *FALSE,* it can be set to zero and means that incoming connection requests from any address will be accepted.

RemotePort
The remote port to which this EFI TCPv6 Protocol instance connects or from which connection request will be accepted by this EFI TCPv6 Protocol instance. If *ActiveFlag* is **FALSE** it can be zero and means that incoming connection request from any port will be accepted. Its value can not be zero when *ActiveFlag* is **TRUE**.

ActiveFlag
Set it to **TRUE** to initiate an active open. Set it to **FALSE** to initiate a passive open to act as a server.

```
//*******************************************************
// EFI_TCP6_OPTION
//*******************************************************
typedef struct {
  UINT32         ReceiveBufferSize;
  UINT32         SendBufferSize;
  UINT32         MaxSynBackLog;
  UINT32         ConnectionTimeout;
  UINT32         DataRetries;
  UINT32         FinTimeout;
  UINT32         TimeWaitTimeout;
  UINT32         KeepAliveProbes;
  UINT32         KeepAliveTime;
  UINT32         KeepAliveInterval;
  BOOLEAN        EnableNagle;
  BOOLEAN        EnableTimeStamp;
  BOOLEAN        EnableWindowScaling;
  BOOLEAN        EnableSelectiveAck;
  BOOLEAN        EnablePathMtuDiscovery;
}   EFI_TCP6_OPTION;
```

ReceiveBufferSize
The size of the TCP receive buffer.

SendBufferSize
The size of the TCP send buffer.

MaxSynBackLog
The length of incoming connect request queue for a passive instance. When set to zero, the value is implementation specific.

ConnectionTimeout
The maximum seconds a TCP instance will wait for before a TCP connection established. When set to zero, the value is implementation specific.

DataRetries
The number of times TCP will attempt to retransmit a packet on an established connection. When set to zero, the value is implementation specific.

FinTimeout
How many seconds to wait in the FIN_WAIT_2 states for a final FIN flag before the TCP instance is closed. This timeout is in effective only if the application has called Close() to disconnect the connection completely. It is also called FIN_WAIT_2 timer in other implementations. When set to zero, it should be disabled because the FIN_WAIT_2 timer itself is against the standard.

TimeWaitTimeout
How many seconds to wait in TIME_WAIT state before the TCP instance is closed. The timer is disabled completely to provide a method to close the TCP connection quickly if it is set to zero. It is against the related RFC documents.

KeepAliveProbes
The maximum number of TCP keep-alive probes to send before giving up and resetting the connection if no response from the other end. Set to zero to disable keep-alive probe.

KeepAliveTime
The number of seconds a connection needs to be idle before TCP sends out periodical keep-alive probes. When set to zero, the value is implementation specific. It should be ignored if keep-alive probe is disabled.

KeepAliveInterval
The number of seconds between TCP keep-alive probes after the periodical keep-alive probe if no response. When set to zero, the value is implementation specific. It should be ignored if keep-alive probe is disabled.

EnableNagle
Set it to **TRUE** to enable the Nagle algorithm as defined in RFC896. Set it to **FALSE** to disable it.

EnableTimeStamp
Set it to **TRUE** to enable TCP timestamps option as defined in RFC7323. Set to **FALSE** to disable it.

EnableWindowScaling
Set it to **TRUE** to enable TCP window scale option as defined in RFC7323. Set it to **FALSE** to disable it.

EnableSelectiveAck
Set it to **TRUE** to enable selective acknowledge mechanism described in RFC 2018. Set it to **FALSE** to disable it. Implementation that supports SACK can optionally support DSAK as defined in RFC 2883.

EnablePathMtudiscovery
Set it to **TRUE** to enable path MTU discovery as defined in RFC 1191. Set to **FALSE** to disable it.

Option setting with digital value will be modified by driver if it is set out of the implementation specific range and an implementation specific default value will be set accordingly.

```
//*******************************************************
// EFI_TCP6_CONFIG_DATA
//*******************************************************
```

(continues on next page)

(continued from previous page)

```
typedef struct {
  UINT8                   TrafficClass;
  UINT8                   HopLimit;
  EFI_TCP6_ACCESS_POINT   AccessPoint;
  EFI_TCP6_OPTION         *ControlOption;
}   EFI_TCP6_CONFIG_DATA;
```

TrafficClass
TrafficClass field in transmitted IPv6 packets.

HopLimit
HopLimit field in transmitted IPv6 packets.

AccessPoint
Used to specify TCP communication end settings for a TCP instance.

ControlOption
Used to configure the advance TCP option for a connection. If set to *NULL,* implementation specific options for TCP connection will be used.

```
//*******************************************************
// EFI_TCP6_CONNECTION_STATE
//*******************************************************

typedef enum {
  Tcp6StateClosed = 0,
  Tcp6StateListen = 1,

  Tcp6StateTimeWait = 8,
  Tcp6StateCloseWait = 9,
  Tcp6StateLastAck = 10
}   EFI_TCP6_CONNECTION_STATE;
```

Status Codes Returned

EFI_SUCCESS	The mode data was read.
EFI_NOT_STARTED	No configuration data is available because this instance hasn't been started.
EFI_INVALID_PARAMETER	*This* is **NULL**.

28.2.6 EFI_TCP6_PROTOCOL.Configure()

Summary

Initialize or brutally reset the operational parameters for this TCP instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP6_CONFIGURE) (
  IN EFI_TCP6_PROTOCOL        *This,
  IN EFI_TCP6_CONFIG_DATA     *Tcp6ConfigData OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_TCP6_PROTOCOL* instance.

Tcp6ConfigData
Pointer to the configure data to configure the instance.

Description

The *Configure()* function does the following:

- Initialize this TCP instance, i.e., initialize the communication end settings and specify active open or passive open for an instance.
- Reset this TCP instance brutally, i.e., cancel all pending asynchronous tokens, flush transmission and receiving buffer directly without informing the communication peer.

No other TCPv6 Protocol operation except *Poll()* can be executed by this instance until it is configured properly. For an active TCP instance, after a proper configuration it may call *Connect()* to initiates the three-way handshake. For a passive TCP instance, its state will transit to *Tcp6StateListen* after configuration, and *Accept()* may be called to listen the incoming TCP connection requests. If *Tcp6ConfigData* is set to *NULL,* the instance is reset. Resetting process will be done brutally, the state machine will be set to *Tcp6StateClosed* directly, the receive queue and transmit queue will be flushed, and no traffic is allowed through this instance.

Status Codes Returned

EFI_SUCCESS	The operational settings are set, changed, or reset successfully.
EFI_NO_MAPPING	The underlying IPv6 driver was responsible for choosing a source address for this instance, but no source address was available for use.
EFI_INVALID_PARAMETER	One or more of the following conditions are **TRUE**: • *This* is **NULL**. • *Tcp6Config Data->AccessPoint.StationAddress* is neither zero nor one of the configured IP addresses in the underlying IPv6 driver. • *Tcp6Confi gData->AccessPoint.RemoteAddress* isn't a valid unicast IPv6 address. • *Tcp6Confi gData->AccessPoint.RemoteAddress* is zero or *Tcp6Co nfigData->AccessPoint.RemotePort* is zero when *Tcp6Co nfigData->AccessPoint.ActiveFlag* is **TRUE**. • A same access point has been configured in other TCP instance properly.

continues on next page

Table 28.12 – continued from previous page

EFI_ACCESS_DENIED	Configuring TCP instance when it is configured without calling *Configure()* with **NULL** to reset it.
EFI_UNSUPPORTED	One or more of the control options are not supported in the implementation.
EFI_OUT_OF_RESOURCES	Could not allocate enough system resources when executing *Configure()*.
EFI_DEVICE_ERROR	An unexpected network or system error occurred.

28.2.7 EFI_TCP6_PROTOCOL.Connect()

Summary

Initiate a nonblocking TCP connection request for an active TCP instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP6_CONNECT) (
  IN EFI_TCP6_PROTOCOL              *This,
  IN EFI_TCP6_CONNECTION_TOKEN      *ConnectionToken
  );
```

Parameters

This

Pointer to the *EFI_TCP6_PROTOCOL* instance.

ConnectionToken

Pointer to the connection token to return when the TCP three-way handshake finishes. Type *EFI_TCP6_CONNECTION_TOKEN* is defined in Related Definition below.

Description

The *Connect()* function will initiate an active open to the remote peer configured in current TCP instance if it is configured active. If the connection succeeds or fails due to any error, the *ConnectionToken->CompletionToken.Event* will be signaled and *ConnectionToken->CompletionToken.Status* will be updated accordingly. This function can only be called for the TCP instance in *Tcp6StateClosed* state. The instance will transfer into *Tcp6StateSynSent* if the function returns *EFI_SUCCESS*. If TCP three-way handshake succeeds, its state will become *Tcp6StateEstablished,* otherwise, the state will return to *Tcp6StateClosed*.

Related Definition

```
//**********************************************************
// EFI_TCP6_COMPLETION_TOKEN
//**********************************************************
typedef struct {
  EFI_EVENT          Event;
  EFI_STATUS         Status;
}   EFI_TCP6_COMPLETION_TOKEN;
```

Event

The Event to signal after request is finished and Status field is updated by the EFI TCPv6 Protocol driver. The type of Event must be *EVT_NOTIFY_SIGNAL*.

Status

The result of the completed operation. *EFI_NO_MEDIA*. There was a media error

The *EFI_TCP6_COMPLETION_TOKEN* is used as a common header for various asynchronous tokens.

```
//*******************************************************
// EFI_TCP6_CONNECTION_TOKEN
//*******************************************************
typedef struct {
  EFI_TCP6_COMPLETION_TOKEN         CompletionToken;
}   EFI_TCP6_CONNECTION_TOKEN;
```

Status

The *Status* in the *CompletionToken* will be set to one of the following values if the active open succeeds or an unexpected error happens:

EFI_SUCCESS: The active open succeeds and the instance's state is Tcp6StateEstablished.

EFI_CONNECTION_RESET: The connect fails because the connection is reset either by instance itself or the communication peer.

EFI_CONNECTION_REFUSED: The receiving or transmission operation fails because this connection is refused.

EFI_ABORTED: The active open is aborted.

EFI_TIMEOUT: The connection establishment timer expires and no more specific information is available.

EFI_NETWORK_UNREACHABLE: The active open fails because an ICMP network unreachable error is received.

EFI_HOST_UNREACHABLE: The active open fails because an ICMP host unreachable error is received.

EFI_PROTOCOL_UNREACHABLE: The active open fails because an ICMP protocol unreachable error is received.

EFI_PORT_UNREACHABLE: The connection establishment timer times out and an ICMP port unreachable error is received.

EFI_ICMP_ERROR: The connection establishment timer times out and some other ICMP error is received.

EFI_DEVICE_ERROR: An unexpected system or network error occurred.

EFI_SECURITY_VIOLATION: The active open was failed because of IPSec policy check.

Status Codes Returned

EFI_SUCCESS	The connection request is successfully initiated and the state of this TCP instance has been changed to *Tcp6StateSynSent*.
EFI_NOT_STARTED	This EFI TCPv6 Protocol instance has not been configured.
EFI_ACCESS_DENIED	One or more of the following conditions are **TRUE:** • This instance is not configured as an active one. • This instance is not in *Tcp6StateClosed* state.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE:**. *This* is **NULL**. • *ConnectionToken* is **NULL**. • *ConnectionToken->CompletionToken.Event* is **NULL**.
EFI_OUT_OF_RESOURCES	The driver can't allocate enough resource to initiate the active open.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

28.2.8 EFI_TCP6_PROTOCOL.Accept()

Summary

Listen on the passive instance to accept an incoming connection request. This is a nonblocking operation.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP6_ACCEPT) (
  IN EFI_TCP6_PROTOCOL          *This,
  IN EFI_TCP6_LISTEN_TOKEN      *ListenToken
  );
```

Parameters

This

Pointer to the EFI_TCP6_PROTOCOL instance.

ListenToken

Pointer to the listen token to return when operation finishes. Type EFI_TCP6_LISTEN_TOKEN is defined in Related Definition below.

Related Definition

```
//************************************************
// EFI_TCP6_LISTEN_TOKEN
//************************************************
typedef struct {
  EFI_TCP6_COMPLETION_TOKEN      CompletionToken;
  EFI_HANDLE                     NewChildHandle;
}   EFI_TCP6_LISTEN_TOKEN;
```

Status

The *Status* in *CompletionToken* will be set to the following value if accept finishes:

EFI_SUCCESS: A remote peer has successfully established a connection to this instance. A new TCP instance has also been created for the connection.

EFI_CONNECTION_RESET: The accept fails because the connection is reset either by instance itself or communication peer.

EFI_ABORTED: The accept request has been aborted.

EFI_SECURITY_VIOLATION: The accept operation was failed because of IPSec policy check.

NewChildHandle

The new TCP instance handle created for the established connection.

Description

The *Accept()* function initiates an asynchronous accept request to wait for an incoming connection on the passive TCP instance. If a remote peer successfully establishes a connection with this instance, a new TCP instance will be created and its handle will be returned in *ListenToken->NewChildHandle*. The newly created instance is configured by inheriting the passive instance's configuration and is ready for use upon return. The new instance is in the *Tcp6StateEstablished* state.

The *ListenToken->CompletionToken.Event* will be signaled when a new connection is accepted, user aborts the listen or connection is reset.

This function only can be called when current TCP instance is in *Tcp6StateListen* state.

Status Codes Returned

EFI_SUCCESS	The listen token has been queued successfully.
EFI_NOT_STARTED	This EFI TCPv6 Protocol instance has not been configured.
EFI_ACCESS_DENIED	One or more of the following are **TRUE:** • This instance is not a passive instance. • This instance is not in *Tcp6StateListen* state. • The same listen token has already existed in the listen token queue of this TCP instance.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE:** • *This* is **NULL**. • *ListenToken* is **NULL**. • *ListentToken->CompletionToken.Event* is **NULL**.
EFI_OUT_OF_RESOURCES	Could not allocate enough resource to finish the operation.
EFI_DEVICE_ERROR	Any unexpected and not belonged to above category error.

28.2.9 EFI_TCP6_PROTOCOL.Transmit()

Summary

Queues outgoing data into the transmit queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP6_TRANSMIT) (
  IN EFI_TCP6_PROTOCOL           *This,
  IN EFI_TCP6_IO_TOKEN           *Token
  );
```

Parameters

This

Pointer to the *EFI_TCP6_PROTOCOL* instance.

Token

Pointer to the completion token to queue to the transmit queue. Type *EFI_TCP6_IO_TOKEN* is defined in "Related Definitions" below.

Description

The *Transmit()* function queues a sending request to this TCP instance along with the user data. The status of the token is updated and the event in the token will be signaled once the data is sent out or some error occurs.

Related Definition

```
//****************************************************
// EFI_TCP6_IO_TOKEN
//****************************************************
typedef struct {
EFI_TCP6_COMPLETION_TOKEN     CompletionToken;
union {
  EFI_TCP6_RECEIVE_DATA       *RxData;
  EFI_TCP6_TRANSMIT_DATA      *TxData;
}                Packet;
}   EFI_TCP6_IO_TOKEN;
```

Status

When transmission finishes or meets any unexpected error it will be set to one of the following values:

EFI_SUCCESS: The receiving or transmission operation completes successfully.

EFI_CONNECTION_FIN: The receiving operation fails because the communication peer has closed the connection and there is no more data in the receive buffer of the instance.

EFI_CONNECTION_RESET: The receiving or transmission operation fails because this connection is reset either by instance itself or the communication peer.

EFI_ABORTED: The receiving or transmission is aborted.

EFI_TIMEOUT: The transmission timer expires and no more specific information is available.

EFI_NETWORK_UNREACHABLE: The transmission fails because an ICMP network unreachable error is received.

EFI_HOST_UNREACHABLE: The transmission fails because an ICMP host unreachable error is received.

EFI_PROTOCOL_UNREACHABLE: The transmission fails because an ICMP protocol unreachable error is received.

EFI_PORT_UNREACHABLE: The transmission fails and an ICMP port unreachable error is received.

EFI_ICMP_ERROR: The transmission fails and some other ICMP error is received.

EFI_DEVICE_ERROR: An unexpected system or network error occurs.

EFI_SECURITY_VIOLATION: The receiving or transmission operation was failed because of IPSec policy check.

RxData

When this token is used for receiving, *RxData* is a pointer to *EFI_TCP6_RECEIVE_DATA*. Type *EFI_TCP6_RECEIVE_DATA* is defined below.

TxData

When this token is used for transmitting, *TxData* is a pointer to *EFI_TCP6_TRANSMIT_DATA*. Type *EFI_TCP6_TRANSMIT_DATA* is defined below.

The EFI_TCP6_IO_TOKEN structure is used for both transmit and receive operations.

When used for transmitting, the CompletionToken.Event and TxData fields must be filled in by the user. After the transmit operation completes, the CompletionToken.Status field is updated by the instance and the Event is signaled.

When used for receiving, the CompletionToken.Event and RxData fields must be filled in by the user. After a receive operation completes, RxData and Status are updated by the instance and the Event is signaled.

```
//*******************************************************
// EFI_TCP6_RECEIVE_DATA
//*******************************************************
typedef struct {
  BOOLEAN                 UrgentFlag;
  UINT32                  DataLength;
  UINT32                  FragmentCount;
  EFI_TCP6_FRAGMENT_DATA  FragmentTable[1];
}  EFI_TCP6_RECEIVE_DATA;
```

UrgentFlag

Whether the data is urgent. When this flag is set, the instance is in urgent mode. The implementations of this specification should follow RFC793 to process urgent data, and should NOT mix the data across the urgent point in one token.

DataLength

When calling *Receive()* function, it is the byte counts of all *Fragmentbuffer* in *FragmentTable* allocated by user. When the token is signaled by TCPv6 driver it is the length of received data in the fragments.

FragmentCount

Number of fragments.

FragmentTable

An array of fragment descriptors. Type *EFI_TCP6_FRAGMENT_DATA* is defined below.

When TCPv6 driver wants to deliver received data to the application, it will pick up the first queued receiving token, update its *Token->Packet.RxData* then signal the *Token->CompletionToken.Event*.

The *FragmentBuffer* in *FragmentTable* is allocated by the application when calling *Receive()* function and received data will be copied to those buffers by the driver. FragmentTable may contain multiple buffers that are NOT in the continuous memory locations. The application should combine those buffers in the FragmentTable to process data if necessary.

```
//**************************************************
// EFI_TCP6_FRAGMENT_DATA
//**************************************************
typedef struct {
  UINT32            FragmentLength;
  VOID              *FragmentBuffer;
}  EFI_TCP6_FRAGMENT_DATA;
```

FragmentLength
Length of data buffer in the fragment.

FragmentBuffer
Pointer to the data buffer in the fragment. *EFI_TCP6_FRAGMENT_DATA* allows multiple receive or transmit buffers to be specified. The purpose of this structure is to provide scattered read and write.

```
//**************************************************
// EFI_TCP6_TRANSMIT_DATA
//**************************************************
typedef struct {
  BOOLEAN                 Push;
  BOOLEAN                 Urgent;
  UINT32                  DataLength;
  UINT32                  FragmentCount;
  EFI_TCP6_FRAGMENT_DATA  FragmentTable[1];
}  EFI_TCP6_TRANSMIT_DATA;
```

Push
If **TRUE,** data must be transmitted promptly, and the PUSH bit in the last TCP segment created will be set. If **FALSE,** data transmission may be delayed to combine with data from subsequent *Transmit()* s for efficiency.

Urgent
The data in the fragment table are urgent and urgent point is in effect if **TRUE**. Otherwise those data are NOT considered urgent.

DataLength
Length of the data in the fragments.

FragmentCount
Number of fragments.

FragmentTable
An array of fragment descriptors. Type *EFI_TCP6_FRAGMENT_DATA* is defined above.

The EFI TCPv6 Protocol user must fill this data structure before sending a packet. The packet may contain multiple buffers in non-continuous memory locations.

Status Codes Returned

EFI_SUCCESS	The data has been queued for transmission.
EFI_NOT_STARTED	This EFI TCPv6 Protocol instance has not been configured.
EFI_NO_MAPPING	The underlying IPv6 driver was responsible for choosing a source address for this instance, but no source address was available for use.

continues on next page

Table 28.15 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following are **TRUE:** • *This* is **NULL**. • *Token* is **NULL**. • *Token->CompletionToken.Event* is **NULL**. • *Token->Packet.TxData* is **NULL**. • *Token->Packet.FragmentCount* is zero. • *Token->Packet.DataLength* is not equal to the sum of fragment lengths.
EFI_ACCESS_DENIED	One or more of the following conditions are **TRUE:** • A transmit completion token with the same *Token->CompletionToken.Event* was already in the transmission queue. • The current instance is in Tcp6StateClosed state. • The current instance is a passive one and it is in *Tcp6StateListen* state. • User has called *Close()* to disconnect this connection.
EFI_NOT_READY	The completion token could not be queued because the transmit queue is full.
EFI_OUT_OF_RESOURCES	Could not queue the transmit data because of resource shortage.
EFI_NETWORK_UNREACHABLE	There is no route to the destination network or address.
EFI_NO_MEDIA	There was a media error.

28.2.10 EFI_TCP6_PROTOCOL.Receive()

Summary

Places an asynchronous receive request into the receiving queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP6_RECEIVE) (
  IN EFI_TCP6_PROTOCOL        *This,
  IN EFI_TCP6_IO_TOKEN        *Token
  );
```

Parameters

This

Pointer to the *EFI_TCP6_PROTOCOL* instance.

Token

Pointer to a token that is associated with the receive data descriptor. Type *EFI_TCP6_IO_TOKEN* is defined in *EFI_TCP6_PROTOCOL.Transmit()*.

Description

The *Receive* () function places a completion token into the receive packet queue. This function is always asynchronous. The caller must allocate the *Token->CompletionToken.Event* and the *FragmentBuffer* used to receive data. The caller also must fill the DataLength which represents the whole length of all *FragmentBuffer*. When the receive operation completes, the EFI TCPv6 Protocol driver updates the *Token->CompletionToken.Status* and *Token->Packet.RxData* fields and the *Token->CompletionToken.Event* is signaled. If got data the data and its length will be copied into the *FragmentTable,* at the same time the full length of received data will be recorded in the *DataLength* fields. Providing a proper notification function and context for the event will enable the user to receive the notification and receiving status. That notification function is guaranteed to not be re-entered.

Status Codes Returned

EFI_SUCCESS	The receive completion token was cached.
EFI_NOT_STARTED	This EFI TCPv6 Protocol instance has not been configured.
EFI_NO_MAPPING	The underlying IPv6 driver was responsible for choosing a source address for this instance, but no source address was available for use.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE:** • *This* is **NULL**. • *Token* is **NULL**. • *Token->CompletionToken.Event* is **NULL**. • *Token->Packet.RxData* is **NULL**. • *Token->Packet.RxData->DataLength* is 0. • The *Token->Packet.RxData->DataLength* is not the sum of all *FragmentBuffer* length in *FragmentTable*.
EFI_OUT_OF_RESOURCES	The receive completion token could not be queued due to a lack of system resources (usually memory).
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI TCPv6 Protocol instance has been reset to startup defaults.
EFI_ACCESS_DENIED	One or more of the following conditions is *TRUE:* • A receive completion token with the same *Token->CompletionToken.Event* was already in the receive queue. • The current instance is in Tcp6StateClosed state. • The current instance is a passive one and it is in *Tcp6StateListen* state. • User has called *Close()* to disconnect this connection.
EFI_CONNECTION_FIN	The communication peer has closed the connection and there is no any buffered data in the receive buffer of this instance.
EFI_NOT_READY	The receive request could not be queued because the receive queue is full.
EFI_NO_MEDIA	There was a media error.

28.2.11 EFI_TCP6_PROTOCOL.Close()

Summary

Disconnecting a TCP connection gracefully or reset a TCP connection. This function is a nonblocking operation.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP6_CLOSE)(
  IN EFI_TCP6_PROTOCOL            *This,
  IN EFI_TCP6_CLOSE_TOKEN         *CloseToken
  );
```

Parameters

This

Pointer to the *EFI_TCP6_PROTOCOL* instance.

CloseToken

Pointer to the close token to return when operation finishes. Type *EFI_TCP6_CLOSE_TOKEN* is defined in Related Definition below.

Related Definition

```
//**************************************************
// EFI_TCP6_CLOSE_TOKEN
//**************************************************
typedef struct {
  EFI_TCP6_COMPLETION_TOKEN   CompletionToken;
  BOOLEAN                     AbortOnClose;
}   EFI_TCP6_CLOSE_TOKEN;
```

Status

When close finishes or meets any unexpected error it will be set to one of the following values:

EFI_SUCCESS: The close operation completes successfully.

EFI_ABORTED: User called configure with NULL without close stopping.

EFI_SECURITY_VIOLATION: The close operation was failed because of IPSec policy check

AbortOnClose

Abort the TCP connection on close instead of the standard TCP close process when it is set to **TRUE**. This option can be used to satisfy a fast disconnect.

Description

Initiate an asynchronous close token to TCP driver. After *Close()* is called, any buffered transmission data will be sent by TCP driver and the current instance will have a graceful close working flow described as RFC 793 if *AbortOnClose* is set to *FALSE,* otherwise, a rest packet will be sent by TCP driver to fast disconnect this connection. When the close operation completes successfully the TCP instance is in *Tcp6StateClosed* state, all pending asynchronous operations are signaled and any buffers used for TCP network traffic are flushed.

Status Codes Returned

EFI_SUCCESS	The *Close()* is called successfully.
EFI_NOT_STARTED	This EFI TCPv6 Protocol instance has not been configured.
EFI_ACCESS_DENIED	One or more of the following conditions are **TRUE:** • *CloseToken* or *CloseToken->CompletionToken.Event* is already in use. • Previous Close() call on this instance has not finished.

continues on next page

Table 28.17 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions are **TRUE:** • *This* is **NULL**. • *CloseToken* is **NULL**. • *CloseToken->CompletionToken.Event* is **NULL**.
EFI_OUT_OF_RESOURCES	Could not allocate enough resource to finish the operation.
EFI_DEVICE_ERROR	Any unexpected and not belonged to above category error.

28.2.12 EFI_TCP6_PROTOCOL.Cancel()

Summary

Abort an asynchronous connection, listen, transmission or receive request.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP6_CANCEL)(
  IN EFI_TCP6_PROTOCOL              *This,
  IN EFI_TCP6_COMPLETION_TOKEN      *Token OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_TCP6_PROTOCOL* instance.

Token

Pointer to a token that has been issued by

EFI_TCP6_PROTOCOL.Connect(),

EFI_TCP6_PROTOCOL.Accept(),

EFII_TCP6_PROTOCOL.Transmit() or

EFI_TCP6_PROTOCOL.Receive(). If **NULL**, all pending tokens issued by above four functions will be aborted. Type

EFI_TCP6_COMPLETION_TOKEN is defined in

EFI_TCP6_PROTOCOL.Connect().

Description

The *Cancel()* function aborts a pending connection, listen, transmit or receive request. If *Token* is not **NULL** and the token is in the connection, listen, transmission or receive queue when it is being cancelled, its T *oken->Status* will be set to *EFI_ABORTED* and then *Token->Event* will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, *EFI_NOT_FOUND* is returned. If *Token* is **NULL** all asynchronous token issued by *Connect(), Accept(), Transmit()* and *Receive()* will be aborted.

Status Codes Returned

EFI_SUCCESS	The asynchronous I/O request is aborted and *Token->Event* is signaled.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NOT_STARTED	This instance hasn't been configured.
EFI_NOT_FOUND	The asynchronous I/O request isn't found in the transmission or receive queue. It has either completed or wasn't issued by *Transmit()* and *Receive()*.
EFI_UNSUPPORTED	The implementation does not support this function.

28.2.13 EFI_TCP6_PROTOCOL.Poll()

Summary

Poll to receive incoming data and transmit outgoing segments.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TCP6_POLL) (
  IN EFI_TCP6_PROTOCOL       *This
  );
```

Parameters

This

Pointer to the *EFI_TCP6_PROTOCOL* instance.

Description

The *Poll()* function increases the rate that data is moved between the network and application and can be called when the TCP instance is created successfully. Its use is optional.

In some implementations, the periodical timer in the MNP driver may not poll the underlying communications device fast enough to avoid drop packets. Drivers and applications that are experiencing packet loss should try calling the *Poll()* function in a high frequency.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_NOT_READY	No incoming or outgoing data is processed.
EFI_TIMEOUT	Data was dropped out of the transmission or receive queue. Consider increasing the polling rate.

28.3 EFI IPv4 Protocol

This section defines the EFI IPv4 (Internet Protocol version 4) Protocol interface. It is split into the following three main sections:

- **EFI IPv4 Service Binding Protocol**
- **EFI IPv4 Variable**
- **EFI IPv4 Protocol**

The EFI IPv4 Protocol provides basic network IPv4 packet I/O services, which includes support for a subset of the Internet Control Message Protocol (ICMP) and may include support for the Internet Group Management Protocol (IGMP).

The EFI IPv4 Protocol supports IPv4 classless IP addressing, and deprecates the original IPv4 classful IP addressing. Please see links to the following RFC documents at http://uefi.org/uefi :

1. RFC 1122 — "Requirements for Internet Hosts –Communication Layers",**
2. RFC 4632 — "Classless Inter-domain Routing (CIDR): The Internet Address Assignment and Aggregation Plan",
3. RFC 3021 — "Using 31-Bit Prefixes on IPv4 Point-to-Point Links"

28.3.1 IP4 Service Binding Protocol

28.3.2 EFI_IP4_SERVICE_BINDING_PROTOCOL

Summary

The EFI IPv4 Service Binding Protocol is used to locate communication devices that are supported by an EFI IPv4 Protocol driver and to create and destroy instances of the EFI IPv4 Protocol child protocol driver that can use the underlying communications device.

GUID

```
#define EFI_IP4_SERVICE_BINDING_PROTOCOL_GUID \
  {0xc51711e7,0xb4bf,0x404a,\
    {0xbf,0xb8,0x0a,0x04,0x8e,0xf1,0xff,0xe4}}
```

Description

A network application that requires basic IPv4 I/O services can use one of the protocol handler services, such as *BS->LocateHandleBuffer()*, to search for devices that publish an EFI IPv4 Service Binding Protocol GUID. Each device with a published EFI IPv4 Service Binding Protocol GUID supports the EFI IPv4 Protocol and may be available for use.

After a successful call to the *EFI_IP4_SERVICE_BINDING_PROTOCOL .CreateChild()* function, the newly created child EFI IPv4 Protocol driver is in an unconfigured state; it is not ready to send and receive data packets.

Before a network application terminates execution, every successful call to the *EFI_IP4_SERVICE_BINDING_PROTOCOL .CreateChild()* function must be matched with a call to the *EFI_IP4_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

28.3.3 IP4 Protocol

28.3.4 EFI_IP4_PROTOCOL

Summary

The EFI IPv4 Protocol implements a simple packet-oriented interface that can be used by drivers, daemons, and applications to transmit and receive network packets.

GUID

```
#define EFI_IP4_PROTOCOL_GUID \
  {0x41d94cd2,0x35b6,0x455a,\
    {0x82,0x58,0xd4,0xe5,0x13,0x34,0xaa,0xdd}}
```

Protocol Interface Structure

```
typedef struct _EFI_IP4_PROTOCOL {
  EFI_IP4_GET_MODE_DATA       GetModeData;
  EFI_IP4_CONFIGURE           Configure;
  EFI_IP4_GROUPS              Groups;
  EFI_IP4_ROUTES              Routes;
  EFI_IP4_TRANSMIT            Transmit;
  EFI_IP4_RECEIVE             Receive;
  EFI_IP4_CANCEL              Cancel;
  EFI_IP4_POLL                Poll;
}   EFI_IP4_PROTOCOL;
```

Parameters

GetModeData
Gets the current operational settings for this instance of the EFI IPv4 Protocol driver. See the *GetModeData()* function description.

Configure
Changes or resets the operational settings for the EFI IPv4 Protocol. See the *Configure()* function description.

Groups
Joins and leaves multicast groups. See the *Groups()* function description.

Routes
Adds and deletes routing table entries. See the *Routes()* function description.

Transmit
Places outgoing data packets into the transmit queue. See the *Transmit()* function description.

Receive
Places a receiving request into the receiving queue. See the *Receive()* function description.

Cancel
Aborts a pending transmit or receive request. See the *Cancel()* function description.

Poll
Polls for incoming data packets and processes outgoing data packets. See the *Poll()* function description.

Description

The *EFI_IP4_PROTOCOL* defines a set of simple IPv4, ICMPv4, and IGMPv4 services that can be used by any network protocol driver, daemon, or application to transmit and receive IPv4 data packets.

NOTE: *All the IPv4 addresses that are described in* EFI_IP4_PROTOCOL *are stored in network byte order. Both incoming and outgoing IP packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order.*

28.3.5 EFI_IP4_PROTOCOL.GetModeData()

Summary

Gets the current operational settings for this instance of the EFI IPv4 Protocol driver.

Prototype

```
typedef
EFI_STATUS
```

(continues on next page)

(continued from previous page)

```
(EFIAPI *EFI_IP4_GET_MODE_DATA) (
  IN EFI_IP4_PROTOCOL                   *This,
  OUT EFI_IP4_MODE_DATA                 *Ip4ModeData OPTIONAL,
  OUT EFI_MANAGED_NETWORK_CONFIG_DATA  *MnpConfigData OPTIONAL,
  OUT EFI_SIMPLE_NETWORK_MODE           *SnpModeData OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_IP4_PROTOCOL* instance.

Ip4ModeData
Pointer to the EFI IPv4 Protocol mode data structure. Type *EFI_IP4_MODE_DATA* is defined in “Related Definitions” below.

MnpConfigData
Pointer to the managed network configuration data structure. Type *EFI_MANAGED_NETWORK_CONFIG_DATA* is defined in *EFI_MANAGED_NETWORK_PROTOCOL.GetModeData()*.

SnpData
Pointer to the simple network mode data structure. Type *EFI_SIMPLE_NETWORK_MODE* is defined in the *EFI_SIMPLE_NETWORK_PROTOCOL*.

Description

The *GetModeData()* function returns the current operational mode data for this driver instance. The data fields in *EFI_IP4_MODE_DATA* are read only. This function is used optionally to retrieve the operational mode data of underlying networks or drivers.

Related Definition

```
//**********************************************
// EFI_IP4_MODE_DATA
//**********************************************
typedef struct {
  BOOLEAN              IsStarted;
  UINT32               MaxPacketSize;
  EFI_IP4_CONFIG_DATA  ConfigData;
  BOOLEAN              IsConfigured;
  UINT32               GroupCount;
  EFI_IPv4_ADDRESS     *GroupTable;
  UINT32               RouteCount;
  EFI_IP4_ROUTE_TABLE  RouteTable;
  UINT32               IcmpTypeCount;
  EFI_IP4_ICMP_TYPE    *IcmpTypeList;
}  EFI_IP4_MODE_DATA;
```

IsStarted
Set to **TRUE** after this EFI IPv4 Protocol instance has been successfully configured with operational parameters by calling the *Configure()* interface when EFI IPv4 Protocol instance is stopped All other fields in this structure are undefined until this field is **TRUE**.

Set to **FALSE** when the instance’s operational parameter has been reset.

MaxPackeSize
The maximum packet size, in bytes, of the packet which the upper layer driver could feed.

ConfigData
Current configuration settings. Undefined until *IsStarted* is **TRUE**. Type *EFI_IP4_CONFIG_DATA* is defined below.

IsConfigured
Set to **TRUE** when the EFI IPv4 Protocol instance has a station address and subnet mask. If it is using the default address, the default address has been acquired.

Set to **FALSE** when the EFI IPv4 Protocol driver is not configured.

GroupCount
Number of joined multicast groups. Undefined until *IsConfigured* is **TRUE**.

GroupTable
List of joined multicast group addresses. Undefined until *IsConfigured* is **TRUE**.

RouteCount
Number of entries in the routing table. Undefined until *IsConfigured* is **TRUE**.

RouteTable
Routing table entries. Undefined until *IsConfigured* is **TRUE**. Type *EFI_IP4_ROUTE_TABLE* is defined below.

IcmpTypeCount
Number of entries in the supported ICMP types list.

IcmpTypeList
Array of ICMP types and codes that are supported by this EFI IPv4 Protocol driver. Type *EFI_IP4_ICMP_TYPE* is defined below.

The *EFI_IP4_MODE_DATA* structure describes the operational state of this IPv4 interface.

```
//**********************************************
// EFI_IP4_CONFIG_DATA
//**********************************************
typedef struct {
  UINT8              DefaultProtocol;
  BOOLEAN            AcceptAnyProtocol;
  BOOLEAN            AcceptIcmpErrors;
  BOOLEAN            AcceptBroadcast;
  BOOLEAN            AcceptPromiscuous;
  BOOLEAN            UseDefaultAddress;
  EFI_IPv4_ADDRESS   StationAddress;
  EFI_IPv4_ADDRESS   SubnetMask;
  UINT8              TypeOfService;
  UINT8              TimeToLive;
  BOOLEAN            DoNotFragment;
  BOOLEAN            RawData;
  UINT32             ReceiveTimeout;
  UINT32             TransmitTimeout;
} EFI_IP4_CONFIG_DATA;
```

DefaultProtocol
The default IPv4 protocol packets to send and receive. Ignored when *AcceptPromiscuous* is **TRUE**. An updated list of protocol numbers can be found at “Links to UEFI-Related Documents” (*http://uefi.org/uefi)* under the heading “IANA Assigned Internet Protocol Numbers list”.

AcceptAnyProtocol
Set to **TRUE** to receive all IPv4 packets that get through the receive filters. Set to **FALSE** to receive only the *DefaultProtocol* IPv4 packets that get through the receive filters. Ignored when *AcceptPromiscuous* is **TRUE**.

AcceptIcmpErrors
Set to **TRUE** to receive ICMP error report packets. Ignored when *AcceptPromiscuous* or *AcceptAnyProtocol* is **TRUE**.

AcceptBroadcast
Set to **TRUE** to receive broadcast IPv4 packets. Ignored when *AcceptPromiscuous* is **TRUE**. Set to **FALSE** to stop receiving broadcast IPv4 packets.

AcceptPromiscuous
Set to **TRUE** to receive all IPv4 packets that are sent to any hardware address or any protocol address. Set to **FALSE** to stop receiving all promiscuous IPv4 packets.

UseDefaultAddress
Set to **TRUE** to use the default IPv4 address and default routing table. If the default IPv4 address is not available yet, then the EFI IPv4 Protocol driver will use *EFI_IP4_CONFIG2_PROTOCOL* to retrieve the IPv4 address and subnet information. (This field can be set and changed only when the EFI IPv4 driver is transitioning from the stopped to the started states.)

StationAddress
The station IPv4 address that will be assigned to this EFI IPv4Protocol instance. The EFI IPv4 Protocol driver will deliver only incoming IPv4 packets whose destination matches this IPv4 address exactly. Address 0.0.0.0 is also accepted as a special case in which incoming packets destined to any station IP address are always delivered. When *EFI_IP4_CONFIG_DATA* is used in *Configure (),* it is ignored if *UseDefaultAddress* is **TRUE;** When *EFI_IP4_CONFIG_DATA* is used in *GetModeData (),* it contains the default address if *UseDefaultAddress* is **TRUE** and the default address has been acquired.

SubnetMask
The subnet address mask that is associated with the station address. When *EFI_IP4_CONFIG_DATA* is used in *Configure (),* it is ignored if *UseDefaultAddress* is **TRUE** ; When *EFI_IP4_CONFIG_DATA* is used in *GetModeData (),* it contains the default subnet mask if *UseDefaultAddress* is **TRUE** and the default address has been acquired.

TypeOfService
TypeOfService field in transmitted IPv4 packets.

TimeToLive
TimeToLive field in transmitted IPv4 packets.

DoNotFragment
State of the *DoNotFragment* bit in transmitted IPv4 packets.

RawData
Set to **TRUE** to send and receive unformatted packets. The other IPv4 receive filters are still applied. Fragmentation is disabled for *RawData* mode. NOTE: Unformatted packets include the IP header and payload. The media header is appended automatically for outgoing packets by underlying network drivers.

ReceiveTimeout
The timer timeout value (number of microseconds) for the receive timeout event to be associated with each assembled packet. Zero means do not drop assembled packets.

TransmitTimeout
The timer timeout value (number of microseconds) for the transmit timeout event to be associated with each outgoing packet. Zero means do not drop outgoing packets.

The *EFI_IP4_CONFIG_DATA* structure is used to report and change IPv4 session parameters.

```
//*********************************************
// EFI_IP4_ROUTE_TABLE
//*********************************************
```

(continues on next page)

(continued from previous page)

```
typedef struct {
  EFI_IPv4_ADDRESS        SubnetAddress;
  EFI_IPv4_ADDRESS        SubnetMask;
  EFI_IPv4_ADDRESS        GatewayAddress;
}   EFI_IP4_ROUTE_TABLE;
```

SubnetAddress
The subnet address to be routed.

SubnetMask
The subnet mask. If (*DestinationAddress* & *SubnetMask* == *SubnetAddress*), then the packet is to be directed to the *GatewayAddress*.

GatewayAddress
The IPv4 address of the gateway that redirects packets to this subnet. If the IPv4 address is 0.0.0.0, then packets to this subnet are not redirected.

EFI_IP4_ROUTE_TABLE is the entry structure that is used in routing tables.

```
//************************************************
// EFI_IP4_ICMP_TYPE
//************************************************
typedef struct {
  UINT8        Type;
  UINT8        Code;
}   EFI_IP4_ICMP_TYPE
```

Type
The type of ICMP message. See RFC 792 and RFC 950.

Code
The code of the ICMP message, which further describes the different ICMP message formats under the same *Type*. See RFC 792 and RFC 950.

EFI_IP4_ICMP_TYPE is used to describe those ICMP messages that are supported by this EFI IPv4 Protocol driver.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_OUT_OF_RESOURCES	The required mode data could not be allocated.

28.3.6 EFI_IP4_PROTOCOL.Configure()

Summary

Assigns an IPv4 address and subnet mask to this EFI IPv4 Protocol driver instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_CONFIGURE) (
  IN EFI_IP4_PROTOCOL         *This,
```

(continues on next page)

(continued from previous page)

```
IN EFI_IP4_CONFIG_DATA      *IpConfigData OPTIONAL
);
```

Parameters

This

Pointer to the *EFI_IP4_PROTOCOL* instance.

IpConfigData

Pointer to the EFI IPv4 Protocol configuration data structure. Type *EFI_IP4_CONFIG_DATA* is defined in *EFI_IP4_PROTOCOL .GetModeData()*.

Description

The *Configure()* function is used to set, change, or reset the operational parameters and filter settings for this EFI IPv4 Protocol instance. Until these parameters have been set, no network traffic can be sent or received by this instance. Once the parameters have been reset (by calling this function with *IpConfigData* set to **NULL**), no more traffic can be sent or received until these parameters have been set again. Each EFI IPv4 Protocol instance can be started and stopped independently of each other by enabling or disabling their receive filter settings with the *Configure()* function.

When *IpConfigData.UseDefaultAddress* is set to *FALSE,* the new station address will be appended as an alias address into the addresses list in the EFI IPv4 Protocol driver. While set to *TRUE, Configure()* will trigger the *EFI_IP4_CONFIG2_PROTOCOL* to retrieve the default IPv4 address if it is not available yet. Clients could frequently call *GetModeData()* to check the status to ensure that the default IPv4 address is ready.

If operational parameters are reset or changed, any pending transmit and receive requests will be cancelled. Their completion token status will be set to *EFI_ABORTED* and their events will be signaled.

Status Codes Returned

EFI_SUCCESS	The driver instance was successfully opened.
EFI_NO_MAPPING	When using the default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_IP_ADDRESS_CONFLICT	There is an address conflict in response to the Arp invocation
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE:** • *This* is **NULL**. • *IpConfigData.StationAddress* is not a unicast IPv4 address. • *IpConfigData.SubnetMask* is not a valid IPv4 subnet mask.
EFI_UNSUPPORTED	One or more of the following conditions is **TRUE:** • A configuration protocol (DHCP, BOOTP, RARP, etc.) could not be located when clients choose to use the default IPv4 address. This EFI IPv4 Protocol implementation does not support this requested filter or timeout setting.
EFI_OUT_OF_RESOURCES	The EFI IPv4 Protocol driver instance data could not be allocated.
EFI_ALREADY_STARTED	The interface is already open and must be stopped before the IPv4 address or subnet mask can be changed. The interface must also be stopped when switching to/from raw packet mode.
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI IPv4 Protocol driver instance is not opened.

28.3.7 EFI_IP4_PROTOCOL.Groups()

Summary

Joins and leaves multicast groups.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_GROUPS) (
  IN EFI_IP4_PROTOCOL      *This,
  IN BOOLEAN               JoinFlag,
  IN EFI_IPv4_ADDRESS      *GroupAddress OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_IP4_PROTOCOL* instance.

JoinFlag

Set to **TRUE** to join the multicast group session and **FALSE** to leave.

GroupAddress

Pointer to the IPv4 multicast address.

Description

The *Groups()* function is used to join and leave multicast group sessions. Joining a group will enable reception of matching multicast packets. Leaving a group will disable the multicast packet reception.

If *JoinFlag* is **FALSE** and *GroupAddress* is **NULL,** all joined groups will be left.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	One or more of the following is **TRUE:** • *This* is **NULL**. • *JoinFlag* is **TRUE** and *GroupAddress* is **NULL**. • *GroupAddress* is not **NULL** and ** GroupAddress* is not a multicast IPv4 address.
EFI_NOT_STARTED	This instance has not been started.
EFI_NO_MAPPING	When using the default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_OUT_OF_RESOURCES	System resources could not be allocated.
EFI_UNSUPPORTED	This EFI IPv4 Protocol implementation does not support multicast groups.
EFI_ALREADY_STARTED	The group address is already in the group table (when *JoinFlag* is **TRUE**).
EFI_NOT_FOUND	The group address is not in the group table (when *JoinFlag* is **FALSE**).
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

28.3.8 EFI_IP4_PROTOCOL.Routes()

Summary

Adds and deletes routing table entries.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_ROUTES) (
  IN EFI_IP4_PROTOCOL      *This,
  IN BOOLEAN               DeleteRoute,
  IN EFI_IPv4_ADDRESS      *SubnetAddress,
  IN EFI_IPv4_ADDRESS      *SubnetMask,
  IN EFI_IPv4_ADDRESS      *GatewayAddress
  );
```

Parameters

This

Pointer to the *EFI_IP4_PROTOCOL* instance.

DeleteRoute

Set to **TRUE** to delete this route from the routing table. Set to **FALSE** to add this route to the routing table. *SubnetAddress* and *SubnetMask* are used as the key to each route entry.

SubnetAddress

The address of the subnet that needs to be routed.

SubnetMask

The subnet mask of *SubnetAddress*.

GatewayAddress

The unicast gateway IPv4 address for this route.

Description

The *Routes()* function adds a route to or deletes a route from the routing table.

Routes are determined by comparing the *SubnetAddress* with the destination IPv4 address arithmetically *AND* -ed with the *SubnetMask*. The gateway address must be on the same subnet as the configured station address.

The default route is added with *SubnetAddress* and *SubnetMask* both set to 0.0.0.0. The default route matches all destination IPv4 addresses that do not match any other routes.

A *GatewayAddress* that is zero is a nonroute. Packets are sent to the destination IP address if it can be found in the ARP cache or on the local subnet. One automatic nonroute entry will be inserted into the routing table for outgoing packets that are addressed to a local subnet (gateway address of 0.0.0.0).

Each EFI IPv4 Protocol instance has its own independent routing table. Those EFI IPv4 Protocol instances that use the default IPv4 address will also have copies of the routing table that was provided by the *EFI_IP4_CONFIG2_PROTOCOL*, and these copies will be updated whenever the EIF IPv4 Protocol driver reconfigures its instances. As a result, client modification to the routing table will be lost.

NOTE: *There is no way to set up routes to other network interface cards because each network interface card has its own independent network stack that shares information only through* EFI IPv4 variable.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_NOT_STARTED	The driver instance has not been started.
EFI_NO_MAPPING	When using the default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE:** • *This* is **NULL**. • *SubnetAddress* is **NULL**. • *SubnetMask* is **NULL**. • *GatewayAddress* is **NULL**. • * *SubnetAddress* is not a valid subnet address. • * *SubnetMask* is not a valid subnet mask. • * *GatewayAddress* is not a valid unicast IPv4 address.
EFI_OUT_OF_RESOURCES	Could not add the entry to the routing table.
EFI_NOT_FOUND	This route is not in the routing table (when *DeleteRoute* is **TRUE**).
EFI_ACCESS_DENIED	The route is already defined in the routing table (when *DeleteRoute* is **FALSE**).

28.3.9 EFI_IP4_PROTOCOL.Transmit()

Summary

Places outgoing data packets into the transmit queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_TRANSMIT) (
  IN EFI_IP4_PROTOCOL            *This,
  IN EFI_IP4_COMPLETION_TOKEN    *Token
  );
```

Parameters

This

Pointer to the *EFI_IP4_PROTOCOL* instance.

Token

Pointer to the transmit token. Type *EFI_IP4_COMPLETION_TOKEN* is defined in “Related Definitions” below.

Description

The *Transmit()* function places a sending request in the transmit queue of this EFI IPv4 Protocol instance. Whenever the packet in the token is sent out or some errors occur, the event in the token will be signaled and the status is updated.

Related Definition

```
//************************************************
// EFI_IP4_COMPLETION_TOKEN
//************************************************
typedef struct {
  EFI_EVENT                  Event;
```

(continues on next page)

(continued from previous page)

```
  EFI_STATUS                 Status;
  union {
    EFI_IP4_RECEIVE_DATA     *RxData;
    EFI_IP4_TRANSMIT_DATA    *TxData;
  }              Packet;
} EFI_IP4_COMPLETION_TOKEN;
```

Event

This *Event* will be signaled after the *Status* field is updated by the EFI IPv4 Protocol driver. The type of *Event* must be EFI_NOTIFY_SIGNAL. The Task Priority Level (TPL) of *Event* must be lower than or equal to TPL_CALLBACK.

Status

Will be set to one of the following values:

EFI_SUCCESS. The receive or transmit completed successfully.

EFI_ABORTED. The receive or transmit was aborted.

EFI_TIMEOUT. The transmit timeout expired.

EFI_ICMP_ERROR. An ICMP error packet was received.

EFI_DEVICE_ERROR. An unexpected system or network error occurred.

EFI_NO_MEDIA. There was a media error

RxData

When this token is used for receiving, *RxData* is a pointer to the *EFI_IP4_RECEIVE_DATA*. Type *EFI_IP4_RECEIVE_DATA* is defined below.

TxData

When this token is used for transmitting, *TxData* is a pointer to the *EFI_IP4_TRANSMIT_DATA*. Type *EFI_IP4_TRANSMIT_DATA* is defined below.

EFI_IP4_COMPLETION_TOKEN structures are used for both transmit and receive operations.

When the structure is used for transmitting, the *Event* and *TxData* fields must be filled in by the EFI IPv4 Protocol client. After the transmit operation completes, EFI IPv4 Protocol updates the *Status* field and the *Event* is signaled.

When the structure is used for receiving, only the *Event* field must be filled in by the EFI IPv4 Protocol client. After a packet is received, the EFI IPv4 Protocol fills in the *RxData* and *Status* fields and the *Event* is signaled. If the packet is an ICMP error message, the *Status* is set to EFI_ICMP_ERROR, and the packet is delivered up as usual. The protocol from the IP head in the ICMP error message is used to de-multiplex the packet.

```
//**********************************************
// EFI_IP4_RECEIVE_DATA
//**********************************************
typedef struct {
```

(continues on next page)

(continued from previous page)

```
  EFI_TIME              TimeStamp;
  EFI_EVENT             RecycleSignal;
  UINT32                HeaderLength;
  EFI_IP4_HEADER        *Header;
  UINT32                OptionsLength;
  VOID                  *Options;
  UINT32                DataLength;
  UINT32                FragmentCount;
  EFI_IP4_FRAGMENT_DATA FragmentTable[1];
}   EFI_IP4_RECEIVE_DATA;
```

TimeStamp
Time when the EFI IPv4 Protocol driver accepted the packet. *TimeStamp* is zero filled if receive timestamps are disabled or unsupported.

RecycleSignal
After this event is signaled, the receive data structure is released and must not be referenced.

HeaderLength
Length of the IPv4 packet header. Zero if *ConfigData.RawData* is **TRUE**.

Header
Pointer to the IPv4 packet header. If the IPv4 packet was fragmented, this argument is a pointer to the header in the first fragment. **NULL** if *ConfigData.RawData* is *TRUE*. Type *EFI_IP4_HEADER* is defined below.

OptionsLength
Length of the IPv4 packet header options. May be zero.

Options
Pointer to the IPv4 packet header options. If the IPv4 packet was fragmented, this argument is a pointer to the options in the first fragment. May be **NULL**.

DataLength
Sum of the lengths of IPv4 packet buffers in *FragmentTable*. May be zero.

FragmentCount
Number of IPv4 payload (or raw) fragments. If *ConfigData.RawData* is *TRUE,* this count is the number of raw IPv4 fragments received so far. May be zero.

FragmentTable
Array of payload (or raw) fragment lengths and buffer pointers. If *ConfigData.RawData* is *TRUE,* each buffer points to a raw IPv4 fragment and thus IPv4 header and options are included in each buffer. Otherwise, IPv4 headers and options are not included in these buffers. Type *EFI_IP4_FRAGMENT_DATA* is defined below.

The EFI IPv4 Protocol receive data structure is filled in when IPv4 packets have been assembled (or when raw packets have been received). In the case of IPv4 packet assembly, the individual packet fragments are only verified and are not reorganized into a single linear buffer.

The *FragmentTable* contains a sorted list of zero or more packet fragment descriptors. The referenced packet fragments may not be in contiguous memory locations.

```
//**********************************************
// EFI_IP4_HEADER
//**********************************************
#pragma pack(1)
typedef struct {
  UINT8             HeaderLength:4;
```

(continues on next page)

(continued from previous page)

```
  UINT8               Version:4;
  UINT8               TypeOfService;
  UINT16              TotalLength;
  UINT16              Identification;
  UINT16              Fragmentation;
  UINT8               TimeToLive;
  UINT8               Protocol;
  UINT16              Checksum;
  EFI_IPv4_ADDRESS    SourceAddress;
  EFI_IPv4_ADDRESS    DestinationAddress;
}   EFI_IP4_HEADER;
#pragma pack()
```

The fields in the IPv4 header structure are defined in the Internet Protocol version 4 specification, which can be found at "Links to UEFI-Related Documents" (*http://uefi.org/uefi*) under the heading "Internet Protocol version 4 Specification".

```
//**********************************************
// EFI_IP4_FRAGMENT_DATA
//**********************************************
typedef struct {
  UINT32                 FragmentLength;
  VOID                   *FragmentBuffer;
}   EFI_IP4_FRAGMENT_DATA;
```

FragmentLength
Length of fragment data. This field may not be set to zero.

FragmentBuffer
Pointer to fragment data. This field may not be set to **NULL**.

The *EFI_IP4_FRAGMENT_DATA* structure describes the location and length of the IPv4 packet fragment to transmit or that has been received.

```
//**********************************************
// EFI_IP4_TRANSMIT_DATA
//**********************************************
typedef struct {
  EFI_IPv4_ADDRESS          DestinationAddress;
  EFI_IP4_OVERRIDE_DATA     *OverrideData;
  UINT32                    OptionsLength;
  VOID                      *OptionsBuffer;
  UINT32                    TotalDataLength;
  UINT32                    FragmentCount;
  EFI_IP4_FRAGMENT_DATA     FragmentTable[1];
}   EFI_IP4_TRANSMIT_DATA;
```

DestinationAddress
The destination IPv4 address. Ignored if *RawData* is **TRUE**.

OverrideData
If not **NULL,** the IPv4 transmission control override data. Ignored if *RawData* is **TRUE**. Type *EFI_IP4_OVERRIDE_DATA* is defined below.

OptionsLength
Length of the IPv4 header options data. Must be zero if the IPv4 driver does not support IPv4 options. Ignored

if *RawData* is **TRUE**.

OptionsBuffer
Pointer to the IPv4 header options data. Ignored if *OptionsLength* is zero. Ignored if *RawData* is **TRUE**.

TotalDataLength
Total length of the *FragmentTable* data to transmit.

FragmentCount
Number of entries in the fragment data table.

FragmentTable
Start of the fragment data table. Type *EFI_IP4_FRAGMENT_DATA* is defined above.

The *EFI_IP4_TRANSMIT_DATA* structure describes a possibly fragmented packet to be transmitted.

```
//**********************************************
// EFI_IP4_OVERRIDE_DATA
//**********************************************
typedef struct {
  EFI_IPv4_ADDRESS         SourceAddress;
  EFI_IPv4_ADDRESS         GatewayAddress;
  UINT8                    Protocol;
  UINT8                    TypeOfService;
  UINT8                    TimeToLive;
  BOOLEAN                  DoNotFragment;
}   EFI_IP4_OVERRIDE_DATA;
```

SourceAddress
Source address override.

GatewayAddress
Gateway address to override the one selected from the routing table. This address must be on the same subnet as this station address. If set to 0.0.0.0, the gateway address selected from routing table will not be overridden.

Protocol
Protocol type override.

TypeOfService
Type-of-service override.

TimeToLive
Time-to-live override.

DoNotFragment
Do-not-fragment override.

The information and flags in the override data structure will override default parameters or settings for one *Transmit()* function call.

Status Codes Returned

EFI_SUCCESS	The data has been queued for transmission.
EFI_NOT_STARTED	This instance has not been started.
EFI_NO_MAPPING	When using the default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.

continues on next page

Table 28.24 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following is **TRUE:** • *This* is **NULL**. • *Token* is **NULL**.. • *Token.Event* is **NULL**. • *Token.Packet.TxData* is **NULL**.. • *Token.Packet.TxData.OverrideData. GatewayAddress* in the override data structure is not a unicast IPv4 address if *OverrideData* is not **NULL**.. • *Token.Packet.TxData.OverrideData. SourceAddress* is not a unicast IPv4 address if *OverrideData* is not **NULL**. • *Token.Packet.OptionsLength* is not zero and *Token.Packet.OptionsBuffer* is **NULL**.. • *Token.Packet.FragmentCount* is zero. • One or more of the *Tok en.Packet.TxData.FragmentTable[]. FragmentLength* fields is zero. • One or more of the *Tok en.Packet.TxData.FragmentTable[]. FragmentBuffer* fields is **NULL**. • *Tok en.Packet.TxData.TotalDataLength* is zero or not equal to the sum of fragment lengths. • The IP header in *FragmentTable* is not a well-formed header when *RawData* is **TRUE**.
EFI_ACCESS_DENIED	The transmit completion token with the same *Token.Event* was already in the transmit queue.
EFI_NOT_READY	The completion token could not be queued because the transmit queue is full.
EFI_NOT_FOUND	Not route is found to destination address.
EFI_OUT_OF_RESOURCES	Could not queue the transmit data.
EFI_BUFFER_TOO_SMALL	*Tok en.Packet.TxData.TotalDataLength* is too short to transmit.
EFI_BAD_BUFFER_SIZE	The length of the IPv4 header + option length + total data length is greater than MTU (or greater than the maximum packet size if * Token.Packet.TxData.OverrideData. DoNotFragment* is *TRUE*.)
EFI_NO_MEDIA	There was a media error.

28.3.10 EFI_IP4_PROTOCOL.Receive()

Summary

Places a receiving request into the receiving queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_RECEIVE) (
  IN EFI_IP4_PROTOCOL           *This,
  IN EFI_IP4_COMPLETION_TOKEN    *Token
  );
```

Parameters

This

Pointer to the *EFI_IP4_PROTOCOL* instance.

Token

Pointer to a token that is associated with the receive data descriptor. Type *EFI_IP4_COMPLETION_TOKEN* is defined in "Related Definitions" of above *Transmit()*.

Description

The *Receive()* function places a completion token into the receive packet queue. This function is always asynchronous.

The *Token.Event* field in the completion token must be filled in by the caller and cannot be **NULL**. When the receive operation completes, the EFI IPv4 Protocol driver updates the *Token.Status* and *Token.Packet.RxData* fields and the *Token.Event* is signaled.

Status Codes Returned

EFI_SUCCESS	The receive completion token was cached.
EFI_NOT_STARTED	This EFI IPv4 Protocol instance has not been started.
EFI_NO_MAPPING	When using the default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE:** • *This* is **NULL**. • *Token* is **NULL**. • *Token.Event* is **NULL**.
EFI_OUT_OF_RESOURCES	The receive completion token could not be queued due to a lack of system resources (usually memory).
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI IPv4 Protocol instance has been reset to startup defaults.
EFI_ACCESS_DENIED	The receive completion token with the same *Token.Event* was already in the receive queue.
EFI_NOT_READY	The receive request could not be queued because the receive queue is full.
EFI_ICMP_ERROR	An ICMP error packet was received.
EFI_NO_MEDIA	There was a media error.

28.3.11 EFI_IP4_PROTOCOL.Cancel()

Summary

Abort an asynchronous transmit or receive request.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_CANCEL)(
  IN EFI_IP4_PROTOCOL            *This,
  IN EFI_IP4_COMPLETION_TOKEN    *Token OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_IP4_PROTOCOL* instance.

Token

Pointer to a token that has been issued by *EFI_IP4_PROTOCOL*.Transmit() or *EFI_IP4_PROTOCOL*.Receive(). If NULL, all pending tokens are aborted. Type *EFI_IP4_COMPLETION_TOKEN* is defined in *EFI_IP4_PROTOCOL.Transmit()*.

Description

The Cancel() function is used to abort a pending transmit or receive request. If the token is in the transmit or receive request queues, after calling this function, *Token->Status* will be set to *EFI_ABORTED* and then *Token->Event* will be signaled. If the token is not in one of the queues, which usually means the asynchronous operation has completed, this function will not signal the token and *EFI_NOT_FOUND* is returned.

Status Codes Returned

EFI_SUCCESS	The asynchronous I/O request was aborted and *Token.->Event* was signaled. When *Token* is **NULL,** all pending requests were aborted and their events were signaled.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NOT_STARTED	This instance has not been started.
EFI_NO_MAPPING	When using the default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_NOT_FOUND	When *Token* is not **NULL,** the asynchronous I/O request was not found in the transmit or receive queue. It has either completed or was not issued by *Transmit()* and *Receive()*.

28.3.12 EFI_IP4_PROTOCOL.Poll()

Summary

Polls for incoming data packets and processes outgoing data packets.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_POLL) (
  IN EFI_IP4_PROTOCOL         *This
  );
```

Parameters

This

Pointer to the *EFI_IP4_PROTOCOL* instance.

Description

The *Poll()* function polls for incoming data packets and processes outgoing data packets. Network drivers and applications can call the *EFI_IP4_PROTOCOL .Poll()* function to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems the periodic timer event may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the *EFI_IP4_PROTOCOL .Poll()* function more often.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_NOT_STARTED	This EFI IPv4 Protocol instance has not been started.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_NOT_READY	No incoming or outgoing data is processed.
EFI_TIMEOUT	Data was dropped out of the transmit and/or receive queue. Consider increasing the polling rate.

28.4 EFI IPv4 Configuration Protocol

This section provides a detailed description of the EFI IPv4 Configuration Protocol.

IMPORTANT NOTICE: The *EFI_IP4_CONFIG_PROTOCOL* has been replaced with the new *EFI_IP4_CONFIG2_PROTOCOL*.

- All new designs based on this specification should exclusively use *EFI_IP4_CONFIG2_PROTOCOL* .
- The *EFI_IP4_CONFIG_PROTOCOL* will be removed in the next revision of this specification.

28.4.1 EFI_IP4_CONFIG_PROTOCOL

IMPORTANT NOTICE: The *EFI_IP4_CONFIG_PROTOCOL* has been replaced with the new *EFI_IP4_CONFIG2_PROTOCOL*.

- All new designs based on this specification should exclusively use *EFI_IP4_CONFIG2_PROTOCOL* .
- The *EFI_IP4_CONFIG_PROTOCOL* will be removed in the next revision of this specification.

Summary

The *EFI_IP4_CONFIG_PROTOCOL* driver performs platform- and policy-dependent configuration for the EFI IPv4 Protocol driver.

GUID

```
#define EFI_IP4_CONFIG_PROTOCOL_GUID \
  {0x3b95aa31,0x3793,0x434b,\
    {0x86,0x67,0xc8,0x07,0x08,0x92,0xe0,0x5e}}
```

Protocol Interface Structure

```
typedef struct _EFI_IP4_CONFIG_PROTOCOL {
  EFI_IP4_CONFIG_START        Start;
  EFI_IP4_CONFIG_STOP         Stop;
  EFI_IP4_CONFIG_GET_DATA     GetData;
}   EFI_IP4_CONFIG_PROTOCOL;
```

Parameters

Start

Starts running the configuration policy for the EFI IPv4 Protocol driver. See the *Start()* function description.

Stop

Stops running the configuration policy for the EFI IPv4 Protocol driver. See the *Stop()* function description.

GetData

Returns the default configuration data (if any) for the EFI IPv4 Protocol driver. See the *GetData()* function description.

Description

In an effort to keep platform policy code out of the EFI IPv4 Protocol driver, the *EFI_IP4_CONFIG_PROTOCOL* driver will be used as the central repository of any platform- and policy-specific configuration for the EFI IPv4 Protocol driver.

An EFI IPv4 Configuration Protocol interface will be installed on each communications device handle that is managed by the platform setup policy. The driver that is responsible for creating EFI IPv4 variable must open the EFI IPv4 Configuration Protocol driver interface *BY_DRIVER|EXCLUSIVE*.

An example of a configuration policy decision for the EFI IPv4 Protocol driver would be to use a static IP address/subnet mask pair on the platform management network interface and then use dynamic IP addresses that are configured by DHCP on the remaining network interfaces.

28.4.2 EFI_IP4_CONFIG_PROTOCOL.Start()

IMPORTANT NOTICE: The *EFI_IP4_CONFIG_PROTOCOL* has been replaced with the new *EFI_IP4_CONFIG2_PROTOCOL*.

- All new designs based on this specification should exclusively use *EFI_IP4_CONFIG2_PROTOCOL* .
- The *EFI_IP4_CONFIG_PROTOCOL* will be removed in the next revision of this specification.

Summary

Starts running the configuration policy for the EFI IPv4 Protocol driver.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_CONFIG_START) (
  IN EFI_IP4_CONFIG_PROTOCOL     *This,
  IN EFI_EVENT                   DoneEvent,
  IN EFI_EVENT                   ReconfigEvent
  );
```

Parameters

This

Pointer to the *EFI_IP4_CONFIG_PROTOCOL* instance.

DoneEvent

Event that will be signaled when the EFI IPv4 Protocol driver configuration policy completes execution. This event must be of type *EVT_NOTIFY_SIGNAL*.

ReconfigEvent

Event that will be signaled when the EFI IPv4 Protocol driver configuration needs to be updated. This event must be of type *EVT_NOTIFY_SIGNAL*.

Description

The *Start* () function is called to determine and to begin the platform configuration policy by the EFI IPv4 Protocol driver. This determination may be as simple as returning *EFI_UNSUPPORTED* if there is no EFI IPv4 Protocol driver configuration policy. It may be as involved as loading some defaults from nonvolatile storage, downloading dynamic data from a DHCP server, and checking permissions with a site policy server.

Starting the configuration policy is just the beginning. It may finish almost instantly or it may take several minutes before it fails to retrieve configuration information from one or more servers. Once the policy is started, drivers should use the *DoneEvent* parameter to determine when the configuration policy has completed. *EFI_IP4_CONFIG_PROTOCOL .GetData()* must then be called to determine if the configuration succeeded or failed.

Until the configuration completes successfully, EFI IPv4 Protocol driver instances that are attempting to use default configurations must return *EFI_NO_MAPPING*.

Once the configuration is complete, the EFI IPv4 Configuration Protocol driver signals *DoneEvent*. The configuration may need to be updated in the future, however; in this case, the EFI IPv4 Configuration Protocol driver must signal *ReconfigEvent,* and all EFI IPv4 Protocol driver instances that are using default configurations must return *EFI_NO_MAPPING* until the configuration policy has been rerun.

Status Codes Returned

EFI_SUCCESS	The configuration policy for the EFI IPv4 Protocol driver is now running.
EFI_INVALID_PARAMETER	One or more of the following parameters is **NULL:** • *This* • *DoneEvent* • *ReconfigEvent*
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_ALREADY_STARTED	The configuration policy for the EFI IPv4 Protocol driver was already started.
EFI_DEVICE_ERROR	An unexpected system error or network error occurred.
EFI_UNSUPPORTED	This interface does not support the EFI IPv4 Protocol driver configuration.

28.4.3 EFI_IP4_CONFIG_PROTOCOL.Stop()

IMPORTANT NOTICE: The *EFI_IP4_CONFIG_PROTOCOL* has been replaced with the new *EFI_IP4_CONFIG2_PROTOCOL.*

- All new designs based on this specification should exclusively use *EFI_IP4_CONFIG2_PROTOCOL* .
- The *EFI_IP4_CONFIG_PROTOCOL* will be removed in the next revision of this specification.

Summary

Stops running the configuration policy for the EFI IPv4 Protocol driver.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_CONFIG_STOP) (
  IN EFI_IP4_CONFIG_PROTOCOL     *This
  );
```

Parameters

This

Pointer to the *EFI_IP4_CONFIG_PROTOCOL* instance.

Description

The *Stop* () function stops the configuration policy for the EFI IPv4 Protocol driver. All configuration data will be lost after calling *Stop()*.

Status Codes Returned

EFI_SUCCESS	The configuration policy for the EFI IPv4 Protocol driver has been stopped.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NOT_STARTED	The configuration policy for the EFI IPv4 Protocol driver was not started.

28.4.4 EFI_IP4_CONFIG_PROTOCOL.GetData()

IMPORTANT NOTICE: The *EFI_IP4_CONFIG_PROTOCOL* has been replaced with the new *EFI_IP4_CONFIG2_PROTOCOL*.

- All new designs based on this specification should exclusively use *EFI_IP4_CONFIG2_PROTOCOL* .
- The *EFI_IP4_CONFIG_PROTOCOL* will be removed in the next revision of this specification.

Summary

Returns the default configuration data (if any) for the EFI IPv4 Protocol driver.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_CONFIG_GET_DATA) (
  IN EFI_IP4_CONFIG_PROTOCOL     *This,
  IN OUT UINTN                   *IpConfigDataSize,
  OUT EFI_IP4_IPCONFIG_DATA      *IpConfigData OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_IP4_CONFIG_PROTOCOL* instance.

IpConfigDataSize
On input, the size of the *IpConfigData* buffer. On output, the count of bytes that were written into the *IpConfigData* buffer.

IpConfigData
Pointer to the EFI IPv4 Configuration Protocol driver configuration data structure. Type *EFI_IP4_IPCONFIG_DATA* is defined in "Related Definitions" below.

Description

The *GetData* () function returns the current configuration data for the EFI IPv4 Protocol driver after the configuration policy has completed.

Related Definition

```
//**********************************************
// EFI_IP4_IPCONFIG_DATA
//**********************************************
typedef struct {
  EFI_IPv4_ADDRESS      StationAddress;
  EFI_IPv4_ADDRESS      SubnetMask;
```

(continues on next page)

(continued from previous page)

```
  UINT32                RouteTableSize;
  EFI_IP4_ROUTE_TABLE   *RouteTable OPTIONAL;
}   EFI_IP4_IPCONFIG_DATA;
```

StationAddress
Default station IP address, stored in network byte order.

SubnetMask
Default subnet mask, stored in network byte order.

RouteTableSize
Number of entries in the following *RouteTable*. May be zero.

RouteTable
Default routing table data (stored in network byte order). Ignored if *RouteTableSize* is zero. Type *EFI_IP4_ROUTE_TABLE* is defined in *EFI_IP4_PROTOCOL .GetModeData()*.

EFI_IP4_IPCONFIG_DATA contains the minimum IPv4 configuration data that is needed to start basic network communication. The *StationAddress* and *SubnetMask* must be a valid unicast IP address and subnet mask.

If *RouteTableSize* is not zero, then *RouteTable* contains a properly formatted routing table for the *StationAddress* / *SubnetMask,* with the last entry in the table being the default route.

Status Codes Returned

EFI_SUCCESS	The EFI IPv4 Protocol driver configuration has been returned.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NOT_STARTED	The configuration policy for the EFI IPv4 Protocol driver is not running.
EFI_NOT_READY	EFI IPv4 Protocol driver configuration is still running.
EFI_ABORTED	EFI IPv4 Protocol driver configuration could not complete.
EFI_BUFFER_TOO_SMALL	* *IpConfigDataSize* is smaller than the configuration data buffer or *IpConfigData* is **NULL**.

28.5 EFI IPv4 Configuration II Protocol

This section provides a detailed description of the EFI IPv4 Configuration II Protocol.

28.5.1 EFI_IP4_CONFIG2_PROTOCOL

Summary

The *EFI_IP4_CONFIG2_PROTOCOL* provides the mechanism to set and get various types of configurations for the EFI IPv4 network stack.

GUID

```
#define EFI_IP4_CONFIG2_PROTOCOL_GUID \
  { 0x5b446ed1, 0xe30b, 0x4faa,\
    { 0x87, 0x1a, 0x36, 0x54, 0xec, 0xa3, 0x60, 0x80 }}
```

Protocol Interface Structure

```
typedef struct _EFI_IP4_CONFIG2_PROTOCOL {
  EFI_IP4_CONFIG2_SET_DATA             SetData;
  EFI_IP4_CONFIG2_GET_DATA             GetData;
  EFI_IP4_CONFIG2_REGISTER_NOTIFY      RegisterDataNotify;
  EFI_IP4_CONFIG2_UNREGISTER_NOTIFY    UnregisterDataNotify;
}   EFI_IP4_CONFIG2_PROTOCOL;
```

Parameters

SetData
Set the configuration for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages. See the *SetData()* function description.

GetData
Get the configuration for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages. See the *GetData()* function description.

RegiseterDataNotify
Register an event that is to be signaled whenever a configuration process on the specified configuration data is done.

UnregisterDataNotify
Remove a previously registered event for the specified configuration data.

Description

The *EFI_IP4_CONFIG2_PROTOCOL* is designed to be the central repository for the common configurations and the administrator configurable settings for the EFI IPv4 network stack.

An EFI IPv4 Configuration II Protocol instance will be installed on each communication device that the EFI IPv4 network stack runs on.

NOTE: *All the network addresses described in* EFI_IP4_CONFIG2_PROTOCOL *are stored in network byte order. All other parameters defined in functions or data structures are stored in host byte order.*

28.5.2 EFI_IP4_CONFIG2_PROTOCOL.SetData()

Summary

Set the configuration for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_CONFIG2_SET_DATA) (
  IN EFI_IP4_CONFIG2_PROTOCOL    *This,
  IN EFI_IP4_CONFIG2_DATA_TYPE   DataType,
  IN UINTN                       DataSize,
  IN VOID                        *Data
  );
```

Parameters

This
Pointer to the *EFI_IP4_CONFIG2_PROTOCOL* instance.

DataType
The type of data to set. Type *EFI_IP4_CONFIG2_DATA_TYPE* is defined in “Related Definitions” below.

DataSize
Size of the buffer pointed to by *Data* in bytes.

Data
The data buffer to set. The type of the data buffer is associated with the *DataType*. The various types are defined in “Related Definitions” below.

Description

This function is used to set the configuration data of type DataType for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages. The successfully configured data is valid after system reset or power-off.

The DataSize is used to calculate the count of structure instances in the Data for some DataType that multiple structure instances are allowed.

This function is always non-blocking. When setting some type of configuration data, an asynchronous process is invoked to check the correctness of the data, such as doing address conflict detection on the manually set local IPv4 address. *EFI_NOT_READY* is returned immediately to indicate that such an asynchronous process is invoked and the process is not finished yet. The caller willing to get the result of the asynchronous process is required to call *RegisterDataNotify()* to register an event on the specified configuration data. Once the event is signaled, the caller can call *GetData()* to get back the configuration data in order to know the result. For other types of configuration data that do not require an asynchronous configuration process, the result of the operation is immediately returned.

Related Definition

```
//**********************************************
// EFI_IP4_CONFIG2_DATA_TYPE
//**********************************************
typedef enum {
  Ip4Config2DataTypeInterfaceInfo,
  Ip4Config2DataTypePolicy,
  Ip4Config2DataTypeManualAddress,
  Ip4Config2DataTypeGateway,
  Ip4Config2DataTypeDnsServer,
  Ip4Config2DataTypeMaximum
} EFI_IP4_CONFIG2_DATA_TYPE;
```

Ip4Config2DataTypeInterfaceInfo
The interface information of the communication device this EFI IPv4 Configuration II Protocol instance manages. This type of data is read only. The corresponding *Data* is of type *EFI_IP4_CONFIG2_INTERFACE_INFO*.

Ip4Config2DataTypePolicy
The general configuration policy for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages. The policy will affect other configuration settings. The corresponding *Data* is of type *EFI_IP4_CONFIG2_POLICY*.

Ip4Config2DataTypeManualAddress
The station addresses set manually for the EFI IPv4 network stack. It is only configurable when the policy is *Ip4Config2PolicyStatic*. The corresponding *Data* is of type *EFI_IP4_CONFIG2_MANUAL_ADDRESS*. When *DataSize* is 0 and *Data* is *NULL*, the existing configuration is cleared from the EFI IPv4 Configuration II Protocol instance.

Ip4Config2DataTypeGateway
The gateway addresses set manually for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol manages. It is not configurable when the policy is *Ip4Config2PolicyDhcp*.

The gateway addresses must be unicast IPv4 addresses. The corresponding *Data* is a pointer to an array of *EFI_IPv4_ADDRESS* instances. When *DataSize* is 0 and *Data* is *NULL,* the existing configuration is cleared from the EFI IPv4 Configuration II Protocol instance.

Ip4Config2DataTypeDnsServer

The DNS server list for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol manages. It is not configurable when the policy is *Ip4Config2PolicyDhcp*.The DNS server addresses must be unicast IPv4 addresses. The corresponding *Data* is a pointer to an array of *EFI_IPv4_ADDRESS* instances. When *DataSize* is 0 and *Data* is *NULL,* the existing configuration is cleared from the EFI IPv4 Configuration II Protocol instance.

```
//*******************************************************
// EFI_IP4_CONFIG2_INTERFACE_INFO related definitions
//*******************************************************
#define EFI_IP4_CONFIG2_INTERFACE_INFO_NAME_SIZE 32

//*******************************************************
// EFI_IP4_CONFIG2_INTERFACE_INFO
//*******************************************************
typedef struct {
  CHAR16                           Name[EFI_IP4_CONFIG2_INTERFACE_INFO_NAME_SIZE];
  UINT8                            IfType;
  UINT32                           HwAddressSize;
  EFI_MAC_ADDRESS                  HwAddress;
  EFI_IPv4_ADDRESS                 StationAddress;
  EFI_IPv4_ADDRESS                 SubnetMask;
  UINT32                           RouteTableSize;
  EFI_IP4_ROUTE_TABLE              *RouteTable OPTIONAL;
}   EFI_IP4_CONFIG2_INTERFACE_INFO;
```

Name

The name of the interface. It is a NULL-terminated Unicode string.

IfType

The interface type of the network interface. See RFC 1700, section “Number Hardware Type”.

HwAddressSize

The size, in bytes, of the network interface’s hardware address.

HwAddress

The hardware address for the network interface.

StationAddress

The station IPv4 address of this EFI IPv4 network stack.

SubnetMask

The subnet address mask that is associated with the station address.

RouteTableSize

Size of the following *RouteTable,* in bytes. May be zero.

RouteTable

The route table of the IPv4 network stack runs on this interface. Set to NULL if *RouteTableSize* is zero. Type *EFI_IP4_ROUTE_TABLE* is defined in *EFI_IP4_PROTOCOL.GetModeData()*.

The *EFI_IP4_CONFIG2_INTERFACE_INFO* structure describes the operational state of the interface this EFI IPv4 Configuration II Protocol instance manages. This type of data is read-only. When reading, the caller allocated buffer is used to return all of the data, i.e., the first part of the buffer is *EFI_IP4_CONFIG2_INTERFACE_INFO* and the followings are the route table if present. The caller should NOT free the buffer pointed to by *RouteTable,* and the caller is only required to free the whole buffer if the data is not needed any more.

```
//************************************************
// EFI_IP4_CONFIG2_POLICY
//************************************************
typedef enum {
  Ip4Config2PolicyStatic,
  Ip4Config2PolicyDhcp,
  Ip4Config2PolicyMax
}   EFI_IP4_CONFIG2_POLICY;

.. TODO: please note there is a missing explanatory note for Ip4Config2PolicyMax not␣
↪included in the list below.
```

Ip4Config2PolicyStatic

Under this policy, the *Ip4Config2DataTypeManualAddress, Ip4Config2DataTypeGateway* and *Ip4Config2DataTypeDnsServer* configuration data are required to be set manually. The EFI IPv4 Protocol will get all required configuration such as IPv4 address, subnet mask and gateway settings from the EFI IPv4 Configuration II protocol.

Ip4Config2PolicyDhcp

Under this policy, the *Ip4Config2DataTypeManualAddress, Ip4Config2DataTypeGateway* and *Ip4Config2DataTypeDnsServer* configuration data are not allowed to set via *SetData()*. All of these configurations are retrieved from DHCP server or other auto-configuration mechanism.

The *EFI_IP4_CONFIG2_POLICY* defines the general configuration policy the EFI IPv4 Configuration II Protocol supports. The default policy for a newly detected communication device is beyond the scope of this document. An implementation might leave it to platform to choose the default policy.

The configuration data of type *Ip4Config2DataTypeManualAddress, Ip4Config2DataTypeGateway* and *Ip4Config2DataTypeDnsServer* will be flushed if the policy is changed from *Ip4Config2PolicyStatic* to *Ip4Config2PolicyDhcp*.

```
//************************************************
// EFI_IP4_CONFIG2_MANUAL_ADDRESS
//************************************************
typedef struct {
  EFI_IPv4_ADDRESS       Address;
  EFI_IPv4_ADDRESS       SubnetMask;
}   EFI_IP4_CONFIG2_MANUAL_ADDRESS;
```

Address

The IPv4 unicast address.

SubnetMask

The subnet mask.

The *EFI_IP4_CONFIG2_MANUAL_ADDRESS* structure is used to set the station address information for the EFI IPv4 network stack manually when the policy is *Ip4Config2PolicyStatic*.

The *EFI_IP4_CONFIG2_DATA_TYPE* includes current supported data types; this specification allows future extension to support more data types.

Status Codes Returned

EFI_SUCCESS	The specified configuration data for the EFI IPv4 network stack is set successfully.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE**: • *This* is **NULL.** • One or more fields in *Data* and *DataSize* do not match the requirement of the data type indicated by *DataType*.
EFI_WRITE_PROTECTED	The specified configuration data is read-only or the specified configuration data can not be set under the current policy.
EFI_ACCESS_DENIED	Another set operation on the specified configuration data is already in process.
EFI_NOT_READY	An asynchronous process is invoked to set the specified configuration data and the process is not finished yet.
EFI_BAD_BUFFER_SIZE	The *DataSize* does not match the size of the type indicated by *DataType*.
EFI_UNSUPPORTED	This *DataType* is not supported.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_DEVICE_ERROR	An unexpected system error or network error occurred.

28.5.3 EFI_IP4_CONFIG2_PROTOCOL.GetData()

Summary

Get the configuration data for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_CONFIG2_GET_DATA) (
  IN EFI_IP4_CONFIG2_PROTOCOL    *This,
  IN EFI_IP4_CONFIG2_DATA_TYPE   DataType,
  IN OUT UINTN                   *DataSize,
  IN VOID                        *Data OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_IP4_CONFIG2_PROTOCOL* instance.

DataType

The type of data to get. Type *EFI_IP4_CONFIG2_DATA_TYPE* is defined in EFI_IP4_CONFIG2_PROTOCOL.SetData().

DataSize

On input, in bytes, the size of *Data*. On output, in bytes, the size of buffer required to store the specified configuration data.

Data

The data buffer in which the configuration data is returned. The type of the data buffer is associated with the *DataType*. Ignored if *DataSize* is 0. The various types are defined in *EFI_IP4_CONFIG2_PROTOCOL.SetData()*.

Description

This function returns the configuration data of type *DataType* for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages.

The caller is responsible for allocating the buffer used to return the specified configuration data and the required size will be returned to the caller if the size of the buffer is too small.

EFI_NOT_READY is returned if the specified configuration data is not ready due to an already in progress asynchronous configuration process. The caller can call *RegisterDataNotify()* to register an event on the specified configuration data. Once the asynchronous configuration process is finished, the event will be signaled and a subsequent *GetData()* call will return the specified configuration data.

Status Codes Returned

EFI_SUCCESS	The specified configuration data is got successfully.
EFI_INVALID_PARAMETER*	One or more of the followings are **TRUE:** • This is **NULL**. • DataSize is **NULL**. • *Data* is **NULL** if *DataSize* is not zero.
EFI_BUFFER_TOO_SMALL	The size of Data is too small for the specified configuration data and the required size is returned in *DataSize*.
EFI_NOT_READY	The specified configuration data is not ready due to an already in progress asynchronous configuration process.
EFI_NOT_FOUND	The specified configuration data is not found.

28.5.4 EFI_IP4_CONFIG2_PROTOCOL.RegisterDataNotify ()

Summary

Register an event that is to be signaled whenever a configuration process on the specified configuration data is done.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_CONFIG2_REGISTER_NOTIFY) (
  IN EFI_IP4_CONFIG2_PROTOCOL       *This,
  IN EFI_IP4_CONFIG2_DATA_TYPE      DataType,
IN EFI_EVENT                        Event
);
```

Parameters

This

Pointer to the *EFI_IP4_CONFIG2_PROTOCOL* instance.

DataType

The type of data to unregister the event for. Type *EFI_IP4_CONFIG2_DATA_TYPE* is defined in EFI_IP4_CONFIG2_PROTOCOL.SetData().

Event

The event to register.

Description

This function registers an event that is to be signaled whenever a configuration process on the specified configuration data is done. An event can be registered for different *DataType* simultaneously and the caller is responsible for determining which type of configuration data causes the signaling of the event in such case.

Status Codes Returned

EFI_SUCCESS	The notification event for the specified configuration data is registered.
EFI_INVALID_PARAMETER	*This* is **NULL** or Event is **NULL**.
EFI_UNSUPPORTED	The configuration data type specified by *DataType* is not supported.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_ACCESS_DENIED	The *Event* is already registered for the *DataType*.

28.5.5 EFI_IP4_CONFIG2_PROTOCOL.UnregisterDataNotify ()

Summary

Remove a previously registered event for the specified configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_CONFIG2_UNREGISTER_NOTIFY) (
  IN EFI_IP4_CONFIG2_PROTOCOL          *This,
  IN EFI_IP4_CONFIG2_DATA_TYPE         DataType,
  IN EFI_EVENT                         Event
  );
```

Parameters

This

Pointer to the *EFI_IP4_CONFIG2_PROTOCOL* instance.

DataType

The type of data to remove the previously registered event for. Type *EFI_IP4_CONFIG2_DATA_TYPE* is defined in EFI_IP4_CONFIG2_PROTOCOL.SetData().

Event

The event to unregister.

Description

This function removes a previously registered event for the specified configuration data.

Status Codes Returned

EFI_SUCCESS	The event registered for the specified configuration data is removed.
EFI_INVALID_PARAMETER	*This* is **NULL** or *Event* is **NULL**.
EFI_NOT_FOUND	The *Event* has not been registered for the specified *DataType*.

28.6 EFI IPv6 Protocol

This section defines the EFI IPv6 (Internet Protocol version 6) Protocol interface. It is split into the following three main sections:

- EFI IPv6 Service Binding Protocol
- EFI IPv6 Variable
- EFI IPv6 Protocol

The EFI IPv6 Protocol provides basic network IPv6 packet I/O services, which includes support for Neighbor Discovery Protocol (ND), Multicast Listener Discovery Protocol (MLD), and a subset of the Internet Control Message Protocol (ICMPv6).

28.6.1 IPv6 Service Binding Protocol

28.6.2 EFI_IP6_SERVICE_BINDING_PROTOCOL

Summary

The EFI IPv6 Service Binding Protocol is used to locate communication devices that are supported by an EFI IPv6 Protocol driver and to create and destroy EFI IPv6 Protocol child instances of the IP6 driver that can use the underlying communications device.

GUID

```
#define EFI_IP6_SERVICE_BINDING_PROTOCOL _GUID \
    {0xec835dd3,0xfe0f,0x617b,\
  {0xa6,0x21,0xb3,0x50,0xc3,0xe1,0x33,0x88}}
```

Description

A network application that requires basic IPv6 I/O services can use one of the protocol handler services, such as *BS->LocateHandleBuffer(),* to search for devices that publish an EFI IPv6 Service Binding Protocol GUID. Each device with a published EFI IPv6 Service Binding Protocol GUID supports the EFI IPv6 Protocol and may be available for use.

After a successful call to the *EFI_IP6_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the newly created child EFI IPv6 Protocol driver is in an un-configured state; it is not ready to send and receive data packets.

Before a network application terminates execution, every successful call to the *EFI_IP6_SERVICE_BINDING_PROTOCOL.CreateChild()* function must be matched with a call to the *EFI_IP6_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

28.6.3 IPv6 Protocol

28.6.4 EFI_IP6_PROTOCOL

Summary

The EFI IPv6 Protocol implements a simple packet-oriented interface that can be used by drivers, daemons, and applications to transmit and receive network packets.

GUID

```
#define EFI_IP6_PROTOCOL_GUID \
  {0x2c8759d5,0x5c2d,0x66ef,\
    {0x92,0x5f,0xb6,0x6c,0x10,0x19,0x57,0xe2}}
```

Protocol Interface Structure

```
typedef struct _EFI_IP6_PROTOCOL {
  EFI_IP6_GET_MODE_DATA    GetModeData;
  EFI_IP6_CONFIGURE        Configure;
  EFI_IP6_GROUPS           Groups;
  EFI_IP6_ROUTES           Routes;
  EFI_IP6_NEIGHBORS        Neighbors;
  EFI_IP6_TRANSMIT         Transmit;
  EFI_IP6_RECEIVE          Receive;
  EFI_IP6_CANCEL           Cancel;
  EFI_IP6_POLL             Poll;
}  EFI_IP6_PROTOCOL;
```

Parameters

GetModeData
Gets the current operational settings for this instance of the EFI IPv6 Protocol driver. See the *GetModeData()* function description.

Configure
Changes or resets the operational settings for the EFI IPv6 Protocol. See the *Configure()* function description.

Groups
Joins and leaves multicast groups. See the *Groups()* function description.

Routes
Adds and deletes routing table entries. See the *Routes()* function description.

Neighbors
Adds and deletes neighbor cache entries. See the *Neighbors()* function description.

Transmit
Places outgoing data packets into the transmit queue. See the *Transmit()* function description.

Receive
Places a receiving request into the receiving queue. See the *Receive()* function description.

Cancel
Aborts a pending transmit or receive request. See the *Cancel()* function description.

Poll
Polls for incoming data packets and processes outgoing data packets. See the *Poll()* function description.

Description

The *EFI_IP6_PROTOCOL* defines a set of simple IPv6, and ICMPv6 services that can be used by any network protocol driver, daemon, or application to transmit and receive IPv6 data packets.

NOTE: *Byte Order: All the IPv6 addresses that are described in* EFI_IP6_PROTOCOL *are stored in network byte order. Both incoming and outgoing IP packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order.*

28.6.5 EFI_IP6_PROTOCOL.GetModeData()

Summary

Gets the current operational settings for this instance of the EFI IPv6 Protocol driver.

Prototype

```
EFI_STATUS
(EFIAPI *EFI_IP6_GET_MODE_DATA) (
  IN EFI_IP6_PROTOCOL                    *This,
  OUT EFI_IP6_MODE_DATA                  *Ip6ModeData OPTIONAL,
  OUT EFI_MANAGED_NETWORK_CONFIG_DATA    *MnpConfigData OPTIONAL,
  OUT EFI_SIMPLE_NETWORK_MODE            *SnpModeData OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_IP6_PROTOCOL* instance.

Ip6ModeData
Pointer to the EFI IPv6 Protocol mode data structure. Type *EFI_IP6_MODE_DATA* is defined in "Related Definitions" below.

MnpConfigData
Pointer to the managed network configuration data structure. Type *EFI_MANAGED_NETWORK_CONFIG_DATA* is defined in *EFI_MANAGED_NETWORK_PROTOCOL.GetModeData()*.

SnpData
Pointer to the simple network mode data structure. Type *EFI_SIMPLE_NETWORK_MODE* is defined in the *EFI_SIMPLE_NETWORK_PROTOCOL*.

Description

The *GetModeData()* function returns the current operational mode data for this driver instance. The data fields in *EFI_IP6_MODE_DATA* are read only. This function is used optionally to retrieve the operational mode data of underlying networks or drivers.

Related Definition

```
//*****************************************
// EFI_IP6_MODE_DATA
//*****************************************
typedef struct {
  BOOLEAN                  IsStarted;

  EFI_IP6_ICMP_TYPE         *IcmpTypeList;
}   EFI_IP6_MODE_DATA;
```

IsStarted
Set to **TRUE** after this EFI IPv6 Protocol instance is started. All other fields in this structure are undefined until this field is **TRUE**. Set to **FALSE** when the EFI IPv6 Protocol instance is stopped.

MaxPackeSize
The maximum packet size, in bytes, of the packet which the upper layer driver could feed.

ConfigData
Current configuration settings. Undefined until *IsStarted* is **TRUE**. Type *EFI_IP6_CONFIG_DATA* is defined below.

IsConfigured
Set to **TRUE** when the EFI IPv6 Protocol instance is configured. The instance is configured when it has a station address and corresponding prefix length. Set to **FALSE** when the EFI IPv6 Protocol instance is not configured.

AddressCount
Number of configured IPv6 addresses on this interface.

AddressList
List of currently configured IPv6 addresses and corresponding prefix lengths assigned to this interface. It is caller's responsibility to free this buffer. Type *EFI_IP6_ADDRESS_INFO* is defined below.

GroupCount
Number of joined multicast groups. Undefined until *IsConfigured* is **TRUE**.

GroupTable
List of joined multicast group addresses. It is caller's responsibility to free this buffer. Undefined until *IsConfigured* is **TRUE**.

RouteCount
Number of entries in the routing table. Undefined until *IsConfigured* is **TRUE**.

RouteTable
Routing table entries. It is caller's responsibility to free this buffer. Type *EFI_IP6_ROUTE_TABLE* is defined below.

NeighborCount
Number of entries in the neighbor cache. Undefined until *IsConfigured* is **TRUE**.

NeighborCache
Neighbor cache entries. It is caller's responsibility to free this buffer. Undefined until *IsConfigured* is **TRUE**. Type *EFI_IP6_NEIGHBOR_CACHE* is defined below.

PrefixCount
Number of entries in the prefix table. Undefined until *IsConfigured* is **TRUE**.

PrefixTable
On-link Prefix table entries. It is caller's responsibility to free this buffer. Undefined until *IsConfigured* is **TRUE**. Type *EFI_IP6_ADDRESS_INFO* is defined below.

IcmpTypeCount
Number of entries in the supported ICMP types list.

IcmpTypeList
Array of ICMP types and codes that are supported by this EFI IPv6 Protocol driver. It is caller's responsibility to free this buffer. Type *EFI_IP6_ICMP_TYPE* is defined below.

```
//*******************************************
// EFI_IP6_CONFIG_DATA
//*******************************************
typedef struct {
  UINT8              DefaultProtocol;
  BOOLEAN            AcceptAnyProtocol;
  BOOLEAN            AcceptIcmpErrors;
  BOOLEAN            AcceptPromiscuous;
  EFI_IPv6_ADDRESS   DestinationAddress;
  EFI_IPv6_ADDRESS   StationAddress;
  UINT8              TrafficClass;
  UINT8              HopLimit;
  UINT32             FlowLabel;
  UINT32             ReceiveTimeout;
  UINT32             TransmitTimeout;
} EFI_IP6_CONFIG_DATA;
```

DefaultProtocol
For the IPv6 packet to send and receive, this is the default value of the 'Next Header' field in the last IPv6 extension header or in the IPv6 header if there are no extension headers. Ignored when *AcceptPromiscuous* is **TRUE**. An updated list of protocol numbers can be found at "Links to UEFI-Related Documents" (*http://uefi.org/uefi)* under the heading "IANA Assigned Internet Protocol Numbers". The following values are illegal: 0 (IPv6 Hop-by-Hop Option), 1(ICMP), 2(IGMP), 41(IPv6), 43(Routing Header for IPv6), 44(Fragment Header for IPv6), 59(No Next Header for IPv6), 60(Destination Options for IPv6), 124(ISIS over IPv4).

AcceptAnyProtocol
Set to **TRUE** to receive all IPv6 packets that get through the receive filters. Set to **FALSE** to receive only the *DefaultProtocol* IPv6 packets that get through the receive filters. Ignored when *AcceptPromiscuous* is **TRUE**.

AcceptIcmpErrors
Set to **TRUE** to receive ICMP error report packets. Ignored when *AcceptPromiscuous* or *AcceptAnyProtocol* is **TRUE**.

AcceptPromiscuous
Set to **TRUE** to receive all IPv6 packets that are sent to any hardware address or any protocol address. Set to **FALSE** to stop receiving all promiscuous IPv6 packets.

DestinationAddress
The destination address of the packets that will be transmitted. Ignored if it is unspecified.

StationAddress
The station IPv6 address that will be assigned to this EFI IPv6 Protocol instance. This field can be set and changed only when the EFI IPv6 driver is transitioning from the stopped to the started states. If the StationAddress is specified, the EFI IPv6 Protocol driver will deliver only incoming IPv6 packets whose destination matches this IPv6 address exactly. The StationAddress is required to be one of currently configured IPv6 addresses. An address containing all zeroes is also accepted as a special case. Under this situation, the IPv6 driver is responsible for binding a source address to this EFI IPv6 protocol instance according to the source address

selection algorithm. Only incoming packets destined to the selected address will be delivered to the user. And the selected station address can be retrieved through later *GetModeData()* call. If no address is available for selecting, *EFI_NO_MAPPING* will be returned, and the station address will only be successfully bound to this EFI IPv6 protocol instance after *IP6ModeData.IsConfigured* changed to **TRUE**.

TrafficClass
TrafficClass field in transmitted IPv6 packets. Default value is zero.

HopLimit
HopLimit field in transmitted IPv6 packets.

FlowLabel
FlowLabel field in transmitted IPv6 packets. Default value is zero.

ReceiveTimeout
The timer timeout value (number of microseconds) for the receive timeout event to be associated with each assembled packet. Zero means do not drop assembled packets.

TransmitTimeout
The timer timeout value (number of microseconds) for the transmit timeout event to be associated with each outgoing packet. Zero means do not drop outgoing packets.

The EFI_IP6_CONFIG_DATA structure is used to report and change IPv6 session parameters.

```
//************************************************
// EFI_IP6_ADDRESS_INFO
//************************************************
typedef struct {
  EFI_IPv6_ADDRESS      Address;
  UINT8                 PrefixLength;
}   EFI_IP6_ADDRESS_INFO;

.. TODO: tweaked the indent on this code. oK?
```

Address
The IPv6 address.

PrefixLength
The length of the prefix associated with the *Address*.

```
//************************************************
// EFI_IP6_ROUTE_TABLE
//************************************************
typedef struct {
  EFI_IPv6_ADDRESS      Gateway;
  EFI_IPv6_ADDRESS      Destination;
  UINT8                 PrefixLength;
}   EFI_IP6_ROUTE_TABLE;
```

Gateway
The IPv6 address of the gateway to be used as the next hop for packets to this prefix. If the IPv6 address is all zeros, then the prefix is on-link.

Destination
The destination prefix to be routed.

PrefixLength
The length of the prefix associated with the *Destination*.

EFI_IP6_ROUTE_TABLE is the entry structure that is used in routing tables.

```
//**********************************************
// EFI_IP6_NEIGHBOR_CACHE
//**********************************************
typedef struct {
  EFI_IPv6_ADDRESS         Neighbor;
  EFI_MAC_ADDRESS          LinkAddress;
  EFI_IP6_NEIGHBOR_STATE   State;
}   EFI_IP6_NEIGHBOR_CACHE;
```

Neighbor
The on-link unicast / anycast IP address of the neighbor.

LinkAddress
Link-layer address of the neighbor.

State
State of this neighbor cache entry.

EFI_IP6_NEIGHBOR_CACHE is the entry structure that is used in neighbor cache. It records a set of entries about individual neighbors to which traffic has been sent recently.

```
//**********************************************
// EFI_IP6_NEIGHBOR_STATE
//**********************************************
typedef enum {
  EfiNeighborInComplete,
  EfiNeighborReachable,
  EfiNeighborStale,
  EfiNeighborDelay,
  EfiNeighborProbe
}   EFI_IP6_NEIGHBOR_STATE;
```

Following is a description of the fields in the above enumeration.

EfiNeighborInComplete
Address resolution is being performed on this entry. Specially, Neighbor Solicitation has been sent to the solicited-node multicast address of the target, but corresponding Neighbor Advertisement has not been received.

EfiNeighborReachable
Positive confirmation was received that the forward path to the neighbor was functioning properly.

EfiNeighborStale
Reachable Time has elapsed since the last positive confirmation was received. In this state, the forward path to the neighbor was functioning properly.

EfiNeighborDelay
This state is an optimization that gives upper-layer protocols additional time to provide reachability confirmation.

EfiNeighborProbe
A reachability confirmation is actively sought by retransmitting Neighbor Solicitations every RetransTimer milliseconds until a reachability confirmation is received.

```
//**********************************************
// EFI_IP6_ICMP_TYPE
//**********************************************
typedef struct {
```

(continues on next page)

(continued from previous page)

```
  UINT8       Type;
  UINT8       Code;
}   EFI_IP6_ICMP_TYPE;
```

Type

The type of ICMP message. See “Links to UEFI-Related Documents” (*http://uefi.org/uefi)* under the heading “Internet Control Message Protocol Version 6 (ICMPv6) Parameters” for the complete list of ICMP message type.

Code

The code of the ICMP message, which further describes the different ICMP message formats under the same Type. See “Links to UEFI-Related Documents” (*http://uefi.org/uefi)* under the heading “Internet Control Message Protocol Version 6 (ICMPv6) Parameters” for details for code of ICMP message.

EFI_IP6_ICMP_TYPE is used to describe those ICMP messages that are supported by this EFI IPv6 Protocol driver.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**
EFI_OUT_OF_RESOURCES	The required mode data could not be allocated.

28.6.6 EFI_IP6_PROTOCOL.Configure()

Summary

Assign IPv6 address and other configuration parameter to this EFI IPv6 Protocol driver instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP6_CONFIGURE) (
  IN EFI_IP6_PROTOCOL             *This,
  IN EFI_IP6_CONFIG_DATA          *Ip6ConfigData OPTIONAL
 );
```

Parameters

This

Pointer to the *EFI_IP6_PROTOCOL* instance.

Ip6ConfigData

Pointer to the EFI IPv6 Protocol configuration data structure. Type *EFI_IP6_CONFIG_DATA* is defined in *EFI_IP6_PROTOCOL.GetModeData()*.

Description

The *Configure()* function is used to set, change, or reset the operational parameters and filter settings for this EFI IPv6 Protocol instance. Until these parameters have been set, no network traffic can be sent or received by this instance. Once the parameters have been reset (by calling this function with *Ip6ConfigData* set to **NULL**), no more traffic can be sent or received until these parameters have been set again. Each EFI IPv6 Protocol instance can be started and stopped independently of each other by enabling or disabling their receive filter settings with the *Configure()* function.

If *Ip6ConfigData.StationAddress* is a valid non-zero IPv6 unicast address, it is required to be one of the currently configured IPv6 addresses list in the EFI IPv6 drivers, or else *EFI_INVALID_PARAMETER* will be returned. If *Ip6ConfigData.StationAddress* is unspecified, the IPv6 driver will bind a source address according to the source address selection algorithm. Clients could frequently call *GetModeData()* to check get currently configured IPv6 address list in the EFI IPv6 driver. If both *Ip6ConfigData.StationAddress* and *Ip6ConfigData.Destination* are unspecified, when transmitting the packet afterwards, the source address filled in each outgoing IPv6 packet is decided based on the destination of this packet.

If operational parameters are reset or changed, any pending transmit and receive requests will be cancelled. Their completion token status will be set to *EFI_ABORTED* and their events will be signaled.

Status Codes Returned

EFI_SUCCESS	The driver instance was successfully opened.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE:** *This* is **NULL**. *Ip6ConfigData.StationAddress* is neither zero nor a unicast IPv6 address. *Ip6ConfigData.StationAddress* is neither zero nor one of the configured IP addresses in the EFI IPv6 driver. *Ip6ConfigData.DefaultProtocol* is illegal.
EFI_OUT_OF_RESOURCES	The EFI IPv6 Protocol driver instance data could not be allocated.
EFI_NO_MAPPING	The IPv6 driver was responsible for choosing a source address for this instance, but no source address was available for use.
EFI_ALREADY_STARTED	The interface is already open and must be stopped before the IPv6 address or prefix length can be changed.
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI IPv6 Protocol driver instance is not opened.
EFI_UNSUPPORTED	Default protocol specified through *Ip6ConfigData.DefaulProtocol* isn't supported.

28.6.7 EFI_IP6_PROTOCOL.Groups()

Summary

Joins and leaves multicast groups.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP6_GROUPS) (
  IN EFI_IP6_PROTOCOL      *This,
  IN BOOLEAN               JoinFlag,
  IN EFI_IPv6_ADDRESS      *GroupAddress OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_IP6_PROTOCOL* instance.

JoinFlag
Set to **TRUE** to join the multicast group session and **FALSE** to leave.

GroupAddress
Pointer to the IPv6 multicast address.

Description

The *Groups()* function is used to join and leave multicast group sessions. Joining a group will enable reception of matching multicast packets. Leaving a group will disable reception of matching multicast packets. Source-Specific Multicast isn't required to be supported.

If *JoinFlag* is **FALSE** and *GroupAddress* is **NULL,** all joined groups will be left.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	One or more of the following is **TRUE:** *This* is **NULL**. *JoinFlag* is **TRUE** and *GroupAddress* is **NULL** *GroupAddress* is not **NULL** and * *GroupAddress* is not a multicast IPv6 address. *GroupAddress* is not **NULL** and * *GroupAddress* is in the range of SSM destination address.
EFI_NOT_STARTED	This instance has not been started.
EFI_OUT_OF_RESOURCES	System resources could not be allocated.
EFI_UNSUPPORTED	This EFI IPv6 Protocol implementation does not support multicast groups.
EFI_ALREADY_STARTED	The group address is already in the group table (when *JoinFlag* is **TRUE**).
EFI_NOT_FOUND	The group address is not in the group table (when *JoinFlag* is **FALSE**).
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

28.6.8 EFI_IP6_PROTOCOL.Routes()

Summary

Adds and deletes routing table entries.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP6_ROUTES) (
  IN EFI_IP6_PROTOCOL         *This,
  IN BOOLEAN                  DeleteRoute,
  IN EFI_IPv6_ADDRESS         *Destination OPTIONAL,
  IN UINT8                    PrefixLength,
  IN EFI_IPv6_ADDRESS         *GatewayAddress OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_IP6_PROTOCOL* instance.

DeleteRoute
Set to **TRUE** to delete this route from the routing table. Set to **FALSE** to add this route to the routing table. *Destination, PrefixLength* and *Gateway* are used as the key to each route entry.

Destination
The address prefix of the subnet that needs to be routed.

PrefixLength
The prefix length of *Destination*. Ignored if Destination is **NULL**.

GatewayAddress
The unicast gateway IPv6 address for this route.

Description

The *Routes()* function adds a route to or deletes a route from the routing table.

Routes are determined by comparing the leftmost *PrefixLength* bits of *Destination* with the destination IPv6 address arithmetically. The gateway address must be on the same subnet as the configured station address.

The default route is added with *Destination* and *PrefixLegth* both set to all zeros. The default route matches all destination IPv6 addresses that do not match any other routes.

All EFI IPv6 Protocol instances share a routing table.

NOTE: *There is no way to set up routes to other network interface cards because each network interface card has its own independent network stack that shares information only through the EFI IPv6 variable.*

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_NOT_STARTED	The driver instance has not been started.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE:** *This* is **NULL**. When *DeleteRoute* is **TRUE**, both *Destination* and *GatewayAddress* are **NULL** When *DeleteRoute* is **FALSE,** either *Destination* or *GatewayAddress* is **NULL** * *GatewayAddress* is not a valid unicast IPv6 address. * *GatewayAddress* is one of the local configured IPv6 addresses.
EFI_OUT_OF_RESOURCES	Could not add the entry to the routing table.
EFI_NOT_FOUND	This route is not in the routing table (when *DeleteRoute* is **TRUE**).
EFI_ACCESS_DENIED	The route is already defined in the routing table (when *DeleteRoute* is **FALSE**).

28.6.9 EFI_IP6_PROTOCOL.Neighbors()

Summary

Add or delete Neighbor cache entries.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP6_NEIGHBORS) (
  IN EFI_IP6_PROTOCOL            *This,
  IN BOOLEAN                     DeleteFlag,
  IN EFI_IPv6_ADDRESS            *TargetIp6Address,
  IN EFI_MAC_ADDRESS             *TargetLinkAddress OPTIONAL
  IN UINT32                      Timeout,
```

(continues on next page)

(continued from previous page)

```
  IN BOOLEAN                    Override
  );
```

Parameters

This
Pointer to the *EFI_IP6_PROTOCOL* instance.

DeleteFlag
Set to **TRUE** to delete the specified cache entry, set to **FALSE** to add (or update, if it already exists and *Override* is **TRUE**) the specified cache entry. *TargetIp6Address* is used as the key to find the requested cache entry.

TargetIp6Address
Pointer to Target IPv6 address.

TargetLinkAddress
Pointer to link-layer address of the target. Ignored if **NULL**.

Timeout
Time in 100-ns units that this entry will remain in the neighbor cache, it will be deleted after Timeout. A value of zero means that the entry is permanent. A non-zero value means that the entry is dynamic.

Override
If *TRUE,* the cached link-layer address of the matching entry will be overridden and updated; if *FALSE, EFI_ACCESS_DENIED* will be returned if a corresponding cache entry already existed.

Description

The *Neighbors()* function is used to add, update, or delete an entry from neighbor cache.

IPv6 neighbor cache entries are typically inserted and updated by the network protocol driver as network traffic is processed. Most neighbor cache entries will time out and be deleted if the network traffic stops. Neighbor cache entries that were inserted by *Neighbors()* may be static (will not timeout) or dynamic (will time out).

The implementation should follow the neighbor cache timeout mechanism which is defined in RFC4861. The default neighbor cache timeout value should be tuned for the expected network environment.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_NOT_STARTED	The driver instance has not been started.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE:** This is **NULL**. *TargetIpAddress* is **NULL**. * *TargetLinkAddress* is invalid when not **NULL.** * *TargetIpAddress* is not a valid unicast IPv6 address. * *TargetIpAddress* is one of the local configured IPv6 addresses.
EFI_OUT_OF_RESOURCES	Could not add the entry to the neighbor cache.
EFI_NOT_FOUND	This entry is not in the neighbor cache (when *DeleteFlag* is **TRUE** or when *DeleteFlag* is **FALSE** while *TargetLinkAddress* is **NULL.**).
EFI_ACCESS_DENIED	The to-be-added entry is already defined in the neighbor cache, and that entry is tagged as un-overridden (when *DeleteFlag* is **FALSE**).

28.6.10 EFI_IP6_PROTOCOL.Transmit()

Summary

Places outgoing data packets into the transmit queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP6_TRANSMIT) (
  IN EFI_IP6_PROTOCOL            *This,
  IN EFI_IP6_COMPLETION_TOKEN    *Token
  );
```

Parameters

This

Pointer to the *EFI_IP6_PROTOCOL* instance.

Token

Pointer to the transmit token. Type *EFI_IP6_COMPLETION_TOKEN* is defined in “Related Definitions” below.

Description

The *Transmit( )* function places a sending request in the transmit queue of this EFI IPv6 Protocol instance. Whenever the packet in the token is sent out or some errors occur, the event in the token will be signaled and the status is updated.

Related Definition

```
//****************************************
// EFI_IP6_COMPLETION_TOKEN
//****************************************
typedef struct {
  EFI_EVENT                   Event;
  EFI_STATUS                  Status;
  union {
    EFI_IP6_RECEIVE_DATA      *RxData;
    EFI_IP6_TRANSMIT_DATA     *TxData;
  }             Packet;
} EFI_IP6_COMPLETION_TOKEN;
```

Event

This *Event* will be signaled after the Status field is updated by the EFI IPv6 Protocol driver. The type of *Event* must be *EFI_NOTIFY_SIGNAL*.

Status

Will be set to one of the following values:

EFI_SUCCESS: The receive or transmit completed successfully.

EFI_ABORTED: The receive or transmit was aborted.

EFI_TIMEOUT: The transmit timeout expired.

EFI_ICMP_ERROR: An ICMP error packet was received.

EFI_DEVICE_ERROR: An unexpected system or network error occurred.

EFI_SECURITY_VIOLATION: The transmit or receive was failed because of an IPsec policy check.

RxData

When the Token is used for receiving, *RxData* is a pointer to the *EFI_IP6_RECEIVE_DATA*. Type *EFI_IP6_RECEIVE_DATA* is defined below.

TxData

When the Token is used for transmitting, *TxData* is a pointer to the *EFI_IP6_TRANSMIT_DATA*. Type *EFI_IP6_TRANSMIT_DATA* is defined below.

EFI_IP6_COMPLETION_TOKEN structures are used for both transmit and receive operations.

When the structure is used for transmitting, the *Event* and *TxData* fields must be filled in by the EFI IPv6 Protocol client. After the transmit operation completes, the EFI IPv6 Protocol driver updates the *Status* field and the *Event* is signaled.

When the structure is used for receiving, only the *Event* field must be filled in by the EFI IPv6 Protocol client. After a packet is received, the EFI IPv6 Protocol driver fills in the RxData and *Status* fields and the Event is signaled

```
//********************************************
// EFI_IP6_RECEIVE_DATA
//********************************************
typedef struct _EFI_IP6_RECEIVE_DATA {
  EFI_TIME                TimeStamp;
  EFI_EVENT               RecycleSignal;
  UINT32                  HeaderLength;
  EFI_IP6_HEADER          *Header;
  UINT32                  DataLength;
  UINT32                  FragmentCount;
  EFI_IP6_FRAGMENT_DATA   FragmentTable[1];
}  EFI_IP6_RECEIVE_DATA;
```

TimeStamp

Time when the EFI IPv6 Protocol driver accepted the packet. *TimeStamp is zero filled if timestamps are disabled or unsupported.*

RecycleSignal

After this event is signaled, the receive data structure is released and must not be referenced.

HeaderLength

Length of the IPv6 packet headers, including both the IPv6 header and any extension headers.

Header

Pointer to the IPv6 packet header. If the IPv6 packet was fragmented, this argument is a pointer to the header in the first fragment. Type *EFI_IP6_HEADER* is defined below.

DataLength

Sum of the lengths of IPv6 packet buffers in FragmentTable. May be zero.

FragmentCount

Number of IPv6 payload fragments. May be zero.

FragmentTable
Array of payload fragment lengths and buffer pointers. Type *EFI_IP6_FRAGMENT_DATA* is defined below.

The EFI IPv6 Protocol receive data structure is filled in when IPv6 packets have been assembled. In the case of IPv6 packet assembly, the individual packet fragments are only verified and are not reorganized into a single linear buffer.

The *FragmentTable* contains a sorted list of zero or more packet fragment descriptors. The referenced packet fragments may not be in contiguous memory locations.

```
//******************************************
// EFI_IP6_HEADER
//******************************************
#pragma pack(1)
typedef struct _EFI_IP6_HEADER {
  UINT8               TrafficClassH:4;
  UINT8               Version:4;
  UINT8               FlowLabelH:4;
  UINT8               TrafficClassL:4;
  UINT16              FlowLabelL;
  UINT16              PayloadLength;
  UINT8               NextHeader;
  UINT8               HopLimit;
  EFI_IPv6_ADDRESS    SourceAddress;
  EFI_IPv6_ADDRESS    DestinationAddress;
} EFI_IP6_HEADER;
#pragma pack
```

The fields in the IPv6 header structure are defined in the Internet Protocol version6 specification, which can be found at “Links to UEFI-Related Documents” (*http://uefi.org/uefi)* under the heading “Internet Protocol version 6 Specification”.

```
//************************************************
// EFI_IP6_FRAGMENT_DATA
//************************************************
typedef struct _EFI_IP6_FRAGMENT_DATA {
  UINT32                  FragmentLength;
  VOID                    *FragmentBuffer;
}   EFI_IP6_FRAGMENT_DATA;
```

FragmentLength
Length of fragment data. This field may not be set to zero.

FragmentBuffer
Pointer to fragment data. This field may not be set to **NULL**.

The *EFI_IP6_FRAGMENT_DATA* structure describes the location and length of the IPv6 packet fragment to transmit or that has been received.

```
//***********************************************
// EFI_IP6_TRANSMIT_DATA
//***********************************************
typedef struct _EFI_IP6_TRANSMIT_DATA {
  EFI_IPv6_ADDRESS           DestinationAddress;
  EFI_IP6_OVERRIDE_DATA      *OverrideData;
  UINT32                     ExtHdrsLength;
  VOID                       *ExtHdrs;
```

(continues on next page)

(continued from previous page)

```
  UINT8                       NextHeader;
  UINT32                      DataLength;
  UINT32                      FragmentCount
  EFI_IP6_FRAGMENT_DATA       FragmentTable[1];
}   EFI_IP6_TRANSMIT_DATA;
```

DestinationAddress
The destination IPv6 address. If it is unspecified, *ConfigData.DestinationAddress* will be used instead.

OverrideData
If not *NULL,* the IPv6 transmission control override data. Type *EFI_IP6_OVERRIDE_DATA* is defined below.

ExtHdrsLength
Total length in byte of the IPv6 extension headers specified in *ExtHdrs*

ExtHdrs
Pointer to the IPv6 extension headers. The IP layer will append the required extension headers if they are not specified by ExtHdrs. Ignored if *ExtHdrsLength* is zero.

NextHeader
The protocol of first extension header in *ExtHdrs*. Ignored if *ExtHdrsLength* is zero.

DataLength
Total length in bytes of the *FragmentTable* data to transmit.

FragmentCount
Number of entries in the fragment data table.

FragmentTable
Start of the fragment data table. Type *EFI_IP6_FRAGMENT_DATA* is defined above.

The *EFI_IP6_TRANSMIT_DATA* structure describes a possibly fragmented packet to be transmitted.

```
//**********************************************
// EFI_IP6_OVERRIDE_DATA
//**********************************************
typedef struct _EFI_IP6_OVERRIDE_DATA {
  UINT8        Protocol;
  UINT8        HopLimit;
  UINT32       FlowLabel;
}   EFI_IP6_OVERRIDE_DATA;
```

Protocol
Protocol type override.

HopLimit
Hop-Limit override.

FlowLabel
Flow-Label override.

The information and flags in the override data structure will override default parameters or settings for one *Transmit()* function call.

Status Codes Returned

EFI_SUCCESS	The data has been queued for transmission.

continues on next page

Table 28.40 – continued from previous page

EFI_NOT_STARTED	This instance has not been started.
EFI_NO_MAPPING	The IPv6 driver was responsible for choosing a source address for this transmission, but no source address was available for use.
EFI_INVALID_PARAMETER	One or more of the following is **TRUE:** • *This* is **NULL**. • *Token* is **NULL**. • *Token.Event* is **NULL** • *Token.Packet.TxData* is **NULL**. • *Token.Packet.ExtHdrsLength* is not zero and *Token.Packet.ExtHdrs* is **NULL**. • *Token.Packet.FragmentCount* is zero. • One or more of the *Token.Packet.TxDat FragmentTable[].FragmentLength* fields is zero. • One or more of the *Token.Packet.TxDat FragmentTable[].FragmentBuffer* fields is **NULL**. • *Token.Packet.TxData.DataLength* is zero or not equal to the sum of fragment lengths. • *Token.Packet.TxData.DestinationAddress* is non-zero when *DestinationAddress* is configured as non-zero when doing *Configure()* for this EFI IPv6 protocol instance. • *Token. Packet.TxData.DestinationAddress* is unspecified when *DestinationAddress* is unspecified when doing *Configure()* for this EFI IPv6 protocol instance.
EFI_ACCESS_DENIED	The transmit completion token with the same *Token.Event* was already in the transmit queue.
EFI_NOT_READY	The completion token could not be queued because the transmit queue is full.
EFI_NOT_FOUND	No route was found to destination address.
EFI_OUT_OF_RESOURCES	Could not queue the transmit data.
EFI_BUFFER_TOO_SMALL	*Token.Packet.TxData.DataLength* is too short to transmit.
EFI_BAD_BUFFER_SIZE	If *Token.Packet.TxData.DataLength* is beyond the maximum that which can be described through the Fragment Offset field in Fragment header when performing fragmentation.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_NO_MEDIA	There was a media error.

28.6.11 EFI_IP6_PROTOCOL.Receive()

Summary

Places a receiving request into the receiving queue.

Prototype

```
typedef
  EFI_STATUS
  (EFIAPI *EFI_IP6_RECEIVE) (
    IN EFI_IP6_PROTOCOL            *This,
```

(continues on next page)

(continued from previous page)

```
    IN EFI_IP6_COMPLETION_TOKEN    *Token
    );
```

Parameters

This

Pointer to the *EFI_IP6_PROTOCOL* instance.

Token

Pointer to a token that is associated with the receive data descriptor. Type *EFI_IP6_COMPLETION_TOKEN* is defined in "Related Definitions" of above *Transmit()*.

Description

The *Receive()* function places a completion token into the receive packet queue. This function is always asynchronous.

The *Token.Event* field in the completion token must be filled in by the caller and cannot be **NULL**. When the receive operation completes, the EFI IPv6 Protocol driver updates the *Token.Status* and *Token.Packet.RxData* fields and the *Token.Event* is signaled.

Status Codes Returned

EFI_SUCCESS	The receive completion token was cached.
EFI_NOT_STARTED	This EFI IPv6 Protocol instance has not been started.
EFI_NO_MAPPING	When IP6 driver responsible for binding source address to this instance, while no source address is available for use.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE:** *This* is **NULL**. *Token* is **NULL**. *Token.Event* is **NULL**.
EFI_OUT_OF_RESOURCES	The receive completion token could not be queued due to a lack of system resources (usually memory).
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI IPv6 Protocol instance has been reset to startup defaults.
EFI_ACCESS_DENIED	The receive completion token with the same *Token.Event* was already in the receive queue.
EFI_NOT_READY	The receive request could not be queued because the receive queue is full.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_NO_MEDIA	There was a media error.

28.6.12 EFI_IP6_PROTOCOL.Cancel()

Summary

Abort an asynchronous transmits or receive request.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP6_CANCEL)(
  IN EFI_IP6_PROTOCOL            *This,
```

(continues on next page)

(continued from previous page)

```
  IN EFI_IP6_COMPLETION_TOKEN    *Token OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_IP6_PROTOCOL* instance.

Token

Pointer to a token that has been issued by *EFI_IP6_PROTOCOL.Transmit()* or *EFI_IP6_PROTOCOL.Receive()*. If *NULL,* all pending tokens are aborted. Type *EFI_IP6_COMPLETION_TOKEN* is defined in *EFI_IP6_PROTOCOL.Transmit()*.

Description

The *Cancel()* function is used to abort a pending transmit or receive request. If the token is in the transmit or receive request queues, after calling this function, Token->Status will be set to *EFI_ABORTED* and then Token->Event will be signaled. If the token is not in one of the queues, which usually means the asynchronous operation has completed, this function will not signal the token and *EFI_NOT_FOUND* is returned.

Status Codes Returned

EFI_SUCCESS	The asynchronous I/O request was aborted and *Token->Event* was signaled. When *Token* is *NULL,* all pending requests were aborted and their events were signaled.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NOT_STARTED	This instance has not been started.
EFI_NOT_FOUND	When *Token* is not **NULL**, the asynchronous I/O request was not found in the transmit or receive queue. It has either completed or was not issued by *Transmit()* and *Receive()*.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

28.6.13 EFI_IP6_PROTOCOL.Poll()

Summary

Polls for incoming data packets and processes outgoing data packets.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP6_POLL) (
  IN EFI_IP6_PROTOCOL      *This
  );
```

Description

The *Poll()* function polls for incoming data packets and processes outgoing data packets. Network drivers and applications can call the *EFI_IP6_PROTOCOL.Poll()* function to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems the periodic timer event may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the *EFI_IP6_PROTOCOL.Poll()* function more often.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_NOT_STARTED	This EFI IPv6 Protocol instance has not been started.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_NOT_READY	No incoming or outgoing data is processed.
EFI_TIMEOUT	Data was dropped out of the transmit and/or receive queue. Consider increasing the polling rate.

28.7 EFI IPv6 Configuration Protocol

This section provides a detailed description of the EFI IPv6 Configuration Protocol.

28.7.1 EFI_IP6_CONFIG_PROTOCOL

Summary

The *EFI_IP6_CONFIG_PROTOCOL* provides the mechanism to set and get various types of configurations for the EFI IPv6 network stack.

GUID

```
#define EFI_IP6_CONFIG_PROTOCOL_GUID \
  {0x937fe521,0x95ae,0x4d1a,\
    {0x89,0x29,0x48,0xbc,0xd9,0x0a,0xd3,0x1a}
```

Protocol Interface Structure

```
typedef struct _EFI_IP6_CONFIG_PROTOCOL {
  EFI_IP6_CONFIG_SET_DATA           SetData;
  EFI_IP6_CONFIG_GET_DATA           GetData;
  EFI_IP6_CONFIG_REGISTER_NOTIF     RegisterDataNotify;
  EFI_IP6_CONFIG_UNREGISTER_NOTIFY  UnregisterDataNotify;
}   EFI_IP6_CONFIG_PROTOCOL;
```

Parameters

SetData
Set the configuration for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages. See the *SetData()* function description.

GetData
Get the configuration or register an event to monitor the change of the configuration for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages. See the *GetData()* function description.

RegiseterDataNotify
Register an event that is to be signaled whenever a configuration process on the specified configuration data is done.

UnregisterDataNotify
Remove a previously registered event for the specified configuration data.

Description

The *EFI_IP6_CONFIG_PROTOCOL* is designed to be the central repository for the common configurations and the administrator configurable settings for the EFI IPv6 network stack.

An EFI IPv6 Configuration Protocol instance will be installed on each communication device that the EFI IPv6 network stack runs on.

28.7.2 EFI_IP6_CONFIG_PROTOCOL.SetData()

Summary

Set the configuration for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP6_CONFIG_SET_DATA) (
  IN EFI_IP6_CONFIG_PROTOCOL        *This,
  IN EFI_IP6_CONFIG_DATA_TYPE       DataType,
  IN UINTN                          DataSize,
  IN VOID                           *Data
  );
```

Parameters

This
Pointer to the *EFI_IP6_CONFIG_PROTOCOL* instance.

DataType
The type of data to set. Type *EFI_IP6_CONFIG_DATA_TYPE* is defined in "Related Definitions" below.

DataSize
Size of the buffer pointed to by *Data* in bytes.

Data
The data buffer to set. The type of the data buffer is associated with the *DataType*. The various types are defined in "Related Definitions" below.

Description

This function is used to set the configuration data of type DataType for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages.

The *DataSize* is used to calculate the count of structure instances in the Data for some *DataType* that multiple structure instances are allowed.

This function is always non-blocking. When setting some type of configuration data, an asynchronous process is invoked to check the correctness of the data, such as doing Duplicate Address Detection on the manually set local IPv6 addresses. *EFI_NOT_READY* is returned immediately to indicate that such an asynchronous process is invoked and the process is not finished yet. The caller willing to get the result of the asynchronous process is required to call *RegisterDataNotify()* to register an event on the specified configuration data. Once the event is signaled, the caller can call *GetData()* to get back the configuration data in order to know the result. For other types of configuration data that do not require an asynchronous configuration process, the result of the operation is immediately returned.

Related Definition

```
//*******************************************************
// EFI_IP6_CONFIG_DATA_TYPE
//*******************************************************
typedef enum {
  Ip6ConfigDataTypeInterfaceInfo,
  Ip6ConfigDataTypeAltInterfaceId,
  Ip6ConfigDataTypePolicy,
  Ip6ConfigDataTypeDupAddrDetectTransmits,
  Ip6ConfigDataTypeManualAddress,
  Ip6ConfigDataTypeGateway,
  Ip6ConfigDataTypeDnsServer,
  Ip6ConfigDataTypeMaximum
}   EFI_IP6_CONFIG_DATA_TYPE;
```

Ip6ConfigDataTypeInterfaceInfo
The interface information of the communication device this EFI IPv6 Configuration Protocol instance manages. This type of data is read only. The corresponding *Data* is of type *EFI_IP6_CONFIG_INTERFACE_INFO*.

Ip6ConfigDataTypeAltInterfaceId
The alternative interface ID for the communication device this EFI IPv6 Configuration Protocol instance manages if the link local IPv6 address generated from the interfaced ID based on the default source the EFI IPv6 Protocol uses is a duplicate address. The length of the interface ID is 64 bit. The corresponding *Data* is of type *EFI_IP6_CONFIG_INTERFACE_ID*.

Ip6ConfigDataTypePolicy
The general configuration policy for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages. The policy will affect other configuration settings. The corresponding *Data* is of type *EFI_IP6_CONFIG_POLICY*.

Ip6ConfigDataTypeDupAddrDetectTransmits
The number of consecutive Neighbor Solicitation messages sent while performing Duplicate Address Detection on a tentative address. A value of zero indicates that Duplicate Address Detection will not be performed on tentative addresses. The corresponding *Data* is of type *EFI_IP6_CONFIG_DUP_ADDR_DETECT_TRANSMITS*.

Ip6ConfigDataTypeManualAddress
The station addresses set manually for the EFI IPv6 network stack. It is only configurable when the policy is *Ip6ConfigPolicyManual*. The corresponding Data is a pointer to an array of *EFI_IPv6_ADDRESS* instances. When *DataSize* is 0 and *Data* is *NULL,* the existing configuration is cleared from the EFI IPv6 Configuration Protocol instance.

Ip6ConfigDataTypeGateway
The gateway addresses set manually for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol manages. It is not configurable when the policy is *Ip6ConfigPolicyAutomatic*. The gateway addresses must be unicast IPv6 addresses. The corresponding Data is a pointer to an array of *EFI_IPv6_ADDRESS* instances. When *DataSize* is 0 and *Data* is *NULL,* the existing configuration is cleared from the EFI IPv6 Configuration Protocol instance.

Ip6ConfigDataTypeDnsServer
The DNS server list for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol manages. It is not configurable when the policy is *Ip6ConfigPolicyAutomatic*.The DNS server addresses must be unicast IPv6 addresses. The corresponding Data is a pointer to an array of *EFI_IPv6_ADDRESS* instances. When *DataSize* is 0 and *Data* is *NULL,* the existing configuration is cleared from the EFI IPv6 Configuration Protocol instance.

```
//*******************************************************
// EFI_IP6_CONFIG_INTERFACE_INFO
```

(continues on next page)

(continued from previous page)

```
//*******************************************************
typedef struct {
  CHAR16                Name[32];
  UINT8                 IfType;
  UINT32                HwAddressSize;
  EFI_MAC_ADDRESS       HwAddress;
  UINT32                AddressInfoCount;
  EFI_IP6_ADDRESS_INFO  *AddressInfo;
  UINT32                RouteCount;
  EFI_IP6_ROUTE_TABLE   *RouteTable;
}   EFI_IP6_CONFIG_INTERFACE_INFO;
```

Name
The name of the interface. It is a NULL-terminated string.

IfType
The interface type of the network interface. See RFC 3232, section "Number Hardware Type".

HwAddressSize
The size, in bytes, of the network interface's hardware address.

HwAddress
The hardware address for the network interface.

AddressInfoCount
Number of *EFI_IP6_ADDRESS_INFO* structures pointed to by AddressInfo.

AddressInfo
Pointer to an array of *EFI_IP6_ADDRESS_INFO* instances which contain the local IPv6 addresses and the corresponding prefix length information. Set to **NULL** if *AddressInfoCount* is zero. Type *EFI_IP6_ADDRESS_INFO* is defined in *EFI_IP6_PROTOCOL.GetModeData()*.

RouteCount
Number of route table entries in the following *RouteTable*.

RouteTable
The route table of the IPv6 network stack runs on this interface. Set to **NULL** if *RouteCount* is zero. Type *EFI_IP6_ROUTE_TABLE* is defined in *EFI_IP6_PROTOCOL.GetModeData()*.

The EFI_IP6_CONFIG_INTERFACE_INFO structure describes the operational state of the interface this EFI IPv6 Configuration Protocol instance manages. This type of data is read-only. When reading, the caller allocated buffer is used to return all of the data, i.e., the first part of the buffer is EFI_IP6_CONFIG_INTERFACE_INFO and the followings are the array of EFI_IP6_ADDRESS_INFO and the route table if present. The caller should NOT free the buffer pointed to by AddressInfo or RouteTable, and the caller is only required to free the whole buffer if the data is not needed any more.

```
//****************************************************
// EFI_IP6_CONFIG_INTERFACE_ID
//****************************************************
typedef struct {
  UINT8           Id[8];
}   EFI_IP6_CONFIG_INTERFACE_ID;
```

The *EFI_IP6_CONFIG_INTERFACE_ID* structure describes the 64-bit interface ID.

```
//****************************************************
// EFI_IP6_CONFIG_POLICY
//****************************************************
typedef enum {
  Ip6ConfigPolicyManual,
  Ip6ConfigPolicyAutomatic
}   EFI_IP6_CONFIG_POLICY;
```

Ip6ConfigPolicyManual

Under this policy, the *IpI6ConfigDataTypeManualAddress, Ip6ConfigDataTypeGateway* and *Ip6ConfigDataTypeDnsServer* configuration data are required to be set manually. The EFI IPv6 Protocol will get all required configuration such as address, prefix and gateway settings from the EFI IPv6 Configuration protocol.

Ip6ConfigPolicyAutomatic

Under this policy, the *IpI6ConfigDataTypeManualAddress, Ip6ConfigDataTypeGateway* and *Ip6ConfigDataTypeDnsServer* configuration data are not allowed to set via *SetData()*. All of these configurations are retrieved from some auto configuration mechanism. The EFI IPv6 Protocol will use the IPv6 stateless address autoconfiguration mechanism and/or the IPv6 stateful address autoconfiguration mechanism described in the related RFCs to get address and other configuration information.

The *EFI_IP6_CONFIG_POLICY* defines the general configuration policy the EFI IPv6 Configuration Protocol supports. The default policy for a newly detected communication device is beyond the scope of this document. An implementation might leave it to platform to choose the default policy.

The configuration data of type *IpI6ConfigDataTypeManualAddress, Ip6ConfigDataTypeGateway* and *Ip6ConfigDataTypeDnsServer* will be flushed if the policy is changed from *Ip6ConfigPolicyManual* to *Ip6ConfigPolicyAutomatic*.

```
//*******************************************************
// EFI_IP6_CONFIG_DUP_ADDR_DETECT_TRANSMITS
//*******************************************************
typedef struct {
  UINT32             DupAddrDetectTransmits;
}   EFI_IP6_CONFIG_DUP_ADDR_DETECT_TRANSMITS;
```

The *EFI_IP6_CONFIG_DUP_ADDR_DETECT_TRANSMITS* structure describes the number of consecutive Neighbor Solicitation messages sent while performing Duplicate Address Detection on a tentative address. The default value for a newly detected communication device is 1.

```
//*******************************************************
// EFI_IP6_CONFIG_MANUAL_ADDRESS
//*******************************************************
typedef struct {
  EFI_IPv6_ADDRESS      Address;
  BOOLEAN               IsAnycast;
  UINT8                 PrefixLength;
}   EFI_IP6_CONFIG_MANUAL_ADDRESS;
```

Address

The IPv6 unicast address.

IsAnycast

Set to **TRUE** if *Address* is anycast.

PrefixLength

The length, in bits, of the prefix associated with this *Address*.

The EFI_IP6_CONFIG_MANUAL_ADDRESS structure is used to set the station address information for the EFI IPv6 network stack manually when the policy is Ip6ConfigPolicyManual.

Status Codes Returned

EFI_SUCCESS	The specified configuration data for the EFI IPv6 network stack is set successfully.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE:** • *This* is **NULL**. • One or more fields in *Data* and *DataSize* do not match the requirement of the data type indicated by *DataType*.
EFI_WRITE_PROTECTED	The specified configuration data is read-only or the specified configuration data can not be set under the current policy.
EFI_ACCESS_DENIED	Another set operation on the specified configuration data is already in process.
EFI_NOT_READY	An asynchronous process is invoked to set the specified configuration data and the process is not finished yet.
EFI_BAD_BUFFER_SIZE	The *DataSize* does not match the size of the type indicated by *DataType*.
EFI_UNSUPPORTED	This *DataType* is not supported.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_DEVICE_ERROR	An unexpected system error or network error occurred.

28.7.3 EFI_IP6_CONFIG_PROTOCOL.GetData()

Summary

Get the configuration data for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP6_CONFIG_GET_DATA) (
  IN EFI_IP6_CONFIG_PROTOCOL        *This,
  IN EFI_IP6_CONFIG_DATA_TYPE       DataType,
  IN OUT UINTN                      *DataSize,
  IN VOID                           *Data OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_IP6_CONFIG_PROTOCOL* instance.

DataType

The type of data to get. Type *EFI_IP6_CONFIG_DATA_TYPE* is defined in *EFI_IP6_CONFIG_PROTOCOL.SetData()*.

DataSize

On input, in bytes, the size of *Data*. On output, in bytes, the size of buffer required to store the specified configuration data.

Data

The data buffer in which the configuration data is returned. The type of the data buffer is associated with the *DataType*. Ignored if *DataSize* is 0. The various types are defined in *EFI_IP6_CONFIG_PROTOCOL.SetData()*.

Description

This function returns the configuration data of type *DataType* for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages.

The caller is responsible for allocating the buffer used to return the specified configuration data and the required size will be returned to the caller if the size of the buffer is too small.

EFI_NOT_READY is returned if the specified configuration data is not ready due to an already in progress asynchronous configuration process. The caller can call *RegisterDataNotify()* to register an event on the specified configuration data. Once the asynchronous configuration process is finished, the event will be signaled and a subsequent *GetData()* call will return the specified configuration data.

Status Codes Returned

EFI_SUCCESS	The specified configuration data is got successfully.
EFI_INVALID_PARAMETER	One or more of the followings are **TRUE:** • *This* is **NULL**. • *DataSize* is **NULL**. • *Data* is **NULL** if * *DataSize* is not zero.
EFI_BUFFER_TOO_SMALL	The size of Data is too small for the specified configuration data and the required size is returned in *DataSize*.
EFI_NOT_READY	The specified configuration data is not ready due to an already in progress asynchronous configuration process.
EFI_NOT_FOUND	The specified configuration data is not found.

28.7.4 EFI_IP6_CONFIG_PROTOCOL.RegisterDataNotify ()

Summary

Register an event that is to be signaled whenever a configuration process on the specified configuration data is done.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP6_CONFIG_REGISTER_NOTIFY) (
  IN EFI_IP6_CONFIG_PROTOCOL       *This,
  IN EFI_IP6_CONFIG_DATA_TYPE      DataType,
  IN EFI_EVENT                     Event
  );
```

Parameters

This

Pointer to the *EFI_IP6_CONFIG_PROTOCOL* instance.

DataType

The type of data to unregister the event for. Type *EFI_IP6_CONFIG_DATA_TYPE* is defined in *EFI_IP6_CONFIG_PROTOCOL.SetData()*.

Event

The event to register.

Description

This function registers an event that is to be signaled whenever a configuration process on the specified configuration data is done. An event can be registered for different DataType simultaneously and the caller is responsible for determining which type of configuration data causes the signaling of the event in such case.

Status Codes Returned

EFI_SUCCESS	The notification event for the specified configuration data is registered.
EFI_INVALID_PARAMETER	This is **NULL** or Event is **NULL**.
EFI_UNSUPPORTED	The configuration data type specified by DataType is not supported.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_ACCESS_DENIED	The Event is already registered for the DataType.

28.7.5 EFI_IP6_CONFIG_PROTOCOL.UnregisterDataNotify()

Summary

Remove a previously registered event for the specified configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IP6_CONFIG_UNREGISTER_NOTIFY) (
  IN EFI_IP6_CONFIG_PROTOCOL            *This,
  IN EFI_IP6_CONFIG_DATA_TYPE           DataType,
  IN EFI_EVENT                          Event
  );
```

Parameters

This

Pointer to the EFI_IP6_CONFIG_PROTOCOL instance.

DataType

The type of data to remove the previously registered event for. Type *EFI_IP6_CONFIG_DATA_TYPE* is defined in *EFI_IP6_CONFIG_PROTOCOL.SetD* ata().

Event

The event to unregister.

Description

This function removes a previously registered event for the specified configuration data.

Status Codes Returned

EFI_SUCCESS	The event registered for the specified configuration data is removed.
EFI_INVALID_PARAMETER	This is **NULL** or Event is **NULL**
EFI_NOT_FOUND	The event has not been registered for the specified DataType.

28.8 IPsec

28.8.1 IPsec Overview

IPsec is a framework of open standards that provides data confidentiality, data integrity, data authentication and replay protection between participating peers. A set of security services is provided by IPsec for traffic at the IP layer, in both the IPv4 and IPv6 environment. To the stronger, IPV6 requires IPSec support.

IPsec is documented in a series of Internet RFCs. The overall IPsec architecture and implementation are guided by "Security Architecture for the Internet Protocol", RFC 4301.

Two different security protocols - Authentication Header (AH, described in RFC 4302) and Encapsulated Security Payload (ESP, described in RFC 4303) - are used to provide package-level security for IP datagram.

This section attempts to capture the generic configuration for an IPsec implementation in an EFI environment.

28.8.2 EFI IPsec Configuration Protocol

This section provides a detailed description of the EFI IPsec Configuration Protocol. This protocol sets and obtains the IPsec configuration information.

28.8.3 EFI_IPSEC_CONFIG_PROTOCOL

Summary

The *EFI_IPSEC_CONFIG_PROTOCOL* provides the mechanism to set and retrieve security and policy related information for the EFI IPsec protocol driver.

GUID

```
#define EFI_IPSEC_CONFIG_PROTOCOL_GUID \
  {0xce5e5929,0xc7a3,0x4602,\
    {0xad,0x9e,0xc9,0xda,0xf9,0x4e,0xbf,0xcf}}
```

Protocol Interface Structure

```
typedef struct _EFI_IPSEC_CONFIG_PROTOCOL {
  EFI_IPSEC_CONFIG_SET_DATA               SetData;
  EFI_IPSEC_CONFIG_GET_DATA               GetData;
  EFI_IPSEC_CONFIG_GET_NEXT_SELECTOR      GetNextSelector;
  EFI_IPSEC_CONFIG_REGISTER_NOTIFY        RegisterDataNotify;
  EFI_IPSEC_CONFIG_UNREGISTER_NOTIFY      UnregisterDataNotify;
}   EFI_IPSEC_CONFIG_PROTOCOL;
```

Parameters

SetData
Set the configuration and control information for the EFI IPsec protocol driver. See the *SetData()* function description.

GetData
Look up and retrieve the IPsec configuration data. See the *GetData()* function description.

GetNextSelector
Enumerates the current IPsec configuration data entry selector. See the *GetNextSelector()* function description.

RegiseterNotify
Register an event that is to be signaled whenever a configuration process on the specified IPsec configuration data is done.

UnregisterNotify
Remove a registered event for the specified IPsec configuration data.

Description

The *EFI_IPSEC_CONFIG_PROTOCOL* provides the ability to set and lookup the IPsec SAD (Security Association Database), SPD (Security Policy Database) data entry and configure the security association management protocol such as IKEv2. This protocol is used as the central repository of any policy-specific configuration for EFI IPsec driver.

EFI_IPSEC_CONFIG_PROTOCOL can be bound to both IPv4 and IPv6 stack. User can use this protocol for IPsec configuration in both IPv4 and IPv6 environment.

28.8.4 EFI_IPSEC_CONFIG_PROTOCOL.SetData()

Summary

Set the security association, security policy and peer authorization configuration information for the EFI IPsec driver.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IPSEC_CONFIG_SET_DATA) (
  IN EFI_IPSEC_CONFIG_PROTOCOL         *This,
  IN EFI_IPSEC_CONFIG_DATA_TYPE        DataType,
  IN EFI_IPSEC_CONFIG_SELECTOR         *Selector
  IN VOID                              *Data
  IN EFI_IPSEC_CONFIG_SELECTOR         *InsertBefore OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_IPSEC_CONFIG_PROTOCOL* instance.

InsertBefore
Pointer to one entry selector which describes the expected position the new data entry will be added. If *InsertBefore* is *NULL,* the new entry will be appended the end of database.

DataType
The type of data to be set. Type *EFI_IPSEC_CONFIG_DATA_TYPE* is defined in “Related Definitions” below.

Selector
Pointer to an entry selector on operated configuration data specified by *DataType*. A **NULL** *Selector* causes the entire specified-type configuration information to be flushed.

Data
The data buffer to be set. The structure of the data buffer is associated with the *DataType*. The various types are defined in “Related Definitions” below.

Description

This function is used to set the IPsec configuration information of type *DataType* for the EFI IPsec driver.

The IPsec configuration data has a unique selector/identifier separately to identify a data entry. The selector structure depends on *DataType’s* definition.

Using *SetData()* with a *Data* of **NULL** causes the IPsec configuration data entry identified by *DataType* and Selector to be deleted.

Related Definition

```
//****************************************************
// EFI_IPSEC_CONFIG_DATA_TYPE
//****************************************************
typedef enum {
  IPsecConfigDataTypeSpd,
  IPsecConfigDataTypeSad,
  IPsecConfigDataTypePad,
  IPsecConfigDataTypeMaximum
}   EFI_IPSEC_CONFIG_DATA_TYPE;
```

IPsecConfigDataTypeSpd
The IPsec Security Policy Database (aka SPD) setting. In IPsec, an essential element of Security Association (SA) processing is underlying SPD that specifies what services are to be offered to IP datagram and in what fashion. The SPD must be consulted during the processing of all traffic (inbound and outbound), including traffic not protected by IPsec, that traverses the IPsec boundary. With this *DataType, SetData()* function is to set the SPD entry information, which may add one new entry, delete one existed entry or flush the whole database according to the parameter values. The corresponding Data is of type *EFI_IPSEC_SPD_DATA*.

IPsecConfigDataTypeSad
The IPsec Security Association Database (aka SAD) setting. A SA is a simplex connection that affords security services to the traffic carried by it. Security services are afforded to an SA by the use of AH, or ESP, but not both. The corresponding Data is of type *EFI_IPSEC_SA_DATA2* or *EFI_IPSEC_SAD_DATA*. Compared with *EFI_IPSEC_SA_DATA,* the *EFI_IPSEC_SA_DATA2* contains the extra Tunnel Source Address and Tunnel Destination Address thus it is recommended to be use if the implementation supports tunnel mode.

IPsecConfigDataTypePad
The IPsec Peer Authorization Database (aka PAD) setting, which provides the link between the SPD and a security association management protocol. The PAD entry specifies the authentication protocol (e.g. IKEv1, IKEv2) method used and the authentication data. The corresponding *Data* is of type *EFI_IPSEC_PAD_DATA*.

```
//*******************************************************
// EFI_IPSEC_CONFIG_SELECTOR
//*******************************************************
typedef union {
  EFI_IPSEC_SPD_SELECTOR             SpdSelector;
  EFI_IPSEC_SA_ID                    SaId;
  EFI_IPSEC_PAD_ID                   PadId;
}   EFI_IPSEC_CONFIG_SELECTOR;
```

The *EFI_IPSEC_CONFIG_SELECTOR* describes the expected IPsec configuration data selector of type *EFI_IPSEC_CONFIG_DATA_TYPE.*

```
//*******************************************************
// EFI_IPSEC_SPD_SELECTOR
//*******************************************************
typedef struct _EFI_IPSEC_SPD_SELECTOR {
  UINT32                              LocalAddressCount;
  EFI_IP_ADDRESS_INFO                 *LocalAddress;
  UINT32                              RemoteAddressCount;
  EFI_IP_ADDRESS_INFO                 *RemoteAddress;
```

(continues on next page)

(continued from previous page)

```
  UINT16                            NextLayerProtocol;

  // Several additional selectors depend on the ProtoFamily
  UINT16                             LocalPort;
  UINT16                             LocalPortRange;
  UINT16                             RemotePort;
  UINT16                             RemotePortRange;
}   EFI_IPSEC_SPD_SELECTOR;
```

LocalAddressCount
Specifies the actual number of entries in *LocalAddress*.

LocalAddress
A list of ranges of IPv4 or IPv6 addresses, which refers to the addresses being protected by IPsec policy.

RemoteAddressCount
Specifies the actual number of entries in *RemoteAddress*.

RemoteAddress
A list of ranges of IPv4 or IPv6 addresses, which are peer entities to *LocalAddress*.

NextLayerProtocol
Next layer protocol. Obtained from the IPv4 Protocol or the IPv6 Next Header fields. The next layer protocol is whatever comes after any IP extension headers that are present. A zero value is a wildcard that matches any value in *NextLayerProtocol* field.

LocalPort
Local Port if the Next Layer Protocol uses two ports (as do TCP, UDP, and others). A zero value is a wildcard that matches any value in *LocalPort* field.

LocalPortRange
A designed port range size. The start port is *LocalPort,* and the total number of ports is described by *LocalPortRange*. This field is ignored if *NextLayerProtocol* does not use ports.

RemotePort
Remote Port if the Next Layer Protocol uses two ports. A zero value is a wildcard that matches any value in RemotePort field.

RemotePortRange
A designed port range size. The start port is *RemotePort,* and the total number of ports is described by *RemotePortRange*. This field is ignored if *NextLayerProtocol* does not use ports.

NOTE: *The* LocalPort *and* RemotePort *selectors have different meaning depending on the* NextLayerProtocol *field. for example, if* NextLayerProtocol *value is ICMP*, LocalPort *and* RemotePort *describe the ICMP message type and code. This is described in section 4.4.1.1 of RFC 4301).*

```
//*******************************************************
// EFI_IP_ADDRESS_INFO
//********************************************************
typedef struct _EFI_IP_ADDRESS_INFO {
  EFI_IP_ADDRESS                    Address;
  UINT8                             PrefixLength;
}   EFI_IP_ADDRESS_INFO;
```

Address
The IPv4 or IPv6 address.

PrefixLength

The length of the prefix associated with the *Address*.

```
#define MAX_PEERID_LEN 128
//*****************************************************
// EFI_IPSEC_SPD_DATA
//*****************************************************
typedef struct _EFI_IPSEC_SPD_DATA {
  UINT8                                *Name[MAX_PEERID_LEN];
  UINT32                               PackageFlag;
  EFI_IPSEC_TRAFFIC_DIR                TrafficDirection;
  EFI_IPSEC_ACTION                     Action;
  EFI_IPSEC_PROCESS_POLICY             *ProcessingPolicy;
  UINTN                                SaIdCount;
  EFI_IPSEC_SA_ID                      *SaId[1];
}   EFI_IPSEC_SPD_DATA;
```

Name

A null-terminated ASCII name string which is used as a symbolic identifier for an IPsec Local or Remote address. The *Name* is optional, and can be **NULL**.

PackageFlag

Bit-mapped list describing Populate from Packet flags. When creating a SA, if *PackageFlag* bit is set to **TRUE**, instantiate the selector from the corresponding field in the package that triggered the creation of the SA, else from the value(s) in the corresponding SPD entry. The *PackageFlag* bit setting for corresponding selector field of *EFI_IPSEC_SPD_SELECTOR:*

Bit 0: **EFI_IPSEC_SPD_SELECTOR**. *LocalAddress*

Bit 1: **EFI_IPSEC_SPD_SELECTOR**. *RemoteAddress*

Bit 2: **EFI_IPSEC_SPD_SELECTOR**. *NextLayerProtocol*

Bit 3: **EFI_IPSEC_SPD_SELECTOR**. *LocalPort*

Bit 4: **EFI_IPSEC_SPD_SELECTOR**. *RemotePort*

Others: Reserved.

TrafficDirection

The traffic direction of data gram.

Action

Processing choices to indicate which action is required by this policy.

ProcessingPolicy

The policy and rule information for a SPD entry. The type *EFI_IPSEC_PROCESSPOLICY* is defined in below.

SaIdCount

Specifies the actual number of entries in SaId list.

SaId

Pointer to the SAD entry used for the traffic processing. The existed SAD entry links indicate this is the manual key case.

```
//*******************************************************
// EFI_IPSEC_TRAFFIC_DIR
//*******************************************************
```

(continues on next page)

(continued from previous page)

```
typedef enum {
  EfiIPsecInBound,
  EfiIPsecOutBound
} EFI_IPSEC_TRAFFIC_DIR;
```

The *EFI_IPSEC_TRAFFIC_DIR* represents the directionality in an SPD entry. The *EfiIPsecInBound* refers to traffic entering an IPsec implementation via the unprotected interface or emitted by the implementation on the unprotected side of the boundary and directed towards the protected interface. The *EfiIPsecOutBound* refers to traffic entering the implementation via the protected interface, or emitted by the implementation on the protected side of the boundary and directed toward the unprotected interface.

```
//*******************************************************
// EFI_IPSEC_ACTION
//********************************************************
typedef enum {
  EfiIPsecActionDiscard,
  EfiIPsecActionBypass,
  EfiIPsecActionProtect
}   EFI_IPSEC_ACTION;
```

For any inbound or outbound datagram, EFI_IPSEC_ACTION represents three possible processing choices:

EfiIPsecActionDiscard
Refers to traffic that is not allowed to traverse the IPsec boundary (in the direction specified by *EFI_IPSEC_TRAFFIC_DIR* ;

EfiIPsecActionByPass
Refers to traffic that is allowed to cross the IPsec boundary without protection.

EfiIPsecActionProtect
Refers to traffic that is afforded IPsec protection, and for such traffic the SPD must specify the security protocols to be employed, their mode, security service options, and the cryptographic algorithms to be used.

```
//*******************************************************
// EFI_IPSEC_PROCESS_POLICY
//*******************************************************
typedef struct _EFI_IPSEC_PROCESS_POLICY {
  BOOLEAN                     ExtSeqNum;
  BOOLEAN                     SeqOverflow;
  BOOLEAN                     FragCheck;
  EFI_IPSEC_SA_LIFETIME       SaLifetime;
  EFI_IPSEC_MODE              Mode;
  EFI_IPSEC_TUNNEL_OPTION     *TunnelOption;
  EFI_IPSEC_PROTOCOL_TYPE     Proto;
  UINT8                       AuthAlgoId;
  UINT8                       EncAlgoId;
} EFI_IPSEC_PROCESS_POLICY;
```

If required action of an SPD entry is *EfiIPsecActionProtect,* the *EFI_IPSEC_PROCESS_POLICY* structure describes a policy list for traffic processing.

ExtSeqNum
Extended Sequence Number. Is this SA using extended sequence numbers. 64 bit counter is used if **TRUE**.

SeqOverflow
A flag indicating whether overflow of the sequence number counter should generate an auditable event and

prevent transmission of additional packets on the SA, or whether rollover is permitted.

FragCheck
Is this SA using stateful fragment checking. **TRUE** represents stateful fragment checking.

SaLifetime
A time interval after which a SA must be replaced with a new SA (and new SPI) or terminated. The type *EFI_IPSEC_SA_LIFETIME* is defined in below.

Mode
IPsec mode: tunnel or transport

TunnelOption
Tunnel Option. *TunnelOption* is ignored if Mode is *EfiIPsecTransport*. The type *EFI_IPSEC_TUNNEL_OPTION* is defined in below

Proto
IPsec protocol: AH or ESP

AuthAlgoId
Cryptographic algorithm type used for authentication

EncAlgoId
Cryptographic algorithm type used for encryption. *EncAlgo* is **NULL** when IPsec protocol is AH. For ESP protocol, *EncAlgo* can also be used to describe the algorithm if a combined mode algorithm is used.

```
//*******************************************************
// EFI_IPSEC_SA_LIFETIME
//*******************************************************
typedef struct _EFI_IPSEC_SA_LIFETIME {
  UINT64                  ByteCount;
  UINT64                  SoftLifetime;
  UINT64                  HardLifetime
}   EFI_IPSEC_SA_LIFETIME;
```

EFI_IPSEC_SA_LIFETIME defines the lifetime of an SA, which represents when a SA must be replaced or terminated. A value of all 0 for each field removes the limitation of a SA lifetime.

ByteCount
The number of bytes to which the IPsec cryptographic algorithm can be applied. For ESP, this is the encryption algorithm and for AH, this is the authentication algorithm. The *ByteCount* includes pad bytes for cryptographic operations.

SoftLifetime
A time interval in second that warns the implementation to initiate action such as setting up a replacement SA.

HardLifetime
A time interval in second when the current SA ends and is destroyed.

```
//*******************************************************
// EFI_IPSEC_MODE
//*******************************************************
typedef enum {
  EfiIPsecTransport,
  EfiIPsecTunnel
}   EFI_IPSEC_MODE;
```

There are two modes of IPsec operation: transport mode and tunnel mode. In *EfiIPsecTransport* mode, AH and ESP provide protection primarily for next layer protocols; In *EfiIPsecTunnel* mode, AH and ESP are applied to tunneled IP packets.

```
typedef enum {
  EfiIPsecTunnelClearDf,
  EfiIPsecTunnelSetDf,
  EfiIPsecTunnelCopyDf
}   EFI_IPSEC_TUNNEL_DF_OPTION;
```

The option of copying the DF bit from an outbound package to the tunnel mode header that it emits, when traffic is carried via a tunnel mode SA. This applies to SAs where both inner and outer headers are IPv4. The value can be:

EfiIPsecTunnelClearDf:
Clear DF bit from inner header

EfiIPsecTunnelSetDf:
Set DF bit from inner header

EfiIPsecTunnelCopyDf:
Copy DF bit from inner header

```
//********************************************************
// EFI_IPSEC_TUNNEL_OPTION
//********************************************************
typedef struct _EFI_IPSEC_TUNNEL_OPTION {
  EFI_IP_ADDRESS              LocalTunnelAddress;
  EFI_IP_ADDRESS              RemoteTunnelAddress;
  EFI_IPSEC_TUNNEL_DF_OPTION  DF;
}   EFI_IPSEC_TUNNEL_OPTION;
```

LocalTunnelAddress
Local tunnel address when IPsec mode is *EfiIPsecTunnel*

RemoteTunnelAddress
Remote tunnel address when IPsec mode is *EfiIPsecTunnel*

DF
The option of copying the DF bit from an outbound package to the tunnel mode header that it emits, when traffic is carried via a tunnel mode SA.

```
//*******************************************************
// EFI_IPSEC_PROTOCOL_TYPE
//*******************************************************
typedef enum {
  EfiIPsecAH,
  EfiIPsecESP
}   EFI_IPSEC_PROTOCOL_TYPE;
```

IPsec protocols definition. *EfiIPsecAH* is the IP Authentication Header protocol which is specified in RFC 4302. *EfiIPsecESP* is the IP Encapsulating Security Payload which is specified in RFC 4303.

```
//********************************************************
// EFI_IPSEC_SA_ID
//********************************************************
typedef struct _EFI_IPSEC_SA_ID {
  UINT32                        Spi;
  EFI_IPSEC_PROTOCOL_TYPE       Proto;
```

(continues on next page)

(continued from previous page)

```
  EFI_IP_ADDRESS                DestAddress;
}   EFI_IPSEC_SA_ID;
```

A triplet to identify an SA, consisting of the following members:

Spi
Security Parameter Index (aka SPI). An arbitrary 32-bit value that is used by a receiver to identity the SA to which an incoming package should be bound.

Proto
IPsec protocol: AH or ESP

DestAddress
Destination IP address.

```
//********************************************************
// EFI_IPSEC_SA_DATA
//********************************************************
typedef struct _EFI_IPSEC_SA_DATA {
  EFI_IPSEC_MODE                Mode;
  UINT64                        SNCount;
  UINT8                         AntiReplayWindows;
  EFI_IPSEC_ALGO_INFO           AlgoInfo;
  EFI_IPSEC_SA_LIFETIME         SaLifetime;
  UINT32                        PathMTU;
  EFI_IPSEC_SPD_SELECTOR        *SpdSelector;
  BOOLEAN                       ManualSet
}   EFI_IPSEC_SA_DATA;
```

The data items defined in one SAD entry:

Mode
IPsec mode: tunnel or transport

SNCount
Sequence Number Counter. A 64-bit counter used to generate the sequence number field in AH or ESP headers.

ReplayWindows
Anti-Replay Window. A 64-bit counter and a bit-map used to determine whether an inbound AH or ESP packet is a replay.

AlgoInfo
AH/ESP cryptographic algorithm, key and parameters.

SaLifeTime
Lifetime of this SA.

PathMTU
Any observed path MTU and aging variables. The Path MTU processing is defined in section 8 of RFC 4301.

SpdSelector
Link to one SPD entry.

ManualSet
Indication of whether it's manually set or negotiated automatically. If *ManualSet* is *FALSE,* the corresponding SA entry is inserted through IKE protocol negotiation.

```
//*******************************************************
// EFI_IPSEC_SA_DATA2
//*******************************************************
typedef struct _EFI_IPSEC_SA_DATA2 {
  EFI_IPSEC_MODE                Mode;
  UINT64                        SNCount;
  UINT8                         AntiReplayWindows;
  EFI_IPSEC_ALGO_INFO           AlgoInfo;
  EFI_IPSEC_SA_LIFETIME         SaLifetime;
  UINT32                        PathMTU;
  EFI_IPSEC_SPD_SELECTOR        *SpdSelector;
  BOOLEAN                       ManualSet;
  EFI_IP_ADDRESS                TunnelSourceAddress;
  EFI_IP_ADDRESS                TunnelDestinationAddress
}   EFI_IPSEC_SA_DATA2;
```

The data items defined in one SAD entry:

Mode
IPsec mode: tunnel or transport

SNCount
Sequence Number Counter. A 64-bit counter used to generate the sequence number field in AH or ESP headers.

ReplayWindows
Anti-Replay Window. A 64-bit counter and a bit-map used to determine whether an inbound AH or ESP packet is a replay.

AlgoInfo
AH/ESP cryptographic algorithm, key and parameters.

SaLifeTime
Lifetime of this SA.

PathMTU
Any observed path MTU and aging variables. The Path MTU processing is defined in section 8 of RFC 4301.

SpdSelector
Link to one SPD entry.

ManualSet
Indication of whether it's manually set or negotiated automatically. If ManualSet is **FALSE**, the corresponding SA entry is inserted through IKE protocol negotiation

TunnelSourceAddress
The tunnel header IP source address.

TunnelDestinationAddress
The tunnel header IP destination address.

```
//*******************************************************
// EFI_IPSEC_ALGO_INFO
//*******************************************************
typedef union {
  EFI_IPSEC_AH_ALGO_INFO              AhAlgoInfo;
  EFI_IPSEC_ESP_ALGO_INFO             EspAlgoInfo;
}   EFI_IPSEC_ALGO_INFO;
```

(continues on next page)

(continued from previous page)

```
//*******************************************************
// EFI_IPSEC_AH_ALGO_INFO
//*******************************************************
typedef struct _EFI_IPSEC_AH_ALGO_INFO {
  UINT8                AuthAlgoId;
  UINTN                KeyLength;
  VOID                 *Key;
}   EFI_IPSEC_AH_ALGO_INFO;
```

The security algorithm selection for IPsec AH authentication. The required authentication algorithm is specified in RFC 4305.

```
//*******************************************************
// EFI_IPSEC_ESP_ALGO_INFO
//*******************************************************
typedef struct _EFI_IPSEC_ESP_ALGO_INFO {
  UINT8                EncAlgoId;
  UINTN                EncKeyLength;
  VOID                 *EncKey;
  UINT8                AuthAlgoId;
  UINTN                AuthKeyLength;
  VOID                 *AuthKey;
}   EFI_IPSEC_ESP_ALGO_INFO;
```

The security algorithm selection for IPsec ESP encryption and authentication. The required authentication algorithm is specified in RFC 4305. *EncAlgoId* fields can also specify an ESP combined mode algorithm (e.g. AES with CCM mode, specified in RFC 4309), which provides both confidentiality and authentication services.

```
//*******************************************************
// EFI_IPSEC_PAD_ID
//*******************************************************
typedef struct _EFI_IPSEC_PAD_ID {
  BOOLEAN                PeerIdValid;
  union {
    EFI_IP_ADDRESS_INFO   IpAddress;
    UINT8                PeerId [MAX_PEERID_LEN];
  } Id;
} EFI_IPSEC_PAD_ID;
```

The entry selector for IPsec PAD that represents how to authenticate each peer. *EFI_IPSEC_PAD_ID* specifies the identifier for PAD entry, which is also used for SPD lookup.

IpAddress
Pointer to the IPv4 or IPv6 address range.

PeerId
Pointer to a null-terminated ASCII string representing the symbolic names. A PeerId can be a DNS name, Distinguished Name, RFC 822 email address or Key ID (specified in section 4.4.3.1 of RFC 4301)

```
//*******************************************************
// EFI_IPSEC_PAD_DATA
//*******************************************************
typedef struct _EFI_IPSEC_PAD_DATA {
```

(continues on next page)

(continued from previous page)

```
  EFI_IPSEC_AUTH_PROTOCOL_TYPE      AuthProtocol;
  EFI_IPSEC_AUTH_METHOD             AuthMethod;
  BOOLEAN                           IkeIdFlag;
  UINTN                             AuthDataSize;
  VOID                              *AuthData;
  UINTN                             RevocationDataSize;
  VOID                              *RevocationData;
}   EFI_IPSEC_PAD_DATA;
```

The data items defined in one PAD entry:

AuthProtocol
Authentication Protocol for IPsec security association management

AuthMethod
Authentication method used.

IkeIdFlag
The IKE ID payload will be used as a symbolic name for SPD lookup if *IkeIdFlag* is **TRUE**. Otherwise, the remote IP address provided in traffic selector payloads will be used.

AuthDataSize
The size of Authentication data buffer, in bytes.

AuthData
Buffer for Authentication data, (e.g., the pre-shared secret or the trust anchor relative to which the peer's certificate will be validated).

RevocationDataSize
The size of *RevocationData,* in bytes.

RevocationData
Pointer to CRL or OCSP data, if certificates are used for authentication method.

```
//*******************************************************
// EFI_IPSEC_AUTH_PROTOCOL
//*******************************************************
typedef enum {
  EfiIPsecAuthProtocolIKEv1,
  EfiIPsecAuthProtocolIKEv2,
  EfiIPsecAuthProtocolMaximum
}   EFI_IPSEC_AUTH_PROTOCOL_TYPE;
```

EFI_IPSEC_AUTH_PROTOCOL_TYPE defines the possible authentication protocol for IPsec security association management.

```
//*******************************************************
// EFI_IPSEC_AUTH_METHOD
//*******************************************************
typedef enum {
  EfiIPsecAuthMethodPreSharedSecret,
  EfiIPsecAuthMethodCertificates,
  EfiIPsecAuthMethodMaximum
}   EFI_IPSEC_AUTH_METHOD;
```

EfiIPsecAuthMethodPreSharedScret
Using Pre-shared Keys for manual security associations.

EfiIPsecAuthMethodCertificates
IKE employs X.509 certificates for SA establishment.

Status Codes Returned

EFI_SUCCESS	The specified configuration entry data is set successfully.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE:** • *This* is **NULL**.
EFI_UNSUPPORTED	The specified *DataType* is not supported.
EFI_OUT_OF_RESOURCES	The required system resource could not be allocated.

28.8.5 EFI_IPSEC_CONFIG_PROTOCOL.GetData()

Summary

Return the configuration value for the EFI IPsec driver.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IPSEC_CONFIG_GET_DATA) (
  IN EFI_IPSEC_CONFIG_PROTOCOL         *This,
  IN EFI_IPSEC_CONFIG_DATA_TYPE        DataType,
  IN EFI_IPSEC_CONFIG_SELECTOR         *Selector,
  IN OUT UINTN                         *DataSize,
  OUT VOID                             *Data
);
```

Parameters

This
Pointer to the *EFI_IPSEC_CONFIG_PROTOCOL* instance.

DataType
The type of data to retrieve. Type

EFI_IPSEC_CONFIG_DATA_TYPE is defined i
EFI_IPSEC_CONFIG_PROTOCOL.SetData().

Selector
Pointer to an entry selector which is an identifier of the IPsec configuration data entry. Type

EFI_IPSEC_CONFIG_SELECTOR is defined in the
EFI_IPSEC_CONFIG_PROTOCOL.SetData() function description.

DataSize
On output the size of data returned in *Data*.

Data

The buffer to return the contents of the IPsec configuration data. The type of the data buffer is associated with the *DataType*.

Description

This function lookup the data entry from IPsec database or IKEv2 configuration information. The expected data type and unique identification are described in DataType and Selector parameters.

Status Codes Returned

EFI_SUCCESS	The specified configuration data is got successfully.
EFI_INVALID_PARAMETER	One or more of the followings are **TRUE:** • *This* is **NULL**. • *Selector* is **NULL**. • *DataSize* is **NULL**. • *Data* is **NULL**.
EFI_NOT_FOUND	The configuration data specified by *Selector* is not found.
EFI_UNSUPPORTED	The specified *DataType* is not supported.
EFI_BUFFER_TOO_SMALL	The *DataSize* is too small for the result. *DataSize* has been updated with the size needed to complete the request.

28.8.6 EFI_IPSEC_CONFIG_PROTOCOL.GetNextSelector()

Summary

Enumerates the current selector for IPsec configuration data entry.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IPSEC_CONFIG_GET_NEXT_SELECTOR) (
  IN EFI_IPSEC_CONFIG_PROTOCOL            *This,
  IN EFI_IPSEC_CONFIG_DATA_TYPE           DataType,
  IN OUT UINTN                            *SelectorSize,
  IN OUT EFI_IPSEC_CONFIG_SELECTOR        *Selector,
  );
```

Parameters

This

Pointer to the *EFI_IPSEC_CONFIG_PROTOCOL* instance.

DataType

The type of IPsec configuration data to retrieve. Type *EFI_IPSEC_CONFIG_DATA_TYPE* is defined in *EFI_IPSEC_CONFIG_PROTOCOL.SetData()*.

SelectorSize

The size of the *Selector* buffer.

Selector

On input, supplies the pointer to last *Selector* that was returned by *GetNextSelector* (). On output, returns one copy of the current entry *Selector* of a given *DataType*. Type *EFI_IPSEC_CONFIG_SELECTOR* is defined in the *EFI_IPSEC_CONFIG_PROTOCOL.SetData()* function description.

Description

This function is called multiple times to retrieve the entry *Selector* in IPsec configuration database. On each call to *GetNextSelector(),* the next entry *Selector* are retrieved into the output interface. If the entire IPsec configuration database has been iterated, the error *EFI_NOT_FOUND* is returned. If the *Selector* buffer is too small for the next Selector copy, an *EFI_BUFFER_TOO_SMALL* error is returned, and SelectorSize is updated to reflect the size of buffer needed.

On the initial call to *GetNextSelector()* to start the IPsec configuration database search, a pointer to the buffer with all zero value is passed in *Selector*. Calls to *SetData()* between calls to *GetNextSelector* may produce unpredictable results.

Status Codes Returned

EFI_SUCCESS	The specified configuration data is got successfully.
EFI_INVALID_PARAMETER	One or more of the followings are **TRUE:** • *This* is **NULL**. • *SelectorSize* is **NULL**. • *Selector* is **NULL**.
EFI_NOT_FOUND	The next configuration data entry was not found.
EFI_UNSUPPORTED	The specified *DataType* is not supported.
EFI_BUFFER_TOO_SMALL	The *SelectorSize* is too small for the result. This parameter has been updated with the size needed to complete the search request.

28.8.7 EFI_IPSEC_CONFIG_PROTOCOL.RegisterDataNotify ()

Summary

Register an event that is to be signaled whenever a configuration process on the specified IPsec configuration information is done.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IPSEC_CONFIG_REGISTER_NOTIFY) (
  IN EFI_IPSEC_CONFIG_PROTOCOL        *This,
  IN EFI_IPSEC_CONFIG_DATA_TYPE       DataType,
  IN EFI_EVENT                        Event
);
```

Parameters

This

Pointer to the *EFI_IPSEC_CONFIG_PROTOCOL* instance.

DataType

The type of data to be registered the event for. Type *EFI_IPSEC_CONFIG_DATA_TYPE* is defined in *EFI_IPSEC_CONFIG_PROTOCOL.SetData()* function description.

Event

The event to be registered.

Description

This function registers an event that is to be signaled whenever a configuration process on the specified IPsec configuration data is done (e.g. IPsec security policy database configuration is ready). An event can be registered for different *DataType* simultaneously and the caller is responsible for determining which type of configuration data causes the signaling of the event in such case.

Status Codes Returned

EFI_SUCCESS	The event is registered successfully.
EFI_INVALID_PARAMETER	*This* is **NULL** or *Event* is **NULL**.
EFI_ACCESS_DENIED	The *Event* is already registered for the *DataType*.
EFI_UNSUPPORTED	The notify registration unsupported or the specified *DataType* is not supported.

28.8.8 EFI_IPSEC_CONFIG_PROTOCOL.UnregisterDataNotify ()

Summary

Remove the specified event that is previously registered on the specified IPsec configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IPSEC_CONFIG_UNREGISTER_NOTIFY) (
  IN EFI_IPSEC_CONFIG_PROTOCOL          *This,
  IN EFI_IPSEC_CONFIG_DATA_TYPE         DataType,
  IN EFI_EVENT                          Event
  );
```

Parameters

This

Pointer to the EFI_IPSEC_CONFIG_PROTOCOL instance.

DataType

The configuration data type to remove the registered event for. Type *EFI_IPSEC_CONFIG_DATA_TYPE* is defined in *EFI_IPSEC_CONFIG_PROTOCOL.SetData()* function description.

Event

The event to be unregistered.

Description

This function removes a previously registered event for the specified configuration data.

Status Codes Returned

EFI_SUCCESS	The event is removed successfully.
EFI_NOT_FOUND	The *Event* specified by *DataType* could not be found in the database.
EFI_INVALID_PARAMETER	*This* is **NULL** or *Event* is **NULL**.
EFI_UNSUPPORTED	The notify registration unsupported or the specified *DataType* is not supported.

28.8.9 EFI IPsec Protocol

This section provides a detailed description of the *EFI_IPSEC_PROTOCOL*. This protocol handles IPsec-protected traffic.*

28.8.10 EFI_IPSEC_PROTOCOL

Summary

The *EFI_IPSEC_PROTOCOL* is used to abstract the ability to deal with the individual packets sent and received by the host and provide packet-level security for IP datagram.

GUID

```
#define EFI_IPSEC_PROTOCOL_GUID \
  {0xdfb386f7,0xe100,0x43ad,\
    {0x9c,0x9a,0xed,0x90,0xd0,0x8a,0x5e,0x12 }}
```

Protocol Interface Structure

```
typedef struct _EFI_IPSEC_PROTOCOL {
  EFI_IPSEC_PROCESS           Process;
  EFI_EVENT                   DisabledEvent;
  BOOLEAN                     DisabledFlag;
}   EFI_IPSEC_PROTOCOL;
```

Parameters

Process
Handle the IPsec message.

DisabledEvent
Event signaled when the interface is disabled.

DisabledFlag
State of the interface.

Description

The EFI_IPSEC_PROTOCOL provides the ability for securing IP communications by authenticating and/or encrypting each IP packet in a data stream.

EFI_IPSEC_PROTOCOL can be consumed by both the IPv4 and IPv6 stack. A user can employ this protocol for IPsec package handling in both IPv4 and IPv6 environment.

28.8.11 EFI_IPSEC_PROTOCOL.Process()

Summary

Handles IPsec packet processing for inbound and outbound IP packets.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_IPSEC_PROCESS) (
  IN EFI_IPSEC_PROTOCOL          *This,
```

(continues on next page)

(continued from previous page)

```
  IN EFI_HANDLE                   NicHandle,
  IN UINT8                        IpVer,
  IN OUT VOID                     *IpHead,
  IN UINT8                        *LastHead,
  IN VOID                         *OptionsBuffer,
  IN UINT32                       OptionsLength,
  IN OUT EFI_IPSEC_FRAGMENT_DATA **FragmentTable,
  IN UINT32                       *FragmentCount,
  IN EFI_IPSEC_TRAFFIC_DIR        TrafficDirection,
  OUT EFI_EVENT                   *RecycleSignal
)
```

Related Definition

```
//*******************************************************
// EFI_IPSEC_FRAGMENT_DATA
//*******************************************************
typedef struct _EFI_IPSEC_FRAGMENT_DATA {
  UINT32                FragmentLength;
  VOID                  *FragmentBuffer;
}   EFI_IPSEC_FRAGMENT_DATA;
```

EFI_IPSEC_FRAGMENT_DATA defines the instances of packet fragments.

This
Pointer to the *EFI_IPSEC_PROTOCOL* instance.

NicHandle
Instance of the network interface.

IpVer
IPV4 or IPV6.

IpHead
Pointer to the IP Header.

LastHead
The protocol of the next layer to be processed by IPsec.

OptionsBuffer
Pointer to the options buffer.

OptionsLength
Length of the options buffer.

FragmentTable
Pointer to a list of fragments.

FragmentCount
Number of fragments.

TrafficDirection
Traffic direction.

RecycleSignal
Event for recycling of resources.

Description

The *EFI_IPSEC_PROCESS* process routine handles each inbound or outbound packet. The behavior is that it can perform one of the following actions: bypass the packet, discard the packet, or protect the packet.

Status Codes Returned

EFI_SUCCESS	The packet was bypassed and all buffers remain the same.
EFI_SUCCESS	The packet was protected.
EFI_ACCESS_DENIED	The packet was discarded.

28.8.12 EFI IPsec2 Protocol

This section provides a detailed description of the *EFI_IPSEC2_PROTOCOL*. This protocol handles IPsec-protected traffic.

28.8.13 EFI_IPSEC2_PROTOCOL

Summary

The *EFI_IPSEC2_PROTOCOL* is used to abstract the ability to deal with the individual packets sent and received by the host and provide packet-level security for IP datagram..

GUID

```
#define EFI_IPSEC2_PROTOCOL_GUID \
  {0xa3979e64, 0xace8, 0x4ddc, \
    {0xbc, 0x07, 0x4d, 0x66, 0xb8, 0xfd, 0x09, 0x77}};
```

Protocol Interface Structure

```
typedef struct _EFI_IPSEC2_PROTOCOL {
  EFI_IPSEC_PROCESSEXT        ProcessExt;
  EFI_EVENT                   DisabledEvent;
  BOOLEAN                     DisabledFlag;
}   EFI_IPSEC2_PROTOCOL;
```

Parameters

ProcessExt
Handle the IPsec message with the extension header processing support.

DisabledEvent
Event signaled when the interface is disabled.

DisabledFlag
State of the interface.

Description

The *EFI_IPSEC2_PROTOCOL* provides the ability for securing IP communications by authenticating and/or encrypting each IP packet in a data stream.

EFI_IPSEC2_PROTOCOL can be consumed by both the IPv4 and IPv6 stack. A user can employ this protocol for IPsec package handling in both IPv4 and IPv6 environment.

28.8.14 EFI_IPSEC2_PROTOCOL.ProcessExt()

Summary

Handles IPsec processing for both inbound and outbound IP packets. Compare with *Process()* in *EFI_IPSEC_PROTOCOL,* this interface has the capability to process Option(Extension Header).

Prototype

```
Typedef
EFI_STATUS
(EFIAPI *EFI_IPSEC_PROCESSEXT) (
IN EFI_IPSEC2_PROTOCOL          *This,
IN EFI_HANDLE                   NicHandle,
IN UINT8                        IpVer,
IN OUT VOID                     *IpHead,
IN OUT UINT8                    *LastHead,
IN OUT VOID                     **OptionsBuffer,
IN OUT UINT32                   *OptionsLength,
IN OUT EFI_IPSEC_FRAGMENT_DATA  **FragmentTable,
IN OUT UINT32                   *FragmentCount,
IN EFI_IPSEC_TRAFFIC_DIR        TrafficDirection,
OUT EFI_EVENT                   *RecycleSignal
)
```

Parameters

This
Pointer to the *EFI_IPSEC2_PROTOCOL* instance.

NicHandle
Instance of the network interface.

IpVer
IP version.IPV4 or IPV6.

IpHead
Pointer to the IP Header it is either the *EFI_IP4_HEADER* or *EFI_IP6_HEADER*.On input, it contains the IP header. On output,

1. in tunnel mode and the traffic direction is inbound, the buffer will be reset to zero by IPsec;
2. in tunnel mode and the traffic direction is outbound, the buffer will reset to be the tunnel IP header.
3. in transport mode, the related fielders (like payload length, Next header) in IP header will be modified according to the condition.

LastHead
For IP4, it is the next protocol in IP header. For IP6 it is the Next Header of the last extension header.

OptionsBuffer
On input, it contains the options (extensions header) to be processed by IPsec. On output,

1. in tunnel mode and the traffic direction is outbound, it will be set to *NULL,* and that means this contents was wrapped after inner header and should not be concatenated after tunnel header again;
2. in transport mode and the traffic direction is inbound, if there are IP options (extension headers) protected by IPsec, IPsec will concatenate the those options after the input options (extension headers);
3. on other situations, the output of contents of *OptionsBuffer* might be same with input's. The caller should take the responsibility to free the buffer both on input and on output.

OptionsLength

On input, the input length of the options buffer. On output, the output length of the options buffer.

FragmentTable

Pointer to a list of fragments. On input, these fragments contain the IP payload. On output,

1. in tunnel mode and the traffic direction is inbound, the fragments contain the whole IP payload which is from the IP inner header to the last byte of the packet;*
2. in tunnel mode and the traffic direction is the outbound, the fragments contains the whole encapsulated payload which encapsulates the whole IP payload between the encapsulated header and encapsulated trailer fields.*
3. in transport mode and the traffic direction is inbound, the fragments contains the IP payload which is from the next layer protocol to the last byte of the packet;*
4. in transport mode and the traffic direction is outbound, the fragments contains the whole encapsulated payload which encapsulates the next layer protocol information between the encapsulated header and encapsulated trailer fields.*

FragmentCount

Number of fragments.

TrafficDirection

Traffic direction.

RecycleSignal

Event for recycling of resources.

Description

The *EFI_IPSEC_PROCESSEXT* process routine handles each inbound or outbound packet with the support of options (extension headers) processing. The behavior is that it can perform one of the following actions: bypass the packet, discard the packet, or protect the packet.

Status Codes Returned

EFI_SUCCESS	The packet was bypassed and all buffers remain the same.
EFI_SUCCESS	The packet was processed by IPsec successfully.
EFI_ACCESS_DENIED	The packet was discarded.
EFI_NOT_READY	The IKE negotiation is invoked and the packet was discarded.
EFI_INVALID_PARAMETER	One of more of following are **TRUE** If *OptionsBuffer* is **NULL;** If *OptionsLength* is **NULL;** If *FragmentTable* is **NULL;** If *FragmentCount* is **NULL;**

28.9 Network Protocol - EFI FTP Protocol

This section defines the EFI FTPv4 (File Transfer Protocol version 4) Protocol that interfaces over EFI FTPv4 Protocol

28.9.1 EFI_FTP4_SERVICE_BINDING_PROTOCOL Summary

Summary

The *EFI_FTP4_SERVICE_BINDING_PROTOCOL* is used to locate communication devices that are supported by an EFI FTPv4 Protocol driver and to create and destroy instances of the EFI FTPv4 Protocol child protocol driver that can use the underlying communication device.

GUID

```
#define EFI_FTP4_SERVICE_BINDING_PROTOCOL_GUID \
  {0xfaaecb1, 0x226e, 0x4782,\
    {0xaa, 0xce, 0x7d, 0xb9, 0xbc, 0xbf, 0x4d, 0xaf}}
```

Description

A network application or driver that requires FTPv4 I/O services can use one of the protocol handler services, such as *BS->LocateHandleBuffer(),* to search for devices that publish an EFI FTPv4 Service Binding Protocol GUID. Each device with a published EFI FTPv4 Service Binding Protocol GUID supports the EFI FTPv4 Protocol service and may be available for use.

After a successful call to the *EFI_FTP4_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the newly created child EFI FTPv4 Protocol driver instance is in an unconfigured state; it is not ready to transfer data.

Before a network application terminates execution, every successful call to the *EFI_FTP4_SERVICE_BINDING_PROTOCOL.CreateChild()* function must be matched with a call to the *EFI_FTP4_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

Each instance of the EFI FTPv4 Protocol driver can support one file transfer operation at a time. To download two files at the same time, two instances of the EFI FTPv4 Protocol driver will need to be created.

NOTE: *Byte Order: f not specifically specified, the IP addresses used in the* EFI_FTP4_PROTOCOL *are in network byte order and the ports are in host byte order*.

28.9.2 EFI_FTP4_PROTOCOL

Summary

The EFI FTPv4 Protocol provides basic services for client-side FTP (File Transfer Protocol) operations.

GUID

```
#define EFI_FTP4_PROTOCOL_GUID \
  {0xeb338826, 0x681b, 0x4295,\
    {0xb3, 0x56, 0x2b, 0x36, 0x4c, 0x75, 0x7b, 0x09}}
```

Protocol Interface Structure

```
typedef struct _EFI_FTP4_PROTOCOL {
  EFI_FTP4_GET_MODE_DATA      GetModeData;
  EFI_FTP4_CONNECT            Connect;
  EFI_FTP4_CLOSE              Close;
```

(continues on next page)

(continued from previous page)

```
  EFI_FTP4_CONFIGURE          Configure;
  EFI_FTP4_READ_FILE          ReadFile;
  EFI_FTP4_WRITE_FILE         WriteFile;
  EFI_FTP4_READ_DIRECTORY     ReadDirectory;
  EFI_FTP4_POLL               Poll;
} EFI_FTP4_PROTOCOL;
```

Parameters

GetModeData
Reads the current operational settings. See the *GetModeData()* function description.

Connect
Establish control connection with the FTP server by using the TELNET protocol according to FTP protocol definition. See the *Connect()* function description

Close
Gracefully disconnecting a FTP control connection This function is a nonblocking operation. See the *Close()* function description.

Configure
Sets and clears operational parameters for an FTP child driver. See the *Configure()* function description.

ReadFile
Downloads a file from an FTPv4 server. See the *ReadFile()* function description.

WriteFile
Uploads a file to an FTPv4 server. This function may be unsupported in some EFI implementations. See the *WriteFile()* function description.

ReadDirectory
Download a related file "directory" from an FTPv4 server. This function may be unsupported in some implementations. See the *ReadDirectory()* function description.

Poll
Polls for incoming data packets and processes outgoing data packets. See the *Poll()* function description.

28.9.3 EFI_FTP4_PROTOCOL.GetModeData()

Summary

Gets the current operational settings.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_FTP4_GET_MODE_DATA)(
  IN EFI_FTP4_PROTOCOL              *This,
  OUT EFI_FTP4_CONFIG_DATA          *ModeData
  );
```

Parameters

This
Pointer to the *EFI_FTP4_PROTOCOL* instance.

ModeData

Pointer to storage for the EFI FTPv4 Protocol driver mode data. Type *EFI_FTP4_CONFIG_DATA* is defined in "Related Definitions" below. The string buffers for Username and Password in *EFI_FTP4_CONFIG_DATA* are allocated by the function, and the caller should take the responsibility to free the buffer later.

Description

The GetModeData() function reads the current operational settings of this EFI FTPv4 Protocol driver instance. *EFI_FTP4_CONFIG_DATA* is defined in the *EFI_FTP4_PROTOCOL.Configure*.

Status Codes Returned

EFI_SUCCESS	This function is called successfully.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE**: • *This* is **NULL**. • *ModeData* is **NULL**.
EFI_NOT_STARTED	The EFI FTPv4 Protocol driver has not been started.
EFI_OUT_OF_RESOURCES	Could not allocate enough resource to finish the operation.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

28.9.4 EFI_FTP4_PROTOCOL.Connect()

Summary

Initiate a FTP connection request to establish a control connection with FTP server

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_FTP4_CONNECT) (
  IN EFI_FTP4_PROTOCOL           *This,
  IN EFI_FTP4_CONNECTION_TOKEN   *Token
  );
```

Parameters

This

Pointer to the *EFI_FTP4_PROTOCOL* instance.

Token

Pointer to the token used to establish control connection.

Related Definition

```
//*****************************************************
// EFI_FTP4_CONNECTION_TOKEN
//*****************************************************
typedef struct {
  EFI_EVENT                Event;
  EFI_STATUS               Status;
}   EFI_FTP4_CONNECTION_TOKEN;
```

Event

The Event to signal after the connection is established and *Status* field is updated by the EFI FTP v4 Protocol driver. The type of *Event* must be *EVENT_NOTIFY_SIGNAL,* and its Task Priority Level (TPL) must be lower than or equal to *TPL_CALLBACK*. If it is set to NULL, this function will not return until the function completes

Status

The variable to receive the result of the completed operation.

Status Codes Returned

EFI_SUCCESS	The FTP connection is established successfully.
EFI_ACCESS_DENIED	The FTP server denied the access the user's request to access it.
EFI_CONNECTION_RESET	The connect fails because the connection is reset either by instance itself or communication peer.
EFI_TIMEOUT	The connection establishment timer expired and no more specific information is available.
EFI_NETWORK_UNREACHABLE	The active open fails because an ICMP network unreachable error is received.
EFI_HOST_UNREACHABLE	The active open fails because an ICMP host unreachable error is received.
EFI_PROTOCOL_UNREACHABLE	The active open fails because an ICMP protocol unreachable error is received.
EFI_PORT_UNREACHABLE	The connection establishment timer times out and an ICMP port unreachable error is received.
EFI_ICMP_ERROR	The connection establishment timer timeout and some other ICMP error is received.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

Description

The Connect() function will initiate a connection request to the remote FTP server with the corresponding connection token. If this function returns EFI_SUCCESS, the connection sequence is initiated successfully. If the connection succeeds or failed due to any error, the Token->Event will be signaled and Token->Status will be updated accordingly.

Status Codes Returned

EFI_SUCCESS	The connection sequence is successfully initiated.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE:** ^{2} This is **NULL.** ^{2} Token is **NULL.** ^{2} Token->Event is **NULL.**
EFI_NOT_STARTED	The EFI FTPv4 Protocol driver has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_OUT_OF_RESOURCES	Could not allocate enough resource to finish the operation.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

28.9.5 EFI_FTP4_PROTOCOL.Close()

Summary

Disconnecting a FTP connection gracefully.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_FTP4_CLOSE)(
  IN EFI_FTP4_PROTOCOL           *This,
  IN EFI_FTP4_CONNECTION_TOKEN   *Token
  );
```

Parameters

This

Pointer to the *EFI_FTP4_PROTOCOL* instance.

Token

Pointer to the token used to close control connection.

Description

The *Close()* function will initiate a close request to the remote FTP server with the corresponding connection token. If this function returns *EFI_SUCCESS,* the control connection with the remote FTP server is closed.

Status Codes Returned

EFI_SUCCESS	The close request is successfully initiated.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE**: • This is **NULL**. • ConnectionToken is **NULL**. • ConnectionToken->Event is **NULL**.
EFI_NOT_STARTED	The EFI FTPv4 Protocol driver has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_OUT_OF_RESOURCES	Could not allocate enough resource to finish the operation.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

28.9.6 EFI_FTP4_PROTOCOL.Configure()

Summary

Sets or clears the operational parameters for the FTP child driver.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_FTP4_CONFIGURE) (
  IN EFI_FTP4_PROTOCOL           *This,
  IN EFI_FTP4_CONFIG_DATA        *FtpConfigData OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_FTP4_PROTOCOL* instance.

FtpConfigData

Pointer to configuration data that will be assigned to the FTP child driver instance. If *NULL,* the FTP child driver instance is reset to startup defaults and all pending transmit and receive requests are flushed.

Related Definition

```
//****************************************************
// EFI_FTP4_CONFIG_DATA
//****************************************************
typedef struct {
  UINT8             *Username;
  UINT8             *Password;
  BOOLEAN           Active;
  BOOLEAN           UseDefaultSetting;
  EFI_IPv4_ADDRESS   StationIp;
  EFI_IPv4_ADDRESS   SubnetMask;
  EFI_IPv4_ADDRESS   GatewayIp;
  EFI_IPv4_ADDRESS   ServerIp;
  UINT16            ServerPort;
  UINT16            AltDataPort;
  UINT8             RepType;
  UINT8             FileStruct;
  UINT8             TransMode;
}   EFI_FTP4_CONFIG_DATA;
```

Username

Pointer to a ASCII string that contains user name. The caller is responsible for freeing *Username* after *GetModeData()* is called.

Password

Pointer to a ASCII string that contains password. The caller is responsible for freeing *Password* after *GetModeData()* is called.

Active

Set it to **TRUE** to initiate an active data connection. Set it to **FALSE** to initiate a passive data connection.

UseDefaultSetting

Boolean value indicating if default network setting used.

StationIp

IP address of station if *UseDefaultSetting* is **FALSE**.

SubnetMask

Subnet mask of station if *UseDefaultSetting* is **FALSE**.

GatewayIp
IP address of gateway if *UseDefaultSetting* is **FALSE**.

ServerIp
IP address of FTPv4 server.

ServerPort
FTPv4 server port number of control connection, and the default value is 21 as convention.

ALtDataPort
FTPv4 server port number of data connection. If it is zero, use (*ServerPort* - 1) by convention.

RepType
A byte indicate the representation type. The right 4 bit is used for first parameter, the left 4 bit is use for second parameter

- For the first parameter, 0x0 = image, 0x1 = EBCDIC, 0x2 = ASCII, 0x3 = local
- For the second parameter, 0x0 = Non-print, 0x1 = Telnet format effectors, 0x2 = Carriage Control
- If it is a local type, the second parameter is the local byte byte size.
- If it is a image type, the second parameter is undefined.

FileStruct
Defines the file structure in FTP used. 0x00 = file, 0x01 = record, 0x02 = page

TransMode
Defines the transfer mode used in FTP. 0x00 = stream, 0x01 = Block, 0x02 = Compressed

Description

The *Configure()* function will configure the connected FTP session with the configuration setting specified in *FtpConfigData*. The configuration data can be reset by calling *Configure()* with *FtpConfigData* set to **NULL**.

Status Codes Returned

EFI_SUCCESS	The FTPv4 driver was configured successfully.
EFI_INVALID_PARAMETER	One or more following conditions are **TRUE:** • *This* is **NULL**. • *FtpConfigData.RepType* is invalid. • *FtpConfigData.FileStruct* in invalid. • *FtpConfigData.TransMode* is invalid. • IP address in *FtpConfigData* is invalid.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) has not finished yet.
EFI_UNSUPPORTED	One or more of the configuration parameters are not supported by this implementation.
EFI_OUT_OF_RESOURCES	The EFI FTPv4 Protocol driver instance data could not be allocated.
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI FTPv4 Protocol driver instance is not configured.

28.9.7 EFI_FTP4_PROTOCOL.ReadFile()

Summary

Downloads a file from an FTPv4 server.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_FTP4_READ_FILE)(
  IN EFI_FTP4_PROTOCOL          *This,
  IN EFI_FTP4_COMMAND_TOKEN     *Token
  );
```

Parameters

This

Pointer to the *EFI_FTP4_PROTOCOL* instance.

Token

Pointer to the token structure to provide the parameters that are used in this operation. Type *EFI_FTP4_COMMAND_TOKEN* is defined in "Related Definitions" below.

Related Definition

```
//*******************************************************
// EFI_FTP4_COMMAND_TOKEN
//*******************************************************
typedef struct {
  EFI_EVENT                 Event;
  UINT8                     *Pathname;
  UINT64                    DataBufferSize;
  VOID                      *DataBuffer;
  EFI_FTP4_DATA_CALLBACK    DataCallback;
  VOID                      *Context;
  EFI_STATUS                Status;
}   EFI_FTP4_COMMAND_TOKEN;
```

Event

The *Event* to signal after request is finished and *Status* field is updated by the EFI FTP v4 Protocol driver. The type of *Event* must be *EVT_NOTIFY_SIGNAL*, and its Task Priority Level (TPL) must be lower than or equal to *TPL_CALLBACK*. If it is set to *NULL*, related function must wait until the function completes

Pathname

Pointer to a null-terminated ASCII name string.

DataBuffersize

The size of data buffer in bytes

DataBuffer

Pointer to the data buffer. Data downloaded from FTP server through connection is downloaded here.

DataCallback

Pointer to a callback function. If it is receiving function that leads to inbound data, the callback function is called when databuffer is full. Then, old data in the data buffer should be flushed and new data is stored from the beginning of data buffer. If it is a transmit function that lead to outbound data and *DataBufferSize* of *Data* in *DataBuffer* has been transmitted, this callback function is called to supply additional data to be transmitted. The size of additional data to be transmitted is indicated in *DataBufferSize,* again. If there is no data remained, *DataBufferSize* should be set to 0

Context

Pointer to the parameter for *DataCallback*.

Status

The variable to receive the result of the completed operation.

EFI_SUCCESS — The FTP command is completed successfully.

EFI_ACCESS_DENIED — The FTP server denied the access to the requested file.

EFI_CONNECTION_RESET — The connect fails because the connection is reset either by instance itself or communication peer.

EFI_TIMEOUT — The connection establishment timer expired and no more specific information is available.

EFI_NETWORK_UNREACHABLE — The active open fails because an ICMP network unreachable error is received.

EFI_HOST_UNREACHABLE — The active open fails because an ICMP host unreachable error is received.

EFI_PROTOCOL_UNREACHABLE — The active open fails because an ICMP protocol unreachable error is received.

EFI_PORT_UNREACHABLE — The connection establishment timer times out and an ICMP port unreachable error is received.

EFI_ICMP_ERROR — The connection establishment timer timeout and some other ICMP error is received.

EFI_DEVICE_ERROR — An unexpected system or network error occurred.

Related Definition

```
//*******************************************************
// EFI_FTP4_DATA_CALLBACK
//*******************************************************
typedef
EFI_STATUS
(EFIAPI *EFI_FTP4_DATA_CALLBACK)(
```

(continues on next page)

(continued from previous page)

```
  IN EFI_FTP4_COMMAND_TOKEN   *Token,
  IN EFI_FTP4_PROTOCOL        *This,
  );
```

This

Pointer to the EFI_FTP4_PROTOCOL instance.

Token

Pointer to the token structure to provide the parameters that are used in this operation. Type EFI_FTP4_COMMAND_TOKEN is defined in "Related Definitions" above.

Description

The ReadFile() function is used to initialize and start an FTPv4 download process and optionally wait for completion. When the download operation completes, whether successfully or not, the Token.Status field is updated by the EFI FTPv4 Protocol driver and then Token.Event is signaled (if it is not NULL).

Data will be downloaded from the FTPv4 server into Token.DataBuffer. If the file size is larger than Token.DataBufferSize, Token.DataCallback will be called to allow for processing data and then new data will be placed at the beginning of Token.DataBuffer.

Status Codes Returned

EFI_SUCCESS	The data file is being downloaded successfully.
EFI_INVALID_PARAMETER	One or more of the parameters is not valid. • This is **NULL**. • Token is **NULL**. • Token. Pathname is **NULL**. • Token. DataBuffer is **NULL**. • Token. DataBufferSize is 0.
EFI_NOT_STARTED	The EFI FTPv4 Protocol driver has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.

28.9.8 EFI_FTP4_PROTOCOL.WriteFile()

Summary

Uploads a file from an FTPv4 server.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_FTP4_WRITE_FILE)(
  IN EFI_FTP4_PROTOCOL          *This,
  IN EFI_FTP4_COMMAND_TOKEN     *Token
  );
```

Parameters

This

Pointer to the *EFI_FTP4_PROTOCOL* instance.

Token

Pointer to the token structure to provide the parameters that are used in this operation. Type *EFI_FTP4_COMMAND_TOKEN* is defined in " *EFI_FTP4_READ_FILE* " .

Description

The *WriteFile()* function is used to initialize and start an FTPv4 upload process and optionally wait for completion. When the upload operation completes, whether successfully or not, the *Token.Status* field is updated by the EFI FTPv4 Protocol driver and then *Token.Event* is signaled (if it is not **NULL**).

Data to be uploaded to server is stored into *Token.DataBuffer* . *Token.DataBufferSize* is the number bytes to be transferred. If the file size is larger than *Token.DataBufferSize, Token.DataCallback* will be called to allow for processing data and then new data will be placed at the beginning of *Token.DataBuffer*. *Token.DataBufferSize* is updated to reflect the actual number of bytes to be transferred. *Token.DataBufferSize* is set to 0 by the call back to indicate the completion of data transfer.

Status Codes Returned

EFI_SUCCESS	The data file is being uploaded successfully.
EFI_UNSUPPORTED	The operation is not supported by this implementation.
EFI_INVALID_PARAMETER	One or more of the parameters is not valid. • This is **NULL**. • Token is **NULL**. • Token. Pathname is **NULL**. • Token. DataBuffer is **NULL**. • Token. DataBufferSize is 0.
EFI_NOT_STARTED	The EFI FTPv4 Protocol driver has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.

28.9.9 EFI_FTP4_PROTOCOL.ReadDirectory()

Summary

Download a data file "directory" from a FTPv4 server. May be unsupported in some EFI implementations.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_FTP4_READ_DIRECTORY) (
  IN EFI_FTP4_PROTOCOL              *This,
  IN EFI_FTP4_COMMAND_TOKEN         *Token
  );
```

Parameters

This

Pointer to the *EFI_FTP4_PROTOCOL* instance.

Token

Pointer to the token structure to provide the parameters that are used in this operation. Type *EFI_FTP4_COMMAND_TOKEN* is defined in " *EFI_FTP4_READ_FILE* " .

Description

The *ReadDirectory()* function is used to return a list of files on the FTPv4 server that logically (or operationally) related to *Token.Pathname,* and optionally wait for completion. When the download operation completes, whether successfully or not, the *Token.Status* field is updated by the EFI FTPv4 Protocol driver and then *Token.Event* is signaled (if it is not **NULL**).

Data will be downloaded from the FTPv4 server into *Token.DataBuffer*. If the file size is larger than *Token.DataBufferSize, Token.DataCallback* will be called to allow for processing data and then new data will be placed at the beginning of *Token.DataBuffer*.

Status Codes Returned

EFI_SUCCESS	The file list information is being downloaded successfully.
EFI_UNSUPPORTED	The operation is not supported by this implementation.
EFI_INVALID_PARAMETER	One or more of the parameters is not valid. • *This* is **NULL**. • *Token* is **NULL.** • *Token. DataBuffer* is **NULL.** • *Token. DataBufferSize* is 0.
EFI_NOT_STARTED	The EFI FTPv4 Protocol driver has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.

28.9.10 EFI_FTP4_PROTOCOL.Poll()

Summary

Polls for incoming data packets and processes outgoing data packets.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_FTP4_POLL) (
  IN EFI_FTP4_PROTOCOL     *This
  );
```

Parameters

This

Pointer to the *EFI_FTP4_PROTOCOL* instance.

Description

The *Poll()* function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the *Poll()* function more often.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_NOT_STARTED	This EFI FTPv4 Protocol instance has not been started.
EFI_INVALID_PARAMETER	This is **NULL**.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_TIMEOUT	Data was dropped out of the transmit and/or receive queue. Consider increasing the polling rate.

28.10 EFI TLS Protocols

28.10.1 EFI TLS Service Binding Protocol

28.10.1.1 EFI_TLS_SERVICE_BINDING_PROTOCOL

Summary

The EFI TLS Service Binding Protocol is used to locate EFI TLS Protocol drivers to create and destroy child of the driver to communicate with other host using TLS protocol.

GUID

```
#define EFI_TLS_SERVICE_BINDING_PROTOCOL_GUID \
  { \
    0x952cb795, 0xff36, 0x48cf, 0xa2, 0x49, 0x4d, 0xf4, 0x86, 0xd6, 0xab, 0x8d \
}
```

Description

The TLS consumer need locate EFI_TLS_SERVICE_BINDING_PROTOCOL and call CreateChild() to create a new child of EFI_TLS_PROTOCOL and EFI_TLS_CONFIGURATION_PROTOCOL instance. Then usE EFI_TLS_CONFIGURATION_PROTOCOL to set TLS configuration data, and use EFI_TLS_PROTOCOL to start TLS session. After use, the TLS consumer needs to call DestroyChild() to destroy it.

28.10.2 EFI TLS Protocol

28.10.2.1 EFI_TLS_PROTOCOL

Summary

This protocol provides the ability to manage TLS session.

GUID

```
#define EFI_TLS_PROTOCOL_GUID \
  { 0xca959f, 0x6cfa, 0x4db1, \
    {0x95, 0xbc, 0xe4, 0x6c, 0x47, 0x51, 0x43, 0x90 }}
```

Protocol Interface Structure

```
typedef struct _EFI_TLS_PROTOCOL {
  EFI_TLS_SET_SESSION_DATA          SetSessionData;
  EFI_TLS_GET_SESSION_DATA          GetSessionData;
  EFI_TLS_BUILD_RESPONSE_PACKET     BuildResponsePacket;
  EFI_TLS_PROCESS_PACKET            ProcessPacket;
  }   EFI_TLS_PROTOCOL;
```

Parameters

SetSessionData
Set TLS session data. See the *SetSessionData ()* function description.

GetSessionData
Get TLS session data. See the *GetSessionData ()* function description.

BuildResponsePacket
Build response packet according to TLS state machine. This function is only valid for alert, handshake and change_cipher_spec content type. See the *BuildResponsePacket ()* function description.

ProcessPacket
Decrypt or encrypt TLS packet during session. This function is only valid after session connected and for application_data content type. See the *ProcessPacket ()* function description.

Description

The *EFI_TLS_PROTOCOL* is used to create, destroy and manage TLS session. For detail of TLS, please refer to TLS related RFC.

28.10.3 EFI_TLS_PROTOCOL.SetSessionData ()

Summary

Set TLS session data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TLS_SET_SESSION_DATA)(
  IN EFI_TLS_PROTOCOL                *This,
  IN EFI_TLS_SESSION_DATA_TYPE       DataType,
  IN VOID                            *Data,
  IN UINTN                           DataSize
  );
```

Parameters

This
Pointer to the *EFI_TLS_PROTOCOL* instance.

DataType
TLS session data type. See *EFI_TLS_SESSION_DATA_TYPE*

Data
Pointer to session data.

DataSize
Total size of session data.

Description

The *SetSessionData()* function set data for a new TLS session. All session data should be set before *BuildResponsePacket()* invoked.

Related Definition

```

EfiTlsVersion
TLS session Version. The corresponding *Data* is of type *EFI_TLS_VERSION*.

EfiTlsConnectionEnd
TLS session as client or as server. The corresponding *Data* is of *EFI_TLS_CONNECTION_END*.

EfiTlsCipherList
A priority list of preferred algorithms for the TLS session. The corresponding Data is a list of EFI_TLS_CIPHER.

EfiTlsCompressionMethod
TLS session compression method. The corresponding Data is of type *EFI_TLS_COMPRESSION*.

EfiTlsExtensionData
TLS session extension data. The corresponding *Data* is a list of type *EFI_TLS_EXTENDION*.

EfiTlsVerifyMethod
TLS session verify method. The corresponding *Data* is of type *EFI_TLS_VERIFY*.

EfiTlsSessionID
TLS session data session ID. For *SetSessionData(),* it is TLS session ID used for session resumption. For *GetSessionData(),* it is the TLS session ID used for current session. The corresponding *Data* is of type *EFI_TLS_SESSION_ID*.

EfiTlsSessionState
TLS session data session state. The corresponding *Data* is of type *EFI_TLS_SESSION_STATE*.

EfiTlsClientRandom
TLS session data client random. The corresponding *Data* is of type *EFI_TLS_RANDOM*.

EfiTlsServerRandom
TLS session data server random. The corresponding *Data* is of type *EFI_TLS_RANDOM*.

EfiTlsKeyMaterial
TLS session data key material. The corresponding *Data* is of type *EFI_TLS_MASTER_SECRET*.

EfiTlsVerifyHost
TLS session hostname for validation which is used to verify whether the name within the peer certificate matches a given host name. This parameter is invalid when *EfiTlsVerifyMethod* is *EFI_TLS_VERIFY_NONE*. The corresponding Data is of type *EFI_TLS_VERIFY_HOST*.

```
//*******************************************************
// EFI_TLS_VERSION
//*******************************************************
typedef struct {
  UINT8        Major;
  UINT8        Minor;
}  EFI_TLS_VERSION;
```

NOTE: *The TLS version definition is from SSL3.0 to latest TLS (e.g. 1.2). SSL2.0 is obsolete and should not be used.*

```
//*******************************************************
// EFI_TLS_CONNECTION_END
//*******************************************************
typedef enum {
  EfiTlsClient,
  EfiTlsServer,
  } EFI_TLS_CONNECTION_END;
```

TLS connection end is to define TLS session as client or as server.

```
//*******************************************************
// EFI_TLS_CIPHER
//*******************************************************
typedef struct {
 UINT8             Data1;
  UINT8             Data2;
} EFI_TLS_CIPHER;
```

NOTE: *The definition of EFI_TLS_CIPHER is from RFC 5246 A.4.1.Hello Messages. The value of EFI_TLS_CIPHER is from TLS Cipher Suite Registry of IANA.*

```
//*******************************************************
// EFI_TLS_COMPRESSION
//*******************************************************
typedef UINT8 EFI_TLS_COMPRESSION;
```

NOTE: *The value of EFI_TLS_COMPRESSION definition is from RFC 3749.*

```
//*******************************************************
// EFI_TLS_EXTENSION
//*******************************************************
typedef struct {
  UINT16       ExtensionType;
  UINT16       Length;
  UINT8        Data [];
  } EFI_TLS_EXTENSION;
```

NOTE: *The definition of* EFI_TLS_EXTENSION *is from RFC 5246 A.4.1. Hello Messages.*

```
//*******************************************************
// EFI_TLS_VERIFY
//*******************************************************
typedef UINT32 EFI_TLS_VERIFY;
#define EFI_TLS_VERIFY_NONE                    0x0
#define EFI_TLS_VERIFY_PEER                    0x1
#define EFI_TLS_VERIFY_FAIL_IF_NO_PEER_CERT    0x2
#define EFI_TLS_VERIFY_CLIENT_ONCE             0x4
```

The consumer needs to use either *EFI_TLS_VERIFY_NONE* or *EFI_TLS_VERIFY_PEER*. *EFI_TLS_VERIFY_FAIL_IF_NO_PEER_CERT* and *EFI_TLS_VERIFY_CLIENT_ONCE* can be ORed with *EFI_TLS_VERIFY_PEER*. *EFI_TLS_VERIFY_FAIL_IF_NO_PEER_CERT* is only meaningful in the server mode, which means the TLS session will fail if the client certificate is absent. *EFI_TLS_VERIFY_CLIENT_ONCE* means the TLS session only verifies the client once, and doesn't request a certificate during re-negotiation.

```
//*******************************************************
// EFI_TLS_VERIFY_HOST
//*******************************************************
typedef struct {
  EFI_TLS_VERIFY_HOST_FLAG         Flags;
  CHAR8                            *HostName;
}   EFI_TLS_VERIFY_HOST;
```

Flags

The host name validation flags. The flags arguments can be ORed.

HostName

The specified host name to be verified.

```
//*******************************************************
// EFI_TLS_VERIFY_HOST_FLAG
//*******************************************************
typedef UINT32 EFI_TLS_VERIFY_HOST_FLAG;
#define EFI_TLS_VERIFY_FLAG_NONE                      0x00
#define EFI_TLS_VERIFY_FLAG_ALWAYS_CHECK_SUBJECT      0x01
#define EFI_TLS_VERIFY_FLAG_NO_WILDCARDS              0x02
#define EFI_TLS_VERIFY_FLAG_NO_PARTIAL_WILDCARDS      0x04
#define EFI_TLS_VERIFY_FLAG_MULTI_LABEL_WILDCARDS     0x08
#define EFI_TLS_VERIFY_FLAG_SINGLE_LABEL_SUBDOMAINS   0x10
#define EFI_TLS_VERIFY_FLAG_NEVER_CHECK_SUBJECT       0x20
```

EFI_TLS_VERIFY_FLAG_NONE means no additional flags set for hostname validation. Wildcards are supported and they match only in the left-most label.

EFI_TLS_VERIFY_FLAG_ALWAYS_CHECK_SUBJECT means to always check the Subject Distinguished Name (DN) in the peer certificate even if the certificate contains Subject Alternative Name (SAN).

EFI_TLS_VERIFY_FLAG_NO_WILDCARDS means to disable the match of all wildcards.

EFI_TLS_VERIFY_FLAG_NO_PARTIAL_WILDCARDS means to disable the "*" as wildcard in labels that have a prefix or suffix (e.g. "www*" or "*www").

EFI_TLS_VERIFY_FLAG_MULTI_LABEL_WILDCARDS allows the "*" to match more than one labels. Otherwise, only matches a single label.

EFI_TLS_VERIFY_FLAG_SINGLE_LABEL_SUBDOMAINS restricts to only match direct child sub-domains which start with ".". For example, a name of ".example.com" would match "www.example.com" with this flag, but would not match “www.sub.example.com”.

EFI_TLS_VERIFY_FLAG_NEVER_CHECK_SUBJECT means never check the Subject Distinguished Name (DN) even there is no Subject Alternative Name (SAN) in the certificate.

If both *EFI_TLS_VERIFY_FLAG_ALWAYS_CHECK_SUBJECT* and *EFI_TLS_VERIFY_FLAG_NEVER_CHECK_SUBJECT* are specified, *EFI_INVALID_PARAMETER* will be returned. If *EFI_TLS_VERIFY_FLAG_NO_WILDCARDS* is set with *EFI_TLS_VERIFY_FLAG_NO_PARTIAL_WILDCARDS* or *EFI_TLS_VERIFY_FLAG_MULTI_LABEL_WILDCARDS, EFI_INVALID_PARAMETER* will be returned.

```
//*********************************************************
// EFI_TLS_RANDOM
//*********************************************************
typedef struct {
  UINT32          GmtUnixTime;
  UINT8           RandomBytes[28];
}   EFI_TLS_RANDOM;
```

NOTE: *The definition of* EFI_TLS_RANDOM *is from RFC 5246 A.4.1. Hello Messages*.

```
//******************************************************
// EFI_TLS_MASTER_SECRET
//******************************************************
typedef struct {
  UINT8 *Data[48];
}   EFI_TLS_MASTER_SECRET;
```

NOTE: *The definition of* EFI_TLS_MASTER_SECRETE *is from RFC 5246 8.1. Computing the Master Secret*.

```
//*******************************************************
// EFI_TLS_SESSION_ID
//*******************************************************
#define MAX_TLS_SESSION_ID_LENGTH 32
typedef struct {
  UINT16             Length;
  UINT8              Data[MAX_TLS_SESSION_ID_LENGTH];
}   EFI_TLS_SESSION_ID;
```

NOTE: *The definition of* EFI_TLS_SESSION_ID *is from RFC 5246 A.4.1. Hello Messages.*

```
//*****************************************************
// EFI_TLS_SESSION_STATE
//*****************************************************
Typedef enum {
  EfiTlsSessionNotStarted,
  EfiTlsSessionHandShaking,
  EfiTlsSessionDataTransferring,
  EfiTlsSessionClosing,
  EfiTlsSessionError,
  EfiTlsSessionStateMaximum
}   EFI_TLS_SESSION_STATE;
```

The definition of *EFI_TLS_SESSION_STATE* is below:

When a new child of TLS protocol is created, the initial state of TLS session is *EfiTlsSessionNotStarted*.

The consumer can call *BuildResponsePacket()* with NULL to get ClientHello to start the TLS session. Then the status is *EfiTlsSessionHandShaking*.

During handshake, the consumer need call *BuildResponsePacket()* with input data from peer, then get response packet and send to peer. After handshake finish, the TLS session status becomes *EfiTlsSessionDataTransferring,* and consume can use *ProcessPacket()* for data transferring.

Finally, if consumer wants to active close TLS session, consumer need call SetSessionData to set TLS session state to *EfiTlsSessionClosing,* and call *BuildResponsePacket()* with NULL to get CloseNotify alert message, and sent it out.

If any error happen during parsing ApplicationData content type, EFI_ABORT will be returned by *ProcessPacket(),* and TLS session state will become *EfiTlsSessionError*. Then consumer need call *BuildResponsePacket()* with NULL to get alert message and sent it out.

Status Codes Returned

EFI_SUCCESS	The TLS session data is set successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL** • *Data* is **NULL**. • *DataSize* is 0.
EFI_UNSUPPORTED	The *DataType* is unsupported.
EFI_ACCESS_DENIED	If the *DataType* is one of below: • *EfiTlsClientRandom* • *EfiTlsServerRandom* • *EfiTlsKeyMaterial*
EFI_NOT_READY	Current TLS session state is NOT *EfiTlsSessionStateNotStarted*.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.

28.10.4 EFI_TLS_PROTOCOL.GetSessionData ()

Summary

Get TLS session data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TLS_GET_SESSION_DATA)(
  IN EFI_TLS_PROTOCOL            *This,
  IN EFI_TLS_SESSION_DATA_TYPE   DataType,
  IN OUT VOID                    *Data, OPTIONAL
  IN OUT UINTN                   *DataSize
  );
```

Parameters

This

Pointer to the *EFI_TLS_PROTOCOL* instance.

DataType

TLS session data type. See EFI_TLS_SESSION_DATA_TYPE

Data

Pointer to session data.

DataSize

Total size of session data. On input, it means the size of *Data* buffer. On output, it means the size of copied *Data* buffer if *EFI_SUCCESS,* and means the size of desired *Data* buffer if *EFI_BUFFER_TOO_SMALL*.

Description

The GetSessionData() function return the TLS session information.

Status Codes Returned

EFI_SUCCESS	The TLS session data is got successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • This is NULL. • DataSize is NULL. • Data is NULL if *DataSize is not zero.
EFI_UNSUPPORTED	The DataType is unsupported.
EFI_NOT_FOUND	The TLS session data is not found.
EFI_NOT_READY	The DataType is not ready in current session state.
EFI_BUFFER_TOO_SMALL	The buffer is too small to hold the data.

28.10.5 EFI_TLS_PROTOCOL.BuildResponsePacket ()

Summary

Build response packet according to TLS state machine. This function is only valid for alert, handshake and change_cipher_spec content type.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TLS_BUILD_RESPONSE_PACKET)(
  IN EFI_TLS_PROTOCOL         *This,
  IN UINT8                    *RequestBuffer, OPTIONAL
  IN UINTN                    RequestSize, OPTIONAL
  OUT UINT8                   *Buffer, OPTIONAL
  IN OUT UINTN                *BufferSize
  );
```

Parameters

This

Pointer to the *EFI_TLS_PROTOCOL* instance.

RequestBuffer

Pointer to the most recently received TLS packet. NULL means TLS need initiate the TLS session and response packet need to be ClientHello.

RequestSize
Packet size in bytes for the most recently received TLS packet. 0 is only valid when *RequestBuffer* is NULL.

Buffer
Pointer to the buffer to hold the built packet.

BufferSize
Pointer to the buffer size in bytes. On input, it is the buffer size provided by the caller. On output, it is the buffer size in fact needed to contain the packet.

Description

The *BuildResponsePacket()* function builds TLS response packet in response to the TLS request packet specified by *RequestBuffer* and *RequestSize*. If *RequestBuffer* is NULL and *RequestSize* is 0, and TLS session status is *EfiTlsSessionNotStarted,* the TLS session will be initiated and the response packet needs to be ClientHello. If *RequestBuffer* is NULL and *RequestSize* is 0, and TLS session status is *EfiTlsSessionClosing,* the TLS session will be closed and response packet needs to be CloseNotify. If *RequestBuffer* is NULL and *RequestSize* is 0, and TLS session status is *EfiTlsSessionError,* the TLS session has errors and the response packet needs to be Alert message based on error type.

Status Codes Returned

EFI_SUCCESS	The required TLS packet is built successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *RequestBuffer* is **NULL** but *RequestSize* is NOT 0. • *RequestSize* is 0 but *RequestBuffer* is **NOT NULL**. • *BufferSize* is **NULL**. • *Buffer* is **NULL**.if *BufferSize* is not zero.
EFI_BUFFER_TOO_SMALL	*BufferSize* is too small to hold the response packet.
EFI_NOT_READY	Current TLS session state is NOT ready to build *ResponsePacket*.
EFI_ABORTED	Something wrong build response packet.

28.10.6 EFI_TLS_PROTOCOL.ProcessPacket ()

Summary

Decrypt or encrypt TLS packet during session. This function is only valid after session connected and for application_data content type.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TLS_PROCESS_PACKET)(
  IN EFI_TLS_PROTOCOL                *This,
  IN OUT EFI_TLS_FRAGMENT_DATA       **FragmentTable,
  IN UINT32                          *FragmentCount,
  IN EFI_TLS_CRYPT_MODE              CryptMode
  );
```

Parameters

This
Pointer to the *EFI_TLS_PROTOCOL* instance.

FragmentTable

Pointer to a list of fragment. The caller will take responsible to handle the original *FragmentTable* while it may be reallocated in TLS driver. If *CryptMode* is *EfiTlsEncrypt,* on input these fragments contain the TLS header and plain text TLS APP payload; on output these fragments contain the TLS header and cypher text TLS APP payload. If *CryptMode* is *EfiTlsDecrypt,* on input these fragments contain the TLS header and cypher text TLS APP payload; on output these fragments contain the TLS header and plain text TLS APP payload.

FragmentCount

Number of fragment.

CryptMode

Crypt mode.

Description

The *ProcessPacket ()* function process each inbound or outbound TLS APP packet.

Related Definition

```
//*******************************************************
// EFI_TLS_FRAGMENT_DATA
//*******************************************************
typedef struct {
  UINT32       FragmentLength;
  VOID         *FragmentBuffer;
}  EFI_TLS_FRAGMENT_DATA;
```

FragmentLength

Length of data buffer in the fragment.

FragmentBuffer

Pointer to the data buffer in the fragment.

```
//*******************************************************
// EFI_TLS_CRYPT_MODE
//*******************************************************
typedef enum {
  EfiTlsEncrypt,
  EfiTlsDecrypt,
}  EFI_TLS_CRYPT_MODE;
```

EfiTlsEncrypt

Encrypt data provided in the fragment buffers.

EfiTlsDecrypt

Decrypt data provided in the fragment buffers.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.

continues on next page

Table 28.67 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *FragmentTable* is **NULL**. • *FragmentCount* is **NULL**. • *CryptoMode* is invalid.
EFI_NOT_READY	Current TLS session state is NOT EfiTlsSessionDataTransferring.
EFI_ABORTED	Something wrong decryption the message. TLS session status will become EfiTlsSessionError. The caller need call *BuildResponsePacket()* to generate Error Alert message and send it out.
EFI_OUT_OF_RESOURCES	No enough resource to finish the operation.

28.10.7 EFI TLS Configuration Protocol

28.10.7.1 EFI_TLS_CONFIGURATION_PROTOCOL

Summary

This protocol provides a way to set and get TLS configuration.

GUID

```
#define EFI_TLS_CONFIGURATION_PROTOCOL_GUID \
  { 0x1682fe44, 0xbd7a, 0x4407, \
    {0xb7, 0xc7, 0xdc, 0xa3, 0x7c, 0xa3, 0x92, 0x2d }}
```

Protocol Interface Structure

```
typedef struct _EFI_TLS_CONFIGURATION_PROTOCOL {
  EFI_TLS_CONFIGURATION_SET_DATA          SetData;
  EFI_TLS_CONFIGURATION_GET_DATA          GetData;
}   EFI_TLS_CONFIGURATION_PROTOCOL;
```

Parameters

SetData
Set TLS configuration data. See the *SetData()* function description.

GetData
Get TLS configuration data. See the *GetData()* function description.

Description

The *EFI_TLS_CONFIGURATION_PROTOCOL* is designed to provide a way to set and get TLS configuration, such as Certificate, private key file.

28.10.8 EFI_TLS_CONFIGURATION_PROTOCOL.SetData()

Summary

Set TLS configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TLS_CONFIGURATION_SET_DATA)(
  IN EFI_TLS_CONFIGURATION_PROTOCOL       *This,
  IN EFI_TLS_CONFIG_DATA_TYPE              DataType,
  IN VOID                                 *Data,
  IN UINTN                                DataSize
  );
```

Parameters

This
Pointer to the *EFI_TLS_CONFIGURATION_PROTOCOL* instance.

DataType
Configuration data type. See EFI_TLS_CONFIG_DATA_TYPE

Data
Pointer to configuration data.

DataSize
Total size of configuration data.

Description

The *SetData()* function sets TLS configuration to non-volatile storage or volatile storage.

Related Definition

```
//*****************************************************
// EFI_TLS_CONFIG_DATA_TYPE
//*****************************************************
typedef enum {
  EfiTlsConfigDataTypeHostPublicCert,
  EfiTlsConfigDataTypeHostPrivateKey,
  EfiTlsConfigDataTypeCACertificate,
  EfiTlsConfigDataTypeCertRevocationList,
  EfiTlsConfigDataTypeMaximum

} EFI_TLS_CONFIG_DATA_TYPE;
```

EfiTlsConfigDataTypeHostPublicCert
Local host configuration data: public certificate data.This data should be DER-encoded binary X.509 certificate or PEM-encoded X.509 certificate.

EfiTlsConfigDataTypeHostPrivateKey
Local host configuration data: private key data.

EfiTlsConfigDataTypeCACertificate
CA certificate to verify peer. This data should be PEM-encoded RSA or PKCS#8 private key.

EfiTlsConfigDataTypeCertRevocationList

CA-supplied Certificate Revocation List data. This data should be DER-encoded CRL data.

Status Codes Returned

EFI_SUCCESS	The TLS configuration data is set successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *Data* is **NULL**. • *DataSize* is 0.
EFI_UNSUPPORTED	The *DataType* is unsupported.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.

28.10.9 EFI_TLS_CONFIGURATION_PROTOCOL.GetData()

Summary

Get TLS configuration data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_TLS_CONFIGURATION_GET_DATA)(
  IN EFI_TLS_CONFIGURATION_PROTOCOL          *This,
  IN EFI_TLS_CONFIG_DATA_TYPE                DataType,
  IN OUT VOID                                *Data, OPTIONAL
  IN OUT UINTN                               *DataSize
  );
```

Parameters

This

Pointer to the *EFI_TLS_CONFIGURATION_PROTOCOL* instance.

DataType

Configuration data type. See EFI_TLS_CONFIG_DATA_TYPE

Data

Pointer to configuration data.

DataSize

Total size of configuration data. On input, it means the size of *Data* buffer. On output, it means the size of copied *Data* buffer if *EFI_SUCCESS,* and means the size of desired *Data* buffer if *EFI_BUFFER_TOO_SMALL.*

Description

The *GetData()* function gets TLS configuration.

Status Codes Returned

EFI_SUCCESS	The TLS configuration data is got successfully.

continues on next page

Table 28.69 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *DataSize* is **NULL** • *Data* is **NULL** if *DataSize* is not zero.
EFI_UNSUPPORTED	The *DataType* is unsupported.
EFI_NOT_FOUND	The TLS configuration data is not found.
EFI_BUFFER_TOO_SMALL	The buffer is too small to hold the data.

CHAPTER

TWENTYNINE

NETWORK PROTOCOLS — ARP, DHCP, DNS, HTTP AND REST

29.1 ARP Protocol

This section defines the EFI Address Resolution Protocol (ARP) Protocol interface. It is split into the following two main sections:

- ARP Service Binding Protocol (ARPSBP)
- ARP Protocol (ARP)

ARP provides a generic implementation of the Address Resolution Protocol that is described in RFCs 826 and 1122. For RFCs can be found see “Links to UEFI-Related Documents” (*uefi.org/uefi*) under the heading “IETF” (RFCs 826 and 1122) for details for code of ICMP message.

29.1.1 EFI_ARP_SERVICE_BINDING_PROTOCOL

Summary

The ARPSBP is used to locate communication devices that are supported by an ARP driver and to create and destroy instances of the ARP child protocol driver.

The EFI Service Binding Protocol in *EFI Services Binding* defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the ARP.

GUID

```
#define EFI_ARP_SERVICE_BINDING_PROTOCOL_GUID \
  {0xf44c00ee,0x1f2c,0x4a00,\
    {0xaa,0x09,0x1c,0x9f,0x3e,0x08,0x00,0xa3}}
```

Description

A network application (or driver) that requires network address resolution can use one of the protocol handler services, such as *BS->LocateHandleBuffer(),* to search for devices that publish a ARPSBP GUID. Each device with a published ARPSBP GUID supports ARP and may be available for use.

After a successful call to the *EFI_ARP _SERVICE_BINDING_PROTOCOL.CreateChild()* function, the child ARP driver instance is in an unconfigured state; it is not ready to resolve addresses.

All child ARP driver instances that are created by one *EFI_ARP _SERVICE_BINDING_PROTOCOL* instance will share an ARP cache to improve efficiency.

Before a network application terminates execution, every successful call to the

EFI_ARP _SERVICE_BINDING_PROTOCOL.CreateChild() function must be matched with a call to the *EFI_ARP _SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

NOTE: *All the network addresses that are described in* EFI_ARP_PROTOCOL *are stored in network byte order. Both incoming and outgoing ARP packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order*.

29.1.2 EFI_ARP_PROTOCOL

Summary

ARP is used to resolve local network protocol addresses into network hardware addresses.

GUID

```
#define EFI_ARP_PROTOCOL_GUID \
  {0xf4b427bb,0xba21,0x4f16,\
    {0xbc,0x4e,0x43,0xe4,0x16,0xab,0x61,0x9c}}
```

Protocol Interface Structure

```
typedef struct _EFI_ARP_PROTOCOL {
  EFI_ARP_CONFIGURE      Configure;
  EFI_ARP_ADD            Add;
  EFI_ARP_FIND           Find;
  EFI_ARP_DELETE         Delete;
  EFI_ARP_FLUSH          Flush;
  EFI_ARP_REQUEST        Request;
  EFI_ARP_CANCEL         Cancel;
}   EFI_ARP_PROTOCOL;
```

Parameters

Configure
Adds a new station address (protocol type and network address) to the ARP cache. See the *Configure()* function description.

Add
Manually inserts an entry to the ARP cache for administrative purpose. See the *Add()* function description.

Find
Locates one or more entries in the ARP cache. See the *Find()* function description.

Delete
Removes an entry from the ARP cache. See the *Delete()* function description.

Flush
Removes all dynamic ARP cache entries of a specified protocol type. See the *Flush()* function description.

Request
Starts an ARP request session. See the *Request()* function description.

Cancel
Abort previous ARP request session. See the *Cancel()* function description.

Description

The *EFI_ARP _PROTOCOL* defines a set of generic ARP services that can be used by any network protocol driver to resolve subnet local network addresses into hardware addresses. Normally, a periodic timer event internally sends and receives packets for ARP. But in some systems where the periodic timer is not supported, drivers and applications that are experiencing packet loss should try calling the *Poll()* function of the EFI Managed Network Protocol frequently.

NOTE: Add() *and* Delete() *are typically used for administrative purposes, such as denying traffic to and from a specific remote machine, preventing ARP requests from coming too fast, and providing static address pairs to save time*. Find() *is also used to update an existing ARP cache entry*.

29.1.3 EFI_ARP_PROTOCOL.Configure()

Summary

Assigns a station address (protocol type and network address) to this instance of the ARP cache.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_ARP_CONFIGURE) (
  IN EFI_ARP_PROTOCOL          *This,
  IN EFI_ARP_CONFIG_DATA       *ConfigData OPTIONAL
  );
```

Parameters

This
A pointer to the *EFI_ARP _PROTOCOL* instance.

ConfigData
A pointer to the *EFI_ARP _CONFIG_DATA* structure. Type *EFI_ARP _CONFIG_DATA* is defined in “Related Definitions” below.

Description

The *Configure()* function is used to assign a station address to the ARP cache for this instance of the ARP driver. Each ARP instance has one station address. The *EFI_ARP _PROTOCOL* driver will respond to ARP requests that match this registered station address. A call to *Configure()* with the *ConfigData* field set to **NULL** will reset this ARP instance.

Once a protocol type and station address have been assigned to this ARP instance, all the following ARP functions will use this information. Attempting to change the protocol type or station address to a configured ARP instance will result in errors.

Related Definitions

```
//*****************************************************
// EFI_ARP_CONFIG_DATA
//*****************************************************
typedef struct {
  UINT16       SwAddressType;
  UINT8        SwAddressLength;
  VOID         *StationAddress;
  UINT32       EntryTimeOut;
  UINT32       RetryCount;
  UINT32       RetryTimeOut;
}   EFI_ARP_CONFIG_DATA;
```

SwAddressType
16-bit protocol type number in host byte order. For more information see "Links to UEFI-Related Documents" (*uefi.org/uefi*) under the heading "16-bit protocol type numbers".

SwAddressLength
Length in bytes of the station's protocol address to register.

StationAddress
Pointer to the first byte of the protocol address to register. For example, if *SwAddressType* is 0x0800 (IP), then *StationAddress* points to the first byte of this station's IP address stored in network byte order.

EntryTimeOut
The timeout value in 100-ns units that is associated with each new dynamic ARP cache entry. If it is set to zero, the value is implementation-specific.

RetryCount
The number of retries before a MAC address is resolved. If it is set to zero, the value is implementation-specific.

RetryTimeOut
The timeout value in 100-ns units that is used to wait for the ARP reply packet or the timeout value between two retries. Set to zero to use implementation-specific value.

Status Codes Returned

EFI_SUCCESS	The new station address was successfully registered.
EFI_INVALID_PARAMETER	• One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *SwAddressLength* is zero when *ConfigData* is not **NULL**. • *StationAddress* is **NULL** when *ConfigData* is not **NULL**.
EFI_ACCESS_DENIED	The *SwAddressType, SwAddressLength,* or *StationAddress* is different from the one that is already registered.
EFI_OUT_OF_RESOURCES	Storage for the new *StationAddress* could not be allocated.

29.1.4 EFI_ARP_PROTOCOL.Add()

Summary

Inserts an entry to the ARP cache.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_ARP_ADD) (
  IN EFI_ARP_PROTOCOL      *This,
  IN BOOLEAN               DenyFlag,
  IN VOID                  *TargetSwAddress OPTIONAL,
  IN VOID                  *TargetHwAddress OPTIONAL,
  IN UINT32                TimeoutValue,
  IN BOOLEAN               Overwrite
  );
```

Parameters

This

A pointer to the *EFI_ARP _PROTOCOL* instance..

DenyFlag

Set to **TRUE** if this entry is a "deny" entry.

Set to **FALSE** if this entry is a "normal" entry.

TargetSwAddress

Pointer to a protocol address to add (or deny). May be set to **NULL** if *DenyFlag* is **TRUE**.

TargetHwAddress

Pointer to a hardware address to add (or deny). May be set to **NULL** if *DenyFlag* is ***TRUE**.*

TimeoutValue

Time in 100-ns units that this entry will remain in the ARP cache. A value of zero means that the entry is permanent. A nonzero value will override the one given by *Configure()* if the entry to be added is dynamic entry.

Overwrite

If **TRUE,** the matching cache entry will be overwritten with the supplied parameters.

If **FALSE,** *EFI_ACCESS_DENIED* is returned if the corresponding cache entry already exists.

Description

The *Add()* function is used to insert entries into the ARP cache.

ARP cache entries are typically inserted and updated by network protocol drivers as network traffic is processed. Most ARP cache entries will time out and be deleted if the network traffic stops. ARP cache entries that were inserted by the *Add()* function may be static (will not time out) or dynamic (will time out).

Default ARP cache timeout values are not covered in most network protocol specifications (although RFC 1122 comes pretty close) and will only be discussed in general in this specification. The timeout values that are used in the EFI Sample Implementation should be used only as a guideline. Final product implementations of the EFI network stack should be tuned for their expected network environments.

The *Add()* function can insert the following two types of entries into the ARP cache:

- "Normal" entries
- "Deny" entries

"Normal" entries must have both a *TargetSwAddress* and *TargetHwAddress* and are used to resolve network protocol addresses into network hardware addresses. Entries are keyed by *TargetSwAddress.* Each *TargetSwAddress* can have only one *TargetHwAddress.* A *TargetHwAddress* may be referenced by multiple *TargetSwAddress* entries.

"Deny" entries may have a *TargetSwAddress* or a *TargetHwAddress,* but not both. These entries tell the ARP driver to ignore any traffic to and from (and to) these addresses. If a request comes in from an address that is being denied, then the request is ignored.

If a normal entry to be added matches a deny entry of this driver, *Overwrite* decides whether to remove the matching deny entry. On the other hand, an existing normal entry can be removed based on the value of *Overwrite* if a deny entry to be added matches the existing normal entry. Two entries are matched only when they have the same addresses or when one of the normal entry addresses is the same as the address of a deny entry.

Status Codes Returned

EFI_SUCCESS	The entry has been added or updated.

continues on next page

Table 29.2 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: *This* is **NULL**. *DenyFlag* is **FALSE** and *TargetHwAddress* is **NULL**. *DenyFlag* is **FALSE** and *TargetSwAddress* is **NULL**. *TargetHwAddress* is **NULL** and *TargetSwAddress* is **NULL** Both *TargetSwAddress* and *TargetHwAddress* are not **NULL** when *DenyFlag* is **TRUE**.
EFI_OUT_OF_RESOURCES	The new ARP cache entry could not be allocated.
EFI_ACCESS_DENIED	The ARP cache entry already exists and *Overwrite* is not **TRUE**.
EFI_NOT_STARTED	The ARP driver instance has not been configured.

29.1.5 EFI_ARP_PROTOCOL.Find()

Summary

Locates one or more entries in the ARP cache.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_ARP_FIND) (
  IN EFI_ARP_PROTOCOL          *This,
  IN BOOLEAN                   BySwAddress,
  IN VOID                      *AddressBuffer OPTIONAL,
  OUT UINT32                   *EntryLength OPTIONAL,
  OUT UINT32                   *EntryCount OPTIONAL,
  OUT EFI_ARP_FIND_DATA        **Entries OPTIONAL,
  IN BOOLEAN Refresh
  );
```

Parameters

This

A pointer to the *EFI_ARP _PROTOCOL* instance.

BySwAddress

Set to **TRUE** to look for matching software protocol addresses.

Set to **FALSE** to look for matching hardware protocol addresses.

AddressBuffer

Pointer to address buffer. Set to **NULL** to match all addresses.

EntryLength

The size of an entry in the entries buffer. To keep the *EFI_ARP _FIND_DATA* structure properly aligned, this field may be longer than *sizeof(EFI_ARP _FIND_DATA)* plus the length of the software and hardware addresses.

EntryCount

The number of ARP cache entries that are found by the specified criteria.

Entries
Pointer to the buffer that will receive the ARP cache entries. Type *EFI_ARP _FIND_DATA* is defined in "Related Definitions" below.

Refresh
Set to **TRUE** to refresh the timeout value of the matching ARP cache entry.

Description

The *Find()* function searches the ARP cache for matching entries and allocates a buffer into which those entries are copied. The first part of the allocated buffer is *EFI_ARP _FIND_DATA,* following which are protocol address pairs and hardware address pairs.

When finding a specific protocol address (*BySwAddress* is **TRUE** and *AddressBuffer* is not **NULL**), the ARP cache timeout for the found entry is reset if *Refresh* is set to **TRUE**. If the found ARP cache entry is a permanent entry, it is not affected by *Refresh.*

Related Definitions

```
//**************************************************
// EFI_ARP_FIND_DATA
//**************************************************
typedef struct {
  UINT32          Size;
  BOOLEAN         DenyFlag;
  BOOLEAN         StaticFlag;
  UINT16          HwAddressType;
  UINT16          SwAddressType;
  UINT8           HwAddressLength;
  UINT8           SwAddressLength;
}   EFI_ARP_FIND_DATA;
```

Size
Length in bytes of this entry.

DenyFlag

Set to **TRUE** if this entry is a "deny" entry.

Set to **FALSE** if this entry is a "normal" entry.

StaticFlag

Set to **TRUE** if this entry will not time out.

Set to **FALSE** if this entry will time out.

HwAddressType
16-bit ARP hardware identifier number.

SwAddressType
16-bit protocol type number.

HwAddressLength
Length of the hardware address.

SwAddressLength
Length of the protocol address.

Status Codes Returned

EFI_SUCCESS	The requested ARP cache entries were copied into the buffer.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • Both *EntryCount* and *EntryLength* are **NULL**, when *Refresh* is **FALSE**.
EFI_NOT_FOUND	No matching entries were found.
EFI_NOT_STARTED	The ARP driver instance has not been configured.

29.1.6 EFI_ARP_PROTOCOL.Delete()

Summary

Removes entries from the ARP cache.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_ARP_DELETE) (
  IN EFI_ARP_PROTOCOL        *This,
  IN BOOLEAN                 BySwAddress,
  IN VOID                    *AddressBuffer OPTIONAL
  );
```

Parameters

This

A pointer to the *EFI_ARP _PROTOCOL* instance.

BySwAddress

Set to **TRUE** to delete matching protocol addresses.

Set to **FALSE** to delete matching hardware addresses.

AddressBuffer

Pointer to the address buffer that is used as a key to look for the cache entry. Set to **NULL** to delete all entries.

Description

The Delete() function removes specified ARP cache entries.

Status Codes Returned

EFI_SUCCESS	The entry was removed from the ARP cache.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NOT_FOUND	The specified deletion key was not found.
EFI_NOT_STARTED	The ARP driver instance has not been configured.

29.1.7 EFI_ARP_PROTOCOL.Flush()

Summary

Removes all dynamic ARP cache entries that were added by this interface.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_ARP_FLUSH) (
 IN EFI_ARP_PROTOCOL       *This
 );
```

Parameters

This

A pointer to the *EFI_ARP _PROTOCOL* instance.

Description

The *Flush()* function deletes all dynamic entries from the ARP cache that match the specified software protocol type.

Status Codes Returned

EFI_SUCCESS	The cache has been flushed.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NOT_FOUND	There are no matching dynamic cache entries.
EFI_NOT_STARTED	The ARP driver instance has not been configured.

29.1.8 EFI_ARP_PROTOCOL.Request()

Summary

Starts an ARP request session.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_ARP_REQUEST) (
  IN EFI_ARP_PROTOCOL           *This,
  IN VOID                       *TargetSwAddress OPTIONAL,
  IN EFI_EVENT                  ResolvedEvent OPTIONAL,
  OUT VOID                      *TargetHwAddress
  );
```

Parameters

This

A pointer to the *EFI_ARP _PROTOCOL* instance..

TargetSwAddress

Pointer to the protocol address to resolve.

ResolvedEvent

Pointer to the event that will be signaled when the address is resolved or some error occurs.

TargetHwAddress

Pointer to the buffer for the resolved hardware address in network byte order. The buffer must be large enough to hold the resulting hardware address. *TargetHwAddress* must not be **NULL**.

Description

The *Request()* function tries to resolve the *TargetSwAddress* and optionally returns a *TargetHwAddress* if it already exists in the ARP cache.

If the registered *SwAddressType* (see *EFI_ARP _PROTOCOL.Add()*) is IPv4 or IPv6 and the *TargetSwAddress* is a multicast address, then the *TargetSwAddress* is resolved using the underlying *EFI_MANAGED_NETWORK_PROTOCOL.McastIpToMac()* function.

If the *TargetSwAddress* is **NULL,** then the network interface hardware broadcast address is returned immediately in *TargetHwAddress.*

If the *ResolvedEvent* is not **NULL** and the address to be resolved is not in the ARP cache, then the event will be signaled when the address request completes and the requested hardware address is returned in the *TargetHwAddress.* If the timeout expires and the retry count is exceeded or an unexpected error occurs, the event will be signaled to notify the caller, which should check the *TargetHwAddress* to see if the requested hardware address is available. If it is not available, the *TargetHwAddress* is filled by zero.

If the address to be resolved is already in the ARP cache and resolved, then the event will be signaled immediately if it is not **NULL,** and the requested hardware address is also returned in *TargetHwAddress.*

Status Codes Returned

EFI_SUCCESS	The data was copied from the ARP cache into the *TargetHwAddress* buffer.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: *This* is **NULL** *TargetHwAddress* is **NULL**
EFI_ACCESS_DENIED	The requested address is not present in the normal ARP cache but is present in the deny address list. Outgoing traffic to that address is forbidden.
EFI_NOT_STARTED	The ARP driver instance has not been configured.
EFI_NOT_READY	The request has been started and is not finished.
EFI_UNSUPPORTED	The requested conversion is not supported in this implementation or configuration.

29.1.9 EFI_ARP_PROTOCOL.Cancel()

Summary

Cancels an ARP request session.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_ARP_CANCEL) (
  IN EFI_ARP_PROTOCOL        *This,
  IN VOID                    *TargetSwAddress OPTIONAL,
```

(continues on next page)

(continued from previous page)

```
IN EFI_EVENT                 ResolvedEvent OPTIONAL
);
```

Parameters

This
A pointer to the *EFI_ARP _PROTOCOL* instance.

TargetSwAddress
Pointer to the protocol address in previous request session.

ResolvedEvent
Pointer to the event that is used as the notification event in previous request session.

Description

The *Cancel()* function aborts the previous ARP request (identified by *This, TargetSwAddress* and *ResolvedEvent*) that is issued by *EFI_ARP _PROTOCOL.Request().* If the request is in the internal ARP request queue, the request is aborted immediately and its *ResolvedEvent* is signaled. Only an asynchronous address request needs to be canceled. If *TargeSwAddress* and *ResolveEvent* are both **NULL,** all the pending asynchronous requests that have been issued by *This* instance will be cancelled and their corresponding events will be signaled.

Status Codes Returned

EFI_SUCCESS	The pending request session(s) is/are aborted and corresponding event(s) is/are signaled.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *TargetSwAddress* is not **NULL** and *ResolvedEvent* is **NULL** • *TargetSwAddress* is **NULL** and *ResolvedEvent* is not **NULL**
EFI_NOT_STARTED	The ARP driver instance has not been configured.
EFI_NOT_FOUND	The request is not issued by *EFI_ARP _PROTOCOL.Request().*

29.2 EFI DHCPv4 Protocol

This section provides a detailed description of the *EFI_DHCP4_PROTOCOL* and the *EFI_DHCP4_SERVICE_BINDING_PROTOCOL.* The EFI DHCPv4 Protocol is used to collect configuration information for the EFI IPv4 Protocol drivers and to provide DHCPv4 server and PXE boot server discovery services.

29.2.1 EFI_DHCP4_SERVICE_BINDING_PROTOCOL

Summary

The EFI DHCPv4 Service Binding Protocol is used to locate communication devices that are supported by an EFI DHCPv4 Protocol driver and to create and destroy EFI DHCPv4 Protocol child driver instances that can use the underlying communications device.

GUID

```
#define EFI_DHCP4_SERVICE_BINDING_PROTOCOL_GUID \
 {0x9d9a39d8,0xbd42,0x4a73,\
   {0xa4,0xd5,0x8e,0xe9,0x4b,0xe1,0x13,0x80}}
```

Description

A network application or driver that requires basic DHCPv4 services can use one of the protocol handler services, such as *BS->LocateHandleBuffer(),* to search for devices that publish an EFI DHCPv4 Service Binding Protocol GUID. Each device with a published EFI DHCPv4 Service Binding Protocol GUID supports the EFI DHCPv4 Protocol and may be available for use.

After a successful call to the *EFI_DHCP4_SERVICE_BINDING_PROTOCOL .CreateChild()* function, the newly created EFI DHCPv4 Protocol child driver instance is ready to be used by a network application or driver.

Before a network application or driver terminates execution, every successful call to the *EFI_DHCP4_SERVICE_BINDING_PROTOCOL .CreateChild()* function must be matched with a call to the *EFI_DHCP4_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

29.2.2 EFI_DHCP4_PROTOCOL

Summary

This protocol is used to collect configuration information for the EFI IPv4 Protocol drivers and to provide DHCPv4 server and PXE boot server discovery services.

GUID

```
#define EFI_DHCP4_PROTOCOL_GUID \
 {0x8a219718,0x4ef5,0x4761,\
   {0x91,0xc8,0xc0,0xf0,0x4b,0xda,0x9e,0x56}}
```

Protocol Interface Structure

```
typedef struct _EFI_DHCP4_PROTOCOL {
  EFI_DHCP4_GET_MODE_DATA        GetModeData;
  EFI_DHCP4_CONFIGURE            Configure;
  EFI_DHCP4_START                Start;
  EFI_DHCP4_RENEW_REBIND         RenewRebind;
  EFI_DHCP4_RELEASE              Release;
  EFI_DHCP4_STOP                 Stop;
  EFI_DHCP4_BUILD                Build;
  EFI_DHCP4_TRANSMIT_RECEIVE     TransmitReceive;
  EFI_DHCP4_PARSE                Parse;
}  EFI_DHCP4_PROTOCOL;
```

Parameters

GetModeData
Gets the EFI DHCPv4 Protocol driver status and operational data. See the *GetModeData()* function description.

Configure
Initializes, changes, or resets operational settings for the EFI DHCPv4 Protocol driver. See the *Configure()* function description.

Start
Starts the DHCP configuration process. See the *Start()* function description.

RenewRebind
Tries to manually extend the lease time by sending a request packet. See the *RenewRebind()* function description.

Release
Releases the current configuration and returns the EFI DHCPv4 Protocol driver to the initial state. See the *Release()* function description.

Stop
Stops the DHCP configuration process no matter what state the driver is in. After being stopped, this driver will not automatically communicate with the DHCP server. See the *Stop()* function description.

Build
Puts together a DHCP or PXE packet. See the *Build()* function description.

TransmitReceive
Transmits a DHCP or PXE packet and waits for response packets. See the *TransmitReceive()* function description.

Parse
Parses the packed DHCP or PXE option data. See the *Parse()* function description.

Description

The EFI_DHCP4_PROTOCOL is used to collect configuration information for the EFI IPv4 Protocol driver and provide DHCP server and PXE boot server discovery services.

Byte Order Note

All the IPv4 addresses that are described in *EFI_DHCP4_PROTOCOL* are stored in network byte order. Both incoming and outgoing DHCP packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order

29.2.3 EFI_DHCP4_PROTOCOL.GetModeData()

Summary

Returns the current operating mode and cached data packet for the EFI DHCPv4 Protocol driver.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP4_GET_MODE_DATA)(
  IN EFI_DHCP4_PROTOCOL            *This,
  OUT EFI_DHCP4_MODE_DATA          *Dhcp4ModeData
  );
```

Parameters

This
Pointer to the *EFI_DHCP4_PROTOCOL* instance.

Dhcp4ModeData
Pointer to storage for the *EFI_DHCP4_MODE_DATA* structure. Type *EFI_DHCP4_MODE_DATA* is defined in “Related Definitions” below.

Description

The *GetModeData()* function returns the current operating mode and cached data packet for the EFI DHCPv4 Protocol driver.

Related Definitions

```
//*******************************************************************
// EFI_DHCP4_MODE_DATA
//*******************************************************************
typedef struct {
  EFI_DHCP4_STATE           State;
  EFI_DHCP4_CONFIG_DATA     ConfigData;
  EFI_IPv4_ADDRESS          ClientAddress;
  EFI_MAC_ADDRESS           ClientMacAddress;
  EFI_IPv4_ADDRESS          ServerAddress;
  EFI_IPv4_ADDRESS          RouterAddress;
  EFI_IPv4_ADDRESS          SubnetMask;
  UINT32                    LeaseTime;
  EFI_DHCP4_PACKET          *ReplyPacket;
}  EFI_DHCP4_MODE_DATA;
```

State

The EFI DHCPv4 Protocol driver operating state. Type *EFI_DHCP4_STATE* is defined below.

ConfigData

The configuration data of the current EFI DHCPv4 Protocol driver instance. Type *EFI_DHCP4_CONFIG_DATA* is defined in EFI_DHCP4_PROTOCOL *.Configure()*.

ClientAddress

The client IP address that was acquired from the DHCP server. If it is zero, the DHCP acquisition has not completed yet and the following fields in this structure are undefined.

ClientMacAddress

The local hardware address.

ServerAddress

The server IP address that is providing the DHCP service to this client.

RouterAddress

The router IP address that was acquired from the DHCP server. May be zero if the server does not offer this address.

SubnetMask

The subnet mask of the connected network that was acquired from the DHCP server.

LeaseTime

The lease time (in 1-second units) of the configured IP address. The value 0xFFFFFFFF means that the lease time is infinite. A default lease of 7 days is used if the DHCP server does not provide a value.

ReplyPacket

The cached latest DHCPACK or DHCPNAK or BOOTP REPLY packet. May be NULL if no packet is cached.

The EFI_DHCP4_MODE_DATA structure describes the operational data of the current DHCP procedure.

```
//*********************************************************
// EFI_DHCP4_STATE
//*********************************************************
typedef enum {
  Dhcp4Stopped      = 0x0,
  Dhcp4Init         = 0x1,
  Dhcp4Selecting    = 0x2,
  Dhcp4Requesting   = 0x3,
  Dhcp4Bound        = 0x4
```

(continues on next page)

(continued from previous page)

```
  Dhcp4Renewing    = 0x5,
  Dhcp4Rebinding   = 0x6,
  Dhcp4InitReboot  = 0x7,
  Dhcp4Rebooting   = 0x8
}  EFI_DHCP4_STATE;
```

Table 29.8: DHCP4 Enumerations

Field	Description
Dhcp4Stopped	The EFI DHCPv4 Protocol driver is stopped and EFI_DHCP4_PROTOCOL.Configure() needs to be called. The rest of the EFI_DHCP4_MODE_DATA structure is undefined in this state.
Dhcp4Init	The EFI DHCPv4 Protocol driver is inactive and EFI_DHCP4_PROTOCOL.Start() needs to be called. The rest of the EFI_DHCP4_MODE_DATA structure is undefined in this state.
Dhcp4Selecting	The EFI DHCPv4 Protocol driver is collecting DHCP offer packets from DHCP servers. The rest of the EFI_DHCP4_MODE_DATA structure is undefined in this state.
Dhcp4Requesting	The EFI DHCPv4 Protocol driver has sent the request to the DHCP server and is waiting for a response. The rest of the EFI_DHCP4_MODE_DATA structure is undefined in this state.
Dhcp4Bound	The DHCP configuration has completed. All of the fields in the EFI_DHCP4_MODE_DATA structure are defined.
Dhcp4Renewing	The DHCP configuration is being renewed and another request has been sent out, but it has not received a response from the server yet. All of the fields in the EFI_DHCP4_MODE_DATA structure are available but may change soon.
Dhcp4Rebinding	The DHCP configuration has timed out and the EFI DHCPv4 Protocol driver is trying to extend the lease time. The rest of the EFI_DHCP4_MODE structure is undefined in this state.
Dhcp4InitReboot	The EFI DHCPv4 Protocol driver is initialized with a previously allocated or known IP address. EFI_DHCP4_PROTOCOL.Start() needs to be called to start the configuration process. The rest of the EFI_DHCP4_MODE_DATA structure is undefined in this state.
Dhcp4Rebooting	The EFI DHCPv4 Protocol driver is seeking to reuse the previously allocated IP address by sending a request to the DHCP server. The rest of the EFI_DHCP4_MODE_DATA structure is undefined in this state.

EFI_DHCP4_STATE defines the DHCP operational states that are described in RFC 2131, which can be obtained at "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "RFC 2131".

A variable number of EFI DHCPv4 Protocol driver instances can coexist but they share the same state machine. More precisely, each communication device has a separate DHCP state machine if there are multiple communication devices. Each EFI DHCPv4 Protocol driver instance that is created by the same EFI DHCPv4 Service Binding Protocol driver instance shares the same state machine. In this document, when we refer to the state of EFI DHCPv4 Protocol driver, we actually refer to the state of the communication device from which the current EFI DHCPv4 Protocol Driver instance is created.

```
//*******************************************
// EFI_DHCP4_PACKET
//*******************************************
#pragma pack(1)
typedef struct {
```

(continues on next page)

(continued from previous page)

```
  UINT32              Size;
  UINT32              Length;
  struct{
    EFI_DHCP4_HEADER  Header;
    UINT32            Magik;
    UINT8             Option[1];
  }  Dhcp4;
}  FI_DHCP4_PACKET;
#pragma pack()
```

Size

Size of the *EFI_DHCP4_PACKET* buffer.

Length

Length of the *EFI_DHCP4_PACKET* from the first byte of the *Header* field to the last byte of the Option[] field.

Header

DHCP packet header.

Magik

DHCP magik cookie in network byte order.

Option

Start of the DHCP packed option data. EFI_DHCP4_PACKET defines the format of DHCPv4 packets. See RFC 2131 for more information.

Status Codes Returned

EFI_SUCCESS	The mode data was returned.
EFI_INVALID_PARAMETER	*This* is **NULL**.

29.2.4 EFI_DHCP4_PROTOCOL.Configure()

Summary

Initializes, changes, or resets the operational settings for the EFI DHCPv4 Protocol driver.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP4_CONFIGURE) (
  IN EFI_DHCP4_PROTOCOL            *This,
  IN EFI_DHCP4_CONFIG_DATA         *Dhcp4CfgData OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_DHCP4_PROTOCOL* instance.

Dhcp4CfgData

Pointer to the *EFI_DHCP4_CONFIG_DATA*. Type *EFI_DHCP4_CONFIG_DATA* is defined in “Related Definitions” below.

Description

The *Configure()* function is used to initialize, change, or reset the operational settings of the EFI DHCPv4 Protocol driver for the communication device on which the EFI DHCPv4 Service Binding Protocol is installed. This function can be successfully called only if both of the following are true:

- This instance of the EFI DHCPv4 Protocol driver is in the *Dhcp4Stopped, Dhcp4Init, Dhcp4InitReboot,* or *Dhcp4Bound* states.
- No other EFI DHCPv4 Protocol driver instance that is controlled by this EFI DHCPv4 Service Binding Protocol driver instance has configured this EFI DHCPv4 Protocol driver.

When this driver is in the *Dhcp4Stopped* state, it can transfer into one of the following two possible initial states:

- *Dhcp4Init*
- *Dhcp4InitReboot*

The driver can transfer into these states by calling *Configure()* with a non- **NULL** *Dhcp4CfgData.* The driver will transfer into the appropriate state based on the supplied client network address in the *ClientAddress* parameter and DHCP options in the *OptionList* parameter as described in RFC 2131.

When *Configure()* is called successfully while *Dhcp4CfgData* is set to *NULL,* the default configuring data will be reset in the EFI DHCPv4 Protocol driver and the state of the EFI DHCPv4 Protocol driver will not be changed. If one instance wants to make it possible for another instance to configure the EFI DHCPv4 Protocol driver, it must call this function with *Dhcp4CfgData* set to **NULL**.

Related Definitions

```
//*******************************************************************
// EFI_DHCP4_CONFIG_DATA
//*******************************************************************
typedef struct {
  UINT32                  DiscoverTryCount;
  UINT32                  *DiscoverTimeout;
  UINT32                  RequestTryCount;
  UINT32                  *RequestTimeout;
  EFI_IPv4_ADDRESS        ClientAddress;
  EFI_DHCP4_CALLBACK      Dhcp4Callback;
  VOID                    *CallbackContext;
  UINT32                  OptionCount;
  EFI_DHCP4_PACKET_OPTION  **OptionList;
}  EFI_DHCP4_CONFIG_DATA;
```

DiscoverTryCount

Number of times to try sending a packet during the *Dhcp4SendDiscover* event and waiting for a response during the *Dhcp4RcvdOffer* event. (This value is also the number of entries in the *DiscoverTimeout* array.) Set to zero to use the default try counts and timeout values.

DiscoverTimeout

Maximum amount of time (in seconds) to wait for returned packets in each of the retries. Timeout values of zero will default to a timeout value of one second. Set to **NULL** to use default timeout values.

RequestTryCount

Number of times to try sending a packet during the *Dhcp4SendReques* t event and waiting for a response during the *Dhcp4RcvdAck* event before accepting failure. (This value is also the number of entries in the *RequestTimeout* array.) Set to zero to use the default try counts and timeout values.

RequestTimeout

Maximum amount of time (in seconds) to wait for return packets in each of the retries. Timeout values of zero will default to a timeout value of one second. Set to **NULL** to use default timeout values.

ClientAddress

For a DHCPDISCOVER, setting this parameter to the previously allocated IP address will cause the EFI DHCPv4 Protocol driver to enter the *Dhcp4InitReboot* state. Also, set this field to 0.0.0.0 to enter the *Dhcp4Init* state.For a DHCPINFORM this parameter should be set to the client network address which was assigned to the client during a DHCPDISCOVER.

Dhcp4Callback

The callback function to intercept various events that occurred in the DHCP configuration process. Set to **NULL** to ignore all those events. Type *EFI_DHCP4_CALLBACK* is defined below.

CallbackContext

Pointer to the context that will be passed to *Dhcp4Callback* when it is called.

OptionCount

Number of DHCP options in the *OptionList.*

OptionList

List of DHCP options to be included in every packet that is sent during the *Dhcp4SendDiscover* event. Pad options are appended automatically by DHCP driver in outgoing DHCP packets. If *OptionList* itself contains pad option, they are ignored by the driver. *OptionList* can be freed after *EFI_DHCP4_PROTOCOL .Configure()* returns. Ignored if *OptionCount* is zero. Type *EFI_DHCP4_PACKET_OPTION* is defined below.

```
//*******************************************************************
// EFI_DHCP4_CALLBACK
//*******************************************************************
typedef EFI_STATUS (*EFI_DHCP4_CALLBACK)(
  IN EFI_DHCP4_PROTOCOL    *This,
  IN VOID                  *Context,
  IN EFI_DHCP4_STATE       CurrentState,
  IN EFI_DHCP4_EVENT       Dhcp4Event,
  IN EFI_DHCP4_PACKET      *Packet, OPTIONAL
  OUT EFI_DHCP4_PACKET     **NewPacket OPTIONAL
  );
```

This

Pointer to the EFI DHCPv4 Protocol instance that is used to configure this callback function.

Context

Pointer to the context that is initialized by *EFI_DHCP4_PROTOCOL .Configure().*

CurrentState

The current operational state of the EFI DHCPv4 Protocol driver. Type *EFI_DHCP4_STATE* is defined in *EFI_DHCP4_PROTOCOL .GetModeData().*

Dhcp4Event

The event that occurs in the current state, which usually means a state transition. Type *EFI_DHCP4_EVENT* is defined below.

Packet

The DHCP packet that is going to be sent or already received. May be **NULL** if the event has no associated packet. Do not cache this packet except for copying it. Type *EFI_DHCP4_PACKET* is defined in *EFI_DHCP4_PROTOCOL .GetModeData().*

NewPacket

The packet that is used to replace the above *Packet.* Do not set this pointer exactly to the above *Packet* or a modified *Packet. NewPacket* can be **NULL** if the EFI DHCPv4 Protocol driver does not expect a new packet to be returned. The user may set *NewPacket* to **NULL** if no replacement occurs.

EFI_DHCP4_CALLBACK is provided by the consumer of the EFI DHCPv4 Protocol driver to intercept events that occurred in the configuration process. This structure provides advanced control of each state transition of the DHCP process. The returned status code determines the behavior of the EFI DHCPv4 Protocol driver. There are three possible returned values, which are described in the following table.

Status Codes Returned

EFI_SUCCESS	Tells the EFI DHCPv4 Protocol driver to continue the DHCP process. When it is in the *Dhcp4Selecting* state, it tells the EFI DHCPv4 Protocol driver to stop collecting additional packets. The driver will exit the *Dhcp4Selecting* state and enter the *Dhcp4Requesting* state.
EFI_NOT_READY	Only used in the *Dhcp4Selecting* state. The EFI DHCPv4 Protocol driver will continue to wait for more packets until the retry timeout expires.
EFI_ABORTED	Tells the EFI DHCPv4 Protocol driver to abort the current process and return to the *Dhcp4Init* or *Dhcp4InitReboot* state.

```
//*******************************************************
// EFI_DHCP4_EVENT
//*******************************************************
typedef enum {
  Dhcp4SendDiscover    = 0x01,
  Dhcp4RcvdOffer       = 0x02,
  Dhcp4SelectOffer     = 0x03,
  Dhcp4SendRequest     = 0x04,
  Dhcp4RcvdAck         = 0x05,
  Dhcp4RcvdNak         = 0x06,
  Dhcp4SendDecline     = 0x07,
  Dhcp4BoundCompleted  = 0x08,
  Dhcp4EnterRenewing   = 0x09,
  Dhcp4EnterRebinding  = 0x0a,
  Dhcp4AddressLost     = 0x0b,
  Dhcp4Fail            = 0x0c
}  EFI_DHCP4_EVENT;
```

Following is a description of the fields in the above enumeration.

Dhcp4SendDiscover

The packet to start the configuration sequence is about to be sent. The packet is passed to *Dhcp4Callback* and can be modified or replaced in *Dhcp4Callback*.

Dhcp4RcvdOffer

A reply packet was just received. This packet is passed to *Dhcp4Callback,* which may copy this packet and cache it for selecting a task later. If the callback returns *EFI_SUCCESS,* this driver will finish the selecting state. If *EFI_NOT_READY* is returned, this driver will continue to wait for additional reply packets until the timer expires. In either case, *Dhcp4SelectOffer* will occur for the user to select an offer.

Dhcp4SelectOffer

It is time for *Dhcp4Callback* to select an offer. This driver passes the latest received DHCPOFFER packet to the callback. The *Dhcp4Callback* may store one packet in the *NewPacket* parameter of the function that was selected from previously received DHCPOFFER packets. If the latest packet is the selected one or if the user does not care about it, no extra overhead is needed. Simply skipping this event is enough.

Dhcp4SendRequest A

request packet is about to be sent. The user can modify or replace this packet.

Dhcp4RcvdAck
A DHCPACK packet was received and will be passed to *Dhcp4Callback*. The callback may decline this DHCPACK packet by returning *EFI_ABORTED*. In this case, the EFI DHCPv4 Protocol driver will proceed to the *Dhcp4SendDecline* event.

Dhcp4RcvdNak
A DHCPNAK packet was received and will be passed to *Dhcp4Callback*. The EFI DHCPv4 Protocol driver will then return to the *Dhcp4Init* state no matter what status code is returned from the callback function.

Dhcp4SendDecline
A decline packet is about to be sent. *Dhcp4Callback* can modify or replace this packet.The EFI DHCPv4 Protocol driver will then be set to the *Dhcp4Init* state.

Dhcp4BoundCompleted
The DHCP configuration process has completed. No packet is associated with this event.

Dhcp4EnterRenewing
It is time to enter the *Dhcp4Renewing* state and to contact the server that originally issued the network address. No packet is associated with this event.

Dhcp4EnterRebinding
It is time to enter the *Dhcp4Rebinding* state and to contact any server. No packet is associated with this event.

Dhcp4AddressLost
The configured IP address was lost either because the lease has expired, the user released the configuration, or a DHCPNAK packet was received in the *Dhcp4Renewing* or *Dhcp4Rebinding* state. No packet is associated with this event.

Dhcp4Fail
The DHCP process failed because a DHCPNAK packet was received or the user aborted the DHCP process at a time when the configuration was not available yet. No packet is associated with this event.

```
//*******************************************
// EFI_DHCP4_HEADER
//*******************************************
#pragma pack(1)
typedef struct{
  UINT8              OpCode;
  UINT8              HwType;
  UINT8              HwAddrLen;
  UINT8              Hops;
  UINT32             Xid;
  UINT16             Seconds;
  UINT16             Reserved;
  EFI_IPv4_ADDRESS   ClientAddr;
  EFI_IPv4_ADDRESS   YourAddr;
  EFI_IPv4_ADDRESS   ServerAddr;
  EFI_IPv4_ADDRESS   GatewayAddr;
  UINT8              ClientHwAddr[16];
  CHAR8              ServerName[64];
  CHAR8              BootFileName[128];
}   EFI_DHCP4_HEADER;
#pragma pack()
```

OpCode
Message type. 1 = BOOTREQUEST, 2 = BOOTREPLY.

HwType
Hardware address type.

HwAddrLen
Hardware address length.

Hops
Maximum number of hops (routers, gateways, or relay agents) that this DHCP packet can go through before it is dropped.

Xid
DHCP transaction ID.

Seconds
Number of seconds that have elapsed since the client began address acquisition or the renewal process.

Reserved
Reserved for future use.

ClientAddr
Client IP address from the client.

YourAddr
Client IP address from the server.

ServerAddr
IP address of the next server in bootstrap.

GatewayAddr
Relay agent IP address.

ClientHwAddr
Client hardware address.

ServerName
Optional server host name.

BootFileName
Boot file name.

EFI_DHCP4_HEADER describes the semantics of the DHCP packet header. This packet header is in network byte order.

```
//*******************************************
// EFI_DHCP4_PACKET_OPTION
//*******************************************
#pragma pack(1)
typedef struct {
  UINT8      OpCode;
  UINT8      Length;
  UINT8      Data[1];
}  EFI_DHCP4_PACKET_OPTION;
#pragma pack()
```

OpCode
DHCP option code.

Length
Length of the DHCP option data. Not present if *OpCode* is 0 or 255.

Data
Start of the DHCP option data. Not present if *OpCode* is 0 or 255 or if *Length* is zero.

The DHCP packet option data structure is used to reference option data that is packed in the DHCP packets. Use caution when accessing multibyte fields because the information in the DHCP packet may not be properly aligned for the machine architecture.

Status Codes Returned

EFI_SUCCESS	The EFI DHCPv4 Protocol driver is now in the *Dhcp4Init* or *Dhcp4InitReboot* state, if the original state of this driver was *Dhcp4Stopped, Dhcp4Init, Dhcp4InitReboot,* or *Dhcp4Bound* and the value of *Dhcp4CfgData* was not **NULL**. Otherwise, the state was left unchanged.
EFI_ACCESS_DENIED	This instance of the EFI DHCPv4 Protocol driver was not in the *Dhcp4Stopped, Dhcp4Init, Dhcp4InitReboot,* or *Dhcp4Bound* state.
EFI_ACCESS_DENIED	Another instance of this EFI DHCPv4 Protocol driver is already in a valid configured state.
EFI_INVALID_PARAMETER	One or more following conditions are **TRUE**: • *This* is **NULL**. • *DiscoverTryCount* > 0 and *DiscoverTimeout* is **NULL** • *RequestTryCount* > 0 and *RequestTimeout* is **NULL**. • *OptionCount* >0 and *OptionList* is **NULL**. • *ClientAddress* is not a valid unicast address.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

29.2.5 EFI_DHCP4_PROTOCOL.Start()

Summary

Starts the DHCP configuration process.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP4_START) (
  IN EFI_DHCP4_PROTOCOL        *This,
  IN EFI_EVENT                 CompletionEvent OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_DHCP4_PROTOCOL* instance.

CompletionEvent

If not **NULL,** indicates the event that will be signaled when the EFI DHCPv4 Protocol driver is transferred into the *Dhcp4Bound* state or when the DHCP process is aborted. *EFI_DHCP4_PROTOCOL .GetModeData()* can be called to check the completion status. If **NULL,** *EFI_DHCP4_PROTOCOL.Start()* will wait until the driver is transferred into the *Dhcp4Bound* state or the process fails.

Description

The *Start()* function starts the DHCP configuration process. This function can be called only when the EFI DHCPv4 Protocol driver is in the *Dhcp4Init* or *Dhcp4InitReboot* state.

If the DHCP process completes successfully, the state of the EFI DHCPv4 Protocol driver will be transferred through *Dhcp4Selecting* and *Dhcp4Requesting* to the *Dhcp4Bound* state. The *CompletionEvent* will then be signaled if it is not **NULL**.

If the process aborts, either by the user or by some unexpected network error, the state is restored to the *Dhcp4Init* state. The *Start()* function can be called again to restart the process.

Refer to RFC 2131 for precise state transitions during this process. At the time when each event occurs in this process, the callback function that was set by *EFI_DHCP4_PROTOCOL .Configure()* will be called and the user can take this opportunity to control the process.

Status Codes Returned

EFI_SUCCESS	The DHCP configuration process has started, or it has completed when *CompletionEvent* is **NULL**.
EFI_NOT_STARTED	The EFI DHCPv4 Protocol driver is in the *Dhcp4Stopped* state. *EFI_DHCP4_PROTOCOL .Configure()* needs to be called.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_TIMEOUT	The DHCP configuration process failed because no response was received from the server within the specified timeout value.
EFI_ABORTED	The user aborted the DHCP process.
EFI_ALREADY_STARTED	Some other EFI DHCPv4 Protocol instance already started the DHCP process.
EFI_DEVICE_ERROR	An unexpected network or system error occurred.
EFI_NO_MEDIA	There was a media error.

29.2.6 EFI_DHCP4_PROTOCOL.RenewRebind()

Summary

Extends the lease time by sending a request packet.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP4_RENEW_REBIND) (
  IN EFI_DHCP4_PROTOCOL            *This,
  IN BOOLEAN                       RebindRequest,
  IN EFI_EVENT                     CompletionEvent OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_DHCP4_PROTOCOL* instance.

RebindRequest

If **TRUE,** this function broadcasts the request packets and enters the *Dhcp4Rebinding* state. Otherwise, it sends a unicast request packet and enters the *Dhcp4Renewing* state.

CompletionEvent

If not **NULL,** this event is signaled when the renew/rebind phase completes or some error occurs. *EFI_DHCP4_PROTOCOL .GetModeData()* can be called to check the completion status. If **NULL,** *EFI_DHCP4_PROTOCOL.RenewRebind()* will busy-wait until the DHCP process finishes.

Description

The *RenewRebind()* function is used to manually extend the lease time when the EFI DHCPv4 Protocol driver is in the *Dhcp4Bound* state and the lease time has not expired yet. This function will send a request packet to the previously found server (or to any server when *RebindRequest* is **TRUE**) and transfer the state into the *Dhcp4Renewing* state (or *Dhcp4Rebinding* when *RebindingRequest* is **TRUE**). When a response is received, the state is returned to *Dhcp4Bound.*

If no response is received before the try count is exceeded (the *RequestTryCount* field that is specified in *EFI_DHCP4_CONFIG_DATA*) but before the lease time that was issued by the previous server expires, the driver will return to the *Dhcp4Bound* state and the previous configuration is restored. The outgoing and incoming packets can be captured by the *EFI_DHCP4_CALLBACK* function.

Status Codes Returned

EFI_SUCCESS	The EFI DHCPv4 Protocol driver is now in the *Dhcp4Renewing* state or is back to the *Dhcp4Bound* state.
EFI_NOT_STARTED	The EFI DHCPv4 Protocol driver is in the *Dhcp4Stopped* state. *EFI_DHCP4_PROTOCOL .Configure()* needs to be called.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_TIMEOUT	There was no response from the server when the try count was exceeded.
EFI_ACCESS_DENIED	The driver is not in the *Dhcp4Bound* state.
EFI_DEVICE_ERROR	An unexpected network or system error occurred.

29.2.7 EFI_DHCP4_PROTOCOL.Release()

Summary

Releases the current address configuration.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP4_RELEASE) (
  IN EFI_DHCP4_PROTOCOL      *This
  );
```

Parameters

This

Pointer to the *EFI_DHCP4_PROTOCOL* instance.

Description

The *Release()* function releases the current configured IP address by doing either of the following:

- Sending a DHCPRELEASE packet when the EFI DHCPv4 Protocol driver is in the *Dhcp4Bound* state
- Setting the previously assigned IP address that was provided with the *EFI_DHCP4_PROTOCOL .Configure()* function to 0.0.0.0 when the driver is in *Dhcp4InitReboot* state

After a successful call to this function, the EFI DHCPv4 Protocol driver returns to the *Dhcp4Init* state and any subsequent incoming packets will be discarded silently.

Status Codes Returned

EFI_SUCCESS	The EFI DHCPv4 Protocol driver is now in the *Dhcp4Init* phase.

continues on next page

Table 29.14 – continued from previous page

EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_ACCESS_DENIED	The EFI DHCPv4 Protocol driver is not in the *Dhcp4Bound* or *Dhcp4InitReboot* state.
EFI_DEVICE_ERROR	An unexpected network or system error occurred.

29.2.8 EFI_DHCP4_PROTOCOL.Stop()

Summary

Stops the DHCP configuration process.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP4_STOP) (
  IN EFI_DHCP4_PROTOCOL      *This
  );
```

Parameters

This

Pointer to the *EFI_DHCP4_PROTOCOL* instance.

Description

The *Stop()* function is used to stop the DHCP configuration process. After this function is called successfully, the EFI DHCPv4 Protocol driver is transferred into the *Dhcp4Stopped* state. *EFI_DHCP4_PROTOCOL .Configure()* needs to be called before DHCP configuration process can be started again. This function can be called when the EFI DHCPv4 Protocol driver is in any state.

Status Codes Returned

EFI_SUCCESS	The EFI DHCPv4 Protocol driver is now in the *Dhcp4Stopped* state.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NO_MEDIA	There was a media error.

29.2.9 EFI_DHCP4_PROTOCOL.Build()

Summary

Builds a DHCP packet, given the options to be appended or deleted or replaced.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP4_BUILD) (
  IN EFI_DHCP4_PROTOCOL        *This,
  IN EFI_DHCP4_PACKET          *SeedPacket,
  IN UINT32                    DeleteCount,
  IN UINT8                     *DeleteList OPTIONAL,
  IN UINT32                    AppendCount,
  IN EFI_DHCP4_PACKET_OPTION   *AppendList[] OPTIONAL,
```

(continues on next page)

(continued from previous page)

```
OUT EFI_DHCP4_PACKET         **NewPacket
);
```

Parameters

This
Pointer to the *EFI_DHCP4_PROTOCOL* instance.

SeedPacket
Initial packet to be used as a base for building new packet. Type *EFI_DHCP4_PACKET* is defined in *EFI_DHCP4_PROTOCOL .GetModeData()*.

DeleteCount
Number of opcodes in the *DeleteList*.

DeleteList
List of opcodes to be deleted from the seed packet. Ignored if *DeleteCount* is zero.

AppendCount
Number of entries in the *OptionList*.

AppendList
Pointer to a DHCP option list to be appended to *SeedPacket*. If *SeedPacket* also contains options in this list, they are replaced by new options (except pad option). Ignored if *AppendCount* is zero. Type *EFI_DHCP4_PACKET_OPTION* is defined in *EFI_DHCP4_PROTOCOL .Configure()*.

NewPacket
Pointer to storage for the pointer to the new allocated packet. Use the EFI Boot Service *FreePool()* on the resulting pointer when done with the packet.

Description

The *Build()* function is used to assemble a new packet from the original packet by replacing or deleting existing options or appending new options. This function does not change any state of the EFI DHCPv4 Protocol driver and can be used at any time.

Status Codes Returned

EFI_SUCCESS	The new packet was built.
EFI_OUT_OF_RESOURCES	Storage for the new packet could not be allocated.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *SeedPacket* is **NULL**. • *SeedPacket* is not a well-formed DHCP packet. • *AppendCount* is not zero and *AppendList* is **NULL**. • *DeleteCount* is not zero and *DeleteList* is **NULL**. • *NewPacket* is **NULL** • Both *DeleteCount* and *AppendCount* are zero and *NewPacket* is not **NULL**.

29.2.10 EFI_DHCP4_PROTOCOL.TransmitReceive()

Summary

Transmits a DHCP formatted packet and optionally waits for responses.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP4_TRANSMIT_RECEIVE) (
  IN EFI_DHCP4_PROTOCOL                  *This,
  IN EFI_DHCP4_TRANSMIT_RECEIVE_TOKEN    *Token
  );
```

Parameters

This

Pointer to the *EFI_DHCP4_PROTOCOL* instance.

Token

Pointer to the *EFI_DHCP4_TRANSMIT_RECEIVE_TOKEN* structure. Type *EFI_DHCP4_TRANSMIT_RECEIVE_TOKEN* is defined in “Related Definitions” below.

Description

The *TransmitReceive()* function is used to transmit a DHCP packet and optionally wait for the response from servers. This function does not change the state of the EFI DHCPv4 Protocol driver and thus can be used at any time.

Related Definitions

```
//*******************************************
// EFI_DHCP4_TRANSMIT_RECEIVE_TOKEN
//*******************************************
typedef struct {
  EFI_STATUS                  Status;
  EFI_EVENT                   CompletionEvent;
  EFI_IPv4_ADDRESS            RemoteAddress;
  UINT16                      RemotePort;
  EFI_IPv4_ADDRESS            GatewayAddress;
  UINT32                      ListenPointCount;
  EFI_DHCP4_LISTEN_POINT      *ListenPoints;
  UINT32                      TimeoutValue;
  EFI_DHCP4_PACKET            *Packet;
  UINT32                      ResponseCount;
  EFI_DHCP4_PACKET            *ResponseList;
}  EFI_DHCP4_TRANSMIT_RECEIVE_TOKEN;
```

Status

The completion status of transmitting and receiving. Possible values are described in the “Status Codes Returned” table below. When *CompletionEvent* is *NULL,* this status is the same as the one returned by the *TransmitReceive()* function.

CompletionEvent

If not *NULL,* the event that will be signaled when the collection process completes. If *NULL,* this function will busy-wait until the collection process competes.

RemoteAddress
Pointer to the server IP address. This address may be a unicast, multicast, or broadcast address.

RemotePort
Server listening port number. If zero, the default server listening port number (67) will be used.

GatewayAddress
Pointer to the gateway address to override the existing setting.

ListenPointCount
The number of entries in *ListenPoints.* If zero, the default station address and port number 68 are used.

ListenPoints
An array of station address and port number pairs that are used as receiving filters. The first entry is also used as the source address and source port of the outgoing packet. Type *EFI_DHCP4_LISTEN_POINT* is defined below.

TimeoutValue
Number of seconds to collect responses. Zero is invalid.

Packet
Pointer to the packet to be transmitted. Type *EFI_DHCP4_PACKET* is defined in *EFI_DHCP4_PROTOCOL .GetModeData().*

ResponseCount
Number of received packets.

ResponseList
Pointer to the allocated list of received packets. The caller must use the EFI Boot Service *FreePool()* when done using the received packets.

```
//*************************************************
// EFI_DHCP4_LISTEN_POINT
//*************************************************
typedef struct {
  EFI_IPv4_ADDRESS       ListenAddress;
  EFI_IPv4_ADDRESS       SubnetMask;
  UINT16                 ListenPort;
}  EFI_DHCP4_LISTEN_POINT;
```

ListenAddress
Alternate listening address. It can be a unicast, multicast, or broadcast address. The *TransmitReceive()* function will collect only those packets that are destined to this address.

SubnetMask
The subnet mask of above listening unicast/broadcast IP address. Ignored if *ListenAddress* is a multicast address. If it is *0.0.0.0,* the subnet mask is automatically computed from unicast *ListenAddress.* Cannot be *0.0.0.0* if *ListenAddress* is direct broadcast address on subnet.

ListenPort
Alternate station source (or listening) port number. If zero, then the default station port number (68) will be used.

Status Codes Returned

EFI_SUCCESS	The packet was successfully queued for transmission.

continues on next page

Table 29.17 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *Token.RemoteAddress* is zero. • *Token.Packet* is **NULL**. • *Token.Packet* is not a well-formed DHCP packet. • The transaction ID in *Token.Packet* is in use by another DHCP process.
EFI_NOT_READY	The previous call to this function has not finished yet. Try to call this function after collection process completes.
EFI_NO_MAPPING	The default station address is not available yet.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_UNSUPPORTED	The implementation doesn't support this function
EFI_NO_MEDIA	There was a media error.
Others	Some other unexpected error occurred.

29.2.11 EFI_DHCP4_PROTOCOL.Parse()

Summary

Parses the packed DHCP option data.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP4_PARSE) (
  IN EFI_DHCP4_PROTOCOL            *This,
  IN EFI_DHCP4_PACKET              *Packet
  IN OUT UINT32                    *OptionCount,
  IN OUT EFI_DHCP4_PACKET_OPTION   *PacketOptionList[] OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_DHCP4_PROTOCOL* instance.

Packet

Pointer to packet to be parsed. Type *EFI_DHCP4_PACKET* is defined in *EFI_DHCP4_PROTOCOL .GetModeData()*.

OptionCount

On input, the number of entries in the *PacketOptionList*. On output, the number of entries that were written into the *PacketOptionList*.

PacketOptionList

List of packet option entries to be filled in. End option or pad options are not included. Type *EFI_DHCP4_PACKET_OPTION* is defined in *EFI_DHCP4_PROTOCOL .Configure()*.

Description

The Parse() function is used to retrieve the option list from a DHCP packet. If *OptionCount isn't zero, and there is enough space for all the DHCP options in the Packet, each element of PacketOptionList is set to point to somewhere in the Packet->Dhcp4.Option where a new DHCP option begins. If RFC3396 is supported, the caller should reassemble the parsed DHCP options to get the finial result. If *OptionCount is zero or there isn't enough space for all of them, the number of DHCP options in the Packet is returned in OptionCount.

Status Codes Returned

EFI_SUCCESS	The packet was successfully parsed.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • This is NULL. • Packet is NULL. • Packet is not a well-formed DHCP packet. • OptionCount is NULL.
EFI_BUFFER_TOO_SMALL	One or more of the following conditions is TRUE: • *OptionCount is smaller than the number of options that were found in the Packet. • PacketOptionList is NULL.
EFI_OUT_OF_RESOURCE	The packet is failed to parse because of resource shortage.

29.3 EFI DHCP6 Protocol

This section provides a detailed description of the *EFI_DHCP6_PROTOCOL* and the *EFI_DHCP6_SERVICE_BINDING_PROTOCOL.*

29.3.1 DHCP6 Service Binding Protocol

29.3.2 EFI_DHCP6_SERVICE_BINDING_PROTOCOL

Summary

The EFI DHCPv6 Service Binding Protocol is used to locate communication devices that are supported by an EFI DHCPv6 Protocol driver and to create and destroy EFI DHCPv6 Protocol child instances that can use the underlying communications device.

GUID

```
#define EFI_DHCP6_SERVICE_BINDING_PROTOCOL     _GUID \
   {0x9fb9a8a1,0x2f4a,0x43a6,\
  {0x88,0x9c,0xd0,0xf7,0xb6,0xc4,0x7a,0xd5}}
```

Description

A network application or driver that requires basic DHCPv6 services can use one of the protocol handler services, such as *BS->LocateHandleBuffer(),* to search for devices that publish an EFI DHCPv6 Service Binding Protocol GUID. Each device with a published EFI DHCPv6 Service Binding Protocol GUID supports the EFI DHCPv6 Protocol and may be available for use.

After a successful call to the *EFI_DHCP6_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the newly created EFI DHCPv6 Protocol child instance is ready to be used by a network application or driver.

Before a network application or driver terminates execution, every successful call to the *EFI_DHCP6_SERVICE_BINDING_PROTOCOL.CreateChild()* function must be matched with a call to the *EFI_DHCP6_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

29.3.3 DHCP6 Protocol

29.3.4 EFI_DHCP6_PROTOCOL

Summary

The EFI DHCPv6 Protocol is used to get IPv6 addresses and other configuration parameters from DHCPv6 servers.

GUID

```
#define EFI_DHCP6_PROTOCOL_GUID \
 {0x87c8bad7,0x595,0x4053,\
   {0x82,0x97,0xde,0xde,0x39,0x5f,0x5d,0x5b}}
```

Protocol Interface Structure

```
typedef struct _EFI_DHCP6_PROTOCOL {
  EFI_DHCP6_GET_MODE_DATA    GetModeData;
  EFI_DHCP6_CONFIGURE        Configure;
  EFI_DHCP6_START            Start;
  EFI_DHCP6_INFO_REQUEST     InfoRequest;
  EFI_DHCP6_RENEW_REBIND     RenewRebind;
  EFI_DHCP6_DECLINE          Decline;
  EFI_DHCP6_RELEASE          Release;
  EFI_DHCP6_STOP             Stop;
  EFI_DHCP6_PARSE            Parse;
}  EFI_DHCP6_PROTOCOL;
```

Parameters

GetModeData
Get the current operating mode data and configuration data for the EFI DHCPv6 Protocol instance. See the *GetModeData()* function description.

Configure
Initialize or clean up the configuration data for the EFI DHCPv6 Protocol instance. See the *Configure()* function description.

Start
Start the DHCPv6 S.A.R.R process. See the *Start()* function description.

InfoRequest
Request configuration parameters without the assignment of any IPv6 addresses to the client. See the *InfoRequest()* function description.

RenewRebind
Tries to manually extend the valid and preferred lifetimes for the IPv6 addresses of the configured IA by sending Renew or Rebind packet. See the *RenewRebind()* function description.

Decline
Inform that one or more addresses assigned by a DHCPv6 server are already in use by another node. See the *Decline()* function description.

Release
Release one or more addresses associated with the configured IA. See the *Release()* function description.

Stop
Stop the DHCPv6 S.A.R.R process. See the *Stop() f* unction description.

Parse
Parses the option data in the DHCPv6 packet. See the *Parse()* function description.

Description

The EFI DHCPv6 Protocol is used to get IPv6 addresses and other configuration parameters from DHCPv6 servers.

NOTE: *Byte Order: All the IPv6 addresses that are described in* EFI_DHCP6_PROTOCOL *are stored in network byte order. Both incoming and outgoing DHCPv6 packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order*

29.3.5 EFI_DHCP6_PROTOCOL.GetModeData ()

Summary

Retrieve the current operating mode data and configuration data for the EFI DHCPv6 Protocol instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP6_GET_MODE_DATA)(
  IN EFI_DHCP6_PROTOCOL        *This,
  OUT EFI_DHCP6_MODE_DATA      *Dhcp6ModeData* OPTIONAL,
  OUT EFI_DHCP6_CONFIG_DATA    *Dhcp6ConfigData* OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_DHCP6_PROTOCOL* instance.

Dhcp6ModeData
Pointer to the DHCPv6 mode data structure. The caller is responsible for freeing this structure and each reference buffer. Type *EFI_DHCP6_MODE_DATA* is defined in “Related Definitions” below.

Dhcp6ConfigData
Pointer to the DHCPv6 configuration data structure. The caller is responsible for freeing this structure and each reference buffer. Type *EFI_DHCP6_CONFIG_DATA* is defined in *EFI_DHCP6_PROTOCOL.Configure()*.

Description

Retrieve the current operating mode data and configuration data for the EFI DHCPv6 Protocol instance.

Related Definitions

```
//*******************************************************
// EFI_DHCP6_MODE_DATA
//*******************************************************
typedef struct {
  EFI_DHCP6_DUID         *ClientId;
  EFI_DHCP6_IA           *Ia;
}  EFI_DHCP6_MODE_DATA;
```

ClientId

Pointer to the DHCPv6 unique identifier. The caller is responsible for freeing this buffer. Typ *e EFI_DHCP6_DUI* D is defined below.

Ia

Pointer to the configured IA of current instance. The caller can free this buffer after using it. Type *EFI_DHCP6_IA* is defined below.

```
//*******************************************************************
// EFI_DHCP6_DUID
//*******************************************************************
typedef struct {
  UINT16       Length;
  UINT8        Duid[1];
}  EFI_DHCP6_DUID;
```

Length

Length of DUID in octets.

Duid

Array of DUID octets.

The *EFI_DHCP6_DUID* structure is to specify DHCPv6 unique identifier for either DHCPv6 client or DHCPv6 server. The DUID-UUID shall be used for all transactions.

```
//****************************************************
// EFI_DHCP6_IA
//****************************************************
typedef struct {
  EFI_DHCP6_IA_DESCRIPTOR        Descriptor;
  EFI_DHCP6_STATE                State;
  EFI_DHCP6_PACKACT              *ReplyPacket;
  UINT32                         IaAddressCount;
  EFI_DHCP6_IA_ADDRESS           IaAddress[1];
}  EFI_DHCP6_IA;
```

Descriptor

The descriptor for IA. Type *EFI_DHCP6_IA_DESCRIPTOR* is defined below.

State

The state of the configured IA. Type *EFI_DHCP6_STATE* is defined below.

ReplyPacket

Pointer to the cached latest Reply packet. May be **NULL** if no packet is cached.

IaAddressCount

Number of IPv6 addresses of the configured IA.

IaAddress

List of the IPv6 addresses of the configured IA. When the state of the configured IA is in *Dhcp6Bound, Dhcp6Renewing* and *Dhcp6Rebinding,* the IPv6 addresses are usable. Type *EFI_DHCP6_IA_ADDRESS* is defined below.

```
//******************************************************************
// EFI_DHCP6_IA_DESCRIPTOR
//******************************************************************
typedef struct {
```

(continues on next page)

(continued from previous page)

```
  UINT16           Type;
  UINT32           IaId;
}  EFI_DHCP6_IA_DESCRIPTOR;
```

Type

Type for an IA.

IaId

The identifier for an IA.

```
#define EFI_DHCP6_IA_TYPE_NA 3
#define EFI_DHCP6_IA_TYPE_TA 4
```

EFI_DHCP6_IA_TYPE_NA

An IA which carries assigned not temporary address.

EFI_DHCP6_IA_TYPE_TA An IA which carries assigned temporary address.

```
//*******************************************************************
// EFI_DHCP6_STATE
//*******************************************************************
typedef enum {
  Dhcp6Init         = 0x0,
  Dhcp6Selecting    = 0x1,
  Dhcp6Requesting   = 0x2,
  Dhcp6Declining    = 0x3,
  Dhcp6Confirming   = 0x4,
  Dhcp6Releasing    = 0x5,
  Dhcp6Bound        = 0x6,
  Dhcp6Renewing     = 0x7,
  Dhcp6Rebinding    = 0x8
}  EFI_DHCP6_STATE;
```

The Table below, *Field Descriptions* , describes the fields in the above enumeration.

Table 29.19: Field Descriptions

Dhcp6Init	The EFI DHCPv6 Protocol instance is configured, and start() needs to be called
Dhcp6Selecting	A Solicit packet is sent out to discover DHCPv6 server, and the EFI DHCPv6 Protocol instance is collecting Advertise packets.
Dhcp6Requesting	A Request is sent out to the DHCPv6 server, and the EFI DHCPv6 Protocol instance is waiting for Reply packet.
Dhcp6Declining	A Decline packet is sent out to indicate one or more addresses of the configured IA are in use by another node, and the EFI DHCPv6 Protocol instance is waiting for Reply packet.
Dhcp6Confirming	A Confirm packet is sent out to confirm the IPv6 addresses of the configured IA, and the EFI DHCPv6 Protocol instance is waiting for Reply packet
Dhcp6Releasing	A Release packet is sent out to release one or more IPv6 addresses of the configured IA, and the EFI DHCPv6 Protocol instance is waiting for Reply packet.
Dhcp6Bound	The DHCPv6 S.A.R.R process is completed for the configured IA.
Dhcp6Renewing	A Renew packet is sent out to extend lifetime for the IPv6 addresses of the configured IA, and the EFI DHCPv6 Protocol instance is waiting for Reply packet.

continues on next page

Table 29.19 – continued from previous page

Dhcp6Rebinding	A Rebind packet is sent out to extend lifetime for the IPv6 addresses of the configured IA, and the EFI DHCPv6 Protocol instance is waiting for Reply packet.

```
//*******************************************************
// EFI_DHCP6_IA_ADDRESS
//*******************************************************
typedef struct {
  EFI_IPv6_ADDRESS       IpAddress;
  UINT32                 PreferredLifetime;
  UINT32                 ValidLifetime;
}  EFI_DHCP6_IA_ADDRESS;
```

IpAddress
The IPv6 address.

PreferredLifetime
The preferred lifetime in unit of seconds for the IPv6 address.

ValidLifetime
The valid lifetime in unit of seconds for the IPv6 address.

The *EFI_DHCP6_IA_ADDRESS* structure is specify IPv6 address associated with an IA.

```
//*******************************************
// EFI_DHCP6_PACKET
//*******************************************
#pragma pack(1)
typedef struct {
  UINT32               Size;
  UINT32               Length;
  struct{
    EFI_DHCP6_HEADER   Header;
    UINT8              Option[1];
 } Dhcp6;
} EFI_DHCP6_PACKET;
#pragma pack()
```

Size
Size of the *EFI_DHCP6_PACKET* buffer.

Length
Length of the *EFI_DHCP6_PACKET* from the first byte of the Header field to the last byte of the *Option[]* field.

Header
The DHCPv6 packet header.

Option
Start of the DHCPv6 packed option data.

EFI_DHCP6_PACKET defines the format of the DHCPv6 packet. See RFC 3315 for more information.

```
//*******************************************
// EFI_DHCP6_HEADER
//*******************************************
#pragma pack(1)
typedef struct{
```

(continues on next page)

(continued from previous page)

```
  UINT32         TransactionId:24;
  UINT32         MessageType:8;
}  EFI_DHCP6_HEADER;
#pragma pack()
```

TransactionId

The DHCPv6 transaction ID.

MessageType

The DHCPv6 message type.

EFI_DHCP6_HEADER defines the format of the DHCPv6 header. See RFC 3315 for more information.

Status Codes Returned

EFI_SUCCESS	The mode data was returned.
EFI_ACCESS_DENIED	The EFI DHCPv6 Protocol instance has not been configured when *Dhcp6ConfigData* is not **NULL**.
EFI_INVALID_PARAMETER	One or more following conditions are **TRUE**: • *This* is **NULL**. • Both *Dhcp6ConfigData* and *Dhcp6ModeData* are **NULL**.

29.3.6 EFI_DHCP6_PROTOCOL.Configure ()

Summary

Initialize or clean up the configuration data for the EFI DHCPv6 Protocol instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP6_CONFIGURE) (
  IN EFI_DHCP6_PROTOCOL        *This,
  IN EFI_DHCP6_CONFIG_DATA     *Dhcp6CfgData OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_DHCP6_PROTOCOL* instance.

Dhcp6CfgData

Pointer to the DHCPv6 configuration data structure. Type *EFI_DHCP6_CONFIG_DATA* is defined in "Related Definitions" below.

Description

The *Configure()* function is used to initialize or clean up the configuration data of the EFI DHCPv6 Protocol instance

- When *Dhcp6CfgData* is not **NULL** and *Configure()* is called successfully, the configuration data will be initialized in the EFI DHCPv6 Protocol instance and the state of the configured IA will be transferred into *Dhcp6Init*.
- When *Dhcp6CfgData* is **NULL** and *Configure()* is called successfully, the configuration data will be cleaned up and no IA will be associated with the EFI DHCPv6 Protocol instance.

To update the configuration data for an EFI DCHPv6 Protocol instance, the original data must be cleaned up before setting the new configuration data.

Related Definitions

```
//*******************************************************
// EFI_DHCP6_CONFIG_DATA
//*******************************************************
typedef struct {
  EFI_DHCP6_CALLBACK         Dhcp6Callback;
  VOID                       *CallbackContext;
  UINT32                     OptionCount;
  EFI_DHCP6_PACKET_OPTION    **OptionList;
  EFI_DHCP6_IA_DESCRIPTOR    IaDescriptor;
  EFI_EVENT                  IaInfoEvent;
  BOOLEAN                    ReconfigureAccept;
  BOOLEAN                    RapidCommit;
  EFI_DHCP6_RETRANSMISSION   *SolicitRetransmission;
}  EFI_DHCP6_CONFIG_DATA;
```

Dhcp6Callback
The callback function is to intercept various events that occur in the DHCPv6 S.A.R.R process. Set to NULL to ignore all those events. Type *EFI_DHCP6_CALLBACK* is defined below.

CallbackContext
Pointer to the context that will be passed to *Dhcp6Callback*.

OptionCount
Number of the DHCPv6 options in the *OptionList*.

OptionList
The buffer can be freed after *EFI_DHCP6_PROTOCOL. Configure()* returns. Ignored if *OptionCount* is zero. *OptionList* should not contain Client Identifier option and any IA option, which will be appended by EFI DHCPv6 Protocol instance automatically. Type *EFI_DHCP6_PACKET_OPTION* is defined below.

IaDescriptor
The descriptor for the IA of the EFI DHCPv6 Protocol instance. Type *EFI_DHCP6_IA_DESCRIPTOR* is defined below.

IaInfoEvent
If not *NULL,* the event will be signaled when any IPv6 address information of the configured IA is updated, including IPv6 address, preferred lifetime and valid lifetime, or the DHCPv6 S.A.R.R process fails. Otherwise, *Start(), renewrebind(), decline(), release()* and s *top()* will be blocking operations, and they will wait for the exchange process completion or failure.

ReconfigureAccept
If *TRUE,* the EFI DHCPv6 Protocol instance is willing to accept Reconfigure packet. Otherwise, it will ignore it. Reconfigure Accept option can not be specified through *OptionList* parameter.

RapidCommit
If *TRUE,* the EFI DHCPv6 Protocol instance will send Solicit packet with Rapid Commit option. Otherwise, Rapid Commit option will not be included in Solicit packet. Rapid Commit option can not be specified through OptionList parameter.

SolicitRetransmission
Parameter to control Solicit packet retransmission behavior. Type *EFI_DHCP6_RETRANSMISSION* is defined in “Related Definition” below. The buffer can be freed after *EFI_DHCP6_PROTOCOL. Configure()* returns.

```
//*******************************************************
// EFI_DHCP6_CALLBACK
//*******************************************************
typedef EFI_STATUS (EFIAPI *EFI_DHCP6_CALLBACK)(
  IN EFI_DHCP6_PROTOCOL      *This,
  IN VOID                    *Context,
  IN EFI_DHCP6_STATE         CurrentState,
  IN EFI_DHCP6_EVENT         Dhcp6Event,
  IN EFI_DHCP6_PACKET        *Packet,
  OUT EFI_DHCP6_PACKET       **NewPacket OPTIONAL
  );
```

This

Pointer to the *EFI_DHCP6_PROTOCOL* instance that is used to configure this callback function.

Context

Pointer to the context that is initialized by *EFI_DHCP6_PROTOCOL.Configure()*.

CurrentState

The current state of the configured IA. Type *EFI_DHCP6_STATE* is defined in *EFI_DHCP6_PROTOCOL.GetModeData()*.

Dhcp6Event

The event that occurs in the current state, which usually means a state transition. Type *EFI_DHCP6_EVENT* is defined below.

Packet

Pointer to the DHCPv6 packet that is about to be sent or has been received. The EFI DHCPv6 Protocol instance is responsible for freeing the buffer. Type *EFI_DHCP6_PACKET* is defined in *EFI_DHCP6_PROTOCOL.GetModeData()*.

NewPacket

Pointer to the new DHCPv6 packet to overwrite the *Packet*. *NewPacket* can not share the buffer with *Packet*. If * *NewPacket* is not *NULL*, the EFI DHCPv6 Protocol instance is responsible for freeing the buffer.

EFI_DHCP6_CALLBACK is provided by the consumer of the EFI DHCPv6 Protocol instance to intercept events that occurs in the DHCPv6 S.A.R.R process. There are two possible returned values, which are described in the following table.

Table 29.21: Callback Return Values

EFI_SUCCESS	Tell the EFI DHCPv6 Protocol instance to continue the DHCPv6 S.A.R.R process.
EFI_ABORTED	Tell the EFI DHCPv6 Protocol instance to abort the DHCPv6 S.A.R.R process, and the state of the configured IA will be transferred to *Dhcp6Init*.

```
//*******************************************
// EFI_DHCP6_PACKET_OPTION
//*******************************************
#pragma pack(1)
typedef struct {
  UINT16         OpCode;
  UINT16         OpLen;
  UINT8          Data[1];
}  EFI_DHCP6_PACKET_OPTION;
#pragma pack()
```

OpCode
The DHCPv6 option code, stored in network order.

OpLen
Length of the DHCPv6 option data, stored in network order. From the first byte to the last byte of the Data field.

Data
The data for the DHCPv6 option.

EFI_DHCP6_PACKET_OPTION defines the format of the DHCPv6 option, stored in network order. See RFC 3315 for more information. This data structure is used to reference option data that is packed in the DHCPv6 packet.

```
//*****************************************************
// EFI_DHCP6_EVENT
//*****************************************************
typedef enum {
  Dhcp6SendSolicit     = 0x0,
  Dhcp6RcvdAdvertise   = 0x1,
  Dhcp6SelectAdvertise = 0x2,
  Dhcp6SendRequest     = 0x3,
  Dhcp6RcvdReply       = 0x4,
  Dhcp6RcvdReconfigure = 0x5,
  Dhcp6SendDecline     = 0x6,
  Dhcp6SendConfirm     = 0x7,
  Dhcp6SendRelease     = 0x8,
  Dhcp6SendRenew       = 0x9,
  Dhcp6SendRebind      = 0xa
}  EFI_DHCP6_EVENT;
```

Dhcp6SendSolicit
A Solicit packet is about to be sent. The packet is passed to *Dhcp6Callback* and can be modified or replaced in *Dhcp6Callback*.

Dhcp6RcvdAdvertise
An Advertise packet is received and will be passed to *Dhcp6Callback*.

Dhcp6SelectAdvertise
It is time for *Dhcp6Callback* to determine whether select the default Advertise packet by RFC 3315 policy, or overwrite it by specific user policy.

Dhcp6SendRequest
A Request packet is about to be sent. The packet is passed to *Dhcp6Callback* and can be modified or replaced in *Dhcp6Callback*.

Dhcp6RcvdReply
A Reply packet is received and will be passed to *Dhcp6Callback*.

Dhcp6RcvdReconfigure
A Reconfigure packet is received and will be passed to *Dhcp6Callback*.

Dhcp6SendDecline
A Decline packet is about to be sent. The packet is passed to *Dhcp6Callback* and can be modified or replaced in *Dhcp6Callback*.

Dhcp6SendConfirm
A Confirm packet is about to be sent. The packet is passed to *Dhcp6Callback* and can be modified or replaced in *Dhcp6Callback*.

Dhcp6SendRelease
A Release packet is about to be sent. The packet is passed to *Dhcp6Callback* and can be modified or replaced in

Dhcp6Callback.

Dhcp6SendRenew
A Renew packet is about to be sent. The packet is passed to *Dhcp6Callback* and can be modified or replaced in Dhcp6Callback.

Dhcp6SendRebind
A Rebind packet is about to be sent. The packet is passed to *Dhcp6Callback* and can be modified or replaced in *Dhcp6Callback.*

```
//*******************************************************
// EFI_DHCP6_RETRANSMISSION
//*******************************************************
typedef struct {
  UINT32     Irt;
  UINT32     Mrc;
  UINT32     Mrt;
  UINT32     Mrd;
}  EFI_DHCP6_RETRANSMISSION;
```

Irt
Initial retransmission timeout.

Mrc
Maximum retransmission count for one packet. If *Mrc* is zero, there's no upper limit for retransmission count.

Mrt
Maximum retransmission timeout for each retry. It's the upper bound of the number of retransmission timeout. If *Mrt* is zero, there is no upper limit for retransmission timeout.

Mrd
Maximum retransmission duration for one packet. It's the upper bound of the numbers the client may retransmit a message. If *Mrd* is zero, there's no upper limit for retransmission duration.

Status Codes Returned

EFI_SUCCESS	The mode data was returned.
EFI_INVALID_PARAMETER	One or more following conditions are **TRUE** • This is **NULL**. • *OptionCount* > 0 and *OptionList* is **NULL**. • *OptionList* is not *NULL,* and Client Id option, Reconfigure Accept option, Rapid Commit option or any IA option is specified in the *OptionList.* • *IaDescriptor. Type* is neither *EFI_DHCP6_IA_TYPE_NA* nor *EFI_DHCP6_IA_TYPE_NA*. • *IaDescriptor* is not unique. • Both *IaInfoEvent* and *SolicitRetransmission* are **NULL**. • *SolicitRetransmission* is not **NULL,** and both *SolicitRetransmission->Mrc* and *SolicitRetransmission->Mrd* are zero.

continues on next page

Table 29.22 – continued from previous page

EEFI_ACCESS_DENIED	The EFI DHCPv6 Protocol instance has been already configured when *Dhcp6CfgData* is not **NULL**. The EFI DHCPv6 Protocol instance has already started the DHCPv6 S.A.R.R when *Dhcp6CfgData* is **NULL**.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

29.3.7 EFI_DHCP6_PROTOCOL.Start ()

Summary

Start the DHCPv6 S.A.R.R process.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP6_START) (
  IN EFI_DHCP6_PROTOCOL    *This
  );
```

Parameters

This

Pointer to the *EFI_DHCP6_PROTOCOL* instance.

Description

The *Start()* function starts the DHCPv6 S.A.R.R process. This function can be called only when the state of the configured IA is in the *Dhcp6Init* state. If the DHCPv6 S.A.R.R process completes successfully, the state of the configured IA will be transferred through *Dhcp6Selecting* and *Dhcp6Requesting* to *Dhcp6Bound* state. The update of the IPv6 addresses will be notified through *EFI_DHCP6_CONFIG_DATA.IaInfoEvent.* At the time when each event occurs in this process, the callback function set by *EFI_DHCP6_PROTOCOL.Configure()* will be called and the user can take this opportunity to control the process. If *EFI_DHCP6_CONFIG_DATA.IaInfoEvent* is *NULL,* the *Start()* function call is a blocking operation. It will return after the DHCPv6 S.A.R.R process completes or aborted by users. If the process is aborted by system or network error, the state of the configured IA will be transferred to *Dhcp6Init.* The *Start()* function can be called again to restart the process.

Status Codes Returned

EFI_SUCCESS	The DHCPv6 S.A.R.R process is completed and at least one IPv6 address has been bound to the configured IA when *E FI_DHCP6_CONFIG_DATA.IaInfoEvent* is **NULL**. The DHCPv6 S.A.R.R process is started when *E FI_DHCP6_CONFIG_DATA.IaInfoEvent* is not **NULL**.
EFI_ACCESS_DENIED	The EFI DHCPv6 Child instance hasn't been configured.
EFI_INVALID_PARAMETER	This is NULL.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_ALREADY_STARTED	The DHCPv6 S.A.R.R process has already started.
EFI_DEVICE_ERROR	An unexpected network or system error occurred.
EFI_NO_RESPONSE	The DHCPv6 S.A.R.R process failed because of no response.

continues on next page

Table 29.23 – continued from previous page

EFI_NO_MAPPING	No IPv6 address has been bound to the configured IA after the DHCPv6 S.A.R.R process.
EFI_ABORTED	The DHCPv6 S.A.R.R process aborted by user.
EFI_NO_MEDIA	There was a media error.

29.3.8 EFI_DHCP6_PROTOCOL.InfoRequest ()

Summary

Request configuration information without the assignment of any IA addresses of the client.

Prototype

```
Typedef
EFI_STATUS
(EFIAPI *EFI_DHCP6_INFO_REQUEST) (
  IN EFI_DHCP6_PROTOCOL          *This,
  IN BOOLEAN                     SendClientId,
  IN EFI_DHCP6_PACKET_OPTION     *OptionRequest,
  IN UINT32                      OptionCount,
  IN EFI_DHCP6_PACKET_OPTION     *OptionList[] OPTIONAL,
  IN EFI_DHCP6_RETRANSMISSION    *Retransmission,
  IN EFI_EVENT                   TimeoutEvent OPTIONAL,
  IN EFI_DHCP6_INFO_CALLBACK     ReplyCallback,
  IN VOID                        *CallbackContext OPTIONAL
 );
```

Parameters

This

Pointer to the *EFI_DHCP6_PROTOCOL* instance.

SendClientId

If *TRUE,* the EFI DHCPv6 Protocol instance will build Client Identifier option and include it into Information Request packet. If *FALSE,* Client Identifier option will not be included. Client Identifier option can not be specified through OptionList parameter.

OptionRequest

Pointer to the Option Request option in the Information Request packet. Option Request option can not be specified through *OptionList* parameter.

OptionCount

Number of options in *OptionList.*

OptionList

List of other DHCPv6 options. These options will be appended to the Option Request option. The caller is responsible for freeing this buffer. Type is defined in *EFI_DHCP6_PROTOCOL.GetModeData().*

Retransmission

Parameter to control Information Request packet retransmission behavior. Type *EFI_DHCP6_RETRANSMISSION* is defined in "Related Definition" below. The buffer can be freed after *EFI_DHCP6_PROTOCOL.InfoRequest()* returns.

TimeoutEvent

If not *NULL,* this event is signaled when the information request exchange aborted because of no response. If *NULL,* the function call is a blocking operation; and it will return after the information-request exchange process finish or aborted by users.

ReplyCallback

The callback function is to intercept various events that occur in the Information Request exchange process. It should not be set to **NULL**. Type *EFI_DHCP6_INFO_CALLBACK* is defined below.

CallbackContext

Pointer to the context that will be passed to *ReplyCallback.*

Description

The *InfoRequest()* function is used to request configuration information without the assignment of any IPv6 address of the client. Client sends out Information Request packet to obtain the required configuration information, and DHCPv6 server responds with Reply packet containing the information for the client. The received Reply packet will be passed to the user by *ReplyCallback* function. If user returns *EFI_NOT_READY* from *ReplyCallback,* the EFI DHCPv6 Protocol instance will continue to receive other Reply packets unless timeout according to the Retransmission parameter. Otherwise, the Information Request exchange process will be finished successfully if user returns *EFI_SUCCESS* from *ReplyCallback* .

Related Definitions

```
//*******************************************************
// EFI_DHCP6_CALLBACK
//*******************************************************
typedef EFI_STATUS (EFIAPI *EFI_DHCP6_INFO_CALLBACK)(
  IN EFI_DHCP6_PROTOCOL      *This,
  IN VOID                    *Context,
  IN EFI_DHCP6_PACKET        *Packet,
 );
```

This

Pointer to the *EFI_DHCP6_PROTOCOL* instance that is used to configure this callback function.

Context

Pointer to the context that is initialized in the *EFI_DHCP6_PROTOCOL.InfoRequest* ().

Packet

Pointer to Reply packet that has been received. The EFI DHCPv6 Protocol instance is responsible for freeing the buffer. Type *EFI_DHCP6_PACKET* is defined in *EFI_DHCP6_PROTOCOL.GetModeData().*

EFI_DHCP6_INFO_CALLBACK is provided by the consumer of the EFI DHCPv6 Protocol instance to intercept events that occurs in the DHCPv6 Information Request exchange process. There are three possible returned values, which are described in the following table.

EFI_SUCCESS	Tell the EFI DHCPv6 Protocol instance to finish Information Request exchange process.
EFI_NOT_READY	Tell the EFI DHCPv6 Protocol instance to continue Information Request exchange process.
EFI_ABORTED	Tell the EFI DHCPv6 Protocol instance to abort the Information Request exchange process

Status Codes Returned

EFI_SUCCESS	The DHCPv6 information request exchange process completed when *TimeoutEvent* is **NULL**. Information Request packet has been sent to DHCPv6 server when *TimeoutEvent* is not **NULL**.

Table 29.25 – continued from previous page

EFI_INVALID_PARAMETER	One or more following conditions are **TRUE**: • *This* is **NULL**. • *OptionRequest* is **NULL** or *OptionRequest->OpCode* is invalid. • *OptionCount* > 0 and *OptionList* is **NULL**. • *OptionList* is not *NULL,* and Client Identify option or Option Request option is specified in the *OptionList.* • *Retransmission* is **NULL**. • Both *Retransmission->Mrc* and *Retransmission->Mrd* are zero. • *ReplyCallback* is **NULL**.
EFI_DEVICE_ERROR	An unexpected network or system error occurred.
EFI_NO_RESPONSE	The DHCPv6 information request exchange process failed because of no response, or not all requested-options are responded by DHCPv6 servers when Timeout happened.
EFI_ABORTED	The DHCPv6 information request exchange process aborted by user.

29.3.9 EFI_DHCP6_PROTOCOL.RenewRebind ()

Summary

Manually extend the valid and preferred lifetimes for the IPv6 addresses of the configured IA and update other configuration parameters by sending Renew or Rebind packet.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP6_RENEW_REBIND) (
  IN EFI_DHCP6_PROTOCOL          *This,
  IN BOOLEAN                     RebindRequest
  );
```

Parameters

This

Pointer to the *EFI_DHCP6_PROTOCOL* instance.

RebindRequest

If *TRUE,* it will send Rebind packet and enter the *Dhcp6Rebinding* state. Otherwise, it will send Renew packet and enter the *Dhcp6Renewing* state.

Description

The *RenewRebind* () function is used to manually extend the valid and preferred lifetimes for the IPv6 addresses of the configured IA and update other configuration parameters by sending Renew or Rebind packet.

- When RebindRequest is **FALSE** and the state of the configured IA is Dhcp6Bound, it will send Renew packet to the previously DHCPv6 server and transfer the state of the configured IA to Dhcp6Renewing. If valid Reply packet received, the state transfers to Dhcp6Bound and the valid and preferred timer restarts. If fails, the state transfers to Dhcp6Bound but the timer continues.
- When RebindRequest is **TRUE** and the state of the configured IA is Dhcp6Bound, it will send Rebind packet. If valid Reply packet received, the state transfers to Dhcp6Bound and the valid and preferred timer restarts. If fails, the state transfers to Dhcp6Init and the IA can't be used.

Status Codes Returned

EFI_SUCCESS	The DHCPv6 renew/rebind exchange process has completed and at least one IPv6 address of the configured IA has been bound again when *EFI_DHCP6_CONFIG_DATA.IaInfoEvent* is **NULL**. The EFI DHCPv6 Protocol instance has sent Renew or Rebind packet when EFI_DHCP6_CONFIG_DATA.IaInfoEvent is not **NULL**.
EFI_ACCESS_DENIED	The EFI DHCPv6 Child instance hasn't been configured, or the state of the configured IA is not in *Dhcp6Bound*.
EFI_ALREADY_STARTED	The state of the configured IA has already entered Dhcp6Renewing when *RebindRequest* is **FALSE**. The state of the configured IA has already entered Dhcp6Rebinding when *RebindRequest* is **TRUE**.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_DEVICE_ERROR	An unexpected network or system error occurred.
EFI_NO_RESPONSE	The DHCPv6 renew/rebind exchange process failed because of no response.
EFI_NO_MAPPING	No IPv6 address has been bound to the configured IA after the DHCPv6 renew/rebind exchange process.
EFI_ABORTED	The DHCPv6 renew/rebind exchange process aborted by user.

29.3.10 EFI_DHCP6_PROTOCOL.Decline ()

Summary

Inform that one or more IPv6 addresses assigned by a server are already in use by another node.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP6_DECLINE) (
  IN EFI_DHCP6_PROTOCOL        *This,
  IN UINT32                    AddressCount,
  IN EFI_IPv6_ADDRESS          *Addresses
  );
```

Parameters

This

Pointer to the *EFI_DHCP6_PROTOCOL* instance.

AddressCount

Number of declining IPv6 addresses.

Addresses

Pointer to the buffer stored all the declining IPv6 addresses.

Description

The *Decline* () function is used to manually decline the assignment of IPv6 addresses, which have been already used by another node. If all IPv6 addresses of the configured IA are declined through this function, the state of the IA will switch through *Dhcp6Declining* to *Dhcp6Init,* otherwise, the state of the IA will restore to *Dhcp6Bound* after the declining process. The *Decline* () can only be called when the IA is in Dhcp6Bound state. If the *EFI_DHCP6_CONFIG_DATA.IaInfoEvent* is *NULL,* this function is a blocking operation. It will return after the declining process finishes, or aborted by user.

Status Codes Returned

EFI_SUCCESS	The DHCPv6 decline exchange process has completed when *E FI_DHCP6_CONFIG_DATA.IaInfoEvent* is **NULL**. The EFI DHCPv6 Protocol instance has sent Decline packet when *E FI_DHCP6_CONFIG_DATA.IaInfoEvent* is not **NULL**.
EFI_INVALID_PARAMETER	One or more following conditions are **TRUE** • *This* is **NULL**. • *AddressCount* is zero or *Addresses* is **NULL**.
EFI_NOT_FOUND	Any specified IPv6 address is not correlated with the configured IA for this instance.
EFI_ACCESS_DENIED	The EFI DHCPv6 Child instance hasn't been configured, or the state of the configured IA is not in *Dhcp6Bound.*
EFI_DEVICE_ERROR	An unexpected network or system error occurred.
EFI_ABORTED	The DHCPv6 decline exchange process aborted by user.

29.3.11 EFI_DHCP6_PROTOCOL.Release ()

Summary

Release one or more IPv6 addresses associated with the configured IA for current instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP6_RELEASE) (
  IN EFI_DHCP6_PROTOCOL            *This,
  IN UINT32                        AddressCount,
  IN EFI_IPv6_ADDRESS              *Addresses
  );
```

Parameters

This
Pointer to the *EFI_DHCP6_PROTOCOL* instance.

AddressCount
Number of releasing IPv6 addresses.

Addresses
Pointer to the buffer stored all the releasing IPv6 addresses. Ignored if *AddressCount* is zero.

Description

The *Release* () function is used to manually release the one or more IPv6 address. If *AddressCount* is zero, it will release all IPv6 addresses of the configured IA. If all IPv6 addresses of the IA are released through this function, the state of the IA will switch through *Dhcp6Releasing* to *Dhcp6Init,* otherwise, the state of the IA will restore to *Dhcp6Bound* after the releasing process. The *Release* () can only be called when the IA is in *Dhcp6Bound* state. If the *EFI_DHCP6_CONFIG_DATA.IaInfoEvent* is *NULL,* the function is a blocking operation. It will return after the releasing process finishes, or aborted by user.

Status Codes Returned

EFI_SUCCESS	The DHCPv6 release exchange process has completed when *E FI_DHCP6_CONFIG_DATA.IaInfoEvent* is **NULL**. The EFI DHCPv6 Protocol instance has sent Release packet when *E FI_DHCP6_CONFIG_DATA.IaInfoEvent* is not **NULL**.
EFI_INVALID_PARAMETER	One or more following conditions are **TRUE** • *This* is **NULL**. • *AddressCount* is not zero and *Addresses* is **NULL**.
EFI_NOT_FOUND	Any specified IPv6 address is not correlated with the configured IA for this instance.
EFI_ACCESS_DENIED	The EFI DHCPv6 Child instance hasn't been configured, or the state of the configured IA is not in *Dhcp6Bound.*
EFI_DEVICE_ERROR	An unexpected network or system error occurred.
EFI_ABORTED	The DHCPv6 release exchange process aborted by user.

29.3.12 EFI_DHCP6_PROTOCOL.Stop ()

Summary

Stop the DHCPv6 S.A.R.R process.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP6_STOP) (
  IN EFI_DHCP6_PROTOCOL      *This
  );
```

Parameters

This

Pointer to the *EFI_DHCP6_PROTOCOL* instance.

Description

The *Stop* () function is used to stop the DHCPv6 S.A.R.R process. If this function is called successfully, all the IPv6 addresses of the configured IA will be released and the state of the configured IA will be transferred to *Dhcp6Init.*

Status Codes Returned

EFI_SUCCESS	The DHCPv6 S.A.R.R process has been stopped when *E FI_DHCP6_CONFIG_DATA.IaInfoEvent* is **NULL**. The EFI DHCPv6 Protocol instance has sent Release packet if need release or has been stopped if needn't, when *E FI_DHCP6_CONFIG_DATA.IaInfoEvent* is not **NULL**.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NO_MEDIA	There was a media error.

29.3.13 EFI_DHCP6_PROTOCOL.Parse ()

Summary

Parse the option data in the DHCPv6 packet.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP6_PARSE) (
  IN EFI_DHCP6_PROTOCOL        *This,
  IN EFI_DHCP6_PACKET          *Packet,
  IN OUT UINT32                *OptionCount,
  IN EFI_DHCP6_PACKET_OPTION   *PacketOptionList[] OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_DHCP6_PROTOCOL i* nstance.

Packet
Pointer to packet to be parsed. Type *EFI_DHCP6_PACKET* is defined in *EFI_DHCP6_PROTOCOL.GetModeData().*

OptionCount
On input, the number of entries in the PacketOptionList. On output, the number of DHCPv6 options in the Packet.

PacketOptionList
List of pointers to the DHCPv6 options in the *Packet.* Type *EFI_DHCP6_PACKET_OPTION* is defined in *EFI_DHCP6_PROTOCOL.Config* ure(). The *OpCode* and *OpLen* in *EFI_DHCP6_PACKET_O* PTION are both stored in network byte order.

Description

The *Parse()* function is used to retrieve the option list in the DHCPv6 packet.

Status Codes Returned

EFI_SUCCESS	The packet was successfully parsed.
EFI_INVALID_PARAMETER	One or more following conditions are **TRUE** • *This* is **NULL**. • *Packet* is **NULL**. • *Packet* is not a well-formed DHCPv6 packet. • *OptionCount* is **NULL**. • * *OptionCount* is not zero and *PacketOptionList* is **NULL**.
EFI_BUFFER_TOO_SMALL	* *OptionCount* is smaller than the number of options that were found in the *Packet.*

29.4 EFI DNSv4 Protocol

This section defines the EFI Domain Name Service Binding Protocol interface. It is split into the following two main sections.

- DNSv4 Service Binding Protocol (DNSv4SB)
- DNSv4 Protocol (DNSv4)

29.4.1 EFI_DNS4_SERVICE_BINDING_PROTOCOL

Summary

The DNSv4SB is used to locate communication devices that are supported by a DNS driver and to create and destroy instances of the DNS child protocol driver.

The EFI Service Binding Protocol in *EFI Services Binding* defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the DNSv4.

GUID

```
#define EFI_DNS4_SERVICE_BINDING_PROTOCOL_GUID \
  { 0xb625b186, 0xe063, 0x44f7,\
    { 0x89, 0x5, 0x6a, 0x74, 0xdc, 0x6f, 0x52, 0xb4}}
```

Description

A network application (or driver) that requires network address resolution can use one of the protocol handler services, such as *BS->LocateHandleBuffer(),* to search for devices that publish a DNSV4SB GUID. Each device with a published DNSV4SB GUID supports DNS and may be available for use.

After a successful call to the *EFI_DNS4_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the child DNS driver instance is in an unconfigured state; it is not ready to resolve addresses.

Before a network application terminates execution, every successful call to the EFI_DNS4_SERVICE_BINDING_PROTOCOL.CreateChi *ld()* function must be matched with a call to the *EFI_DNS4_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

NOTE: *All the network addresses that are described in* EFI_DNS4_PROTOCOL *are stored in network byte order. Both incoming and outgoing DNS packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order.*

29.4.2 EFI_DNS4_PROTOCOL

Summary

This protocol provides the function to get the host name and address mapping, also provides pass through interface to retrieve arbitrary information from DNS.

The EFI_DNS4_Protocol is primarily intended to retrieve host addresses using the standard DNS protocol (RFC1035), and support for this protocol is required. Implementations may optionally also support local network name resolution methods such as LLMNR (RFC4795) however DNS queries shall always take precedence, and any use of local network name protocols would be restricted to cases where resolution using DNS protocol fails.

As stated above, all instances of EFI_DNS4_Protocol will utilize a common DNS cache containing the successful results of previous queries on any interface. However, it should be noted that every instance of EFI_DNS4_Protocol is associated with a specific network device or interface, and that all network actions initiated using a specific instance of the DNS protocol will occur only via use of the associated network interface. This means, in a system with multiple network interfaces, that a specific DNS server will often only be reachable using a specific network instance, and therefore the protocol user will need to take steps to insure the DNS instance associated with the proper network interface is used. Or alternatively, the caller may perform DNS functions against all interfaces until successful result is achieved.

GUID

```
#define EFI_DNS4_PROTOCOL_GUID \
  { 0xae3d28cc, 0xe05b, 0x4fa1,\
    {0xa0, 0x11, 0x7e, 0xb5, 0x5a, 0x3f, 0x14, 0x1 }}
```

Protocol Interface Structure

```
typedef struct _EFI_DNS4_PROTOCOL {
  EFI_DNS4_GET_MODE_DATA       GetModeData;
  EFI_DNS4_CONFIGURE           Configure;
  EFI_DNS4_HOST_NAME_TO_IP     HostNameToIp;
  EFI_DNS4_IP_TO_HOST_NAME     IpToHostName;
  EFI_DNS4_GENERAL_LOOKUP      GeneralLookUp;
  EFI_DNS4_UPDATE_DNS_CACHE    UpdateDnsCache;
  EFI_DNS4_POLL                Poll;
  EFI_DNS4_CANCEL              Cancel;
}  EFI_DNS4_PROTOCOL;
```

29.4.3 EFI_DNS4_PROTOCOL.GetModeData()

Summary

Retrieve the current mode data of this DNS instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS4_GET_MODE_DATA)(
  IN EFI_DNS4_PROTOCOL              *This,
  OUT EFI_DNS4_MODE_DATA            *DnsModeData
  );
```

Description

This function is used to retrieve DNS mode data for this DNS instance.

Parameter

This

Pointer to *EFI_DNS4_PROTOCOL* instance.

DnsModeData

Pointer to the caller-allocated storage for the *EFI_DNS4_MODE_DATA* structure.

Related Definitions

```
//***********************************************
// EFI_DNS4_MODE_DATA
//***********************************************
typedef struct {
  EFI_DNS4_CONFIG_DATA       DnsConfigData;
  UINT32                     DnsServerCount;
  EFI_IPv4_ADDRESS           *DnsServerList;
  UINT32                     DnsCacheCount;
  EFI_DNS4_CACHE_ENTRY       *DnsCacheList;
}  EFI_DNS4_MODE_DATA;
```

DnsConfigData
The current configuration data of this instance. Type *EFI_DNS4_CONFIG_DATA* is defined below.

DnsServerCount
Number of configured DNS servers.

DnsServerList
Pointer to common list of addresses of all configured DNS server used by *EFI_DNS4_PROTOCOL* instances. List will include DNS servers configured by this or any other *EFI_DNS4_PROTOCOL* instance. The storage for this list is allocated by the driver publishing this protocol, and must be freed by the caller.

DnsCacheCount
Number of DNS Cache entries. The DNS Cache is shared among all DNS instances.

DnsCacheList
Pointer to a buffer containing *DnsCacheCount* DNS Cache entry structures. The storage for this list is allocated by the driver publishing this protocol and must be freed by caller.

```
//***********************************************
// EFI_DNS4_CONFIG_DATA
//***********************************************
typedef struct {
  UINTN              DnsServerListCount;
  EFI_IPv4_ADDRESS   *DnsServerList;
  BOOLEAN            UseDefaultSetting;
  BOOLEAN            EnableDnsCache;
  UINT8              Protocol;
  EFI_IPv4_ADDRESS   StationIp;
  EFI_IPv4_ADDRESS   SubnetMask;
  UINT16             LocalPort;
  UINT32             RetryCount;
  UINT32             RetryInterval;
}  EFI_DNS4_CONFIG_DATA;
```

DnsServerListCount
Count of the DNS servers. When used with *GetModeData(),* this field is the count of originally configured servers when *Configure()* was called for this instance. When used with *Configure()* this is the count of caller-supplied servers. If the *DnsServerListCount* is zero, the DNS server configuration will be retrieved from DHCP server automatically.

DnsServerList
Pointer to DNS server list containing *DnsServerListCount* entries or NULL if *DnsServerListCount* is 0. For *Configure(),* this will be NULL when there are no caller-supplied server addresses, and, the DNS instance will retrieve DNS server from DHCP Server. The provided DNS server list is recommended to be filled up in the sequence of preference. When used with *GetModeData(),* the buffer containing the list will be allocated by

the driver implementing this protocol and must be freed by the caller. When used with *Configure(),* the buffer containing the list will be allocated and released by the caller.

UseDefaultSetting
Set to **TRUE** *to use the default IP address/subnet mask and default routing table. <http://www.iana.org/assignments/protocol-numbers>*__

EnableDnsCache
If *TRUE,* enable DNS cache function for this DNS instance. If *FALSE,* all DNS query will not lookup local DNS cache.

Protocol
Use the protocol number defined in "Links to UEFI-Related Documents" (*http://uefi.org/uefi)* under the heading " IANA Protocol Numbers". Only TCP or UDP are supported, and other protocol values are invalid. An implementation can choose to support only UDP, or both TCP and UDP.

StationIp
If *UseDefaultSetting* is **FALSE** indicates the station address to use.

SubnetMask
If *UseDefaultSetting* is **FALSE** indicates the subnet mask to use.

LocalPort
Local port number. Set to zero to use the automatically assigned port number.

RetryCount
Retry number if no response received after *RetryInterval.*

RetryInterval
Minimum interval of retry is 2 second. If the retry interval is less than 2 second, then use the 2 second.

```
//***********************************************
// EFI_DNS4_CACHE_ENTRY
//***********************************************
typedef struct {
  CHAR16              *HostName;
  EFI_IPv4_ADDRESS    *IpAddress;
   UINT32             Timeout;
}  EFI_DNS4_CACHE_ENTRY;
```

HostName
Host name.

IpAddress
IP address of this host.

Timeout
Time in second unit that this entry will remain in DNS cache. A value of zero means that this entry is permanent. A nonzero value will override the existing one if this entry to be added is dynamic entry. Implementations may set its default timeout value for the dynamically created DNS cache entry after one DNS resolve succeeds.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_NOT_STARTED	When *DnsConfigData* is queried, no configuration data is available because this instance has not been configured.
EFI_INVALID_PARAMETER	*This* is **NULL** or *DnsModeData* is **NULL**.
EFI_OUT_OF_RESOURCES	Failed to allocate needed resources.

29.4.4 EFI_DNS4_PROTOCOL.Configure()

Summary

Configures this DNS instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS4_CONFIGURE)(
  IN EFI_DNS4_PROTOCOL         *This,
  IN EFI_DNS4_CONFIG_DATA      *DnsConfigData
);
```

Description

This function is used to configure DNS mode data for this DNS instance.

Parameters

This

Pointer to *EFI_DNS4_PROTOCOL* instance.

DnsConfigData

Pointer to caller-allocated buffer containing *EFI_DNS4_CONFIG_DATA* structure containing the desired Configuration data. If NULL, the driver will reinitialize the protocol instance to the unconfigured state.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_UNSUPPORTED	The designated protocol is not supported.
EFI_INVALID_PARAMTER	*This* is **NULL**. The StationIp address provided in *DnsConfigData* is not a valid unicast. *DnsServerList* is **NULL** while *DnsServerListCount* is not **ZERO**. *DnsServerListCount* is **ZERO** while *DnsServerList* is not **NULL**.
EFI_OUT_OF_RESOURCES	The DNS instance data or required space could not be allocated.
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI DNSv4 Protocol instance is not configured.
EFI_ALREADY_STARTED	Second call to *Configure()* with *DnsConfigData.* To reconfigure the instance the caller must call *Configure()* with NULL first to return driver to unconfigured state.

29.4.5 EFI_DNS4_PROTOCOL.HostNameToIp()

Summary

Host name to host address translation.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS4_HOST_NAME_TO_IP) (
```

(continues on next page)

(continued from previous page)

```
  IN EFI_DNS4_PROTOCOL           *This,
  IN CHAR16                      *HostName,
  IN EFI_DNS4_COMPLETION_TOKEN   *Token
);
```

Parameter

This

Pointer to *EFI_DNS4_PROTOCOL* instance.

Hostname

Pointer to buffer containing fully-qualified Domain Name including Hostname. To resolve successfully, characters within the FQDN string must be chosen according to the format and from within the set of ASCII characters authorized by DNS specifications. Any translation required for reference to domains or hostnames defined as containing Unicode characters, for example use of Punycode, must be performed by caller.

Token

Pointer to the caller-allocated completion token to return at the completion of the process to translate host name to host address. Type *EFI_DNS4_COMPLETION_TOKEN* is defined in "Related Definitions" below.

Related Definitions

```
//*******************************************
// EFI_DNS4_COMPLETION_TOKEN
//*******************************************
typedef struct {
  EFI_EVENT                   Event;
  EFI_STATUS                  Status;
  UINT32                      RetryCount;
  UINT32                      RetryInterval;
  union {
    DNS_HOST_TO_ADDR_DATA     *H2AData;
    DNS_ADDR_TO_HOST_DATA     *A2HData;
    DNS_GENERAL_LOOKUP_DATA   *GLookupData;
  }  RspData;
}   EFI_DNS4_COMPLETION_TOKEN;
```

Event

This *Event* will be signaled after the *Status* field is updated by the EFI DNS protocol driver. The type of *Event* must be *EFI_NOTIFY_SIGNAL.*

Status

Will be set to one of the following values.

EFI_SUCCESS : The host name to address translation completed successfully.

EFI_NOT_FOUND : No matching Resource Record (RR) is found.

EFI_TIMEOUT : No DNS server reachable, or RetryCount was exhausted without response from all specified DNS servers.

EFI_DEVICE_ERROR : An unexpected system or network error occurred.

EFI_NO_MEDIA : There was a media error.

RetryCount

Retry number if no response received after *RetryInterval.* If zero, use the parameter configured through

Dns.Configure() interface.

RetryInterval
Minimum interval of retry is 2 second. If the retry interval is less than 2 second, then use the 2 second. If zero, use the parameter configured through Dns.Configure() interface.

H2AData
When the Token is used for host name to address translation, *H2AData* is a pointer to the *DNS_HOST_TO_ADDR_DATA*. Type *DNS_HOST_TO_ADDR_DATA* is defined below.

A2HData
When the Token is used for host address to host name translation, *A2HData* is a pointer to the *DNS_ADDR_TO_HOST_DATA*. Type *DNS_ADDR_TO_HOST_DATA* is defined below.

GLookupDATA
When the Token is used for a general lookup function, *GLookupDATA* is a pointer to the *DNS_GENERAL_LOOKUP_DATA*. Type *DNS_GENERAL_LOOKUP_DATA* is defined below.

EFI_DNS4_COMPLETION_TOKEN structures are used for host name to address translation, host address to name translation and general lookup operation, the *Event, RetryCount* and *RetryInterval* fields filed must be filled by the EFI DNS4 Protocol Client. After the operation completes, the EFI DNS4 protocol driver fill in the *RspData* and *Status* field and the *Event* is signaled.

```
//*********************************************
// DNS_HOST_TO_ADDR_DATA
//*********************************************
typedef struct {
  UINT32             IpCount;
  EFI_IPv4_Address   *IpList;
}  DNS_HOST_TO_ADDR_DATA;
```

IpCount
Number of the returned IP addresses.

IpList
Pointer to the all the returned IP addresses.

```
//*********************************************
// DNS_ADDR_TO_HOST_DATA
//*********************************************
typedef struct {
 CHAR16               *HostName;
}  DNS_ADDR_TO_HOST_DATA;
```

HostName
Pointer to the primary name for this host address. It's the caller's responsibility to free the response memory.

```
//*********************************************
// DNS_GENERAL_LOOKUP_DATA
//*********************************************
typedef struct {
  UINTN                 RRCount;
  DNS_RESOURCE_RECORD  *RRList;
}   DNS_GENERAL_LOOKUP_DATA;
```

RRCount
Number of returned matching RRs.

RRList

Pointer to the all the returned matching RRs. It's caller responsibility to free the allocated memory to hold the returned RRs.

```
//*********************************************
// DNS_RESOURCE_RECORD
//*********************************************
typedef struct {
  CHAR8        *QName;
  UINT16       QType;
  UINT16       QClass;
  UINT32       TTL;
  UINT16       DataLength;
  CHAR8        *RData;
}  DNS_RESOURCE_RECORD;
```

QName

The Owner name.

QType

The Type Code of this RR.

QClass

The CLASS code of this RR.

TTL

32 bit integer which specify the time interval that the resource record may be cached before the source of the information should again be consulted. Zero means this RR cannot be cached.

DataLength

16 big integer which specify the length of *RData*.

RData

A string of octets that describe the resource, the format of this information varies according to *QType* and QClass* difference.

Description

The *HostNameToIp ()* function is used to translate the host name to host IP address. A type A query is used to get the one or more IP addresses for this host.

Status Codes Returned

EFI_SUCCESS	The operation was queued successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE** *This* is **NULL**. *Token* is **NULL**. *Token.* Event is. **NULL** *HostName* is **NULL**. *HostName* string is unsupported format.
EFI_NO_MAPPING	There's no source address is available for use.
EFI_NOT_STARTED	This instance has not been started.

29.4.6 EFI_DNS4_PROTOCOL.IpToHostName()

Summary

IPv4 address to host name translation also known as Reverse DNS lookup.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS4_IP_TO_HOST_NAME) (
  IN EFI_DNS4_PROTOCOL             *This,
  IN EFI_IPv4_ADDRESS              IpAddress,
  IN EFI_DNS4_COMPLETION_TOKEN     *Token
);
```

Parameter

This

Pointer to *EFI_DNS4_PROTOCOL* instance.

IpAddress

IP address.

Token

Pointer to the caller-allocated completion used token to translate host address to host name. Type *EFI_DNS4_COMPLETION_TOKEN* is defined in "Related Definitions" of above *HostNameToIp()*.

Description

The *IpToHostName ()* function is used to translate the host address to host name. A type PTR query is used to get the primary name of the host. Support of this function is optional.

Status Codes Returned

EFI_SUCCESS	The operation was queued successfully.
EFI_UNSUPPORTED	This function is not supported
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE** *This* is **NULL**. *Token* is **NULL**. *Token*. Event is. **NULL** *IpAddress* is not valid IP address.
EFI_NO_MAPPING	There's no source address is available for use.
EFI_ALREADY_STARTED	This *Token* is being used in another DNS session.
EFI_OUT_OF_RESOURCES	Failed to allocate needed resources.

29.4.7 EFI_DNS4_PROTOCOL.GeneralLookUp()

Summary

Retrieve arbitrary information from the DNS server.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS4_GENERAL_LOOKUP) (
  IN EFI_DNS4_PROTOCOL             *This,
  IN CHAR8                         *QName,
  IN UINT16                        QType,
  IN UINT16                        QClass,
  IN EFI_DNS4_COMPLETION_TOKEN     *Token
);
```

Description

This *GeneralLookUp()* function retrieves arbitrary information from the DNS. The caller supplies a *QNAME, QTYPE,* and *QCLASS,* and all of the matching RRs are returned. All RR content (e.g., TTL) was returned. The caller need parse the returned RR to get required information. This function is optional.

Parameters

This
Pointer to *EFI_DNS4_PROTOCOL* instance.

QName
Pointer to Query Name.

QType
Query Type.

QClass
Query Name.

Token
Point to the caller-allocated completion token to retrieve arbitrary information. Type *EFI_DNS4_COMPLETION_TOKEN* is defined in "Related Definitions" of above *HostNameToIp ().*

Status Codes Returned

EFI_SUCCESS	The operation was queued successfully.
EFI_UNSUPPORTED	This function is not supported. Or the requested *QType* is not supported
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE** *This* is **NULL**. *Token* is **NULL**. *Token.* Event is. **NULL** *QName* is **NULL**.
EFI_NO_MAPPING	There's no source address is available for use.

continues on next page

Table 29.35 – continued from previous page

EFI_ALREADY_STARTED	This *Token* is being used in another DNS session.
EFI_OUT_OF_RESOURCES	Failed to allocate needed resources.

29.4.8 EFI_DNS4_PROTOCOL.UpdateDnsCache()

Summary

This function is used to update the DNS Cache.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS4_UPDATE_DNS_CACHE) (
  IN EFI_DNS4_PROTOCOL            *This,
  IN BOOLEAN                      DeleteFlag,
  IN BOOLEAN                      Override,
  IN EFI_DNS4_CACHE_ENTRY         DnsCacheEntry
);
```

Parameters

This

Pointer to *EFI_DNS4_PROTOCOL* instance.

DeleteFlag

If **FALSE,** this function is to add one entry to the DNS Cache. If **TRUE,** this function will delete matching DNS Cache entry.

Override

If **TRUE,** the matching DNS cache entry will be overwritten with the supplied parameter. If **FALSE,** *EFI_ACCESS_DENIED* will be returned if the entry to be added is already exists.

DnsCacheEntry

Pointer to DNS Cache entry.

Description

The *UpdateDnsCache()* function is used to add/delete/modify DNS cache entry. DNS cache can be normally dynamically updated after the DNS resolve succeeds. This function provided capability to manually add/delete/modify the DNS cache.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: *This* is **NULL**. *DnsCacheEntry.HostName* is **NULL**. *DnsCacheEntry.IpAddress* is **NULL**. *DnsCacheEntry.Timeout* is zero.
EFI_ACCESS_DENIED	The DNS cache entry already exists and Override is not **TRUE**.

29.4.9 EFI_DNS4_PROTOCOL.Poll()

Summary

Polls for incoming data packets and processes outgoing data packets.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS4_POLL) (
 IN EFI_DNS4_PROTOCOL        *This
);
```

Parameters

This
Pointer to *EFI_DNS4_PROTOCOL* instance.

Description

The *Poll()* function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the Poll() function more often.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_NOT_STARTED	This EFI DNS Protocol instance has not been started.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_TIMEOUT	Data was dropped out of the transmit and/or receive queue. Consider increasing the polling rate.

29.4.10 EFI_DNS4_PROTOCOL.Cancel()

Summary

Abort an asynchronous DNS operation, including translation between IP and Host, and general look up behavior.

Prototype

EFI Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS4_CANCEL) (
  IN EFI_DNS4_PROTOCOL             *This,
  IN EFI_DNS4_COMPLETION_TOKEN     *Token
);
```

Parameters

This
Pointer to *EFI_DNS4_PROTOCOL* instance.

Token

Pointer to a token that has been issued by

EFI_DNS4_PROTOCOL.HostNameToIp(),
EFI_DNS4_PROTOCOL.IpToHostName() or
EFI_DNS4_PROTOCOL.GeneralLookUp(). If **NULL**, all pending tokens are aborted.

Description

The *Cancel()* function is used to abort a pending resolution request. After calling this function, Token.Status will be set to *EFI_ABORTED* and then *Token.Event* will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, this function will not signal the token and *EFI_NOT_FOUND* is returned.

Status Codes Returned

EFI_SUCCESS	The asynchronous DNS operation was aborted and *Token->Event* is signaled.
EFI_NOT_STARTED	This EFI DNS4 Protocol instance has not been started.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NOT_FOUND	When *Token* is not **NULL**, and the asynchronous DNS operation was not found in the transmit queue. It was either completed or was not issued by *HostNameToIp(), IpToHostName()* or *GeneralLookUp()*.

29.5 EFI DNSv6 Protocol

This section defines the EFI DNSv6 (Domain Name Service version 6) Protocol. It is split into the following two main sections.

- DNSv6 Service Binding Protocol (DNSv6SB)
- DNSv6 Protocol (DNSv6)

29.5.1 DNS6 Service Binding Protocol

29.5.2 EFI_DNS6_SERVICE_BINDING_PROTOCOL

Summary

The DNSv6SB is used to locate communication devices that are supported by a DNS driver and to create and destroy instances of the DNS child protocol driver.

The EFI Service Binding Protocol in *EFI Services Binding* defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the DNSv6.

GUID

```
#define EFI_DNS6_SERVICE_BINDING_PROTOCOL_GUID \
 { 0x7f1647c8, 0xb76e, 0x44b2,\
   { 0xa5, 0x65, 0xf7, 0xf, 0xf1, 0x9c, 0xd1, 0x9e}}
```

Description

A network application (or driver) that requires network address resolution can use one of the protocol handler services, such as *BS->LocateHandleBuffer()*, to search for devices that publish a DNSv6SB GUID. Each device with a published DNSv6SB GUID supports DNSv6 and may be available for use.

After a successful call to the *EFI_DNS6_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the child DNS driver instance is in an un-configured state; it is not ready to resolve addresses.

Before a network application terminates execution, every successful call to the *EFI_DNS6_SERVICE_BINDING_PROTOCOL.CreateChild()* function must be matched with a call to the *EFI_DNS6_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

NOTE: *All the network addresses that are described in* EFI_DNS6_PROTOCOL *are stored in network byte order. Both incoming and outgoing DNS packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order.*

29.5.3 DNS6 Protocol

29.5.4 EFI_DNS6_PROTOCOL

Summary

This protocol provides the function to get the host name and address mapping, also provide pass through interface to retrieve arbitrary information from DNSv6.

The EFI_DNS6_Protocol is primarily intended to retrieve host addresses using the standard DNS protocol (RFC3596), and support for this protocol is required. Implementations may optionally also support local network name resolution methods such as LLMNR (RFC4795) however DNS queries shall always take precedence, and any use of local network name protocols would be restricted to cases where resolution using DNS protocol fails.

As stated above, all instances of EFI_DNS6_Protocol will utilize a common DNS cache containing the successful results of previous queries on any interface. However, it should be noted that every instance of EFI_DNS6_Protocol is associated with a specific network device or interface, and that all network actions initiated using a specific instance of the DNS protocol will occur only via use of the associated network interface. This means, in a system with multiple network interfaces, that a specific DNS server will often only be reachable using a specific network instance, and therefore the protocol user will need to take steps to insure the DNS instance associated with the proper network interface is used. Or alternatively, the caller may perform DNS functions against all interfaces until successful result is achieved.

GUID

```
#define EFI_DNS6_PROTOCOL_GUID \
 { 0xca37bc1f, 0xa327, 0x4ae9,\
   { 0x82, 0x8a, 0x8c, 0x40, 0xd8, 0x50, 0x6a, 0x17 }}
```

Protocol Interface Structure

```
typedef struct _EFI_DNS6_PROTOCOL {
  EFI_DNS6_GET_MODE_DATA       GetModeData;
  EFI_DNS6_CONFIGURE           Configure;
  EFI_DNS6_HOST_NAME_TO_IP     HostNameToIp;
  EFI_DNS6_IP_TO_HOST_NAME     IpToHostName;
  EFI_DNS6_GENERAL_LOOKUP      GeneralLookUp;
  EFI_DNS6_UPDATE_DNS_CACHE    UpdateDnsCache;
  EFI_DNS6_POLL                Poll;
```

(continues on next page)

(continued from previous page)

```
  EFI_DNS6_CANCEL              Cancel;
}  EFI_DNS6_PROTOCOL;
```

29.5.5 EFI_DNS6_PROTOCOL.GetModeData()

Summary

Retrieve mode data of this DNS instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS6_GET_MODE_DATA)(
  IN EFI_DNS6_PROTOCOL            *This,
  OUT EFI_DNS6_MODE_DATA          *DnsModeData
);
```

Description

This function is used to retrieve DNS mode data for this DNS instance.

Parameter

This

Pointer to *EFI_DNS6_PROTOCOL* instance.

DnsModeData

Pointer to the caller-allocated storage for the *EFI_DNS6_MODE_DATA* data.

Related Definitions

```
//**********************************************
// EFI_DNS6_MODE_DATA
//**********************************************
typedef struct {
  EFI_DNS6_CONFIG_DATA         DnsConfigData;
  UINT32                       DnsServerCount;
  EFI_IPv6_ADDRESS             *DnsServerList;
  UINT32                       DnsCacheCount;
  EFI_DNS6_CACHE_ENTRY         *DnsCacheList;
}  EFI_DNS6_MODE_DATA;
```

DnsConfigData

The configuration data of this instance. Type *EFI_DNS6_CONFIG_DATA* is defined below.

DnsServerCount

Number of configured DNS6 servers.

DnsServerList

Pointer to common list of addresses of all configured DNS server used by *EFI_DNS6_PROTOCOL* instances. List will include DNS servers configured by this or any other *EFI_DNS6_PROTOCOL* instance. The storage for this list is allocated by the driver publishing this protocol, and must be freed by the caller

DnsCacheCount

Number of DNS Cache entries. The DNS Cache is shared among all DNS6 instances.

DnsCacheList

Pointer to a buffer containing *DnsCacheCount* DNS Cache entry structures. The storage for this list is allocated by the driver publishing this protocol and must be freed by caller.

```
//**********************************************
// EFI_DNS6_CONFIG_DATA
//**********************************************
typedef struct {
  BOOLEAN              EnableDnsCache;
  UINT8                Protocol;
  EFI_IPv6_ADDRESS     StationIp;
  UINT16               LocalPort;
  UINT32               DnsServerCount;
  EFI_IPv6_ADDRESS     *DnsServerList;
  UINT32               RetryCount;
  UINT32               RetryInterval;
}  EFI_DNS6_CONFIG_DATA;
```

IsDnsServerAuto

If *TRUE,* the DNS server configuration will be retrieved from DHCP server. If *FALSE,* the DNS server configuration will be manually configured through call of *DNSv6.Configure() <http://www.iana.org/assignments/protocol-numbers>*__ interface.

EnableDnsCache

If *TRUE,* enable DNS cache function for this DNS instance. If *FALSE,* all DNS query will not lookup local DNS cache.

Protocol

Use the protocol number defined in Links to UEFI-Related Documents" (*http://uefi.org/uefi)* under the heading "IANA Protocol Numbers". Only TCP or UDP are supported, and other protocol values are invalid. An implementation can choose to support only UDP, or both TCP and UDP.

StationIp

The local IP address to use. Set to zero to let the underlying IPv6 driver choose a source address. If not zero it must be one of the configured IP addresses in the underlying IPv6 driver.

DnsServerCount

Count of the DNS servers. When used with *GetModeData(),* this field is the count of originally configured servers when *Configure()* was called for this instance. When used with *Configure()* this is the count of caller-supplied servers. If the *DnsServerListCount* is zero, the DNS server configuration will be retrieved from DHCP server automatically.

DnsServerList

Pointer to DNS server list containing *DnsServerListCount* entries or **NULL** if *DnsServerListCount* is 0. For *Configure(),* this will be **NULL** when there are no caller-supplied server addresses and the DNS instance will retrieve DNS server from DHCP Server. The provided DNS server list is recommended to be filled up in the sequence of preference. When used with *GetModeData(),* the buffer containing the list will be allocated by the driver implementing this protocol and must be freed by the caller. When used with *Configure(),* the buffer containing the list will be allocated and released by the caller.

LocalPort

Local port number. Set to zero to use the automatically assigned port number.

RetryCount

Retry number if no response received after *RetryInterval.*

RetryInterval

Minimum interval of retry is 2 second. If the retry interval is less than 2 second, then use the 2 second.

```
//**********************************************
// EFI_DNS6_CACHE_ENTRY
//**********************************************
typedef struct {
  CHAR16               *HostName;
  EFI_IPv6_ADDRESS     *IpAddress;
  UINT32               Timeout;
}  EFI_DNS6_CACHE_ENTRY;
```

HostName
Host name. This should be interpreted as Unicode characters.

IpAddress
IP address of this host.

Timeout
Time in second unit that this entry will remain in DNS cache. A value of zero means that this entry is permanent. A nonzero value will override the existing one if this entry to be added is dynamic entry. Implementations may set its default timeout value for the dynamically created DNS cache entry after one DNS resolve succeeds.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_NOT_STARTED	When *DnsConfigData* is queried, no configuration data is available because this instance has not been configured.
EFI_INVALID_PARAMETER	This is **NULL** or *DnsModeData* is **NULL**.
EFI_OUT_OF_RESOURCE	Failed to allocate needed resources.

29.5.6 EFI_DNS6_PROTOCOL.Configure()

Summary

Configure this DNS instance

Prototype

```
typedef
EFI_STATUS
(EFIAPI * EFI_DNS6_CONFIGURE)(
  IN EFI_DNS6_PROTOCOL         *This,
  IN EFI_DNS6_CONFIG_DATA      *DnsConfigData
);
```

Description

The *Configure()* function is used to set and change the configuration data for this EFI DNSv6 Protocol driver instance. Reset the DNS instance if *DnsConfigData* is **NULL**.

Parameters

This
Pointer to *EFI_DNS6_PROTOCOL* instance.

DnsConfigData
Pointer to the configuration data structure. Type

EFI_DNS6_CONFIG_DATA is defined in
EFI_DNS6_PROTOCOL.GetModeData(). All associated storage to be allocated and released by caller.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMTER	*This* is **NULL**. The StationIp address provided in *DnsConfigData* is not zero and not a valid unicast. *DnsServerList* is **NULL** while *DnsServerListCount* is not ZERO. *DnsServerListCount* is **ZERO** while *DnsServerList* is not **NULL**.
EFI_OUT_OF_RESOURCES	The DNS instance data or required space could not be allocated.
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI DNSv6 Protocol instance is not configured.
EFI_UNSUPPORTED	The designated protocol is not supported.
EFI_ALREADY_STARTED	Second call to *Configure()* with *DnsConfigData.* To reconfigure the instance the caller must call *Configure()* with **NULL** first to return driver to unconfigured state.

29.5.7 EFI_DNS6_PROTOCOL.HostNameToIp()

Summary

Host name to host address translation

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS6_HOST_NAME_TO_IP) (
  IN EFI_DNS6_PROTOCOL              *This,
  IN CHAR16                         *HostName,
  IN EFI_DNS6_COMPLETION_TOKEN      *Token
);
```

Parameter

This

Pointer to *EFI_DNS6_PROTOCOL* instance.

Hostname

Pointer to buffer containing fully-qualified Domain Name including *Hostname.* To resolve successfully, characters within the FQDN string must be chosen according to the format and from within the set of ASCII characters authorized by DNS specifications. Any translation required for reference to domains or hostnames defined as containing Unicode characters, for example use of Punycode, must be performed by caller.

Token

Point to the completion token to translate host name to host address. Type *EFI_DNS6_COMPLETION_TOKEN* is defined in "Related Definitions" below.

Related Definitions

```
//*******************************************
// EFI_DNS6_COMPLETION_TOKEN
//*******************************************
typedef struct {
  EFI_EVENT                Event;
  EFI_STATUS               Status;
  UINT32                   RetryCount;
  UINT32                   RetryInterval;
  union {
DNS6_HOST_TO_ADDR_DATA     *H2AData;
DNS6_ADDR_TO_HOST_DATA     *A2HData;
DNS6_GENERAL_LOOKUP_DATA   *GLookupData;
 } RspData;
}  EFI_DNS6_COMPLETION_TOKEN;
```

Event

This *Event* will be signaled after the *Status* field is updated by the EFI DNSv6 protocol driver. The type of *Event* must be *EFI_NOTIFY_SIGNAL.*

Status

Will be set to one of the following values.

EFI_SUCCESS : The host name to address translation completed successfully.

EFI_NOT_FOUND : No matching Resource Record (RR) is found.

EFI_TIMEOUT : No DNS server reachable, or *RetryCount* was exhausted without response from all specified DNS servers.

EFI_DEVICE_ERROR : An unexpected system or network error occurred.

EFI_NO_MEDIA : There was a media error.

RetryCount

The parameter configured through *DNSv6.Configure()* interface. Retry number if no response received after *RetryInterval.*

RetryInterval

The parameter configured through *DNSv6.Configure()* interface. Minimum interval of retry is 2 second. If the retry interval is less than 2 second, then use the 2 second.

H2AData

When the *Token* is used for host name to address translation, *H2AData* is a pointer to the *DNS6_HOST_TO_ADDR_DATA*. Type *DNS6_HOST_TO_ADDR_DATA* is defined below.

A2HData

When the *Token* is used for host address to host name translation, *A2HData* is a pointer to the *DNS6_ADDR_TO_HOST_DATA*. Type *DNS6_ADDR_TO_HOST_DATA* is defined below.

GLookupDATA

When the *Token* is used for a general lookup function, *GLookupDATA* is a pointer to the *DNS6_GENERAL_LOOKUP_DATA*. Type *DNS6_GENERAL_LOOKUP_DATA* is defined below.

EFI_DNS6_COMPLETION_TOKEN structures are used for host name to address translation, host address to name translation and general lookup operation, the *Event* filed must be filled by the EFI DNSv6 Protocol Client. If the caller attempts to reuse *Token* before the completion event is triggered or canceled, *EFI_ALREADY_STARTED* will be returned. After the operation completes, the EFI DNSv6 protocol driver fill in the *RspData* and *Status* field and the *Event* is signaled.

```
//*********************************************
// DNS6_HOST_TO_ADDR_DATA
//*********************************************
typedef struct {
  UINT32                 IpCount;
  EFI_IPv6_ADDRESS       *IpList;
}  DNS6_HOST_TO_ADDR_DATA;
```

IpCount
Number of the returned IP address

IpList
Pointer to the all the returned IP address

```
//*********************************************
// DNS6_ADDR_TO_HOST_DATA
//*********************************************
typedef struct {
 CHAR16                  *HostName;
}  DNS6_ADDR_TO_HOST_DATA;
```

HostName
Pointer to the primary name for this host address. It's the caller's responsibility to free the response memory.

```
//*********************************************
// DNS6_GENERAL_LOOKUP_DATA
//*********************************************
typedef struct {
  UINTN                  RRCount;
  DNS6_RESOURCE_RECORD   *RRList;
}   DNS6_GENERAL_LOOKUP_DATA;
```

RRCount
Number of returned matching RRs.

RRList
Pointer to the all the returned matching RRs. It's caller responsibility to free the allocated memory to hold the returned RRs

```
//*********************************************
// DNS6_RESOURCE_RECORD
//*********************************************
typedef struct {
  CHAR8                  *QName;
  UINT16                 QType;
  UINT16                 QClass;
  UINT32                 TTL;
  UINT16                 DataLength;
  CHAR8                  *RData;
}   DNS6_RESOURCE_RECORD;
```

QName
The Owner name.

QType
The Type Code of this RR

QClass
The CLASS code of this RR.

TTL
32 bit integer which specify the time interval that the resource record may be cached before the source of the information should again be consulted. Zero means this RR cannot be cached.

DataLength
16 big integer which specify the length of *RData* .

RData
A string of octets that describe the resource, the format of this information varies according to *QType* and *QClass* difference.

Description

The *HostNameToIp ()* function is used to translate the host name to host IP address. A type AAAA record query is used to get the one or more IPv6 addresses for this host.

Status Codes Returned

EFI_SUCCESS	The operation was queued successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE** *This* is **NULL**. *Token* is **NULL**. *Token.* Event is **NULL**. *HostName* is **NULL** or buffer contained unsupported characters.
EFI_NO_MAPPING	There's no source address is available for use.
EFI_ALREADY_STARTED	This *Token* is being used in another DNS session.
EFI_NOT_STARTED	This instance has not been started.
EFI_OUT_OF_RESOURCES	Failed to allocate needed resources.

29.5.8 EFI_DNS6_PROTOCOL.IpToHostName()

Summary

Host address to host name translation

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS6_IP_TO_HOST_NAME) (
  IN EFI_DNS6_PROTOCOL               *This,
  IN EFI_IPv6_ADDRESS                IpAddress,
  IN EFI_DNS6_COMPLETION_TOKEN       *Token
);
```

Parameter

This
Pointer to *EFI_DNS6_PROTOCOL* instance.

IpAddress
IP address.

Token

Point to the completion token to translate host address to host name. Type *EFI_DNS6_COMPLETION_TOKEN* is defined in "Related Definitions" of above *HostNameToIp ()*.

Description

The *IpToHostName ()* function is used to translate the host address to host name. A type PTR query is used to get the primary name of the host. Implementation can choose to support this function or not.

Status Codes Returned

EFI_SUCCESS	The operation was queued successfully.
EFI_UNSUPPORTED	This function is not supported
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE** *This* is **NULL**. *Token* is **NULL**. *Token .Event* is. **NULL** *IpAddress* is not valid IP address .
EFI_NO_MAPPING	There's no source address is available for use.
EFI_NOT_STARTED	This instance has not been started.
EFI_OUT_OF_RESOURCES	Failed to allocate needed resources.

29.5.9 EFI_DNS6_PROTOCOL.GeneralLookUp()

Summary

This function provides capability to retrieve arbitrary information from the DNS server.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS6_GENERAL_LOOKUP) (
  IN EFI_DNS6_PROTOCOL          *This,
  IN CHAR8                      *QName,
  IN UINT16                     QType,
  IN UINT16                     QClass,
  IN EFI_DNS6_COMPLETION_TOKEN  *Token
);
```

Description

This *GeneralLookUp()* function retrieves arbitrary information from the DNS. The caller supplies a *QNAME, QTYPE,* and *QCLASS,* and all of the matching RRs are returned. All RR content (e.g., TTL) was returned. The caller need parse the returned RR to get required information. The function is optional. Implementation can choose to support it or not.

Parameters

This

Pointer to *EFI_DNS6_PROTOCOL* instance.

QName

Pointer to Query Name.

QType

Query Type.

QClass

Query Name.

Token

Point to the completion token to retrieve arbitrary information. Type *EFI_DNS6_COMPLETION_TOKEN* is defined in "Related Definitions" of above *HostNameToIp ()*.

Status Codes Returned

EFI_SUCCESS	The operation was queued successfully.
EFI_UNSUPPORTED	This function is not supported. Or the requested QType is not supported
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE** *This* is **NULL**. *Token* is **NULL**. *Token.* Event is. **NULL** *QName* is **NULL**.
EFI_NO_MAPPING	There's no source address is available for use.
EFI_NOT_STARTED	This instance has not been started.
EFI_OUT_OF_RESOURCES	Failed to allocate needed resources.

29.5.10 EFI_DNS6_PROTOCOL.UpdateDnsCache()

Summary

This function is to update the DNS Cache.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS6_UPDATE_DNS_CACHE) (
  IN EFI_DNS6_PROTOCOL              *This,
  IN BOOLEAN                        DeleteFlag,
  IN BOOLEAN                        Override,
  IN EFI_DNS6_CACHE_ENTRY           DnsCacheEntry
);
```

Parameters

This

Pointer to *EFI_DNS6_PROTOCOL* instance.

DeleteFlag

If **FALSE**, this function is to add one entry to the DNS Cache. If **TRUE**, this function will delete matching DNS Cache entry.

Override

If **TRUE**, the matching DNS cache entry will be overwritten with the supplied parameter. If **FALSE**, *EFI_ACCESS_DENIED* will be returned if the entry to be added is already existed.

DnsCacheEntry
Pointer to DNS Cache entry.

Description

The *UpdateDnsCache()* function is used to add/delete/modify DNS cache entry. DNS cache can be normally dynamically updated after the DNS resolve succeeds. This function provided capability to manually add/delete/modify the DNS cache.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: *This* is **NULL**. *DnsCacheEntry.HostName* is **NULL**. *DnsCacheEntry.IpAddress* is **NULL**. *DnsCacheEntry.Timeout* is **ZERO**.
EFI_ACCESS_DENIED	The DNS cache entry already exists and Override is not **TRUE**.
EFI_OUT_OF_RESOURCE	Failed to allocate needed resources.

29.5.11 EFI_DNS6_PROTOCOL.POLL()

Summary

Polls for incoming data packets and processes outgoing data packets.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS6_POLL) (
 IN EFI_DNS6_PROTOCOL        *This
);
```

Parameters

This
Pointer to *EFI_DNS6_PROTOCOL* instance.

Description

The *Poll()* function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the *Poll()* function more often.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_NOT_STARTED	This EFI DNS Protocol instance has not been started.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NO_MAPPING	There's no source address is available for use.

continues on next page

Table 29.45 – continued from previous page

EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_TIMEOUT	Data was dropped out of the transmit and/or receive queue. Consider increasing the polling rate.

29.5.12 EFI_DNS6_PROTOCOL.Cancel()

Abort an asynchronous DNS operation, including translation between IP and Host, and general look up behavior.

EFI Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_DNS6_CANCEL) (
  IN EFI_DNS6_PROTOCOL              *This,
  IN EFI_DNS6_COMPLETION_TOKEN      *Token
);
```

Parameters

This

Pointer to *EFI_DNS6_PROTOCOL* instance.

Token

Pointer to a token that has been issued by

EFI_DNS6_PROTOCOL.HostNameToIp (),
EFI_DNS6_PROTOCOL.IpToHostName() or
EFI_DNS6_PROTOCOL.GeneralLookUp(). If **NULL**, all pending tokens are aborted.

Description

The *Cancel()* function is used to abort a pending resolution request. After calling this function, Token.Status will be set to *EFI_ABORTED* and then *Token.Event* will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, this function will not signal the token and *EFI_NOT_FOUND* is returned.

Status Codes Returned

EFI_SUCCESS	The asynchronous DNS operation was aborted and Token->Event is signaled.
EFI_NOT_STARTED	This EFI DNS6 Protocol instance has not been started.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NO_MAPPING	There's no source address is available for use.
EFI_NOT_FOUND	When Token is not **NULL** and the asynchronous DNS operation was not found in the transmit queue, It is either completed or was not issued by *HostNameToIp(), IpToHostName()* or *GeneralLookUp().*

29.6 EFI HTTP Protocols

This section defines the EFI HTTP Protocol interface. It is split into the following two main sections.

- HTTP Service Binding Protocol (HTTPSB)
- HTTP Protocol (HTTP)

29.6.1 HTTP Service Binding Protocol

29.6.1.1 EFI_HTTP_SERVICE_BINDING_PROTOCOL

Summary

The HTTPSB is used to locate communication devices that are supported by a HTTP driver and to create and destroy instances of the HTTP child protocol driver.

The EFI Service Binding Protocol in *EFI Services Binding* defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the HTTP.

GUID

```
#define EFI_HTTP_SERVICE_BINDING_PROTOCOL_GUID \
 {0xbdc8e6af, 0xd9bc, 0x4379,\
   {0xa7, 0x2a, 0xe0, 0xc4, 0xe7, 0x5d, 0xae, 0x1c}}
```

Description

A network application (or driver) that requires HTTP communication service can use one of the protocol handler services, such as *BS->LocateHandleBuffer(),* to search for devices that publish a HTTPSB GUID. Each device with a published HTTP SB GUID supports HTTP Service Binding Protocol and may be available for use.

After a successful call to the *EFI_HTTP_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the child HTTP driver instance is in an uninitialized state; it is not ready to initiate HTTP data transfer.

Before a network application terminates execution, every successful call to the *EFI_HTTP_SERVICE_BINDING_PROTOCOL.CreateChild()* function must be matched with a call to the E *FI_HTTP_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

29.6.2 EFI HTTP Protocol Specific Definitions

29.6.3 EFI_HTTP_PROTOCOL

Protocol GUID

```
#define EFI_HTTP_PROTOCOL_GUID \
 {0x7A59B29B, 0x910B, 0x4171,\
   {0x82, 0x42, 0xA8, 0x5A, 0x0D, 0xF2, 0x5B, 0x5B}}
```

Protocol Interface Structure

```
typedef struct _EFI_HTTP_PROTOCOL {
  EFI_HTTP_GET_MODE_DATA       GetModeData;
  EFI_HTTP_CONFIGURE           Configure;
  EFI_HTTP_REQUEST             Request;
  EFI_HTTP_CANCEL              Cancel;
  EFI_HTTP_RESPONSE            Response;
  EFI_HTTP_POLL                Poll;
}  EFI_HTTP_PROTOCOL;
```

Parameters

GetModeData
Gets the current operational status. See the *GetModeData()* function description.

Configure
Initialize, change, or reset operational settings in the EFI HTTP protocol instance. See *Configure()* for function description.

Request
Queue a request token into the transmit queue. This function is a non-blocking operation. See *Request()* for function description.

Cancel
Abort a pending request or response operation. See *Cancel()* for function description.

Response
Queue a response token into the receive queue. This function is a non-blocking operation. See *Response()* for function description.

Poll
Poll to receive incoming HTTP response and transmit outgoing HTTP request. See *Poll()* for function description.

Description

The EFI HTTP protocol is designed to be used by EFI drivers and applications to create and transmit HTTP Requests, as well as handle HTTP responses that are returned by a remote host. This EFI protocol uses and relies on an underlying EFI TCP protocol.

29.6.4 EFI_HTTP_PROTOCOL.GetModeData()

Summary

Returns the operational parameters for the current HTTP child instance.

EFI Protocol

```
typedef
EFI_STATUS
(EFIAPI * EFI_HTTP_GET_MODE_DATA)(
  IN EFI_HTTP_PROTOCOL           *This,
  OUT EFI_HTTP_CONFIG_DATA       *HttpConfigData
);
```

Parameters

This
Pointer to *EFI_HTTP_PROTOCOL* instance.

HttpConfigData

Pointer to the buffer for operational parameters of this HTTP instance. Type *EFI_HTTP_CONFIG_DATA* is defined in "Related Definitions" below. It is the responsibility of the caller to allocate the memory for HttpConfigData and *HttpConfigData->AccessPoint.IPv6Node/IPv4Node*. In fact, it is recommended to allocate sufficient memory to record IPv6Node since it is big enough for all possibilities.

Description

The *GetModeData()* function is used to read the current mode data (operational parameters) for this HTTP protocol instance.

Status Codes Returned

EFI_SUCCESS	Operation succeeded
EFI_INVALID_PARAMETER	*This* is **NULL**. *HttpConfigData* is **NULL**. *Http ConfigData->AccessPoint.IPv4Node* or *Http ConfigData->AccessPoint.IPv6Node* is **NULL**
EFI_NOT_STARTED	This EFI HTTP Protocol instance has not been started.

```
//*******************************************
// EFI_HTTP_CONFIG_DATA
//*******************************************
typedef struct {
  EFI_HTTP_VERSION           HttpVersion;
  UINT32                     TimeOutMillisec;
  BOOLEAN                    LocalAddressIsIPv6;
  union {
    EFI_HTTPv4_ACCESS_POINT  *IPv4Node;
    EFI_HTTPv6_ACCESS_POINT  *IPv6Node;
 }         AccessPoint;
}  EFI_HTTP_CONFIG_DATA;
```

HttpVersion

HTTP version that this instance will support.

TimeOutMillsec

Time out (in milliseconds) when blocking for requests.

LocalAddressIsIPv6

Defines behavior of EFI DNS and TCP protocols consumed by this instance. If FALSE, this instance will use *EFI_DNS4_PROTOCOL* and *EFI_TCP4_PROTOCOL*. If **TRUE**, this instance will use *EFI_DNS6_PROTOCOL* and *EFI_TCP6_PROTOCOL*.

IPv4Node

When *LocalAddressIsIPv6* is FALSE, this points to the local address, subnet, and port used by the underlying TCP protocol.

IPv6Node

When *LocalAddressIsIPv6* is **TRUE**, this points to the local IPv6 address and port used by the underlying TCP protocol.

```
//*******************************************
// EFI_HTTP_VERSION
```

(continues on next page)

(continued from previous page)

```
//*******************************************
typedef enum {
  HttpVersion10,
  HttpVersion11,
  HttpVersionUnsupported
}  EFI_HTTP_VERSION;

//*******************************************
// EFI_HTTPv4_ACCESS_POINT
//*******************************************
typedef struct {
  BOOLEAN             UseDefaultAddress;
  EFI_IPv4_ADDRESS    LocalAddress;
  EFI_IPv4_ADDRESS    LocalSubnet;
  UINT16              LocalPort;
}  EFI_HTTPv4_ACCESS_POINT;
```

UseDefaultAddress
Set to **TRUE** to instruct the EFI HTTP instance to use the default address information in every TCP connection made by this instance. In addition, when set to **TRUE**, *LocalAddress* and *LocalSubnet* are ignored.

LocalAddress
If *UseDefaultAddress* is set to **FALSE**, this defines the local IP address to be used in every TCP connection opened by this instance.

LocalSubnet
If *UseDefaultAddress* is set to **FALSE**, this defines the local subnet to be used in every TCP connection opened by this instance.

LocalPort
This defines the local port to be used in every TCP connection opened by this instance.

```
//******************************************
// EFI_HTTPv6_ACCESS_POINT
//******************************************
typedef struct {
  EFI_IPv6_ADDRESS          LocalAddress;
  UINT16                    LocalPort;
}  EFI_HTTPv6_ACCESS_POINT;
```

LocalAddress
Local IP address to be used in every TCP connection opened by this instance.

LocalPort
Local port to be used in every TCP connection opened by this instance.

29.6.5 EFI_HTTP_PROTOCOL.Configure()

Summary

Initialize or brutally reset the operational parameters for this EFI HTTP instance.

EFI Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HTTP_CONFIGURE)(
  IN EFI_HTTP_PROTOCOL           *This,
  IN EFI_HTTP_CONFIG_DATA        *HttpConfigData OPTIONAL
);
```

Parameters

This

Pointer to *EFI_HTTP_PROTOCOL* instance.

HttpConfigData

Pointer to the configure data to configure the instance.

Description

The *Configure()* function does the following:

- When *HttpConfigData* is not **NULL** Initialize this EFI HTTP instance by configuring timeout, local address, port, etc.
- When *HttpConfigData* is **NULL,** reset this EFI HTTP instance by closing all active connections with remote hosts, canceling all asynchronous tokens, and flush request and response buffers without informing the appropriate hosts.

No other EFI HTTP function can be executed by this instance until the *Configure()* function is executed and returns successfully.

Status Codes Returned

EFI_SUCCESS	Operation succeeded.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: *This* is **NULL**. *HttpConfigData->LocalAddressIsIPv6* is **FALSE** and *HttpConfigData->AccessPoint.IPv4Node* is **NULL**. *HttpConfigData->LocalAddressIsIPv6* is **TRUE** and *HttpConfigData->AccessPoint.IPv6Node* is **NULL**.
EFI_ALREADY_STARTED	Reinitialize this HTTP instance without calling *Configure()* with **NULL** to reset it.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_OUT_OF_RESOURCES	Could not allocate enough system resources when executing *Configure()*.
EFI_UNSUPPORTED	One or more options in *ConfigData* are not supported in the implementation.

29.6.6 EFI_HTTP_PROTOCOL.Request()

Summary

The *Request()* function queues an HTTP request to this HTTP instance, similar to* *Transmit()* function in the EFI TCP driver. When the HTTP request is sent successfully, or if there is an error, *Status* in token will be updated and* *Event* will be signaled.

EFI Protocol

```
Typedef
EFI_STATUS
(EFIAPI *EFI_HTTP_REQUEST) (
  IN EFI_HTTP_PROTOCOL           *This,
  IN EFI_HTTP_TOKEN              *Token
);
```

Parameters

This

Pointer to *EFI_HTTP_PROTOCOL* instance.

Token

Pointer to storage containing HTTP request token. Type *EFI_HTTP_TOKEN* is defined in "Related Definitions" below.

Related Definitions

```
//*******************************************
// EFI_HTTP_TOKEN
//*******************************************
typedef struct {
  EFI_EVENT               Event;
  EFI_STATUS              Status;
  EFI_HTTP_MESSAGE        *Message;
}  EFI_HTTP_TOKEN;
```

Event

This *Event* will be signaled after the *Status* field is updated by the EFI HTTP Protocol driver. The type of *Event* must be *EFI_NOTIFY_SIGNAL*. The Task Priority Level (TPL) of Event must be lower than or equal to *TPL_CALLBACK*.

Status

Status will be set to one of the following value if the HTTP request is successfully sent or if an unexpected error occurs:

EFI_SUCCESS : The HTTP request was successfully sent to the remote host.

EFI_HTTP_ERROR : The response message was successfully received but contains a HTTP error. The response status code is returned in Token.

EFI_ABORTED : The HTTP request was canceled by the caller and removed from the transmit queue.

EFI_TIMEOUT : The HTTP request timed out before reaching the remote host.

EFI_DEVICE_ERROR : An unexpected system or network error occurred.

Message
Pointer to storage containing HTTP message data.

```
//*******************************************
// EFI_HTTP_MESSAGE
//*******************************************
typedef struct {
  union {
    EFI_HTTP_REQUEST_DATA        *Request;
    EFI_HTTP_RESPONSE_DATA       *Response;
  }       Data;
  UINTN                          HeaderCount;
  EFI_HTTP_HEADER                *Headers;
  UINTN                          BodyLength;
  VOID                           *Body;
} EFI_HTTP_MESSAGE;
```

Request
When the token is used to send a HTTP request, *Request* is a pointer to storage that contains such data as URL and HTTP method.

Response
When used to await a response, *Response* points to storage containing HTTP response status code.

HeaderCount
Number of HTTP header structures in *Headers* list. On request, this count is provided by the caller. On response, this count is provided by the HTTP driver.

Headers
Array containing list of HTTP headers. On request, this array is populated by the caller. On response, this array is allocated and populated by the HTTP driver. It is the responsibility of the caller to free this memory on both request and response.

BodyLength
Length in bytes of the HTTP body. This can be zero depending on the *HttpMethod* type. *Body* Body associated with the HTTP request or response. This can be **NULL** depending on the *HttpMethod* type.

The HTTP driver will prepare a request string from the information contained in and queue it to the underlying TCP instance to be sent to the remote host. Typically, all fields in the structure will contain content (except *Body* and *BodyLength* when HTTP method is not POST or PUT), but there is a special case when using PUT or POST to send large amounts of data. Depending on the size of the data, it may not be able to be stored in a contiguous block of memory, so the data will need to be provided in chunks. In this case, if *Body* is not **NULL** and *BodyLength* is non-zero and all other fields are **NULL** or *0,* the HTTP driver will queue the data to be sent to the last remote host that a token was successfully sent. If no previous token was sent successfully, this function will return *EFI_INVALID_PARAMETER.*

The HTTP driver is expected to close existing (if any) underlying TCP instance and create new TCP instance if the host name in the request URL is different from previous calls to *Request().* This is consistent with RFC 2616 recommendation that HTTP clients should attempt to maintain an open TCP connection between client and host.

```
//********************************************
// EFI_HTTP_REQUEST_DATA
//********************************************
typedef struct {
  EFI_HTTP_METHOD          Method;
  CHAR16                   *Url;
} EFI_HTTP_REQUEST_DATA;
```

Method

The HTTP method (e.g. GET, POST) for this HTTP Request.

Url

The URI of a remote host. From the information in this field, the HTTP instance will be able to determine whether to use HTTP or HTTPS and will also be able to determine the port number to use. If no port number is specified, port 80 (HTTP) is assumed. See RFC 3986 for more details on URI syntax.

```
//*******************************************
// EFI_HTTP_METHOD
//*******************************************
typedef enum {
  HttpMethodGet,
  HttpMethodPost,
  HttpMethodPatch,
  HttpMethodOptions,
  HttpMethodConnect,
  HttpMethodHead,
  HttpMethodPut,
  HttpMethodDelete,
  HttpMethodTrace,
  HttpMethodMax
}  EFI_HTTP_METHOD;

//*******************************************
// EFI_HTTP_RESPONSE_DATA
//*******************************************
typedef struct {
 EFI_HTTP_STATUS_CODE              StatusCode;
}  EFI_HTTP_RESPONSE_DATA;
```

StatusCode

Response status code returned by the remote host.

```
//*******************************************
// EFI_HTTP_HEADER
//*******************************************
typedef struct {
  CHAR8                          *FieldName;
  CHAR8                          *FieldValue;
} EFI_HTTP_HEADER;
```

FieldName

NULL terminated string which describes a field name. See RFC 2616 Section 14 for detailed information about field names.

FieldValue

NULL terminated string which describes the corresponding field value. See RFC 2616 Section 14 for detailed information about field values.

```
typedef enum {
  HTTP_STATUS_UNSUPPORTED_STATUS = 0,
  HTTP_STATUS_100_CONTINUE,
  HTTP_STATUS_101_SWITCHING_PROTOCOLS,

  HTTP_STATUS_505_HTTP_VERSION_NOT_SUPPORTED,
  HTTP_STATUS_308_PERMANENT_REDIRECT
}  EFI_HTTP_STATUS_CODE;
```

Status Codes Returned

EFI_SUCCESS	Outgoing data was processed.
EFI_NOT_STARTED	This EFI HTTP Protocol instance has not been started.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_TIMEOUT	Data was dropped out of the transmit or receive queue.

continues on next page

Table 29.49 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE** *This* is **NULL**. *Token* is **NULL**. *Token->Message* is **NULL**. *Token->Message->Body* is not **NULL**, *Token->Message->BodyLength* is non-zero, and *Token->Message->Data* is **NULL**, but a previous call to *Request()* has not been completed successfully.
EFI_OUT_OF_RESOURCES	Could not allocate enough system resources.
EFI_UNSUPPORTED	The HTTP method is not supported in current implementation.

29.6.7 EFI_HTTP_PROTOCOL.Cancel()

Summary

Abort an asynchronous HTTP request or response token.

EFI Protocol

```
typedef
EFI_STATUS
(EFIAPI * EFI_HTTP_CANCEL)(
  IN EFI_HTTP_PROTOCOL         *This,
  IN EFI_HTTP_TOKEN            *Token,
);
```

Parameters

This
Pointer to *EFI_HTTP_PROTOCOL* instance.

Token
Point to storage containing HTTP request or response token.

Description

The *Cancel()* function aborts a pending HTTP request or response transaction. If *Token* is not **NULL** and the token is in transmit or receive queues when it is being cancelled, its *Token->Status* will be set to *EFI_ABORTED* and then *Token->Event* will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, *EFI_NOT_FOUND* is returned. If *Token* is **NULL**, all asynchronous tokens issued by *Request()* or *Response()* will be aborted.

Status Codes Returned

EFI_SUCCESS	Request and Response queues are successfully flushed.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NOT_STARTED	This instance hasn't been configured.
EFI_NOT_FOUND	The asynchronous request or response token is not found.
EFI_UNSUPPORTED	The implementation does not support this function.

29.6.8 EFI_HTTP_PROTOCOL.Response()

Summary

The *Response()* function queues an HTTP response to this HTTP instance, similar to *Receive()* function in the EFI TCP driver. When the HTTP response is received successfully, or if there is an error, *Status* in token will be updated and *Event* will be signaled.

EFI Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HTTP_RESPONSE) (
  IN EFI_HTTP_PROTOCOL             *This,
  IN EFI_HTTP_TOKEN                *Token
);
```

Parameters

This

Pointer to *EFI_HTTP_PROTOCOL* instance.

Token

Pointer to storage containing HTTP response token. See *Request()* function for the definition of *EFI_HTTP_TOKEN.*

Description

The HTTP driver will queue a receive token to the underlying TCP instance. When data is received in the underlying TCP instance, the data will be parsed and Token will be populated with the response data. If the data received from the remote host contains an incomplete or invalid HTTP header, the HTTP driver will continue waiting (asynchronously) for more data to be sent from the remote host before signaling Event in Token.

It is the responsibility of the caller to allocate a buffer for *Body* and specify the size in *BodyLength.* If the remote host provides a response that contains a content body, up to *BodyLength* bytes will be copied from the receive buffer into *Body* and *BodyLength* will be updated with the amount of bytes received and copied to *Body.* This allows the client to download a large file in chunks instead of into one contiguous block of memory. Similar to HTTP request, if *Body* is not **NULL** and *BodyLength* is non-zero and all other fields are **NULL** or *0,* the HTTP driver will queue a receive token to underlying TCP instance. If data arrives in the receive buffer, up to *BodyLength* bytes of data will be copied to *Body.* The HTTP driver will then update *BodyLength* with the amount of bytes received and copied to *Body.*

If the HTTP driver does not have an open underlying TCP connection with the host specified in the response URL, *Response()* will return *EFI_ACCESS_DENIED.* This is consistent with RFC 2616 recommendation that HTTP clients should attempt to maintain an open TCP connection between client and host.

Status Codes Returned

EFI_SUCCESS	Allocation succeeded
EFI_NOT_STARTED	This EFI HTTP Protocol instance has not been initialized.

continues on next page

Table 29.51 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE** *This* is **NULL**. *Token* is **NULL**. *Token->Message* is **NULL**. *Token->Message->Body* is not **NULL,** *Token->Message->BodyLength* is non-zero, and *Token->Message->Data* is **NULL,** but a previous call to *Response()* has not been completed successfully
EFI_OUT_OF_RESOURCES	Could not allocate enough system resources.
EFI_ACCESS_DENIED	An open TCP connection is not present with the host specified by response URL.

29.6.9 EFI_HTTP_PROTOCOL.Poll()

Polls for incoming data packets and processes outgoing data packets.

```
typedef
EFI_STATUS
(EFIAPI *EFI_HTTP_POLL) (
 IN EFI_HTTP_PROTOCOL        *This
);
```

Parameters

This

Pointer to EFI_HTTP_PROTOCOL instance.

Description

The *Poll()* function can be used by network drivers and applications to increase the rate that data packets are moved between the communication devices and the transmit and receive queues. In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the *Poll()* function more often.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_INVALID_PARAMETER	*This* is **NULL**
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_NOT_READY	No incoming or outgoing data is processed.
EFI_NOT_STARTED	This EFI HTTP Protocol instance has not been started.

29.6.9.1 Usage Examples

Here is an example of a client making a HTTP Request to download a driver bundle from Intel Driver Download Center. This example includes sample code for how to support a client that is behind a HTTP proxy server.

```
#include <Uefi.h>
#include <HttpProtocol.h>

#define BUFFER_SIZE 0x100000

BOOLEAN gRequestCallbackComplete = FALSE;
BOOLEAN gResponseCallbackComplete = FALSE;

VOID
EFIAPI
RequestCallback(
  IN EFI_EVENT                Event,
  IN VOID                     *Context
  )
{
 gRequestCallbackComplete = TRUE;
}
```

```
VOID
EFIAPI
ResponseCallback(
  IN EFI_EVENT                Event,
  IN VOID                     *Context
  )
{
 gResponseCallbackComplete = TRUE;
}

EFI_STATUS
EFIAPI
HttpClientMain(
  IN EFI_HANDLE               ImageHandle,
  IN EFI_SYSTEM_TABLE         *SystemTable
  )
{
```

```
EFI_STATUS                    Status;
EFI_SERVICE_BINDING_PROTOCOL *ServiceBinding;
EFI_HANDLE                    *Handle;
EFI_HTTP_PROTOCOL             *HttpProtocol;
EFI_HTTP_CONFIG_DATA          ConfigData;
EFI_HTTPv4_ACCESS_POINT       IPv4Node;
EFI_HTTP_REQUEST_DATA         RequestData;
EFI_HTTP_HEADER               RequestHeader;
EFI_HTTP_MESSAGE              RequestMessage;
EFI_HTTP_TOKEN                RequestToken;
EFI_HTTP_RESPONSE_DATA        ResponseData;
EFI_HTTP_MESSAGE              ResponseMessage;
```

(continues on next page)

(continued from previous page)

```
EFI_HTTP_TOKEN               ResponseToken;
UINT8                        *Buffer;
EFI_TIME                     Baseline;
EFI_TIME                     Current;
UINTN                        Timer;
UINTN                        Index;
UINTN                        ContentDownloaded;

29.6.10 HTTP Utilities Protocol

Summary

This section defines the EFI HTTP Utilities Protocol interface.

29.6.11 EFI_HTTP_UTILITIES_PROTOCOL

Protocol GUID

```
#define EFI_HTTP_UTILITIES_PROTOCOL_GUID \
 { 0x3E35C163, 0x4074, 0x45DD,\
   { 0x43, 0x1E, 0x23, 0x98, 0x9D, 0xD8, 0x6B, 0x32 }}
```

Protocol Interface Structure

```
typedef struct _EFI_HTTP_UTILITIES_PROTOCOL {
  EFI_HTTP_UTILS_BUILD         Build;
  EFI_HTTP_UTILS_PARSE         Parse;
} EFI_HTTP_UTILITIES_PROTOCOL;
```

Parameters

Build

Create HTTP header based on a combination of seed header, fields to delete, and fields to append.

Parse

Parses HTTP header and produces an array of key/value pairs.

Description

The EFI HTTP utility protocol is designed to be used by EFI drivers and applications to parse HTTP headers from a byte stream. This driver is neither dependent on network connectivity, nor the existence of an underlying network infrastructure.

29.6.12 EFI_HTTP_UTILITIES_PROTOCOL.Build()

Summary

Provides ability to add, remove, or replace HTTP headers in a raw HTTP message.

EFI Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HTTP_UTILS_BUILD) (
  IN EFI_HTTP_UTILITIES_PROTOCOL       *This,
  IN UINTN                             SeedMessageSize
  IN VOID                              *SeedMessage, OPTIONAL
  IN UINTN                             DeleteCount
  IN CHAR8                             *DeleteList[], OPTIONAL
  IN UINTN                             AppendCount
  IN EFI_HTTP_HEADER                   *AppendList[], OPTIONAL
  OUT UINTN                            *NewMessageSize,
  OUT VOID                             **NewMessage,
);
```

Parameters

This

Pointer to *EFI_HTTP_UTILITIES_PROTOCOL* instance.

SeedMessageSize

Size of the initial HTTP header. This can be zero.

SeedMessage
Initial HTTP header to be used as a base for building a new HTTP header. If NULL, *SeedMessageSize* is ignored.

DeleteCount
Number of null-terminated HTTP header field names in *DeleteList*.

DeleteList
List of null-terminated HTTP header field names to remove from *SeedMessage*. Only the field names are in this list because the field values are irrelevant to this operation.

AppendCount
Number of header fields in *AppendList*.

AppendList
List of HTTP headers to populate *NewMessage* with. If *SeedMessage* is not **NULL,** *AppendList* will be appended to the existing list from *SeedMessage* in *NewMessage*

NewMessageSize
Pointer to number of header fields in *NewMessage*.

NewMessage
Pointer to a new list of HTTP headers based on

Description

The *Build()* function is used to manage the headers portion of an HTTP message by providing the ability to add, remove, or replace HTTP headers.

Status Codes Returned

EFI_SUCCESS	Add, remove, and replace operations succeeded.
EFI_OUT_OF_RESOURCES	Could not allocate memory for *NewMessage*.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE** *This* is **NULL**

29.6.13 EFI_HTTP_UTILITIES_PROTOCOL.Parse()

Summary

Parse HTTP header into array of key/value pairs.

EFI Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HTTP_UTILS_PARSE) (
  IN EFI_HTTP_PROTOCOL               *This,
  IN CHAR8                           *HttpMessage,
  IN UINTN                           HttpMessageSize,
  OUT EFI_HTTP_HEADER                **HeaderFields,
  OUT UINTN                          *FieldCount
);
```

Parameters

This
Pointer to *EFI_HTTP_UTILITIES_PROTOCOL* instance.

HttpMessage
Contains raw unformatted HTTP header string.

HttpMessageSize
Size of HTTP header.

HeaderFields
Array of key/value header pairs.

FieldCount
Number of headers in *HeaderFields.*

Description

The *Parse()* function is used to transform data stored in *HttpHeader* into a list of fields paired with their corresponding values.

Status Codes Returned

EFI_SUCCESS	Allocation succeeded
EFI_NOT_STARTED	This EFI HTTP Protocol instance has not been initialized.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE** • *This* is **NULL** • *HttpMessage* is **NULL** • *HeaderFields* is **NULL** • *FieldCount* is **NULL**

29.7 EFI REST Support Overview

EFI REST(EX) protocols are designed to support REST communication between EFI REST client applications/drivers and REST services. EFI REST client tool uses EFI REST(EX) protocols to send/receive resources to/from REST service to manage systems, configure systems or manipulate resources on REST service. Due to HTTP protocol is commonly used to communicate with REST service in practice, EFI REST(EX) protocols adopt HTTP as the message format to send and receive REST service resource.

EFI REST(EX) driver instance abstracts EFI REST client functionality and provides underlying interface to communicate with REST service. EFI REST(EX) driver instance knows how to communicate with REST service through certain interface after the corresponding configuration is initialized. EFI REST support provides two REST relevant protocols, one is EFI REST protocol which was introduced in UEFI spec 2.5 for providing light-weight EFI REST capability. Another one is EFI REST EX protocol, which is introduced in UEFI spec 2.8 for providing more interoperability between EFI REST client and REST service.

EFI REST and EFI REST EX protocols are not required to coexist on a platform, system integrator determines which EFI REST relevant protocol to be supported on system according to the platform demands. EFI REST support is to provide interoperability between EFI REST client and REST service. The authentication of accessing to REST service is not handled by EFI REST relevant protocols. Different REST service has its own authentication method. EFI REST client has to follow the specification defined by REST service for the authentication process.

Multiple EFI REST(EX) driver instances can be installed on a platform to communicate with different types of REST services or various underlying interfaces to REST services. REST service can be located on the platform locally, or off platform in the remote server. The system integrator can implement In-band EFI REST(EX) driver instance for the

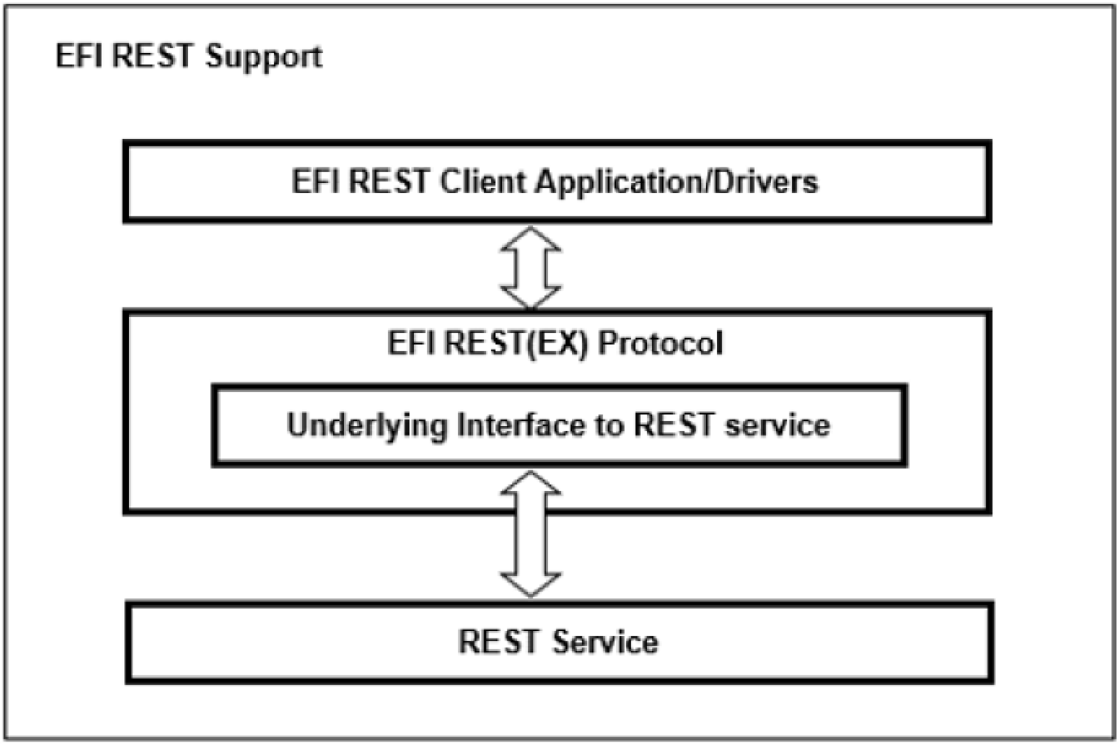

Fig. 29.1: EFI REST Support, Single Protocol

on-platform REST service communications or Out-of-band EFI REST(EX) driver instance for the off-platform REST service communications.

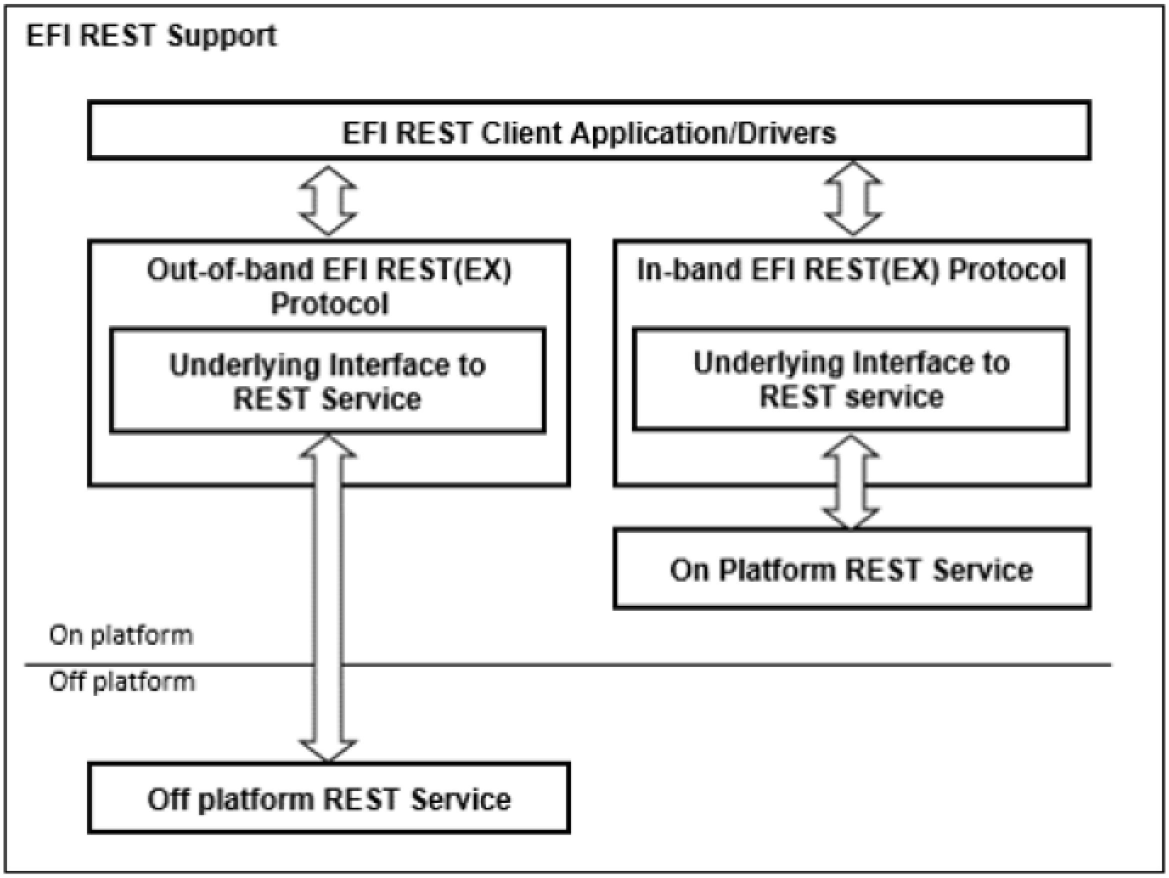

Fig. 29.2: EFI REST Support, Multiple Protocols

29.7.1 EFI REST Support Scenario 1 (PlatformManagement)

The following figure represents a platform which has BMC on board, with the REST service deployed like Redfish service. The In-band EFI REST(EX) protocol (right one) is used by EFI REST client to manage this platform. This platform can also be managed in out of band like from the remote OS REST client. The left one is Out of band EFI REST(EX) protocol which communicate with other REST services like Redfish service in which the resource is belong to other platforms.

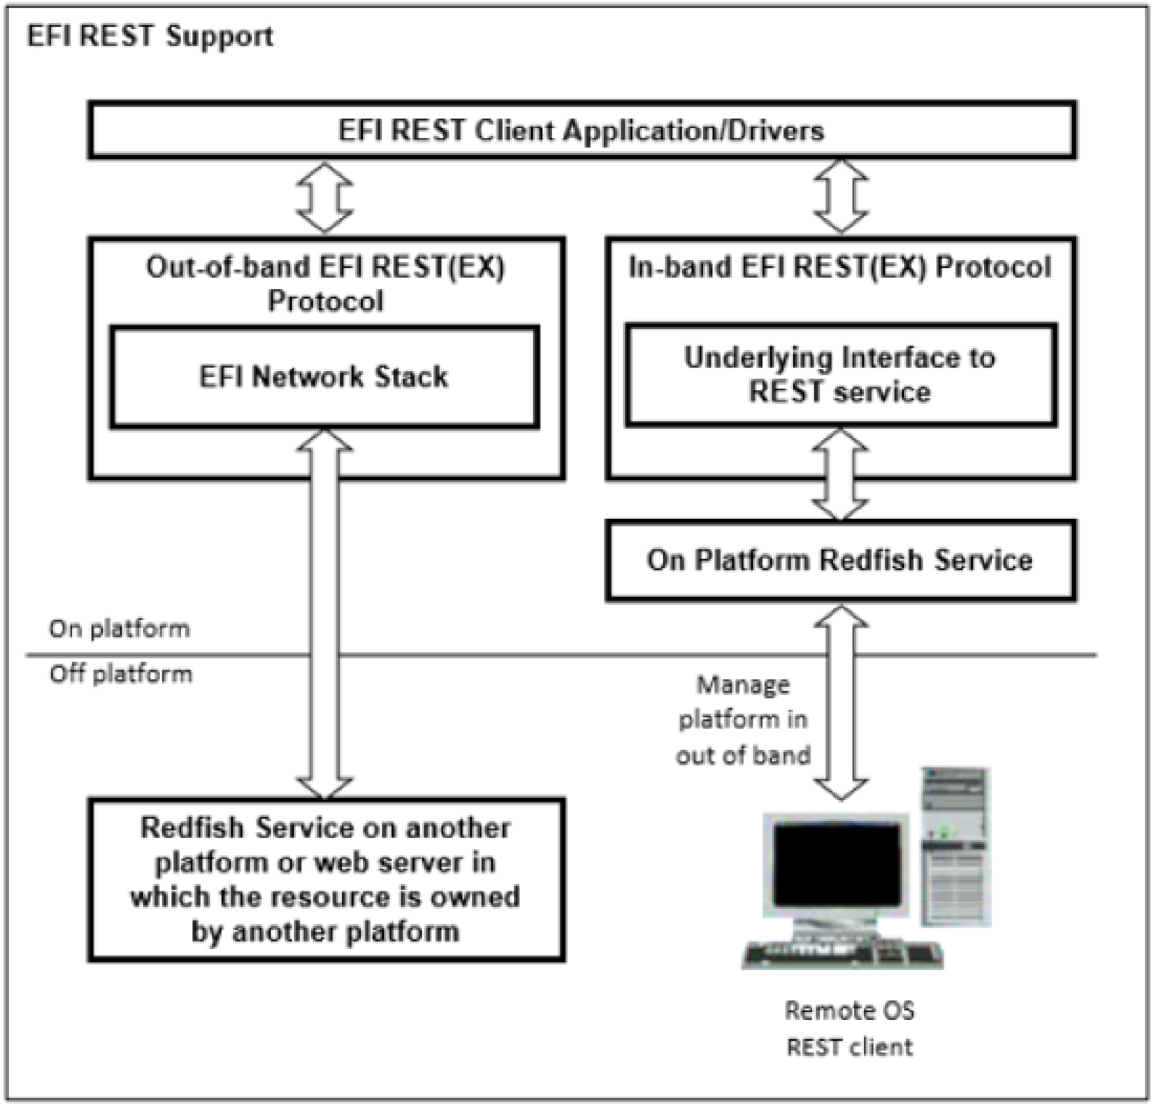

Fig. 29.3: EFI REST Support, BMC on Board

29.7.2 EFI REST Support Scenario 2 (PlatformManagement)

The following figure represents a platform which uses remote Redfish service for the platform management. If treats the resource in remote Redfish service as a part of this platform, the In-band EFI REST(EX) protocol could be implemented to communicate with remote Redfish service. This platform can also be managed in out of band from the remote OS REST client.

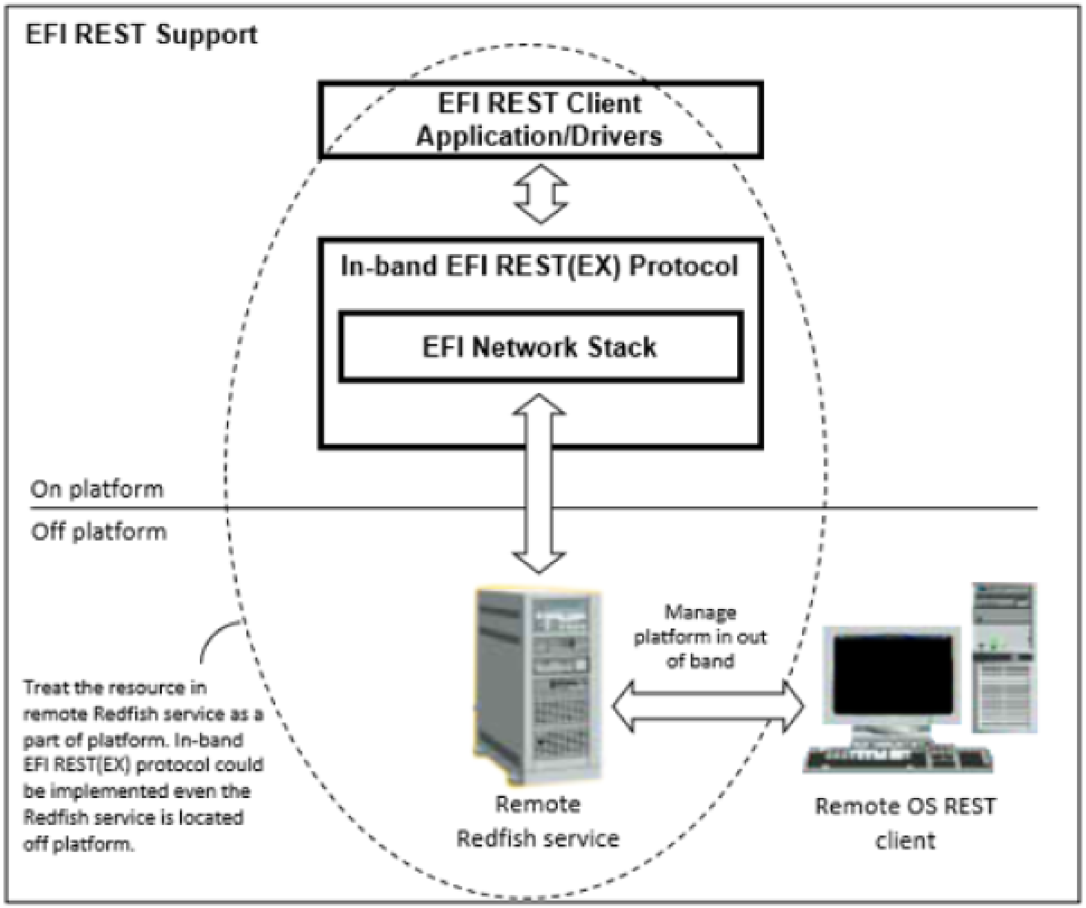

Fig. 29.4: EFI REST Support, Redfish Service

A variety of possible EFI REST(EX) protocol usages are delineated as below. The EFI REST(EX) driver instance could communicate with REST service through underlying interface like EFI network stack, platform specific interface to BMC or others. The working model of EFI REST support depends on the implementation of EFI REST(EX) driver instance and the design of platform.

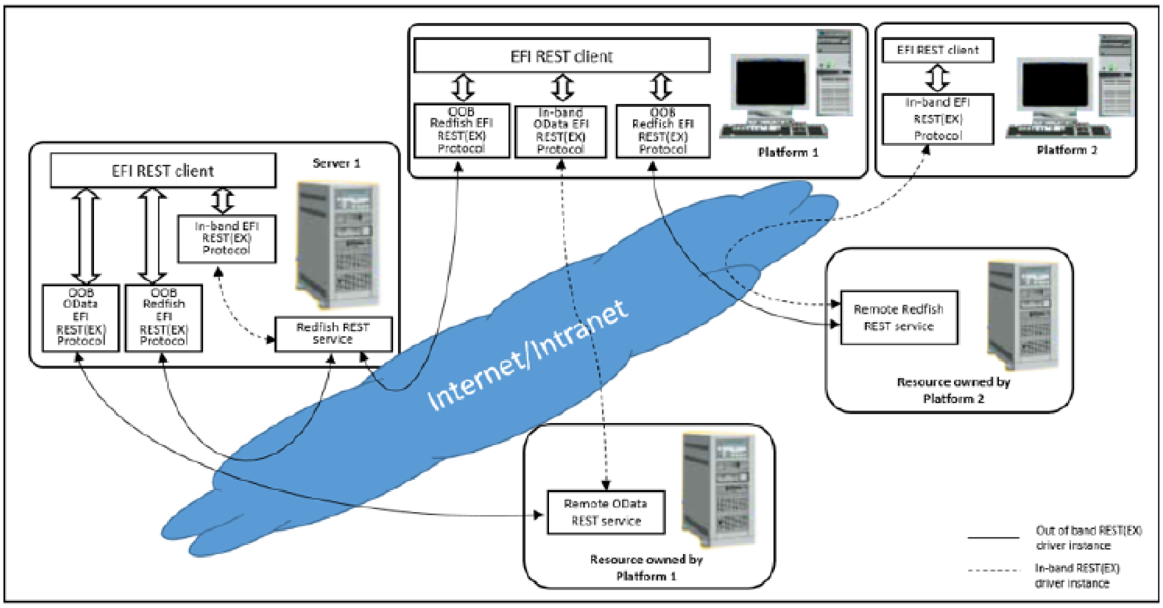

Fig. 29.5: EFI REST Support, Protocol Usages

29.7.3 EFI REST Protocol

This section defines the EFI REST Protocol interface.

29.7.3.1 EFI REST Protocol Definitions

29.7.4 EFI_REST_PROTOCOL

Protocol GUID

```
#define EFI_REST_PROTOCOL_GUID \
  {0x0DB48A36, 0x4E54, 0xEA9C,\
  { 0x9B, 0x09, 0x1E, 0xA5, 0xBE, 0x3A, 0x66, 0x0B }}
```

Protocol Interface Structure

```
typedef struct _EFI_REST_PROTOCOL {
    EFI_REST_SEND_RECEIVE           SendReceive;
    EFI_REST_GET_TIME               GetServiceTime;
} EFI_REST_PROTOCOL;
```

Parameters

RestSendReceive
Provides an HTTP-like interface to send and receive resources from a REST service.

GetServiceTime
Returns the current time of the REST service.

Description

The EFI REST protocol is designed to be used by EFI drivers and applications to send and receive resources from a RESTful service. This protocol abstracts REST (Representational State Transfer) client functionality. This EFI protocol could be implemented to use an underlying EFI HTTP protocol, or it could rely on other interfaces that abstract HTTP access to the resources.

29.7.5 EFI_REST_PROTOCOL.SendReceive()

Summary

Provides a simple HTTP-like interface to send and receive resources from a REST service.

EFI Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_REST_SEND_RECEIVE)(
  IN EFI_REST_PROTOCOL             *This,
  IN EFI_HTTP_MESSAGE              *RequestMessage,
  OUT EFI_HTTP_MESSAGE             *ResponseMessage
  );
```

Parameters

This
Pointer to *EFI_REST_PROTOCOL* instance for a particular REST service.

RequestMessage
Pointer to the REST request data for this resource

ResponseMessage
Pointer to the REST response data obtained for this requested.

Description

The *SendReceive()* function sends a REST request to this REST service, and returns a REST response when the data is retrieved from the service. Both of the REST request and response messages are represented in format of *EFI_HTTP_MESSAGE. RequestMessage* contains the request to the REST resource identified by *UrlRequestMessage->Data.Request->Url*. The *ResponseMessage* is the returned response for that request, including the final HTTP status code, headers and teh REST resource represented in the message body.

The memory buffers pointed by *ResponseMessage->Data.Response, ResponseMessage->Headers* and R *esponseMessage->Body* are allocated by this function, and it is the caller's responsibility to free the buffer when the caller no longer requires the buffer's contents.

It's the REST protocol's responsibility to handle HTTP layer details and return the REST resource to the caller, when this function is implemented by using an underlying EFI HTTP protocol. For example, if an HTTP interim response (Informational 1xx in HTTP 1.1) is received from server, the REST protocol should deal with it and keep waiting for the final response, instead of return the interim response to the caller. Same principle should be observed if the REST protocol relies on other interfaces.

Status Codes Returned

EFI_SUCCESS	operation succeeded
EFI_INVALID_PARAMETER	*This, RequestMessage,* or *ResponseMessage* are **NULL**.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_TIMEOUT	Receiving response message fail due to timeout.

29.7.6 EFI_REST_PROTOCOL.GetServiceTime()

```
typedef
EFI_STATUS
(EFIAPI *EFI_REST_GET_TIME)(
  IN EFI_REST_PROTOCOL           *This,
  OUT EFI_TIME                   *Time
  );
```

Parameters

This

Pointer to *EFI_REST_PROTOCOL* instance.

Time

A pointer to storage to receive a snapshot of the current time of the REST service.

Description

The *GetServiceTime()* function is an optional interface to obtain the current time from this REST service instance. If this REST service does not support retrieving the time, this function returns *EFI_UNSUPPORTED*.

Status Codes Returned

EFI_SUCCESS	operation succeeded
EFI_INVALID_PARAMETER	*This* or *Time* are **NULL**.
EFI_UNSUPPORTED	The RESTful service does not support returning the time
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

29.7.7 EFI REST EX Protocol

This section defines the EFI REST EX Protocol interfaces. It is split into the following two main sections:

- REST EX Service Binding Protocol (RESTEXSB)
- REST EX Protocol (REST EX)

29.7.7.1 REST EX Service Binding Protocol

29.7.8 EFI_REST_EX_SERVICE_BINDING_PROTOCOL

Summary

The RESTEXSB is used to locate the REST services those are supported by a REST EX driver instances and to create and destroy instances of REST EX child protocol driver.

The EFI Service Binding Protocol in *EFI Service Binding Protocol* defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the REST EX.

GUID

```
#define EFI_REST_EX_SERVICE_BINDING_PROTOCOL_GUID \
 {0x456bbe01, 0x99d0, 0x45ea, \
{0xbb, 0x5f, 0x16, 0xd8, 0x4b, 0xed, 0xc5, 0x59}}
```

Description

A REST service client application (or driver) that communicates to REST service can use one of protocol handler services, such as *BS->LocateHandleBuffer(),* to search for devices that publish a RESTEXSB GUID. Each device with a published RESTEXSB GUID supports REST EX Service Binding Protocol and may be available for use.

After a successful call to the *EFI_REST_EX_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the child REST EX driver is in the unconfigured state. It is not ready to communicate with REST service at this moment. The child instance is ready to use to communicate with REST service after the successful *Configure()* is invoked. For EFI REST drivers which don't require additional configuration process, *Configure()* is unnecessary to be invoked before using its child instance. This depends on EFI REST EX driver specific implementation.

Before a REST service client application terminates execution, every successful call to the *EFI_REST_EX_SERVICE_BINDING_PROTOCOL.CreateChild()* function must be matched with a call to the *EFI_REST_EX_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

29.7.8.1 REST EX Protocol Specific Definitions

29.7.9 EFI_REST_EX_PROTOCOL

Protocol GUID

```
#define EFI_REST_EX_PROTOCOL_GUID \
  {0x55648b91, 0xe7d, 0x40a3, \
  {0xa9, 0xb3, 0xa8, 0x15, 0xd7, 0xea, 0xdf, 0x97}}
```

Protocol Interface Structure

```
typedef struct _EFI_REST_EX_PROTOCOL {
  EFI_REST_SEND_RECEIVE               SendReceive;
  EFI_REST_GET_TIME                   GetServiceTime;
  EFI_REST_EX_GET_SERVICE             GetService;
  EFI_REST_EX_GET_MODE_DATA           GetModeData;
  EFI_REST_EX_CONFIGURE               Configure;
  EFI_REST_EX_ASYNC_SEND_RECEIVE      AyncSendReceive;
  EFI_REST_EX_EVENT_SERVICE           EventService;
} EFI_REST_EX_PROTOCOL;
```

Parameters

SendReceive
Provides an HTTP-like interface to send and receive resources from a REST service. The functionality of this function is same as EFI_REST_PROTOCOL.SendReceive(). Refer to section *EFI REST Protocol Definitions* for more details.

GetServiceTime
Returns the current time of the REST service. The functionality of this function is same as EFI_REST_PROTOCOL.GetServiceTime(). Refer to 29.7.1.1 for the details.

GetService
This function returns the type and location of REST service.

GetModeData
This function returns operational configuration of current EFI REST EX child instance.

Configure
This function is used to configure EFI REST EX child instance.

AyncSendReceive

Provides an HTTP-like interface to send and receive resources. The resource returned from REST service is sent to client in asynchronously.

EventService

Provides an interface to subscribe event of specific resource changes on REST service.

Description

The REST EX protocol is designed to use by REST service client applications or drivers to communicate with REST service. REST EX protocol enhances the REST protocol and provides comprehensive interfaces to REST service clients. Akin to REST protocol, REST EX driver instance uses HTTP message for the REST request and response. However, the underlying mechanism of REST EX is not necessary to be HTTP-aware. The underlying mechanism could be any protocols according to the REST service mechanism respectively. REST EX protocol could be used to communicate with In-band or Out-of-band REST service depends on the platform-specific implementation.

29.7.10 EFI_REST_EX_PROTOCOL.SendReceive()

Summary

Provides a simple HTTP-like interface to send and receive resources from a REST service.

EFI Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_REST_SEND_RECEIVE)(
  IN EFI_REST_EX_PROTOCOL          *This,
  IN EFI_HTTP_MESSAGE              *RequestMessage,
  OUT EFI_HTTP_MESSAGE             *ResponseMessage
  );
```

Parameters

Refer to *EFI REST Protocol Definitions* for the details.

Description

Refer to *EFI REST Protocol Definitions* for the details.

Status Codes Returned

EFI_SUCCESS	operation succeeded
EFI_INVALID_PARAMETER	*This, RequestMessage,* or *ResponseMessage* are **NULL**.
EFI_DEVICE_ERROT	An unexpected system or network error occurred.
EFI_NOT_READY	The configuration of this instance is not set yet. *Configure()* must be executed and returns successfully prior to invoke this function.
EFI_TIMEOUT	Receiving response message fail due to timeout.

29.7.11 EFI_REST_EX_PROTOCOL.GetService()

Summary

This function returns the information of REST service provided by this EFI REST EX driver instance.

Protocol Interface

```
typedef
EFI_STATUS
(EFIAPI *EFI_REST_EX_GET_SERVICE)(
    IN EFI_REST_EX_PROTOCOL          *This,
    OUT EFI_REST_EX_SERVICE_INFO     **RestExServiceInfo
 );
```

Parameters

This

This is the *EFI_REST_EX_PROTOCOL* instance.

RestExServiceInfo

Pointer to receive a pointer to *EFI_REST_EX_SERVICE_INFO* structure. The format of *EFI_REST_EX_SERVICE_INFO* is version controlled for the future extension. The version of *EFI_REST_EX_SERVICE_INFO* structure is returned in the header within this structure. EFI REST client refers to the correct format of structure according to the version number. The pointer to *EFI_REST_EX_SERVICE_INFO* is a memory block allocated by EFI REST EX driver instance. That is caller's responsibility to free this memory when this structure is no longer needed. Refer to Related Definitions below for the definitions of *EFI_REST_EX_SERVICE_INFO* structure.

Description

This function returns the information of REST service provided by this REST EX driver instance. The information such as the type of REST service and the access mode of REST EX driver instance (In-band or Out-of-band) are described in *EFI_REST_EX_SERVICE_INFO* structure. For the vendor-specific REST service, vendor-specific REST service information is returned in VendorSpecifcData. Besides the REST service information provided by REST EX driver instance, *EFI_DEVICE_PATH_PROTOCOL* of the REST service is also provided on the handle of REST EX driver instance.

EFI REST client can get the information of REST service from REST service EFI device path node in *EFI_DEVICE_PATH_PROTOCOL* . *EFI_DEVICE_PATH_PROTOCOL* which installed on REST EX driver instance indicates where the REST service is located, such as BMC Device Path, IPV4, IPV6 or others. Refer to *REST Service Device Path* for details of the REST service device path node, which is the sub-type (Sub-type = 32) of Messaging Device Path (type 3).

REST EX driver designer is well know what REST service this REST EX driver instance intends to communicate with. The designer also well know this driver instance is used to talk to BMC through specific platform mechanism or talk to REST server through UEFI HTTP protocol. REST EX driver is responsible to fill up the correct information in *EFI_REST_EX_SERVICE_INFO*. *EFI_REST_EX_SERVICE_INFO* is referred by EFI REST clients to pickup the proper EFI REST EX driver instance to get and set resource. GetService() is a basic and mandatory function which must be able to use even Configure() is not invoked in previously.

   }   EFI_REST_EX_SERVICE_INFO_V_1_0;
```

EfiRestExServiceInfoHeader
The header of EFI_REST_EX_SERVICE_INFO.

RestExServiceType
The REST service type. See below definition.

RestServiceAccessMode
The access mode of REST service. See below definition.

VendorRestServiceName
The name of vendor-specific REST service. This field is only valid if RestExServiceType is EFI_REST_EX_SERVICE_VENDOR_SPECIFIC.

VendorSpecificDataLength
The length of vendor-specific REST service information. This field is only valid if RestExServiceType is EFI_REST_EX_SERVICE_VENDOR_SPECIFIC.

VendorSpecifcData
A pointer to vendor-specific REST service information. This field is only valid if RestExServiceType is EFI_REST_EX_SERVICE_VENDOR_SPECIFIC. The memory buffer pointed by VendorSpecifcData is allocated by EFI REST EX driver instance and must be freed by EFI REST client when it is no longer need.

RestExConfigType
The type of configuration of REST EX driver instance. See GetModeData()and Configure() for the details.

RestExConfigDataLength
The length of REST EX configuration data.

```
//*******************************************************
// EFI_REST_EX_SERVICE_TYPE
//*******************************************************
typedef enum {
EFI_REST_EX_SERVICE_UNSPECIFIC = 1,
  EFI_REST_EX_SERVICE_REDFISH,
  EFI_REST_EX_SERVICE_ODATA,
  EFI_REST_EX_SERVICE_VENDOR_SPECIFIC = 0xff,
  EFI_REST_EX_SERVICE_TYPE_MAX
} EFI_REST_EX_SERVICE_TYPE;
```

EFI_REST_EX_SERVICE_UNSPECIFIC indicates this EFI REST EX driver instance is not used to communicate with any particular REST service. The EFI REST EX driver instance which reports this service type is REST service independent and only provides SendReceive()function to EFI REST client. EFI REST client uses this function to send and receive HTTP message to any target URI and handles the follow up actions by itself. The EFI REST EX driver instance in this type must returns EFI_UNSUPPORTED in below REST EX protocol interfaces, GetServiceTime(), AyncSendReceive() and EventService().

EFI_REST_EX_SERVICE_REDFISH indicates this EFI REST EX driver instance is used to communicate with Redfish REST service.

EFI_REST_EX_SERVICE_ODATA indicates this EFI REST EX driver instance is used to communicate with Odata REST service.

EFI_REST_EX_SERVICE_VENDOR_SPECIFIC indicates this EFI REST EX driver instance is used to communicate with vendor-specific REST service.

```
//*******************************************************
// EFI_REST_EX_SERVICE_ACCESS_MODE
//*******************************************************
typedef enum {
    EFI_REST_EX_SERVICE_IN_BAND_ACCESS = 1,
    EFI_REST_EX_SERVICE_OUT_OF_BAND_ACCESS = 2,
    EFI_REST_EX_SERVICE_ACCESS_MODE_MAX
} EFI_REST_EX_SERVICE_ACCESS_MODE;
```

EFI_REST_EX_SERVICE_IN_BAND_ACCESS mode indicates the REST service is invoked in In-band mechanism in the scope of platform. In most of cases, the In-band mechanism is used to communicate with REST service on platform through some particular devices like BMC, Embedded Controller and other infrastructures built on the platform.

EFI_REST_EX_SERVICE_OUT_OF_BAND_ACCESS mode indicates the REST service is invoked in Out-of-band mechanism. The REST service is located out of platform scope. In most of cases, the Out-of-band mechanism is used to communicate with REST service on other platforms through network or other protocols.

```
//*******************************************************
// EFI_REST_EX_CONFIG_TYPE
//*******************************************************
typedef enum {
  EFI_REST_EX_CONFIG_TYPE_HTTP,
  EFI_REST_EX_CONFIG_TYPE_UNSPECIFIC,
EFI_REST_EX_CONFIG_TYPE_MAX
} EFI_REST_EX_CONFIG_TYPE;
```

EFI_REST_EX_CONFIG_TYPE_HTTP indicates the format of the REST EX configuration is *EFI_REST_EX_HTTP_CONFIG_DATA*. *RestExConfigDataLength* of this type is the size of *EFI_REST_EX_HTTP_CONFIG_DATA*. This configuration type is used for the HTTP-aware EFI REST EX driver instance.

```
//*******************************************************
// EFI_REST_EX_HTTP_CONFIG_DATA
//*******************************************************
typedef struct {
    EFI_HTTP_CONFIG_DATA             HttpConfigData;
    UINT32                           SendReceiveTimeout;
} EFI_REST_EX_HTTP_CONFIG_DATA;
```

HttpConfigData
Parameters to configure the HTTP child instance.

SendReceiveTimeout
Time out (in milliseconds) when blocking for response after send out request message in EFI_REST_EX_PROTOCOL.SendReceive().

EFI_REST_EX_CONFIG_TYPE_UNSPECIFIC indicates the format of REST EX configuration is unspecific. *RestExConfigDataLength* of this type depends on the implementation of non HTTP-aware EFI REST EX driver instance such as BMC EFI REST EX driver instance. The format of configuration for this type refers to the system/platform spec which is out of UEFI scope.

Status Codes Returned

EFI_SUCCESS	*EFI_REST_EX_SERVICE_INFO* is returned in *RestExServiceInfo*.

continues on next page

Table 29.58 – continued from previous page

EFI_UNSUPPORTED	This function is not supported in this REST EX Protocol driver instance.

29.7.12 EFI_REST_EX_PROTOCOL.GetModeData()

Summary

This function returns operational configuration of current EFI REST EX child instance.

Protocol Interface

```
typedef
EFI_STATUS
(EFIAPI *EFI_REST_EX_GET_MODE_DATA)(
  IN EFI_REST_EX_PROTOCOL            *This,
  OUT EFI_REST_EX_CONFIG_DATA        *RestExConfigData
);
```

Parameters

This

This is the *EFI_REST_EX_PROTOCOL* instance.

RestExConfigData

Pointer to receive a pointer to *EFI_REST_EX_CONFIG_DATA*. The memory allocated for configuration data should be freed by caller. See Related Definitions for the details.

Description

This function returns the current configuration of EFI REST EX child instance. The format of operational configuration depends on the implementation of EFI REST EX driver instance. For example, HTTP-aware EFI REST EX driver instance uses EFI HTTP protocol as the underlying protocol to communicate with the REST service. In this case, the type of configuration *EFI_REST_EX_CONFIG_TYPE_HTTP* is returned from GetService(). *EFI_REST_EX_HTTP_CONFIG_DATA* is used as EFI REST EX configuration format and returned to the EFI REST client. For those non HTTP-aware REST EX driver instances, the type of configuration *EFI_REST_EX_CONFIG_TYPE_UNSPECIFIC* is returned from *GetService()*. In this case, the format of returning data could be non-standard. Instead, the format of configuration data is a system/platform specific definition such as a BMC mechanism used in EFI REST EX driver instance. EFI REST client and EFI REST EX driver instance have to refer to the specific system /platform spec which is out of UEFI scope.

Related Definitions

```
//*******************************************************
//EFI_REST_EX_CONFIG_DATA
//*******************************************************
typedef UINT8 *EFI_REST_EX_CONFIG_DATA;
```

Status Codes Returned

EFI_SUCCESS	*EFI_REST_EX_SERVICE_INFO* is returned in *RestExServiceInfo*.
EFI_UNSUPPORTED	This function is not supported in this REST EX Protocol driver instance.
EFI_NOT_READY	The configuration of this instance is not set yet. *Configure()* must be executed and return successfully prior to invoke this function

29.7.13 EFI_REST_EX_PROTOCOL.Configure()

Summary

This function is used to configure EFI REST EX child instance.

Protocol Interface

```
typedef
EFI_STATUS
(EFIAPI *EFI_REST_EX_CONFIGURE)(
  IN EFI_REST_EX_PROTOCOL          *This,
  IN EFI_REST_EX_CONFIG_DATA       RestExConfigData
);
```

Parameters

This

This is the *EFI_REST_EX_PROTOCOL* instance.

RestExConfigData

Pointer to *EFI_REST_EX_CONFIG_DATA*. See Related Definitions in GetModeData() protocol interface.

Description

This function is used to configure the setting of underlying protocol of REST EX child instance. The type of configuration is according to the implementation of EFI REST EX driver instance. For example, HTTP-aware EFI REST EX driver instance uses EFI HTTP protocol as the undying protocol to communicate with REST service. The type of configuration is *EFI_REST_EX_CONFIG_TYPE_HTTP* and *RestExConfigData* is in the format of *EFI_REST_EX_HTTP_CONFIF_DATA*.

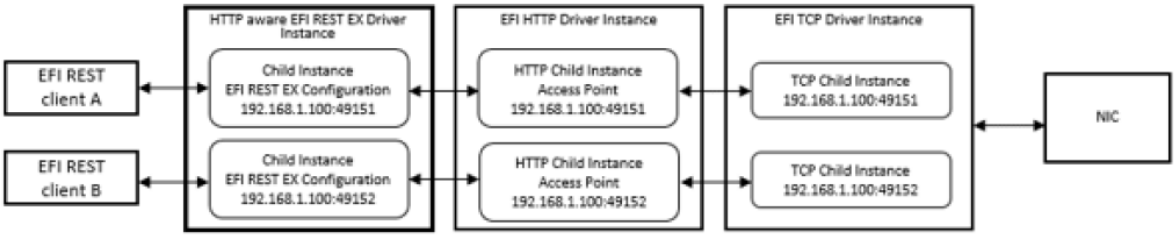
Akin to HTTP configuration, REST EX child instance can be configure to use different HTTP local access point for the data transmission. Multiple REST clients may use different configuration of HTTP to distinguish themselves, such as to use the different TCP port. For those non HTTP-aware REST EX driver instance, the type of configuration is *EFI_REST_EX_CONFIG_TYPE_UNSPECIFIC*. *RestExConfigData* refers to the non industrial standard. Instead, the format of configuration data is system/platform specific definition such as BMC. In this case, EFI REST client and EFI REST EX driver instance have to refer to the specific system/platform spec which is out of the UEFI scope. Besides *GetService()* function, no other EFI REST EX functions can be executed by this instance until *Configure()* is executed and returns successfully. All other functions must returns *EFI_NOT_READY* if this instance is not configured yet. Set *RestExConfigData* to **NULL** means to put EFI REST EX child instance into the unconfigured state.

Status Codes Returned

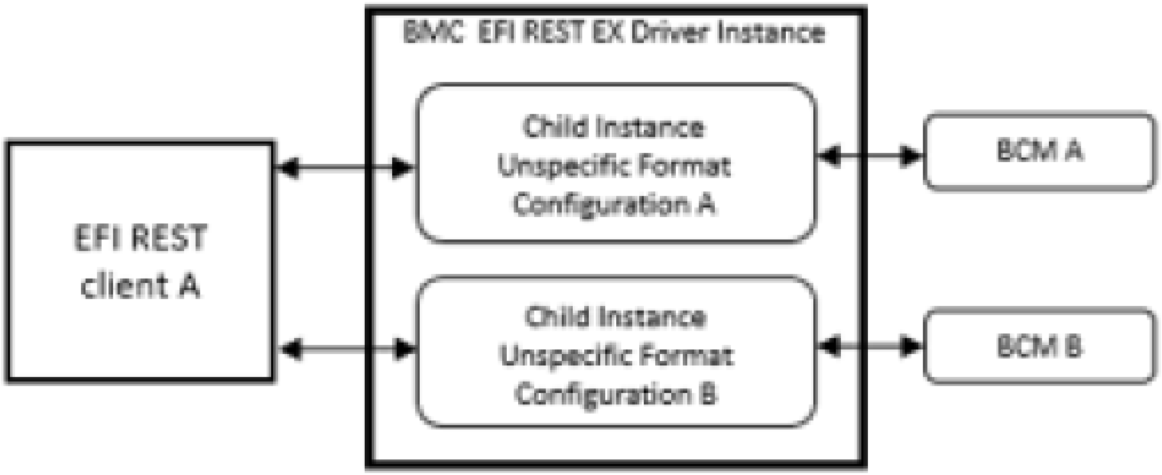
EFI_SUCCESS	*EFI_REST_EX_CONFIG_DATA* is set in successfully.
EFI_DEVICE_ERROR	Configuration for this REST EX child instance is failed with the given *EFI_REST_EX_CONFIG_DATA*
EFI_UNSUPPORTED	This function is not supported in this REST EX Protocol driver instance.

Usage Example

Below illustrations show the usage cases of using different EFI REST EX child instances to communicate with REST service.



In the above case, EFI REST Client A and B use HTTP-aware EFI REST EX driver instance to get and send resource. These two EFI REST clients configure the child instance with specific TCP port. Therefore the data transmission through HTTP can delivered to the proper EFI REST clients.



In the above case, EFI REST Client A creates two EFI REST EX child instances and configures those child instances to connect to two BMCs respectively.

29.7.14 EFI_REST_EX_PROTOCOL.AsyncSendReceive()

Summary

This function sends REST request to REST service and signal caller’s event asynchronously when the final response is received by REST EX Protocol driver instance. The essential design of this function is to handle asynchronous send/receive implicitly according to REST service asynchronous request mechanism. Caller will get the notification once the final response is returned from the REST service.

Protocol Interface

```
typedef
EFI_STATUS
(EFIAPI *EFI_REST_EX_ASYNC_SEND_RECEIVE)(
  IN EFI_REST_EX_PROTOCOL             *This,
  IN EFI_HTTP_MESSAGE                 *RequestMessage OPTIONAL,
  IN EFI_REST_EX_TOKEN                *RestExToken,
```

(continues on next page)

(continued from previous page)

```
  IN UINTN                              *TimeOutInMilliSeconds OPTIONAL
);
```

Parameters

This

This is the *EFI_REST_EX_PROTOCOL* instance.

RequestMessage

This is the REST request message sent to the REST service. Set *RequestMessage* to **NULL** to cancel the previous asynchronous request associated with the corresponding *RestExToken.* See descriptions for the details.

RestExToken

REST EX token which REST EX Protocol instance uses to notify REST client the status of response of asynchronous REST request. See related definition of *EFI_REST_EX_TOKEN.*

TimeOutInMilliSeconds

The pointer to the timeout in milliseconds which REST EX Protocol driver instance refers as the duration to drop asynchronous REST request. **NULL** pointer means no timeout for this REST request. REST EX Protocol driver signals caller's event with *EFI_STATUS* set to *EFI_TIMEOUT* in *RestExToken* if REST EX Protocol can't get the response from REST service within TimeOutInMilliSeconds.

Description

This function is used to send REST request with asynchronous REST service response within certain timeout declared. REST service sometime takes long time to create resource. Sometimes REST service returns response to REST client late because of the shortage of bandwidth or bad network quality. To prevent from unfriendly user experience due to system stuck while waiting for the response from REST service, *EFI_REST_EX_PROTOCOL.AsyncSendReceive()* provides the capability to send asynchronous REST request. Caller sends the REST request and still can execute some other processes on background while waiting the event signaled by REST EX Protocol driver instance.

The implementation of underlying mechanism of asynchronous REST request depends on the mechanism of REST service. HTTP protocol, In-Band management protocol and other protocols has its own way to support asynchronous REST request. Similar to *EFI_REST_EX_PROTOCOL .SendReceive(),* It's the REST EX protocol's responsibility to handle the implementation details and return only the REST resource to the caller. REST EX Protocol driver instance which doesn't support asynchronous REST request can just return *EFI_UNSUPPORTED* to caller. Also, this function must returns *EFI_UNSUPPORTED* if *EFI_REST_EX_SERVICE_TYPE* returned in *EFI_REST_EX_SERVICE_INFO* from GetService() is *EFI_REST_EX_SERVICE_UNSPECIFIC.*

REST clients do not have to know the preprocessors of asynchronous REST request between REST EX Protocol driver instance and REST service. The responsibility of REST EX Protocol driver instance is to monitor the status of resource readiness and to signal caller's *RestExToken* when the status of returning resource is ready. REST EX Protocol driver instance sets *Status* field in *RestExToken* to *EFI_SUCCESS* and sets *ResponseMessage* pointer to the final response from REST service. Then signal caller's event to notify REST client the desired REST resource is received. REST EX Protocol driver instance also has to create an EFI timer to handle the timeout situation. REST EX Protocol driver must drops the asynchronous REST request once the timeout is expired. In this case, REST EX Protocol driver instance sets Status field in RestExToken to *EFI_TIMEOUT* and signal caller's event token.

REST EX Protocol driver instance must has capability to cancel the in process asynchronous REST request when caller asks to terminate specific asynchronous REST request. REST EX Protocol driver instance may not have capability to force REST service to cancel the specific request, however, REST EX Protocol driver instance at lease least can clean up its own internal resource of asynchronous REST request. Caller has to set RequestMessage to **NULL** with *RestExToken* set to *EFI_REST_EX_TOKEN* which was successfully sent to this function previously. REST EX Protocol driver instance finds the given *EFI_REST_EX_TOKEN* from its private database and clean up the associated resource if *EFI_REST_EX_TOKEN* is an in-process asynchronous REST request. REST EX Protocol driver instance then sets Status field in RestExToken to EFI_ABORT and signal caller's event to indicate the asynchronous REST request has been canceled.

REST EX Protocol driver instance maintains the internal property, state machine, status of transfer of each asynchronous REST request. REST EX Protocol driver instance has to clean up the internal resource associated with each asynchronous REST request no matter the transfer is ended with success or fail.

There are two phases of asynchronous REST request. One is the preprocessor of establishing asynchronous REST request between REST EX Protocol driver instance and REST service. Another phase is to retrieve the final response from REST service and send to REST client.

Related Definitions

```
//*******************************************************
//EFI_REST_EX_TOKEN
//*******************************************************
typedef struct {
    EFI_EVENT                Event;
    EFI_STATUS               Status;
    EFI_HTTP_MESSAGE         *ResponseMessage;
} EFI_REST_EX_TOKEN;
```

Event

This event will be signaled after the Status field is updated by the EFI REST EX Protocol driver instance. The type of Event must be *EFI_NOTIFY_SIGNAL*. The Task Priority Level (TPL) of Event must be lower than or equal to *TPL_CALLBACK*, which allows other events to be notified.

Status

Status will be set to one of the following values if the REST EX Protocol driver instance gets the response from the REST service successfully, or if an unexpected error occurs:

EFI_SUCCESS: The resource gets a response from REST service successfully. *ResponseMessage* points to the response in HTTP message structure.

EFI_ABORTED: The asynchronous REST request was canceled by the caller.

EFI_TIMEOUT: The asynchronous REST request timed out before receiving a response from the REST service.

EFI_DEVICE_ERROR: An unexpected error occurred.

ResponseMessage

The REST response message pointed to by this pointer is only valid when *Status* is *EFI_SUCCESS*. The memory buffers pointed to by *ResponseMessage, ResponseMessage->Data.Response, ResponseMessage->Headers* and *ResponseMessage->Body* are allocated by the EFI REST EX driver instance, and it is the caller's responsibility to free the buffer when the caller no longer requires the buffer's contents.

Status Codes Returned

EFI_SUCCESS	Asynchronous REST request is established.
EFI_UNSUPPORTED	This REST EX Protocol driver instance doesn't support asynchronous request.
EFI_TIMEOUT	Asynchronous REST request is not established and timeout is expired.
EFI_ABORT	Previous asynchronous REST request has been canceled.
EFI_DEVICE_ERROR	Otherwise, returns *EFI_DEVICE_ERROR* for other errors according to HTTP Status Code.
EFI_NOT_READY	The configuration of this instance is not set yet. *Configure()* must be executed and returns successfully prior to invoke this function.

29.7.15 EFI_REST_EX_PROTOCOL.EventService()

Summary

This function sends REST request to a REST Event service and signals caller's event token asynchronously when the URI resource change event is received by REST EX Protocol driver instance. The essential design of this function is to monitor event implicitly according to REST service event service mechanism. Caller will get the notification if certain resource is changed.

EFI Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_REST_EX_EVENT_SERVICE)(
  IN EFI_REST_EX_PROTOCOL              *This,
  IN EFI_HTTP_MESSAGE                  *RequestMessage OPTIONAL,
  IN EFI_REST_EX_TOKEN                 *RestExToken
);
```

Parameters

This
This is the EFI_REST_EX_PROTOCOL instance.

RequestMessage
This is the HTTP request message sent to REST service. Set RequestMessage to **NULL** to cancel the previous event service associated with the corresponding RestExToken. See descriptions for the details.

RestExToken
REST EX token which REST EX Protocol driver instance uses to notify REST client the URI resource which monitored by REST client has been changed. See the related definition of *EFI_REST_EX_TOKEN* in *EFI_REST_EX_PROTOCOL.AsyncSendReceive()*.

Description

This function is used to subscribe an event through REST Event service if REST service supports event service. This function listens on resource change of specific REST URI resource. The type of URI resource change event is varied and REST service specific, such as URI resource updated, resource added, resource removed, alert, etc. The way to subscribe REST Event service is also REST service specific, usually described in HTTP body. With the implementation of *EFI_REST_EX_PROTOCOL.EventService()*, REST client can register an REST EX token of particular URI resource change, usually of a time critical nature, until subscription is deleted from REST Event service.

The implementation of underlying mechanism of REST Event service depends on the interface of REST EX Protocol driver instance. HTTP protocol, In-Band management protocols or other protocols can have its own implementation to support REST Event Service request. REST EX Protocol driver instance has knowledge of how to handle the REST Event service. The REST client creates and submits an HTTP-like header/body content in *RequestMessage* which required by REST Event services. How does REST EX Protocol driver instance handle REST Event service and monitor event is REST service-specific. REST EX driver instance can just returns *EFI_UNSUPPORTED* if REST service has no event capability. Also, this function must returns *EFI_UNSUPPORTED* if *EFI_REST_EX_SERVICE_TYPE* returned in *EFI_REST_EX_SERVICE_INFO* from *GetService()* is *EFI_REST_EX_SERVICE_UNSPECIFIC*.

The REST EX Protocol driver instance is responsible to monitor the resource change event pushed from REST service. REST EX Protocol driver instance signals caller's *RestExToken* when the event of resource change is pushed to REST EX Protocol driver instance. The way how REST service pushes event to REST EX Protocol driver instance is implementation-specific and transparent to REST client. REST EX Protocol driver instance sets Status field in *RestExToken* to *EFI_SUCCESS* and sets ResponseMessage pointer to the event resource returned from REST Event service. Then REST EX Protocol driver instance signals caller's event to notify REST client a new REST event is received. REST EX Protocol driver instance also responsible to terminate event subscription and clear up the internal resource associated with REST Event service if the status of subscription resource is returned error.

REST EX Protocol driver instance must has capability to remove event subscription created by REST client. Caller has to set RequestMessage to **NULL** with *RestExToken* set to *EFI_REST_EX_TOKEN* which was successfully sent to this function previously. REST EX Protocol driver instance finds the given *EFI_REST_EX_TOKEN* from its private database and delete the associated event from REST service.

Status Codes Returned

EFI_SUCCESS	Asynchronous REST request is established.
EFI_UNSUPPORTED	This REST EX Protocol driver instance doesn't support asynchronous request.
EFI_ABORT	Previous asynchronous REST request has been canceled or event subscription has been delete from service
EFI_DEVICE_ERROR	Otherwise, returns EFI_DEVICE_ERROR for other errors according to HTTP Status Code.
EFI_NOT_READY	The configuration of this instance is not set yet. *Configure()* must be executed and returns successfully prior to invoke this function.

29.7.15.1 Usage Example (HTTP-aware REST EX Protocol DriverInstance)

The following code example shows how a consumer of REST EX driver would use EFI REST EX ServiceBinding Protocol and EFI REST EX Protocol to send and receive the resources from a REST service.

```
EFI_HANDLE                            ImageHandle;
EFI_HANDLE                            *HandleBuffer;
UINTN                                 HandleNum;
UINTN                                 Index;
EFI_REST_EX_SERVICE_BINDING_PROTOCOL  *RestExService;
EFI_HANDLE                            RestExChild;
EFI_REST_EX_PROTOCOL                  *RestEx;
EFI_REST_EX_SERVICE_INFO              *RestExServiceInfo;
EFI_REST_EX_CONFIG_DATA               RestExConfigData;
EFI_HTTP_MESSAGE                      RequestMessage;
EFI_HTTP_MESSAGE                      ResponseMessage;

//
// Locate all the handles with RESTEX ServiceBinding Protocol.
//
Status = gBS->LocateHandleBuffer (
                  ByProtocol,
                  &gEfiRestExServiceBindingProtocolGuid,
                  NULL,
                  &HandleNum,
                  &HandleBuffer
                  );
if (EFI_ERROR (Status)  || (HandleNum == 0)) {
 return EFI_ABORTED;
}
```

```
for (Index = 0; Index < HandleNum; Index++) {
  //
  // Get the RESTEX ServiceBinding Protocol
  //
```

(continues on next page)

(continued from previous page)

```
  Status = gBS->OpenProtocol (
                  HandleBuffer[Index],
                  &gEfiRestExServiceBindingProtocolGuid,
                  (VOID **) &RestExService,
                  ImageHandle,
                  NULL,
                  EFI_OPEN_PROTOCOL_GET_PROTOCOL
                  );
  if (EFI_ERROR (Status)) {
   return Status;
  }
```

```
//
// Create the corresponding REST EX child
//
Status = RestExService->CreateChild (RestExService, &RestExChild);
if (EFI_ERROR (Status)) {
  return Status;
}

//
// Retrieve the REST EX Protocol from child handle
//
Status = gBS->OpenProtocol (
                RestExChild,
                &gEfiRestExProtocolGuid,
                (VOID **) &RestEx,
                ImageHandle,

     break;
   }
}
```

```
//
// Make sure we have found the preferred REST EX driver.
//
if (Index == HandleNum) {
  goto ON_EXIT;
}

//
// Configure the RESTEX instance.
//
Status =  RestEx->Configure (
                  RestEx,
                  RestExConfigData
                  );
if (EFI_ERROR (Status)) {
   goto ON_EXIT;
}

//
// Send and receive the resources from a REST service.
//
Status = RestEx->SendReceive (
                RestEx,
                &RequestMessage,
                &ResponseMessage
                );
if (EFI_ERROR (Status)) {
   goto ON_EXIT;
}

ON_EXIT:

  RestExService->DestroyChild (RestExService, RestExChild);
  return Status;
```

29.7.15.1.1 EFI_REST_EX_PROTOCOL.AsyncSendReceive()

To those HTTP-aware underlying mechanisms of the REST EX Protocol driver instance and "respond-async" prefer header aware REST service, REST EX Protocol driver instance adds additional HTTP Prefer header field (Refer to IEFT RFC7240) which is set to "respond-async" in the *RequestMessage.* HTTP 202 Accepted Status Code is returned from REST service which indicates the REST request is accepted by REST service, however, the final result is left unknown. The way how REST service returns final response to REST EX Protocol driver instance is REST service implementation-specific and transparent to the REST client. Whether or not the REST service has a proper response to "respond-async" is REST service implementation-specific. AsyncSendReceive() must returns *EFI_UNSUPPORTED* if the REST service that the REST EX instance communicates with is incapable of asynchronous response.

REST EX Protocol driver instance must returns *EFI_SUCCESS* to caller once it gets HTTP 202 Accepted Status Code from REST service. The HTTP Location header field can be returned in HTTP 202 Accepted Status Code. REST EX Protocol driver instance may create an EFI timer to poll the status of URI returned in HTTP Location header field. The content of URI which pointed by HTTP Location header is REST service implementation-specific and not defined in REST EX Protocol specification. REST EX Protocol driver instance provider should have knowledge about how to poll the status of returning resource from given HTTP Location header.

The following flowchart describes the flow of establishing asynchronous REST request on HTTP-aware infrastructure:

Once the asynchronous REST request is established, REST EX Protocol driver instance starts to poll the status of final response on the URI returned in HTTP Location header in HTTP 202 Accepted Status code.

29.7.15.1.2 EFI_REST_EX_PROTOCOL.EventService()

The REST client creates and submits an HTTP-like header/body content in RequestMessage which are required by REST Event services. The REST Event Service will return an HTTP 201 (CREATED) and the Location header in the response shall contain a URI giving the location of newly created subscription resource.

The following flowchart describes the flow of subscribing to a REST Event service on HTTP-aware infrastructure:

Once the REST request is submitted successfully and REST EX Protocol driver instance gets the HTTP 201, REST EX Protocol driver instance starts to monitor whether resource event change is pushed to REST EX Protocol driver instance from REST service.

29.7.16 EFI_REST_EX_PROTOCOL.EventService()

The REST client creates and submits an HTTP-like header/body content in RequestMessage which are required by REST Event services. The REST Event Service will return an HTTP 201 (CREATED) and the Location header in the response shall contain a URI giving the location of newly created subscription resource.

The following flowchart describes the flow of subscribing to a REST Event service on HTTP-aware infrastructure:

Once the REST request is submitted successfully and REST EX Protocol driver instance gets the HTTP 201, REST EX Protocol driver instance starts to monitor whether resource event change is pushed to REST EX Protocol driver instance from REST service.

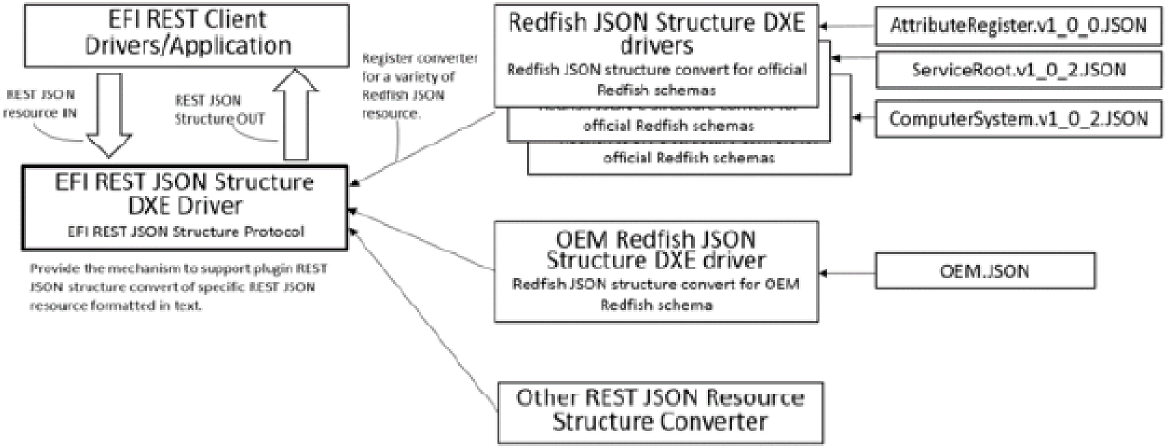
29.7.17 EFI REST JSON Resource to C Structure Converter

29.7.17.1 Overview

EFI REST JSON Structure Protocol is designed as the centralized REST JSON Resource IN-Structure OUT (JSON-IN Structure-OUT in short) and vice versa converter for EFI REST client drivers or EFI REST client applications. This protocol provides the registration function which is invoked by upper layer EFI driver to register converter as the plug-in converter for the well-known REST JSON resource. The EFI driver which provide REST JSON resource to structure converter is EFI REST JSON structure converter producer. In the other hand, EFI drivers or applications which utilize EFI REST JSON Structure protocol is the consumer of EFI REST JSON structure converter. The convert producer is required to register its converter functions with predefined REST JSON resource namespace and data type. EFI REST JSON Structure Protocol maintains the database of all plug-in converter and dispatches the consumer request to proper REST JSON resource structure converter. EFI REST JSON Structure Protocol doesn't have knowledge about the exact structure for the particular REST JSON resource. It just dispatches JSON resource to the correct convert functions and returns the pointer of structure generated by convert producer. This protocol reduces the burdens of JSON resource parsing effort. This also provides the easier way to refer to specific REST JSON property using native C structure reference. Below figure delineates the software stack of EFI REST JSON resource to structure converter architecture.



29.7.17.2 EFI REST JSON Structure Protocol

Summary

EFI REST JSON Structure Protocol provides function to converter producer for the registration of REST JSON resource structure converter. This protocol also provides functions of JSON-IN Structure-OUT and vice versa to converter consumer.

Protocol GUID

```
#define EFI_REST_JSON_STRUCTURE_PROTOCOL_GUID \
 { 0xa9a048f6, 0x48a0, 0x4714, {0xb7, 0xda, 0xa9, 0xad,
   0x87, 0xd4, 0xda, 0xc9}}
```

Protocol Interface Structure

```
typedef struct _EFI_REST_JSON_STRUCTURE_PROTOCOL {
    EFI_REST_JSON_STRUCTURE_REGISTER              Register;
    EFI_REST_JSON_STRUCTURE_TO_STRUCTURE          ToStructure;
    EFI_REST_JSON_STRUCTURE_TO_JSON               ToJson;
    EFI_REST_JSON_STRUCTURE_DESTORY_STRUCTURE     DestoryStructure;
}  EFI_REST_JSON_STRUCTURE_PROTOCOL;
```

Parameters

Register
Register REST JSON structure converter producer.

ToStructure
JSON-IN Structure-OUT function.

ToJson
Structure-IN JSON-OUT function.

DestoryStructure
Destroy JSON structure returned from *ToStructure* function.

Description

Each plug-in JSON resource to structure converter is required to register itself into EFI_REST_JSON_STRUCTURE_PROTOCOL. The plug-in JSON resource to structure converter has to provide corresponding functions for *ToStructure(), ToJson()* and *DestoryStructure()* for the specific REST JSON resource. *EFI_REST_JSON_STRUCTURE_PROTOCOL maintains converter producer using the JSON resource type and version information when registration. The ToStructure(), ToJson()* and *DestoryStructure()* provided by *EFI_REST_JSON_STRUCTURE_PROTOCOL* is published to converter consumer for JSON-IN Structure-OUT and vice versa conversion. *EFI_REST_JSON_STRUCTURE_PROTOCOL* is responsible for dispatching consumer request to the proper converter producer.

29.7.18 EFI_REST_JSON_STRUCTURE.Register ()

Summary

This function provides REST JSON resource to structure converter registration.

Protocol Interface

```
typedef
EFI_STATUS
(EFIAPI *EFI_REST_JSON_STRUCTURE_REGISTER)(
  IN EFI_REST_JSON_STRUCTURE_PROTOCOL          *This,
  IN EFI_REST_JSON_STRUCTURE_SUPPORTED         *JsonStructureSupported,
  IN EFI_REST_JSON_STRUCTURE_TO_STRUCTURE      ToStructure,
  IN EFI_REST_JSON_STRUCTURE_TO_JSON           ToJson,
  IN EFI_REST_JSON_DESTORY_STRUCTURE           DestroyStructure
);
```

Parameters

This
This is the *EFI_REST_JSON_STRUCTURE_PROTOCOL* instance.

JsonStructureSupported
The type and version of REST JSON resource which this converter supports.

ToStructure
The function to convert REST JSON resource to structure.

ToJson
The function to convert REST JSON structure to JSON in text format.

DestroyStructure
Destroy REST JSON structure returned in *ToStructure()* function.

Description

This function is invoked by REST JSON resource to structure converter to register JSON-IN Structure-OUT, Structure-IN JSON-OUT and destroy JSON structure functionalities. The converter producer has to correctly specify REST resource supporting information in *EFI_REST_JSON_STRUCTURE_SUPPORTED*. The information includes the type name, revision and data type of REST resource. Multiple REST JSON resource to structure converters may supported in one drive, refer to below related definition.

Related Definitions

```
typedef CHAR8 *EFI_REST_JSON_RESOURCE_TYPE_DATATYPE;

//*******************************************************
// EFI_REST_JSON_RESOURCE_TYPE_NAMESPACE
//*******************************************************
typedef struct _EFI_REST_JSON_RESOURCE_TYPE_NAMESPACE {
  CHAR8        *ResourceTypeName;
  CHAR8        *MajorVersion;
  CHAR8        *MinorVersion;
  CHAR8        *ErrataVersion;
} EFI_REST_JSON_RESOURCE_TYPE_NAMESPACE;
```

Parameters

ResourceTypeName
CHAR8 pointer to the name of this REST JSON Resource.

MajorVersion
CHAR8 pointer to the string of REST JSON Resource major version.

MinorVersion
CHAR8 pointer to the string of REST JSON Resource minor version.

ErrataVersion
CHAR8 pointer to the string of REST JSON Resource errata version.

```
//*******************************************************
// EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER
//*******************************************************
typedef struct _EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER {
  EFI_REST_JSON_RESOURCE_TYPE_NAMESPACE      Namespace;
  EFI_REST_JSON_RESOURCE_TYPE_DATATYPE       Datatype;
} EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER;
```

Parameters

Namespace
Name space of this REST JSON resource.

Datatype
CHAR8 pointer to the string of data type, could be **NULL** if there is no data type for this REST JSON resource.

```
//*******************************************************
// EFI_REST_JSON_STRUCTURE_SUPPORTED
//*******************************************************
typedef struct _EFI_REST_JSON_STRUCTURE_SUPPORTED{
EFI_REST_JSON_STRUCTURE_SUPPORTED            *Next;
    EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER   JsonResourceType;
    } EFI_REST_JSON_STRUCTURE_SUPPORTED;
```

Parameters

Next

Pointer to next *EFI_REST_JSON_STRUCTURE_SUPPORTED*.

JsonResourceType

Information of REST JSON resource this converter supports.

Status Codes Returned

EFI_SUCCESS	Converter is successfully registered
EFI_INVALID_PARAMETER	One or more of the following is **TRUE**: *This* is **NULL**. *JsonStructureSupported* is **NULL**. *ResourceTypeName* in *JsonStructureSupported* structure is a **NULL** string *ToStructure* is **NULL**. *ToJason* is **NULL**. *DestroyStructure* is **NULL**.
EFI_ALREADY_STARTED	If the JSON resource to structure converter is already registered for this type and revision of JSON resource.
EFI_OUT_OF_RESOURCE	Not enough resource for the converter registration

29.7.19 EFI_REST_JSON_STRUCTURE.ToStructure ()

Summary

JSON-IN Structure-OUT function. Convert the given REST JSON resource into structure.

Protocol Interface

```
typedef
EFI_STATUS
 (EFIAPI *EFI_REST_JSON_STRUCTURE_TO_STRUCTURE)(
    IN   EFI_REST_JSON_STRUCTURE_PROTOCOL          *This,
    IN   EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER    *JsonRsrcIdentifier
 OPTIONAL,
    IN   CHAR8                                     *ResourceJsonText,
    OUT   EFI_REST_JSON_STRUCTURE_HEADER           **JsonStructure
 );
```

Parameters

This

This is the *EFI_REST_JSON_STRUCTURE_PROTOCOL* instance.

JsonRsrcIdentifier

This indicates the resource type and version is given in *ResourceJsonText.* If *JsonRsrcIdentifier* is **NULL**, means the JSON resource type and version information of given *ResourceJsonText* is unsure. User would like to have *EFI_REST_JSON_STRUCTURE_PROTOCOL* to look for the proper JSON structure converter.

ResourceJsonText

REST JSON resource in text format.

JsonStructure

Pointer to receive the pointer to *EFI_REST_JSON_STRUCTURE_HEADER,* refer to related definition for the details.

Description

This function converts the given JSON resource in text format into predefined structure. The definition of structure format is not the scope of *EFI_REST_JSON_STRUCTURE_PROTOCOL. EFI_REST_JSON_STRUCTURE_PROTOCOL* is a centralized JSON-IN Structure-OUT converter which maintain the registration of a variety of JSON resource to structure converters. The structure definition and the corresponding C header file are written and released by 3rd party, OEM, organization or any open source communities. The JSON resource to structure converter (convert producer) may be released in the source format or binary format. The convert producer registers itself to *EFI_REST_JSON_STRUCTURE_PROTOCOL* uses *Register()* and provides EFI JSON resource to structure and vice versa conversion. Consumer has to destroy *JsonStructure* using *DestoryStructure()* function. Resource allocated for *JsonStructure* will be released and cleaned up by converter producer.

When *JsonRsrcIdentifier* is a non **NULL** pointer, *ResourceTypeName* in *EFI_REST_JSON_RESOURCE_TYPE_NAMESPACE* must be a non **NULL** string, however the revision in *EFI_REST_JSON_RESOURCE_TYPE _NAMESPACE* and data type in *EFI_REST_JSON_RESOURCE_TYPE* could be **NULL** string if REST JSON resource is non version controlled or no data type is defined. If *JsonRsrcIdentifier* is a non **NULL** pointer, *EFI_REST_JSON_STRUCTURE_PROTOCOL* looks for the proper converter from its database. Invokes the *ToStructure()* provided by the converter to convert JSON resource to structure.

Another scenario is *JsonRsrcIdentifier* may passed in as **NULL**, this means the JSON resource type and version information of given *ResourceJsonText* is unsure. In this case, *EFI_REST_JSON_STRUCTURE_PROTOCOL* invokes and passes *ResourceJsonText* to *ToStructure()* of each registered converter with *JsonRsrcIdentifier* set to **NULL**. Converter producer may or may not automatically determine REST JSON resource type and version. Converter producer should return *EFI_UNSUPPORTED* if it doesn't support automatically recognition of REST JSON resource. Or converter producer can recognize the given REST JSON resource by parsing the certain properties. This depends on the implementation of JSON resource to structure converter. If one of the registered converter producers can recognize the given *ResourceJsonText,* the *JsonRsrcIdentifier* in *EFI_REST_JSON_STRUCTURE_HEADER* is filled up with the proper REST JSON resource type, version and data type. With the information provided in *EFI_REST_JSON_STRUCTURE_HEADER,* consumer has idea about what the exact type of REST JSON structure is.

Related Definitions

```
//*******************************************************
// EFI_REST_JSON_STRUCTURE_HEADER
//*******************************************************
typedef struct _EFI_REST_JSON_STRUCTURE_HEADER {
  EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER     JsonRsrcIdentifier;
  //
  // Follow by a pointer points to JSON structure, the content in the
  // JSON structure is implementation-specific according to converter producer.
  //
  VOID                                      *JsonStructurePointer;
} EFI_REST_JSON_STRUCTURE_HEADER;
```

Parameters

JsonRsrcIdentifier
Information of REST JSON structure returned from this converter.

JsonStructurePointer
Pointers to JSON structure, the content in the JSON structure is implementation-specific according to the converter producer.

Status Codes Returned

EFI_SUCCESS	Pointer to JSON structure is returned in *JsonStructure*
EFI_INVALID_PARAMETER	One or more of the following is **TRUE**: *This* is **NULL**. *ResourceJsonText* is **NULL**. *JsonRsrcIdentifier* is not **NULL,** but the *ResourceTypeName* in *JsonRsrcIdentifier* is **NULL**. *JsonStructure* is **NULL**.
EFI_NOT_FOUND	No proper JSON resource to structure convert found.

29.7.20 EFI_REST_JSON_STRUCTURE.ToJson ()

Summary

Structure-IN JSON-OUT function. Convert the given REST JSON structure into JSON text. The definition of structure format is not the scope of *EFI_REST_JSON_STRUCTURE_PROTOCOL*. The structure definition and the corresponding C header file are written and released by 3rd party, OEM, organization or any open source communities. Consumer has to free the memory block allocated for *ResourceJsonText* if the JSON resource is no longer needed.

Protocol Interface

```
typedef
EFI_STATUS
(EFIAPI *EFI_REST_JSON_STRUCTURE_TO_JSON)(
  IN EFI_REST_JSON_STRUCTURE_PROTOCOL        *This,
  IN EFI_REST_JSON_STRUCTURE_HEADER          *JsonStructureHeader,
  OUT CHAR8                                  **ResourceJsonText
);
```

Parameters

This
This is the *EFI_REST_JSON_STRUCTURE_PROTOCOL* instance.

JsonStructureHeader
The point to *EFI_REST_JSON_STRUCTURE_HEADER* structure. *EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER* in *EFI_REST_JSON_STRUCTURE_HEADER* must exactly describes the JSON resource type and revision referred by this JSON structure. *ResourceTypeName* in *JsonRsrcIdentifier* must be non **NULL** pointer pointes to string. Revision and data type in *JsonRsrcIdentifier* could be **NULL** if REST JSON resource is not version controlled and or data type definition.

ResourceJsonText
Pointer to receive REST JSON resource in text format.

Description

This functions converts the given REST JSON structure into REST JSON text format resource.

Status Codes Returned

EFI_SUCCESS	Pointer to JSON resource in text format is returned in *ResourceJsonText*
EFI_INVALID_PARAMETER	One or more of the following is **TRUE**: *This* is **NULL**. *JsonStructureHeader* is **NULL** *ResourceJsonText* is **NULL**.
EFI_NOT_FOUND	No proper JSON structure convert found to convert JSON structure to JSON text format.

29.7.21 EFI_REST_JSON_STRUCTURE.DestroyStructure ()

Summary

This function destroys the REST JSON structure.

Protocol Interface

```
typedef
EFI_STATUS
(EFIAPI *EFI_REST_JSON_STRUCTURE_DESTORY_STRUCTURE)(
  IN EFI_REST_JSON_STRUCTURE_PROTOCOL        *This,
  IN EFI_REST_JSON_STRUCTURE_HEADER          *JsonStructureHeader
);
```

Description

This function destroys the JSON structure generated by *ToStructure()* function. REST JSON resource structure converter is responsible for freeing and cleaning up all resource associated with the give JSON structure.

Status Codes Returned

EFI_SUCCESS	JSON structure is successfully destroyed.
EFI_INVALID_PARAMETER	One or more of the following is **TRUE**: • *This* is null. • *JsonStructureHeader* is **NULL**.
EFI_NOT_FOUND	No proper JSON structure converter found to destroy JSON structure.

29.7.21.1 EFI Redfish JSON Structure Converter

For writing and using an EFI Redfish JSON Structure Converter, see Section 31.2, using the EFI_REST_JSON_STRUCTURE_PROTOCOL protocol.

CHAPTER

THIRTY

NETWORK PROTOCOLS — UDP AND MTFTP

30.1 EFI UDP Protocol

This chapter defines the EFI UDP (User Datagram Protocol) Protocol that interfaces over the EFI IP Protocol, and the EFI MTFTP Protocol interface that is built upon the EFI UDP Protocol. Protocols for version 4 and version 6 of UDP and MTFTP are included.

30.1.1 UDP4 Service Binding Protocol

30.1.1.1 EFI_UDP4_SERVICE_BINDING_PROTOCOL

Summary

The EFI UDPv4 Service Binding Protocol is used to locate communication devices that are supported by an EFI UDPv4 Protocol driver and to create and destroy instances of the EFI UDPv4 Protocol child protocol driver that can use the underlying communications device.

GUID

```
#define EFI_UDP4_SERVICE_BINDING_PROTOCOL_GUID \
  {0x83f01464,0x99bd,0x45e5,\
    {0xb3,0x83,0xaf,0x63,0x05,0xd8,0xe9,0xe6}}
```

Description

A network application that requires basic UDPv4 I/O services can use one of the protocol handler services, such as *BS->LocateHandleBuffer()*, to search for devices that publish a EFI UDPv4 Service Binding Protocol GUID. Each device with a published EFI UDPv4 Service Binding Protocol GUID supports the EFI UDPv4 Protocol and may be available for use.

After a successful call to the *EFI_UDP4_SERVICE_BINDING_PROTOCOL .CreateChild()* function, the newly created child EFI UDPv4 Protocol driver is in an unconfigured state; it is not ready to send and receive data packets.

Before a network application terminates execution every successful call to the *EFI_UDP4_SERVICE_BINDING_PROTOCOL .CreateChild()* function must be matched with a call to the *EFI_UDP4_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

30.1.2 UDP4 Protocol

30.1.2.1 EFI_UDP4_PROTOCOL

Summary

The EFI UDPv4 Protocol provides simple packet-oriented services to transmit and receive UDP packets.

GUID

```
#define EFI_UDP4_PROTOCOL_GUID \
  {0x3ad9df29,0x4501,0x478d,\
    {0xb1,0xf8,0x7f,0x7f,0xe7,0x0e,0x50,0xf3}}
```

Protocol Interface Structure

```
typedef struct _EFI_UDP4_PROTOCOL {
  EFI_UDP4_GET_MODE_DATA         GetModeData;
  EFI_UDP4_CONFIGURE             Configure;
  EFI_UDP4_GROUPS                Groups;
  EFI_UDP4_ROUTES                Routes;
  EFI_UDP4_TRANSMIT              Transmit;
  EFI_UDP4_RECEIVE               Receive;
  EFI_UDP4_CANCEL                Cancel;
  EFI_UDP4_POLL                  Poll;
}  EFI_UDP4_PROTOCOL;
```

Parameters

GetModeData
Reads the current operational settings. See the *GetModeData()* function description.

Configure
Initializes, changes, or resets operational settings for the EFI UDPv4 Protocol. See the *Configure()* function description.

Groups
Joins and leaves multicast groups. See the *Groups()* function description.

Routes
Add and deletes routing table entries. See the *Routes()* function description.

Transmit
Queues outgoing data packets into the transmit queue. This function is a nonblocked operation. See the *Transmit()* function description.

Receive
Places a receiving request token into the receiving queue. This function is a nonblocked operation. See the *Receive()* function description.

Cancel
Aborts a pending transmit or receive request. See the *Cancel()* function description.

Poll
Polls for incoming data packets and processes outgoing data packets. See the *Poll()* function description.

Description

The *EFI_UDP4_PROTOCOL* defines an EFI UDPv4 Protocol session that can be used by any network drivers, applications, or daemons to transmit or receive UDP packets. This protocol instance can either be bound to a specified port as a service or connected to some remote peer as an active client. Each instance has its own settings, such as the routing table and group table, which are independent from each other.

NOTE: *In this document, all IPv4 addresses and incoming/outgoing packets are stored in network byte order. All other parameters in the functions and data structures that are defined in this document are stored in host byte order*.

30.1.2.2 EFI_UDP4_PROTOCOL.GetModeData()

Summary

Reads the current operational settings.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP4_GET_MODE_DATA) (
  IN EFI_UDP4_PROTOCOL                  *This,
  OUT EFI_UDP4_CONFIG_DATA              *Udp4ConfigData OPTIONAL,
  OUT EFI_IP4_MODE_DATA                 *Ip4ModeData OPTIONAL,
  OUT EFI_MANAGED_NETWORK_CONFIG_DATA   *MnpConfigData OPTIONAL,
  OUT EFI_SIMPLE_NETWORK_MODE           *SnpModeData OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_UDP4_PROTOCOL* instance.

Udp4ConfigData
Pointer to the buffer to receive the current configuration data. Type *EFI_UDP4_CONFIG_DATA* is defined in “Related Definitions” below.

Ip4ModeData*
Pointer to the EFI IPv4 Protocol mode data structure. Type *EFI_IP4_MODE_DATA* is defined in *EFI_IP4_PROTOCOL .GetModeData()*.

MnpConfigData
Pointer to the managed network configuration data structure. Type *EFI_MANAGED_NETWORK_CONFIG_DATA* is defined in *EFI_MANAGED_NETWORK_PROTOCOL.GetModeData()*.

SnpModeData
Pointer to the simple network mode data structure. Type *EFI_SIMPLE_NETWORK_MODE* is defined in the *EFI_SIMPLE_NETWORK_PROTOCOL.*

Description

The *GetModeData()* function copies the current operational settings of this EFI UDPv4 Protocol instance into user-supplied buffers. This function is used optionally to retrieve the operational mode data of underlying networks or drivers.

Related Definition

```
//****************************************************
// EFI_UDP4_CONFIG_DATA
//****************************************************
typedef struct {
  //Receiving Filters
```

(continues on next page)

(continued from previous page)

```
  BOOLEAN             AcceptBroadcast;
  BOOLEAN             AcceptPromiscuous;
  BOOLEAN             AcceptAnyPort;
  BOOLEAN             AllowDuplicatePort;
  // I/O parameters
  UINT8               TypeOfService;
  UINT8               TimeToLive;
  BOOLEAN             DoNotFragment;
  UINT32              ReceiveTimeout;
  UINT32              TransmitTimeout;
  // Access Point
  BOOLEAN             UseDefaultAddress;
  EFI_IPv4_ADDRESS    StationAddress;
  EFI_IPv4_ADDRESS    SubnetMask;
  UINT16              StationPort;
  EFI_IPv4_ADDRESS    RemoteAddress;
  UINT16              RemotePort;
}  EFI_UDP4_CONFIG_DATA;
```

AcceptBroadcast
Set to **TRUE** to accept broadcast UDP packets.

AcceptPromiscuous
Set to **TRUE** to accept UDP packets that are sent to any address.

AcceptAnyPort
Set to **TRUE** to accept UDP packets that are sent to any port.

AllowDuplicatePort
Set to **TRUE** to allow this EFI UDPv4 Protocol child instance to open a port number that is already being used by another EFI UDPv4 Protocol child instance.

TypeOfService
TypeOfService field in transmitted IPv4 packets.

TimeToLive
TimeToLive field in transmitted IPv4 packets.

DoNotFragment
Set to **TRUE** to disable IP transmit fragmentation.

ReceiveTimeout
The receive timeout value (number of microseconds) to be associated with each incoming packet. Zero means do not drop incoming packets.

TransmitTimeout
The transmit timeout value (number of microseconds) to be associated with each outgoing packet. Zero means do not drop outgoing packets.

UseDefaultAddress
Set to **TRUE** to use the default IP address and default routing table. If the default IP address is not available yet, then the underlying EFI IPv4 Protocol driver will use *EFI_IP4_CONFIG2_PROTOCOL* to retrieve the IP address and subnet information. Ignored for incoming filtering if *AcceptPromiscuous* is set to **TRUE**.

StationAddress
The station IP address that will be assigned to this EFI UDPv4 Protocol instance. The EFI UDPv4 and EFI IPv4 Protocol drivers will only deliver incoming packets whose destination matches this IP address exactly. Address 0.0.0.0 is also accepted as a special case in which incoming packets destined to any station IP address are always

delivered. Not used when *UseDefaultAddress* is **TRUE**. Ignored for incoming filtering if *AcceptPromiscuous* is **TRUE**.

SubnetMask

The subnet address mask that is associated with the station address. Not used when *UseDefaultAddress* is **TRUE**.

StationPort

The port number to which this EFI UDPv4 Protocol instance is bound. If a client of the EFI UDPv4 Protocol does not care about the port number, set *StationPort* to zero. The EFI UDPv4 Protocol driver will assign a random port number to transmitted UDP packets. Ignored if *AcceptAnyPort* is set to **TRUE**.

RemoteAddress

The IP address of remote host to which this EFI UDPv4 Protocol instance is connecting. If *RemoteAddress* is not 0.0.0.0, this EFI UDPv4 Protocol instance will be connected to *RemoteAddress;* i.e., outgoing packets of this EFI UDPv4 Protocol instance will be sent to this address by default and only incoming packets from this address will be delivered to client. Ignored for incoming filtering if *AcceptPromiscuous* is **TRUE**.

RemotePort

The port number of the remote host to which this EFI UDPv4 Protocol instance is connecting. If it is not zero, outgoing packets of this EFI UDPv4 Protocol instance will be sent to this port number by default and only incoming packets from this port will be delivered to client. Ignored if *RemoteAddress* is 0.0.0.0 and ignored for incoming filtering if *AcceptPromiscuous* is **TRUE**.

Status Codes Returned

EFI_SUCCESS	The mode data was read.
EFI_NOT_STARTED	When *Udp4ConfigData* is queried, no configuration data is available because this instance has not been started.
EFI_INVALID_PARAMETER	*This* is **NULL**.

30.1.2.3 EFI_UDP4_PROTOCOL.Configure()

Summary

- Initializes, changes, or resets the operational parameters for this instance of the EFI UDPv4 Protocol.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP4_CONFIGURE) (
  IN EFI_UDP4_PROTOCOL         *This,
  IN EFI_UDP4_CONFIG_DATA      *UdpConfigData OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_UDP4_PROTOCOL* instance.

UdpConfigData

Pointer to the buffer to receive the current mode data.

Description

The *Configure()* function is used to do the following:

- Initialize and start this instance of the EFI UDPv4 Protocol.

- Change the filtering rules and operational parameters.
- Reset this instance of the EFI UDPv4 Protocol.

Until these parameters are initialized, no network traffic can be sent or received by this instance. This instance can be also reset by calling *Configure()* with *UdpConfigData* set to *NULL*. Once reset, the receiving queue and transmitting queue are flushed and no traffic is allowed through this instance.

With different parameters in *UdpConfigData*, *Configure()* can be used to bind this instance to specified port.

Status Codes Returned

EFI_SUCCESS	The configuration settings were set, changed, or reset successfully.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_INVALID_PARAMETER	One or more following conditions are **TRUE** : • *This* is **NULL**. • *UdpConfigData.StationAddress* is not a valid unicast IPv4 address. • *UdpConfigData.SubnetMask* is not a valid IPv4 address mask. The subnet mask must be contiguous. • *UdpConfigData.RemoteAddress* is not a valid unicast IPv4 address if it is not zero.
EFI_ALREADY_STARTED	The EFI UDPv4 Protocol instance is already started/configured and must be stopped/reset before it can be reconfigured. Only *TypeOfService*, *TimeToLive*, *DoNotFragment*, *ReceiveTimeout*, and *TransmitTimeout* can be reconfigured without stopping the current instance of the EFI UDPv4 Protocol.
EFI_ACCESS_DENIED	*UdpConfigData. AllowDuplicatePort* is **FALSE** and *UdpConfigData.StationPort* is already used by other instance.
EFI_OUT_OF_RESOURCES	The EFI UDPv4 Protocol driver cannot allocate memory for this EFI UDPv4 Protocol instance.
EFI_DEVICE_ERROR	An unexpected network or system error occurred and this instance was not opened.

30.1.2.4 EFI_UDP4_PROTOCOL.Groups()

Summary

Joins and leaves multicast groups.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP4_GROUPS) (
  IN EFI_UDP4_PROTOCOL       *This,
  IN BOOLEAN                 JoinFlag,
  IN EFI_IPv4_ADDRESS        *MulticastAddress OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_UDP4_PROTOCOL* instance.

JoinFlag

Set to **TRUE** to join a multicast group. Set to **FALSE** to leave one or all multicast groups.

MulticastAddress

Pointer to multicast group address to join or leave.

Description

The *Groups()* function is used to enable and disable the multicast group filtering.

If the *JoinFlag* is **FALSE** and the *MulticastAddress* is **NULL**, then all currently joined groups are left.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_NOT_STARTED	The EFI UDPv4 Protocol instance has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_OUT_OF_RESOURCES	Could not allocate resources to join the group.
EFI_INVALID_PARAMETER	One or more of the following conditions is TRUE: • This is NULL. • JoinFlag is TRUE and MulticastAddress is NULL. • JoinFlag is TRUE and *MulticastAddress is not a valid multicast address.
EFI_ALREADY_STARTED	The group address is already in the group table (when JoinFlag is TRUE).
EFI_NOT_FOUND	The group address is not in the group table (when JoinFlag is FALSE).
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

30.1.2.5 EFI_UDP4_PROTOCOL.Routes()

Summary

Adds and deletes routing table entries.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP4_ROUTES) (
  IN EFI_UDP4_PROTOCOL       *This,
  IN BOOLEAN                 DeleteRoute,
  IN EFI_IPv4_ADDRESS        *SubnetAddress,
  IN EFI_IPv4_ADDRESS        *SubnetMask,
  IN EFI_IPv4_ADDRESS        *GatewayAddress
  );
```

Parameters

This

Pointer to the *EFI_UDP4_PROTOCOL* instance.

DeleteRoute

Set to **TRUE** to delete this route from the routing table. Set to **FALSE** to add this route to the routing table. *DestinationAddress* and *SubnetMask* are used as the key to each route entry.

SubnetAddress
The destination network address that needs to be routed.

SubnetMask
The subnet mask of *SubnetAddress*.

GatewayAddress
The gateway IP address for this route.

Description

The *Routes()* function adds a route to or deletes a route from the routing table.

Routes are determined by comparing the *SubnetAddress* with the destination IP address and arithmetically *AND* -ing it with the *SubnetMask*. The gateway address must be on the same subnet as the configured station address.

The default route is added with *SubnetAddress* and *SubnetMask* both set to 0.0.0.0. The default route matches all destination IP addresses that do not match any other routes.

A zero *GatewayAddress* is a nonroute. Packets are sent to the destination IP address if it can be found in the Address Resolution Protocol (ARP) cache or on the local subnet. One automatic nonroute entry will be inserted into the routing table for outgoing packets that are addressed to a local subnet (gateway address of 0.0.0.0).

Each instance of the EFI UDPv4 Protocol has its own independent routing table. Instances of the EFI UDPv4 Protocol that use the default IP address will also have copies of the routing table provided by the *EFI_IP4_CONFIG2_PROTOCOL*. These copies will be updated automatically whenever the IP driver reconfigures its instances; as a result, the previous modification to these copies will be lost.

NOTE: *There is no way to set up routes to other network interface cards (NICs) because each NIC has its own independent network stack that shares information only through* EFI UDP4 Variable.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_NOT_STARTED	The EFI UDPv4 Protocol instance has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE** : • *This* is **NULL**. • *SubnetAddress* is **NULL**. • *SubnetMask* is **NULL**. • *GatewayAddress* is **NULL**. • *SubnetAddress* is not a valid subnet address. • *SubnetMask* is not a valid subnet mask. • *GatewayAddress* is not a valid unicast IP address.
EFI_OUT_OF_RESOURCES	Could not add the entry to the routing table.
EFI_NOT_FOUND	This route is not in the routing table.
EFI_ACCESS_DENIED	The route is already defined in the routing table.

30.1.2.6 EFI_UDP4_PROTOCOL.Transmit()

Summary

Queues outgoing data packets into the transmit queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP4_TRANSMIT) (
  IN EFI_UDP4_PROTOCOL               *This,
  IN EFI_UDP4_COMPLETION_TOKEN       *Token
  );
```

Parameters

This
Pointer to the *EFI_UDP4_PROTOCOL* instance.

Token
Pointer to the completion token that will be placed into the transmit queue. Type *EFI_UDP4_COMPLETION_TOKEN* is defined in "Related Definitions" below.

Description

The *Transmit()* function places a sending request to this instance of the EFI UDPv4 Protocol, alongside the transmit data that was filled by the user. Whenever the packet in the token is sent out or some errors occur, the *Token.Event* will be signaled and *Token.Status* is updated. Providing a proper notification function and context for the event will enable the user to receive the notification and transmitting status.

Related Definitions

```
//*******************************************************
// EFI_UDP4_COMPLETION_TOKEN
//*******************************************************
typedef struct {
  EFI_EVENT                 Event;
  EFI_STATUS                Status;
  union {
    EFI_UDP4_RECEIVE_DATA    *RxData;
    EFI_UDP4_TRANSMIT_DATA   *TxData;
  }           Packet;
}  EFI_UDP4_COMPLETION_TOKEN;
```

Event
This *Event* will be signaled after the *Status* field is updated by the EFI UDPv4 Protocol driver. The type of *Event* must be *EVT_NOTIFY_SIGNAL*. The Task Priority Level (TPL) of *Event* must be lower than or equal to *TPL_CALLBACK* .

Status
Will be set to one of the following values:

EFI_SUCCESS. The receive or transmit operation completed successfully.

EFI_ABORTED. The receive or transmit was aborted.

EFI_TIMEOUT. The transmit timeout expired.

EFI_NETWORK_UNREACHABLE. The destination network is unreachable. RxData is set to **NULL** in this situation.

EFI_HOST_UNREACHABLE. The destination host is unreachable. RxData is set to **NULL** in this situation.

EFI_PROTOCOL_UNREACHABLE. The UDP protocol is unsupported in the remote system. RxData is set to **NULL** in this situation.

EFI_PORT_UNREACHABLE. No service is listening on the remote port. RxData is set to **NULL** in this situation.

EFI_ICMP_ERROR. Some other Internet Control Message Protocol (ICMP) error report was received. For example, packets are being sent too fast for the destination to receive them and the destination sent an ICMP source quench report. RxData is set to **NULL** in this situation.

EFI_DEVICE_ERROR. An unexpected system or network error occurred.

EFI_NO_MEDIA. There was a media error.

RxData

When this token is used for receiving, *RxData* is a pointer to *EFI_UDP4_RECEIVE_DATA*. Type *EFI_UDP4_RECEIVE_DATA* is defined below.

TxData

When this token is used for transmitting, *TxData* is a pointer to *EFI_UDP4_TRANSMIT_DATA*. Type *EFI_UDP4_TRANSMIT_DATA* is defined below.

The *EFI_UDP4_COMPLETION_TOKEN* structures are used for both transmit and receive operations.

When used for transmitting, the *Event* and *TxData* fields must be filled in by the EFI UDPv4 Protocol client. After the transmit operation completes, the *Status* field is updated by the EFI UDPv4 Protocol and the *Event* is signaled.

- When used for receiving, only the *Event* field must be filled in by the EFI UDPv4 Protocol client. After a packet is received, *RxData* and *Status* are filled in by the EFI UDPv4 Protocol and the *Event* is signaled.
- The ICMP related status codes filled in *Status* are defined as follows:

```
//******************************************************
// UDP4 Token Status definition
//******************************************************
#define EFI_NETWORK_UNREACHABLE      EFIERR(100)
#define EFI_HOST_UNREACHABLE         EFIERR(101)
#define EFI_PROTOCOL_UNREACHABLE     EFIERR(102)
#define EFI_PORT_UNREACHABLE         EFIERR(103)

//******************************************************
// EFI_UDP4_RECEIVE_DATA
//******************************************************
typedef struct {
  EFI_TIME                  TimeStamp;
  EFI_EVENT                 RecycleSignal;
  EFI_UDP4_SESSION_DATA     UdpSession;
  UINT32                    DataLength;
  UINT32                    FragmentCount;
  EFI_UDP4_FRAGMENT_DATA    FragmentTable[1];
}   EFI_UDP4_RECEIVE_DATA;
```

TimeStamp

Time when the EFI UDPv4 Protocol accepted the packet. *TimeStamp is zero filled if timestamps are disabled or unsupported*

RecycleSignal
Indicates the event to signal when the received data has been processed.

UdpSession
The UDP session data including *SourceAddress*, *SourcePort*, *DestinationAddress*, and *DestinationPort*. Type *EFI_UDP4_SESSION_DATA* is defined below.

DataLength
The sum of the fragment data length.

FragmentCount
Number of fragments. May be zero.

FragmentTable
Array of fragment descriptors. IP and UDP headers are included in these buffers if *ConfigData.RawData* is **TRUE**. Otherwise they are stripped. May be zero. Type *EFI_UDP4_FRAGMENT_DATA* is defined below.

EFI_UDP4_RECEIVE_DATA is filled by the EFI UDPv4 Protocol driver when this EFI UDPv4 Protocol instance receives an incoming packet. If there is a waiting token for incoming packets, the *CompletionToken.Packet.RxData* field is updated to this incoming packet and the *CompletionToken.Event* is signaled. The EFI UDPv4 Protocol client must signal the *RecycleSignal* after processing the packet.

- *FragmentTable* could contain multiple buffers that are not in the continuous memory locations. The EFI UDPv4 Protocol client might need to combine two or more buffers in *FragmentTable* to form their own protocol header.

```
//*****************************************************
// EFI_UDP4_SESSION_DATA
//*****************************************************
typedef struct {
  EFI_IPv4_ADDRESS         SourceAddress;
  UINT16                   SourcePort;
  EFI_IPv4_ADDRESS         DestinationAddress;
  UINT16                   DestinationPort;
}  EFI_UDP4_SESSION_DATA;
```

SourceAddress
Address from which this packet is sent. If this field is set to zero when sending packets, the address that is assigned in *EFI_UDP4_PROTOCOL .Configure()* is used.

SourcePort
Port from which this packet is sent. It is in host byte order. If this field is set to zero when sending packets, the port that is assigned in *EFI_UDP4_PROTOCOL .Configure()* is used. If this field is set to zero and unbound, a call to *EFI_UDP4_PROTOCOL.Transmit()* will fail.

DestinationAddress
Address to which this packet is sent.

DestinationPort
Port to which this packet is sent. It is in host byte order. If this field is set to zero and unconnected, the call to *EFI_UDP4_PROTOCOL .Transmit()* will fail.

The *EFI_UDP4_SESSION_DATA* is used to retrieve the settings when receiving packets or to override the existing settings of this EFI UDPv4 Protocol instance when sending packets.

```
//*****************************************************
// EFI_UDP4_FRAGMENT_DATA
```

(continues on next page)

(continued from previous page)

```
//*****************************************************
typedef struct {
  UINT32             FragmentLength;
  VOID               *FragmentBuffer;
}  EFI_UDP4_FRAGMENT_DATA;
```

FragmentLength
Length of the fragment data buffer.

FragmentBuffer
Pointer to the fragment data buffer.

EFI_UDP4_FRAGMENT_DATA allows multiple receive or transmit buffers to be specified. The purpose of this structure is to avoid copying the same packet multiple times.

```
//****************************************************
// EFI_UDP4_TRANSMIT_DATA
//****************************************************
typedef struct {
  EFI_UDP4_SESSION_DATA      *UdpSessionData;
  EFI_IPv4_ADDRESS           *GatewayAddress;
  UINT32                     DataLength;
  UINT32                     FragmentCount;
  EFI_UDP4_FRAGMENT_DATA     FragmentTable[1];
}  EFI_UDP4_TRANSMIT_DATA;
```

UdpSessionData
If not **NULL**, the data that is used to override the transmitting settings. Type *EFI_UDP4_SESSION_DATA* is defined above.

GatewayAddress
The next-hop address to override the setting from the routing table.

DataLength
Sum of the fragment data length. Must not exceed the maximum UDP packet size.

FragmentCount
Number of fragments.

FragmentTable
Array of fragment descriptors. Type *EFI_UDP4_FRAGMENT_DATA* is defined above.

The EFI UDPv4 Protocol client must fill this data structure before sending a packet. The packet may contain multiple buffers that may be not in a continuous memory location.

Status Codes Returned

EFI_SUCCESS	The data has been queued for transmission.
EFI_NOT_STARTED	This EFI UDPv4 Protocol instance has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.

continues on next page

Table 30.5 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following are **TRUE**: • *This* is **NULL**. • *Token* is **NULL**. • *Token.Event* is **NULL**. • *Token.Packet.TxData* is **NULL**. • *Token.Packet.TxData.FragmentCount* is zero. • *Token.Packet.TxData.DataLength* is not equal to the sum of fragment lengths. • One or more of the *Token.Packet.TxData.FragmentTable[].FragmentLength* fields is zero. • One or more of the *Token.Packet.TxData.FragmentTable[].FragmentBuffer* fields is **NULL**. • *Token.Packet.TxData. GatewayAddress* is not a unicast IPv4 address if it is not **NULL**. • *Token.Packet.TxData.UdpSessionData.SourceAddress* is not a valid unicast IPv4 address or *Token.Packet.TxData.UdpSessionData.DestinationAddress* is zero if the *UdpSessionData* is not **NULL**.
EFI_ACCESS_DENIED	The transmit completion token with the same *Token.Event* was already in the transmit queue.
EFI_NOT_READY	The completion token could not be queued because the transmit queue is full.
EFI_OUT_OF_RESOURCES	Could not queue the transmit data.
EFI_NOT_FOUND	There is no route to the destination network or address.
EFI_BAD_BUFFER_SIZE	The data length is greater than the maximum UDP packet size. Or the length of the IP header + UDP header + data length is greater than MTU if *DoNotFragment* is **TRUE**.
EFI_NO_MEDIA	There was a media error.

30.1.2.7 EFI_UDP4_PROTOCOL.Receive()

Summary

Places an asynchronous receive request into the receiving queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP4_RECEIVE) (
  IN EFI_UDP4_PROTOCOL             *This,
  IN EFI_UDP4_COMPLETION_TOKEN     *Token
  );
```

Parameters

This

Pointer to the *EFI_UDP4_PROTOCOL* instance.

Token

Pointer to a token that is associated with the receive data descriptor. Type *EFI_UDP4_COMPLETION_TOKEN* is defined in *EFI_UDP4_PROTOCOL .Transmit()*.

Description

The *Receive()* function places a completion token into the receive packet queue. This function is always asynchronous.

The caller must fill in the *Token.Event* field in the completion token, and this field cannot be **NULL**. When the receive operation completes, the EFI UDPv4 Protocol driver updates the *Token.Status* and *Token.Packet.RxData* fields and the *Token.Event* is signaled. Providing a proper notification function and context for the event will enable the user to receive the notification and receiving status. That notification function is guaranteed to not be re-entered.

Status Codes Returned

EFI_SUCCESS	The receive completion token was cached.
EFI_NOT_STARTED	This EFI UDPv4 Protocol instance has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *Token* is **NULL**. • *Token.Event* is **NULL**.
EFI_OUT_OF_RESOURCES	The receive completion token could not be queued due to a lack of system resources (usually memory).
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI UDPv4 Protocol instance has been reset to startup defaults.
EFI_ACCESS_DENIED	A receive completion token with the same *Token.Event* was already in the receive queue.
EFI_NOT_READY	The receive request could not be queued because the receive queue is full.
EFI_NO_MEDIA	There was a media error.

30.1.2.8 EFI_UDP4_PROTOCOL.Cancel()

Summary

Aborts an asynchronous transmit or receive request.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP4_CANCEL)(
  IN EFI_UDP4_PROTOCOL           *This,
  IN EFI_UDP4_COMPLETION_TOKEN   *Token OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_UDP4_PROTOCOL* instance.

Token

Pointer to a token that has been issued by *EFI_UDP4_PROTOCOL .Transmit()* or *EFI_UDP4_PROTOCOL.Receive()*.If **NULL**, all pending tokens are aborted. Type *EFI_UDP4_COMPLETION_TOKEN* is defined in *EFI_UDP4_PROTOCOL.Transmit()*.

Description

The *Cancel()* function is used to abort a pending transmit or receive request. If the token is in the transmit or receive request queues, after calling this function, *Token.Status* will be set to *EFI_ABORTED* and then *Token.Event* will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, this function will not signal the token and *EFI_NOT_FOUND* is returned.

Status Codes Returned

EFI_SUCCESS	The asynchronous I/O request was aborted and *Token.Event* was signaled. When *Token* is **NULL**, all pending requests are aborted and their events are signaled.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_NOT_STARTED	This instance has not been started.
EFI_NO_MAPPING	When using the default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_NOT_FOUND	When *Token* is not **NULL**, the asynchronous I/O request was not found in the transmit or receive queue. It has either completed or was not issued by *Transmit()* and *Receive()*.

30.1.2.9 EFI_UDP4_PROTOCOL.Poll()

Summary

Polls for incoming data packets and processes outgoing data packets.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP4_POLL) (
  IN EFI_UDP4_PROTOCOL     *This
  );
```

Parameters

This
Pointer to the *EFI_UDP4_PROTOCOL* instance.

Description

The *Poll()* function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the *Poll()* function more often.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_TIMEOUT	Data was dropped out of the transmit and/or receive queue. Consider increasing the polling rate.

30.2 EFI UDPv6 Protocol

This section defines the EFI UDPv6 (User Datagram Protocol version 6) Protocol that interfaces over the EFI IPv6 Protocol.

30.2.1 UDP6 Service Binding Protocol

30.2.1.1 EFI_UDP6_SERVICE_BINDING_PROTOCOL

Summary

The EFI UDPv6 Service Binding Protocol is used to locate communication devices that are supported by an EFI UDPv6 Protocol driver and to create and destroy instances of the EFI UDPv6 Protocol child instance that uses the underlying communications device.

GUID

```
#define EFI_UDP6_SERVICE_BINDING_PROTOCOL_GUID \
   {0x66ed4721, 0x3c98, 0x4d3e,\
 {0x81, 0xe3, 0xd0, 0x3d, 0xd3, 0x9a, 0x72, 0x54}}
```

Descriptopn

A network application that requires basic UDPv6 I/O services can use one of the protocol handler services, such as *BS->LocateHandleBuffer()*, to search for devices that publish a EFI UDPv6 Service Binding Protocol GUID. Each device with a published EFI UDPv6 Service Binding Protocol GUID supports the EFI UDPv6 Protocol and may be available for use.

After a successful call to the *EFI_UDP6_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the newly created child EFI UDPv6 Protocol driver is in an un-configured state; it is not ready to send and receive data packets.

Before a network application terminates execution, every successful call to the *EFI_UDP6_SERVICE_BINDING_PROTOCOL.CreateChild()* function must be matched with a call to the *EFI_UDP6_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

30.2.2 EFI UDP6 Protocol

30.2.2.1 EFI_UDP6_PROTOCOL

Summary

The EFI UDPv6 Protocol provides simple packet-oriented services to transmit and receive UDP packets.

GUID

```
#define EFI_UDP6_PROTOCOL_GUID \
  {0x4f948815, 0xb4b9, 0x43cb,\
    {0x8a, 0x33, 0x90, 0xe0, 0x60, 0xb3, 0x49, 0x55}}
```

Protocol Interface Structure

```
typedef struct _EFI_UDP6_PROTOCOL {
  EFI_UDP6_GET_MODE_DATA     GetModeData;
  EFI_UDP6_CONFIGURE         Configure;
```

(continues on next page)

(continued from previous page)

```
  EFI_UDP6_GROUPS             Groups;
  EFI_UDP6_TRANSMIT           Transmit;
  EFI_UDP6_RECEIVE            Receive;
  EFI_UDP6_CANCEL             Cancel;
  EFI_UDP6_POLL               Poll;
}  EFI_UDP6_PROTOCOl;
```

Parameters

GetModeData
Reads the current operational settings. See the *GetModeData()* function description.

Configure
Initializes, changes, or resets operational settings for the EFI UDPv6 Protocol. See the *Configure()* function description.

Groups
Joins and leaves multicast groups. See the *Groups()* function description.

Transmit
Queues outgoing data packets into the transmit queue. This function is a non-blocked operation. See the Transmit() function description.

Receive
Places a receiving request token into the receiving queue. This function is a non-blocked operation. See the *Receive()* function description.

Cancel
Aborts a pending transmit or receive request. See the *Cancel()* function description.

Poll
Polls for incoming data packets and processes outgoing data packets. See the *Poll()* function description.

Description

The *EFI_UDP6_PROTOCOL* defines an EFI UDPv6 Protocol session that can be used by any network drivers, applications, or daemons to transmit or receive UDP packets. This protocol instance can either be bound to a specified port as a service or connected to some remote peer as an active client. Each instance has its own settings, such as group table, that are independent from each other.

Note: Byte Order: In this document, all IPv6 addresses and incoming/outgoing packets are stored in network byte order. All other parameters in the functions and data structures that are defined in this document are stored in host byte order.

30.2.2.2 EFI_UDP6_PROTOCOL.GetModeData()

Summary

Read the current operational settings.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP6_GET_MODE_DATA) (
```

(continues on next page)

(continued from previous page)

```
  IN EFI_UDP6_PROTOCOL                *This,
  OUT EFI_UDP6_CONFIG_DATA            *Udp6ConfigData OPTIONAL,
  OUT EFI_IP6_MODE_DATA               *Ip6ModeData OPTIONAL,
  OUT EFI_MANAGED_NETWORK_CONFIG_DATA *MnpConfigData OPTIONAL,
  OUT EFI_SIMPLE_NETWORK_MODE         *SnpModeData OPTIONAL
  );
```

Parameters

This
Pointer to the EFI_UDP6_PROTOCOL instance.

Udp6ConfigData
The buffer in which the current UDP configuration data is returned. Type *EFI_UDP6_CONFIG_DATA* is defined in “Related Definitions” below.

Ip6ModeData
The buffer in which the current EFI IPv6 Protocol mode data is returned. Type *EFI_IP6_MODE_DATA* is defined in *EFI_IP6_PROTOCOL.GetModeData()*.

MnpConfigData
The buffer in which the current managed network configuration data is returned. Type *EFI_MANAGED_NETWORK_CONFIG_DATA* is defined in *EFI_MANAGED_NETWORK_PROTOCOL.GetModeData()*.

SnpModeData
The buffer in which the simple network mode data is returned. Type *EFI_SIMPLE_NETWORK_MODE* is defined in the *EFI_SIMPLE_NETWORK* Protocol.

Description

The *GetModeData()* function copies the current operational settings of this EFI UDPv6 Protocol instance into user-supplied buffers. This function is used optionally to retrieve the operational mode data of underlying networks or drivers.

  //I/O parameters
  ;

  UINT8               TrafficClass;
  UINT8               HopLimit;
  ;
  UINT32              ReceiveTimeout;
  UINT32              TransmitTimeout;
  //Access Point
```

(continues on next page)

(continued from previous page)

```
  EFI_IPv6_ADDRESS     StationAddress;
  UINT16               StationPort;
  EFI_IPv6_ADDRESS     RemoteAddress;
  UINT16               RemotePort;
}  EFI_UDP6_CONFIG_DATA;
```

AcceptPromiscuous
Set to **TRUE** to accept UDP packets that are sent to any address.

AcceptAnyPort
Set to **TRUE** to accept UDP packets that are sent to any port.

AllowDuplicatePort
Set to **TRUE** to allow this EFI UDPv6 Protocol child instance to open a port number that is already being used by another EFI UDPv6 Protocol child instance.

TrafficClass
TrafficClass field in transmitted IPv6 packets.

HopLimit
HopLimit field in transmitted IPv6 packets.

ReceiveTimeout
The receive timeout value (number of microseconds) to be associated with each incoming packet. Zero means do not drop incoming packets.

TransmitTimeout
The transmit timeout value (number of microseconds) to be associated with each outgoing packet. Zero means do not drop outgoing packets.

StationAddress
The station IP address that will be assigned to this EFI UDPv6 Protocol instance. The EFI UDPv6 and EFI IPv6 Protocol drivers will only deliver incoming packets whose destination matches this IP address exactly. Address 0:/128 is also accepted as a special case. Under this situation, underlying IPv6 driver is responsible for binding a source address to this EFI IPv6 protocol instance according to source address selection algorithm. Only incoming packet from the selected source address is delivered. This field can be set and changed only when the EFI IPv6 driver is transitioning from the stopped to the started states. If no address is available for selecting, the EFI IPv6 Protocol driver will use *EFI_IP6_CONFIG_PROTOCOL* to retrieve the IPv6 address.

StationPort
The port number to which this EFI UDPv6 Protocol instance is bound. If a client of the EFI UDPv6 Protocol does not care about the port number, set *StationPort* to zero. The EFI UDPv6 Protocol driver will assign a random port number to transmitted UDP packets. Ignored it if *AcceptAnyPort* is **TRUE**.

RemoteAddress
The IP address of remote host to which this EFI UDPv6 Protocol instance is connecting. If *RemoteAddress* is not 0:/128, this EFI UDPv6 Protocol instance will be connected to *RemoteAddress;* i.e., outgoing packets of this EFI UDPv6 Protocol instance will be sent to this address by default and only incoming packets from this address will be delivered to client. Ignored for incoming filtering if *AcceptPromiscuous* is **TRUE**.

RemotePort
The port number of the remote host to which this EFI UDPv6 Protocol instance is connecting. If it is not zero, outgoing packets of this EFI UDPv6 Protocol instance will be sent to this port number by default and only incoming packets from this port will be delivered to client. Ignored if *RemoteAddress* is 0:/128 and ignored for incoming filtering if *AcceptPromiscuous* is **TRUE**.

Status Codes Returned

EFI_SUCCESS	The mode data was read.
EFI_NOT_STARTED	When *Udp6ConfigData* is queried, no configuration data is available because this instance has not been started.
EFI_INVALID_PARAMETER	*This* is **NULL**.

30.2.2.3 EFI_UDP6_PROTOCOL.Configure()

Summary

Initializes, changes, or resets the operational parameters for this instance of the EFI UDPv6 Protocol.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP6_CONFIGURE) (
  IN EFI_UDP6_PROTOCOL         *This,
  IN EFI_UDP6_CONFIG_DATA      *UdpConfigData OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_UDP6_PROTOCOL* instance.

UdpConfigData

Pointer to the buffer contained the configuration data.

Description

The *Configure()* function is used to do the following:

- Initialize and start this instance of the EFI UDPv6 Protocol.
- Change the filtering rules and operational parameters.
- Reset this instance of the EFI UDPv6 Protocol.

Until these parameters are initialized, no network traffic can be sent or received by this instance. This instance can be also reset by calling *Configure()* with *UdpConfigData* set to **NULL**. Once reset, the receiving queue and transmitting queue are flushed and no traffic is allowed through this instance.

With different parameters in *UdpConfigData*, *Configure()* can be used to bind this instance to specified port.

Status Codes Returned

EFI_SUCCESS	The configuration settings were set, changed, or reset successfully.
EFI_NO_MAPPING	The underlying IPv6 driver was responsible for choosing a source address for this instance, but no source address was available for use.

continues on next page

Table 30.10 – continued from previous page

EFI_INVALID_PARAMETER	One or more following conditions are **TRUE**: *This* is **NULL**. *UdpConfigData.StationAddress* neither zero nor one of the configured IP addresses in the underlying IPv6 driver. *UdpConfigData.RemoteAddress* is not a valid unicast IPv6 address if it is not zero.
EFI_ALREADY_STARTED	The EFI UDPv6 Protocol instance is already started/configured and must be stopped/reset before it can be reconfigured. Only *TrafficClass*, *HopLimit*, *ReceiveTimeout*, and *TransmitTimeout* can be reconfigured without stopping the current instance of the EFI UDPv6 Protocol.
EFI_ACCESS_DENIED	*UdpConfigData. AllowDuplicatePort* is **FALSE** and *UdpConfigData.StationPort* is already used by other instance.
EFI_OUT_OF_RESOURCES	The EFI UDPv6 Protocol driver cannot allocate memory for this EFI UDPv6 Protocol instance.
EFI_DEVICE_ERROR	An unexpected network or system error occurred and this instance was not opened.

30.2.2.4 EFI_UDP6_PROTOCOL.Groups()

Summary

Joins and leaves multicast groups.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP6_GROUPS) (
  IN EFI_UDP6_PROTOCOL         *This,
  IN BOOLEAN                   JoinFlag,
  IN EFI_IPv6_ADDRESS          *MulticastAddress OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_UDP6_PROTOCOL* instance.

JoinFlag

Set to **TRUE** to join a multicast group. Set to **FALSE** to leave one or all multicast groups.

MulticastAddress

Pointer to multicast group address to join or leave.

Description

The *Groups* () function is used to join or leave one or more multicast group.

If the *JoinFlag* is **FALSE** and the *MulticastAddress* is **NULL**, then all currently joined groups are left.

Status Codes Returned

EFI_SUCCESS	The operation completed successfully.
EFI_NOT_STARTED	The EFI UDPv6 Protocol instance has not been started.
EFI_OUT_OF_RESOURCES	Could not allocate resources to join the group.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: *This* is **NULL**. *JoinFlag* is **TRUE** and *MulticastAddress* is ***NULL***. *JoinFlag* is **TRUE** and **MulticastAddress* is not a valid multicast address.
EFI_ALREADY_STARTED	The group address is already in the group table (when *JoinFlag* is **TRUE**).
EFI_NOT_FOUND	The group address is not in the group table (when *JoinFlag* is **FALSE**).
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

30.2.2.5 EFI_UDP6_PROTOCOL.Transmit()

Summary

Queues outgoing data packets into the transmit queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP6_TRANSMIT) (
  IN EFI_UDP6_PROTOCOL           *This,
  IN EFI_UDP6_COMPLETION_TOKEN   *Token
  );
```

Parameters

This

Pointer to the *EFI_UDP6_PROTOCOL* instance.

Token

Pointer to the completion token that will be placed into the transmit queue. Type *EFI_UDP6_COMPLETION_TOKEN* is defined in "Related Definitions" below.

Description

The *Transmit()* function places a sending request to this instance of the EFI UDPv6 Protocol, alongside the transmit data that was filled by the user. Whenever the packet in the token is sent out or some errors occur, the *Token.Event* will be signaled and Token.Status is updated. Providing a proper notification function and context for the event will enable the user to receive the notification and transmitting status.

Related Definitions

```
//****************************************************
// EFI_UDP6_COMPLETION_TOKEN
//****************************************************
typedef struct {
  EFI_EVENT                  Event;
  EFI_STATUS                 Status;
  union {
    EFI_UDP6_RECEIVE_DATA    *RxData;
```

(continues on next page)

(continued from previous page)

```
    EFI_UDP6_TRANSMIT_DATA   *TxData;
  }         Packet;
} EFI_UDP6_COMPLETION_TOKEN;
```

Event

This *Event* will be signaled after the *Status* field is updated by the EFI UDPv6 Protocol driver. The type of *Event* must be *EVT_NOTIFY_SIGNAL*.

Status

Will be set to one of the following values:

EFI_SUCCESS : The receive or transmit operation completed successfully.

EFI_ABORTED : The receive or transmit was aborted.

EFI_TIMEOUT : The transmit timeout expired.

EFI_NETWORK_UNREACHABLE : The destination network is unreachable. *RxData* is set to **NULL** in this situation.

EFI_HOST_UNREACHABLE : The destination host is unreachable. *RxData* is set to **NULL** in this situation.

EFI_PROTOCOL_UNREACHABLE : The UDP protocol is unsupported in the remote system. *RxData* is set to **NULL** in this situation.

EFI_PORT_UNREACHABLE : No service is listening on the remote port. RxData is set to **NULL** in this situation.

EFI_ICMP_ERROR : Some other Internet Control Message Protocol (ICMP) error report was received. For example, packets are being sent too fast for the destination to receive them and the destination sent an ICMP source quench report. *RxData* is set to **NULL** in this situation.

EFI_DEVICE_ERROR : An unexpected system or network error occurred.

EFI_SECURITY_VIOLATION : The transmit or receive was failed because of IPsec policy check.

RxData

When this token is used for receiving, *RxData* is a pointer to *EFI_UDP6_RECEIVE_DATA*. Type *EFI_UDP6_RECEIVE_DATA* is defined below.

TxData

When this token is used for transmitting, *TxData* is a pointer to *EFI_UDP6_TRANSMIT_DATA*. Type *EFI_UDP6_TRANSMIT_DATA* is defined below.

The *EFI_UDP6_COMPLETION_TOKEN* structures are used for both transmit and receive operations.

When used for transmitting, the *Event* and *TxData* fields must be filled in by the EFI UDPv6 Protocol client. After the transmit operation completes, the *Status* field is updated by the EFI UDPv6 Protocol and the *Event* is signaled.

When used for receiving, only the *Event* field must be filled in by the EFI UDPv6 Protocol client. After a packet is received, *RxData* and *Status* are filled in by the EFI UDPv6 Protocol and the *Event* is signaled.

```
//*****************************************************
// EFI_UDP6_RECEIVE_DATA
//*****************************************************
typedef struct {
  EFI_TIME                 TimeStamp;
  EFI_EVENT                RecycleSignal;
  EFI_UDP6_SESSION_DATA    UdpSession;
  UINT32                   DataLength;
```

(continues on next page)

(continued from previous page)

```
  UINT32                  FragmentCount;
  EFI_UDP6_FRAGMENT_DATA   FragmentTable [1];
}  EFI_UDP6_RECEIVE_DATA;
```

TimeStamp

Time when the EFI UDPv6 Protocol accepted the packet. *TimeStamp is zero filled if timestamps are disabled or unsupported.*

RecycleSignal

Indicates the event to signal when the received data has been processed.

UdpSession

The UDP session data including *SourceAddress*, *SourcePort*, *DestinationAddress*, and DestinationPort. Type *EFI_UDP6_SESSION_DATA* is defined below.

DataLength

The sum of the fragment data length.

FragmentCount

Number of fragments. Maybe zero.

FragmentTable

Array of fragment descriptors. Maybe zero. Type *EFI_UDP6_FRAGMENT_DATA* is defined below.

EFI_UDP6_RECEIVE_DATA is filled by the EFI UDPv6 Protocol driver when this EFI UDPv6 Protocol instance receives an incoming packet. If there is a waiting token for incoming packets, the *CompletionToken.Packet.RxData* field is updated to this incoming packet and the *CompletionToken.Event* is signaled. The EFI UDPv6 Protocol client must signal the *RecycleSignal* after processing the packet.

FragmentTable could contain multiple buffers that are not in the continuous memory locations. The EFI UDPv6 Protocol client might need to combine two or more buffers in *FragmentTable* to form their own protocol header.

```
//***********************************************************
// EFI_UDP6_SESSION_DATA
//***********************************************************
typedef struct {
  EFI_IPv6_ADDRESS         SourceAddress;
  UINT16                   SourcePort;
  EFI_IPv6_ADDRESS         DestinationAddress;
  UINT16                   DestinationPort;
}  EFI_UDP6_SESSION_DATA;
```

SourceAddress

Address from which this packet is sent. This filed should not be used when sending packets.

SourcePort

Port from which this packet is sent. It is in host byte order. This filed should not be used when sending packets.

DestinationAddress

Address to which this packet is sent. When sending packet, it'll be ignored if it is zero.

DestinationPort

Port to which this packet is sent. When sending packet, it'll be ignored if it is zero.

The *EFI_UDP6_SESSION_DATA* is used to retrieve the settings when receiving packets or to override the existing settings (only DestinationAddress and DestinationPort can be overridden) of this EFI UDPv6 Protocol instance when sending packets.

```
//**********************************************************
// EFI_UDP6_FRAGMENT_DATA
//**********************************************************
typedef struct {
  UINT32         FragmentLength;
  VOID           *FragmentBuffer;
}  EFI_UDP6_FRAGMENT_DATA;
```

FragmentLength
Length of the fragment data buffer.

FragmentBuffer
Pointer to the fragment data buffer.

EFI_UDP6_FRAGMENT_DATA allows multiple receive or transmit buffers to be specified. The purpose of this structure is to avoid copying the same packet multiple times.

```
//**********************************************
// EFI_UDP6_TRANSMIT_DATA
//**********************************************
typedef struct {
  EFI_UDP6_SESSION_DATA        *UdpSessionData;
  UINT32                       DataLength;
  UINT32                       FragmentCount;
  EFI_UDP6_FRAGMENT_DATA       FragmentTable [1];
}  EFI_UDP6_TRANSMIT_DATA;
```

UdpSessionData If not **NULL**, the data that is used to override the transmitting settings.Only the two filed *UdpSessionData.DestinationAddress* and *UdpSessionData.DestionPort* can be used as the transmitting setting filed. Type *EFI_UDP6_SESSION_DATA* is defined above.

DataLength
Sum of the fragment data length. Must not exceed the maximum UDP packet size.

FragmentCount
Number of fragments.

FragmentTable
Array of fragment descriptors. Type *EFI_UDP6_FRAGMENT_DATA* is defined above.

The EFI UDPv6 Protocol client must fill this data structure before sending a packet. The packet may contain multiple buffers that may be not in a continuous memory location.

Status Codes Returned

EFI_SUCCESS	The data has been queued for transmission.
EFI_NOT_STARTED	This EFI UDPv6 Protocol instance has not been started.
EFI_NO_MAPPING	The underlying IPv6 driver was responsible for choosing a source address for this instance, but no source address was available for use.

continues on next page

Table 30.12 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following are **TRUE**: *This* is **NULL**. *Token* is **NULL**. *Token.Event* is **NULL**. *Token.Packet.TxData* is **NULL**. *Token.Packet.TxData.FragmentCount* is zero. *Token.Packet.TxData.DataLength* is not equal to the sum of fragment lengths. One or more of the *Token.Packet.TxData.FragmentTable[].FragmentLength* fields is zero. One or more of the *Token.Packet.TxData.FragmentTable[].FragmentBuffer* fields is **NULL**. Token.Packet.TxData.UdpSessionData. DestinationAddress is not zero and is not valid unicast Ipv6 address if UdpSessionData is not **NULL**. Token.Packet.TxData.UdpSessionData is **NULL** and this instance's UdpConfigData. RemoteAddress is unspecified. Token.Packet.TxData. UdpSessionData.DestinationAddress is non-zero when DestinationAddress is configured as non-zero when doing Configure() for this EFI Udp6 protocol instance. Token.Packet.TxData.UdpSesionData.DestinationAddress is zero when DestinationAddress is unspecified when doing Configure() for this EFI Udp6 protocol instance
EFI_ACCESS_DENIED	The transmit completion token with the same Token.Event was already in the transmit queue.
EFI_NOT_READY	The completion token could not be queued because the transmit queue is full.
EFI_OUT_OF_RESOURCES	Could not queue the transmit data.
EFI_NOT_FOUND	There is no route to the destination network or address.
EFI_BAD_BUFFER_SIZE	The data length is greater than the maximum UDP packet size.
EFI_NO_MEDIA	There was a media error.

30.2.2.6 EFI_UDP6_PROTOCOL.Receive()

Summary

Places an asynchronous receive request into the receiving queue.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP6_RECEIVE) (
  IN EFI_UDP6_PROTOCOL           *This,
  IN EFI_UDP6_COMPLETION_TOKEN   *Token*
  );
```

Parameters

This

Pointer to the *EFI_UDP6_PROTOCOL* instance.

Token

Pointer to a token that is associated with the receive data descriptor. Type *EFI_UDP6_COMPLETION_TOKEN* is defined in *EFI_UDP6_PROTOCOL.Transmit()*.

Description

The *Receive()* function places a completion token into the receive packet queue. This function is always asynchronous.

The caller must fill in the *Token.Event* field in the completion token, and this field cannot be **NULL**. When the receive operation completes, the EFI UDPv6 Protocol driver updates the *Token.Status* and *Token.Packet.RxData* fields and the *Token.Event* is signaled. Providing a proper notification function and context for the event will enable the user to receive the notification and receiving status. That notification function is guaranteed to not be re-entered.

Status Codes Returned

EFI_SUCCESS	The receive completion token was cached.
EFI_NOT_STARTED	This EFI UDPv6 Protocol instance has not been started.
EFI_NO_MAPPING	The underlying IPv6 driver was responsible for choosing a source address for this instance, but no source address was available for use.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: *This* is **NULL**. *Token* is **NULL**. *Token.Event* is **NULL**.
EFI_OUT_OF_RESOURCES	The receive completion token could not be queued due to a lack of system resources (usually memory).
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI UDPv6 Protocol instance has been reset to startup defaults.
EFI_ACCESS_DENIED	A receive completion token with the same Token.Event was already in the receive queue.
EFI_NOT_READY	The receive request could not be queued because the receive queue is full.
EFI_NO_MEDIA	There was a media error.

30.2.2.7 EFI_UDP6_PROTOCOL.Cancel()

Summary

Aborts an asynchronous transmit or receive request.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP6_CANCEL)(
  IN EFI_UDP6_PROTOCOL           *This,
  IN EFI_UDP6_COMPLETION_TOKEN   *Token OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_UDP6_PROTOCOL* instance.

Token

Pointer to a token that has been issued by *EFI_UDP6_PROTOCOL.Transmit()* or *EFI_UDP6_PROTOCOL.Receive()* .If **NULL**, all pending tokens are aborted. Type *EFI_UDP6_COMPLETION_TOKEN* is defined in *EFI_UDP6_PROTOCOL.Transmit()*.

Description

The Cancel() function is used to abort a pending transmit or receive request. If the token is in the transmit or receive request queues, after calling this function, *Token.Status* will be set to *EFI_ABORTED* and then *Token.Event* will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, this function will not signal the token and *EFI_NOT_FOUND* is returned.

Status Codes Returned

EFI_SUCCESS	The asynchronous I/O request was aborted and *Token.Event* was signaled. When *Token* is **NULL**, all pending requests are aborted and their events are signaled.
EFI_INVALID_PARAMETER	This is **NULL**.
EFI_NOT_STARTED	This instance has not been started.
EFI_NOT_FOUND	When *Token* is not **NULL**, the asynchronous I/O request was not found in the transmit or receive queue. It has either completed or was not issued by *Transmit()* and *Receive()*.

30.2.2.8 EFI_UDP6_PROTOCOL.Poll()

Summary

Polls for incoming data packets and processes outgoing data packets.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UDP6_POLL) (
  IN EFI_UDP6_PROTOCOL     *This
  );
```

Parameters

This

Pointer to the *EFI_UDP6_PROTOCOL* instance.

Description

The *Poll()* function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the *Poll()* function more often.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.

continues on next page

Table 30.15 – continued from previous page

EFI_TIMEOUT	Data was dropped out of the transmit and/or receive queue. Consider increasing the polling rate.

30.3 EFI MTFTPv4 Protocol

The following sections defines the EFI MTFTPv4 Protocol interface that is built upon the EFI UDPv4 Protocol.

30.3.1 EFI_MTFTP4_SERVICE_BINDING_PROTOCOL

Summary

The EFI MTFTPv4 Service Binding Protocol is used to locate communication devices that are supported by an EFI MTFTPv4 Protocol driver and to create and destroy instances of the EFI MTFTPv4 Protocol child protocol driver that can use the underlying communications device.

GUID

```
#define EFI_MTFTP4_SERVICE_BINDING_PROTOCOL_GUID \
  {0x2e800be,0x8f01,0x4aa6,\
    {0x94,0x6b,0xd7,0x13,0x88,0xe1,0x83,0x3f}}
```

Description

A network application or driver that requires MTFTPv4 I/O services can use one of the protocol handler services, such as *BS->LocateHandleBuffer()*, to search for devices that publish an EFI MTFTPv4 Service Binding Protocol GUID. Each device with a published EFI MTFTPv4 Service Binding Protocol GUID supports the EFI MTFTPv4 Protocol service and may be available for use.

After a successful call to the *EFI_MTFTP4_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the newly created child EFI MTFTPv4 Protocol driver instance is in an unconfigured state; it is not ready to transfer data.

Before a network application terminates execution, every successful call to the *EFI_MTFTP4_SERVICE_BINDING_PROTOCOL.CreateChild()* function must be matched with a call to the *EFI_MTFTP4_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

Each instance of the EFI MTFTPv4 Protocol driver can support one file transfer operation at a time. To download two files at the same time, two instances of the EFI MTFTPv4 Protocol driver will need to be created.

30.3.2 EFI_MTFTP4_PROTOCOL

Summary

The EFI MTFTPv4 Protocol provides basic services for client-side unicast and/or multicast TFTP operations.

GUID

```
#define EFI_MTFTP4_PROTOCOL_GUID \
  {0x78247c57,0x63db,0x4708,\
    {0x99,0xc2,0xa8,0xb4,0xa9,0xa6,0x1f,0x6b}}
```

Protocol Interface Structure

```
typedef struct _EFI_MTFTP4_PROTOCOL {
  EFI_MTFTP4_GET_MODE_DATA     GetModeData;
  EFI_MTFTP4_CONFIGURE         Configure;
  EFI_MTFTP4_GET_INFO          GetInfo;
  EFI_MTFTP4_PARSE_OPTIONS     ParseOptions;
  EFI_MTFTP4_READ_FILE         ReadFile;
  EFI_MTFTP4_WRITE_FILE        WriteFile;
  EFI_MTFTP4_READ_DIRECTORY    ReadDirectory;
  EFI_MTFTP4_POLL              Poll;
}  EFI_MTFTP4_PROTOCOL;
```

Parameters

GetModeData
Reads the current operational settings. See the *GetModeData()* function description.

Configure
Initializes, changes, or resets the operational settings for this instance of the EFI MTFTPv4 Protocol driver. See the *Configure()* function description.

GetInfo
Retrieves information about a file from an MTFTPv4 server. See the *GetInfo()* function description.

ParseOptions
Parses the options in an MTFTPv4 OACK (options acknowledgement) packet. See the *ParseOptions()* function description.

ReadFile
Downloads a file from an MTFTPv4 server. See the *ReadFile()* function description.

WriteFile
Uploads a file to an MTFTPv4 server. This function may be unsupported in some EFI implementations. See the *WriteFile()* function description.

ReadDirectory
Downloads a related file "directory" from an MTFTPv4 server. This function may be unsupported in some EFI implementations. See the *ReadDirectory()* function description.

Poll
Polls for incoming data packets and processes outgoing data packets. See the *Poll()* function description.

Description

The *EFI_MTFTP4_PROTOCOL* is designed to be used by UEFI drivers and applications to transmit and receive data files. The EFI MTFTPv4 Protocol driver uses the underlying EFI UDPv4 Protocol driver and EFI IPv4 Protocol driver.

30.3.3 EFI_MTFTP4_PROTOCOL.GetModeData()

Summary

Reads the current operational settings.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP4_GET_MODE_DATA)(
  IN EFI_MTFTP4_PROTOCOL         *This,
```

(continues on next page)

(continued from previous page)

```
  OUT EFI_MTFTP4_MODE_DATA       *ModeData
  );
```

Parameters

This

Pointer to the *EFI_MTFTP4_PROTOCOL* instance.

ModeData

Pointer to storage for the EFI MTFTPv4 Protocol driver mode data. Type *EFI_MTFTP4_MODE_DATA* is defined in “Related Definitions” below.

Description

The *GetModeData()* function reads the current operational settings of this EFI MTFTPv4 Protocol driver instance.

Related Definitions

```
//**************************************************
// EFI_MTFTP4_MODE_DATA
//**************************************************
typedef struct {
  EFI_MTFTP4_CONFIG_DATA   ConfigData;
  UINT8                    SupportedOptionCount;
  UINT8                    **SupportedOptions;
  UINT8                    UnsupportedOptionCount;
  UINT8                    **UnsupportedOptions;
}  EFI_MTFTP4_MODE_DATA;
```

ConfigData

The configuration data of this instance. Type *EFI_MTFTP4_CONFIG_DATA* is defined below.

SupportedOptionCount

The number of option strings in the following *SupportedOptions* array.

SupportedOptions

An array of pointers to null-terminated ASCII option strings that are recognized and supported by this EFI MTFTPv4 Protocol driver implementation.

UnsupportedOptionCount

An array of pointers to null-terminated ASCII option strings that are recognized but not supported by this EFI MTFTPv4 Protocol driver implementation.

UnsupportedOptions

An array of option strings that are recognized but are not supported by this EFI MTFTPv4 Protocol driver implementation.

The *EFI_MTFTP4_MODE_DATA* structure describes the operational state of this instance.

```
//********************************************************
// EFI_MTFTP4_CONFIG_DATA
//********************************************************
typedef struct {
  BOOLEAN              UseDefaultSetting;
  EFI_IPv4_ADDRESS     StationIp;
  EFI_IPv4_ADDRESS     SubnetMask;
  UINT16               LocalPort;
```

(continues on next page)

(continued from previous page)

```
  EFI_IPv4_ADDRESS     GatewayIp;
  EFI_IPv4_ADDRESS     ServerIp;
  UINT16               InitialServerPort;
  UINT16               TryCount;
  UINT16               TimeoutValue;
}  EFI_MTFTP4_CONFIG_DATA;
```

UseDefaultSetting
Set to **TRUE** to use the default station address/subnet mask and the default route table information.

StationIp
If *UseDefaultSetting* is **FALSE**, indicates the station address to use.

SubnetMask
If *UseDefaultSetting* is **FALSE**, indicates the subnet mask to use.

LocalPort
Local port number. Set to zero to use the automatically assigned port number.

GatewayIp
If *UseDefaultSetting* is **FALSE**, indicates the gateway IP address to use.

ServerIp
The IP address of the MTFTPv4 server.

InitialServerPort
The initial MTFTPv4 server port number. Request packets are sent to this port. This number is almost always 69 and using zero defaults to 69.

TryCount
The number of times to transmit MTFTPv4 request packets and wait for a response.

TimeoutValue
The number of seconds to wait for a response after sending the MTFTPv4 request packet.

The *EFI_MTFTP4_CONFIG_DATA* structure is used to report and change MTFTPv4 session parameters.

Status Codes Returned

EFI_SUCCESS	The configuration data was successfully returned.
EFI_OUT_OF_RESOURCES	The required mode data could not be allocated.
EFI_INVALID_PARAMETER	*This* is **NULL** or *ModeData* is **NULL**.

30.3.4 EFI_MTFTP4_PROTOCOL.Configure()

Summary

Initializes, changes, or resets the default operational setting for this EFI MTFTPv4 Protocol driver instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP4_CONFIGURE)(
  IN EFI_MTFTP4_PROTOCOL         *This,
  IN EFI_MTFTP4_CONFIG_DATA      *MtftpConfigData OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_MTFTP4_PROTOCOL* instance.

MtftpConfigData

Pointer to the configuration data structure. Type *EFI_MTFTP4_CONFIG_DATA* is defined in *EFI_MTFTP4_PROTOCOL .GetModeData()*.

Description

The *Configure()* function is used to set and change the configuration data for this EFI MTFTPv4 Protocol driver instance. The configuration data can be reset to startup defaults by calling *Configure()* with *MtftpConfigData* set to **NULL**. Whenever the instance is reset, any pending operation is aborted. By changing the EFI MTFTPv4 Protocol driver instance configuration data, the client can connect to different MTFTPv4 servers. The configuration parameters in *MtftpConfigData* are used as the default parameters in later MTFTPv4 operations and can be overridden in later operations.

Status Codes Returned

EFI_SUCCESS	The EFI MTFTPv4 Protocol driver was configured successfully.
EFI_INVALID_PARAMETER	One or more following conditions are **TRUE**: • *This* is **NULL**. • *MtftpConfigData.UseDefaultSetting* is **FALSE** and *MtftpConfigData.StationIp* is not a valid IPv4 unicast address. • *MtftpCofigData.UseDefaultSetting* is **FALSE** and *MtftpConfigData.SubnetMask* is invalid. • *MtftpCofigData.ServerIp* is not a valid IPv4 unicast address. • *MtftpConfigData.UseDefaultSetting* is **FALSE** and *MtftpConfigData.GatewayIp* is not a valid IPv4 unicast address or is not in the same subnet with station address.
EFI_ACCESS_DENIED	The EFI configuration could not be changed at this time because there is one MTFTP background operation in progress.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) has not finished yet.
EFI_UNSUPPORTED	A configuration protocol (DHCP, BOOTP, RARP, etc.) could not be located when clients choose to use the default address settings.
EFI_OUT_OF_RESOURCES	The EFI MTFTPv4 Protocol driver instance data could not be allocated.
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI MTFTPv4 Protocol driver instance is not configured.

30.3.5 EFI_MTFTP4_PROTOCOL.GetInfo()

Summary

Gets information about a file from an MTFTPv4 server.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP4_GET_INFO)(
```

(continues on next page)

(continued from previous page)

```
  IN EFI_MTFTP4_PROTOCOL         *This,
  IN EFI_MTFTP4_OVERRIDE_DATA    *OverrideData OPTIONAL,
  IN UINT8                       *Filename,
  IN UINT8                       *ModeStr OPTIONAL,
  IN UINT8                       OptionCount,
  IN EFI_MTFTP4_OPTION           *OptionList OPTIONAL,
  OUT UINT32                     *PacketLength,
  OUT EFI_MTFTP4_PACKET          **Packet OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_MTFTP4_PROTOCOL* instance.

OverrideData

Data that is used to override the existing parameters. If **NULL**, the default parameters that were set in the *EFI_MTFTP4_PROTOCOL .Configure()* function are used. Type *EFI_MTFTP4_OVERRIDE_DATA* is defined in "Related Definitions" below.

Filename

Pointer to a null-terminated ASCII file name string.

ModeStr

Pointer to a null-terminated ASCII mode string. If **NULL**, "octet" will be used.

OptionCount

Number of option/value string pairs in *OptionList*.

OptionList

Pointer to array of option/value string pairs. Ignored if *OptionCount* is zero. Type *EFI_MTFTP4_OPTION* is defined in "Related Definitions" below.

PacketLength

The number of bytes in the returned packet.

Packet

The pointer to the received packet. This buffer must be freed by the caller. Type *EFI_MTFTP4_PACKET* is defined in "Related Definitions" below.

Description

The *GetInfo()* function assembles an MTFTPv4 request packet with options; sends it to the MTFTPv4 server; and may return an MTFTPv4 OACK, MTFTPv4 ERROR, or ICMP ERROR packet. Retries occur only if no response packets are received from the MTFTPv4 server before the timeout expires.

Related Definitions

```
//****************************************************
// EFI_MTFTP_OVERRIDE_DATA
//****************************************************
typedef struct {
  EFI_IPv4_ADDRESS       GatewayIp;
  EFI_IPv4_ADDRESS       ServerIp;
  UINT16                 ServerPort;
  UINT16                 TryCount;
  UINT16                 TimeoutValue;
}  EFI_MTFTP4_OVERRIDE_DATA;
```

GatewayIp

IP address of the gateway. If set to 0.0.0.0, the default gateway address that was set by the *EFI_MTFTP4_PROTOCOL .Configure()* function will not be overridden.

ServerIp

IP address of the MTFTPv4 server. If set to 0.0.0.0, it will use the value that was set by the *EFI_MTFTP4_PROTOCOL .Configure()* function.

ServerPort

MTFTPv4 server port number. If set to zero, it will use the value that was set by the *EFI_MTFTP4_PROTOCOL .Configure()* function.

TryCount

Number of times to transmit MTFTPv4 request packets and wait for a response. If set to zero, it will use the value that was set by the *EFI_MTFTP4_PROTOCOL .Configure()* function.

TimeoutValue

Number of seconds to wait for a response after sending the MTFTPv4 request packet. If set to zero, it will use the value that was set by the *EFI_MTFTP4_PROTOCOL .Configure()* function.

The *EFI_MTFTP4_OVERRIDE_DATA* structure is used to override the existing parameters that were set by the *EFI_MTFTP4_PROTOCOL .Configure()* function.

typedef struct {
  UINT8            *OptionStr;
  UINT8            *ValueStr;
}  EFI_MTFTP4_OPTION;
```

OptionStr

Pointer to the null-terminated ASCII MTFTPv4 option string.

ValueStr

Pointer to the null-terminated ASCII MTFTPv4 value string.

```

Table, below, *Descriptions of Parameters in MTFTPv4 PacketStructures* describes the parameters that are listed in the MTFTPv4 packet structure definitions above. All the above structures are byte packed. The pragmas may vary from compiler to compiler. The MTFTPv4 packet structures are also used by the following functions:

- *EFI_MTFTP4_PROTOCOL .ReadFile()*
- *EFI_MTFTP4_PROTOCOL .WriteFile()*
- *EFI_MTFTP4_PROTOCOL .ReadDirectory()*
- The EFI MTFTPv4 Protocol packet check callback functions

NOTE: *Both incoming and outgoing MTFTPv4 packets are in network byte order. All other parameters defined in functions or data structures are stored in host byte order.*

Table 30.18: Descriptions of Parameters in MTFTPv4 PacketStructures

Data Structure	Parameter	Description
EFI_MTFTP4_PACKET	OpCode	Type of packets as defined by the MTFTPv4 packet opcodes. Opcode values are defined below.
	Rrq, Wrq	Read request or write request packet header. See the description for EFI_MTFTP4_REQ_HEADER below in this table
	Oack	Option acknowledge packet header. See the description for EFI_MTFTP4_OACK_HEADER below in this table.
	Data	Data packet header. See the description for EFI_MTFTP4_DATA_HEADER below in this table.
	Ack	Acknowledgement packet header. See the description for EFI_MTFTP4_ACK_HEADER below in this table.
	Data8	This field should be ignored and treated as reserved. Data packet header with big block number. See the description for EFI_MTFTP4_DATA8_HEADER below in this table.

continues on next page

Table 30.18 – continued from previous page

	Ack8	This field should be ignored and treated as reserved. Acknowledgement header with big block number. See the description for EFI_MTFTP4_ACK8_HEADER below in this table.
	Error	Error packet header. See the description for EFI_MTFTP4_ERROR_HEADER below in this table.
EFI_MTFTP4_REQ_HEADER	OpCode	For this packet type, OpCode = EFI_MTFTP4_OPCODE_RRQ for a read request or OpCode = EFI_MTFTP4_OPCODE_WRQ for a write request.
	Filename	The file name to be downloaded or uploaded.
EFI_MTFTP4_OACK_HEADER	OpCode	For this packet type, OpCode = EFI_MTFTP4_OPCODE_OACK.
	Data	The option strings in the option acknowledgement packet.
EFI_MTFTP4_DATA_HEADER	OpCode	For this packet type, OpCode = EFI_MTFTP4_OPCODE_DATA.
	Block	Block number of this data packet.
	Data	The content of this data packet.
EFI_MTFTP4_ACK_HEADER	OpCode	For this packet type, OpCode = EFI_MTFTP4_OPCODE_ACK.
	Block	The block number of the data packet that is being acknowledged.
EFI_MTFTP4_DATA8_HEADER	OpCode	This field should be ignored and treated as reserved. For this packet type, OpCode = EFI_MTFTP4_OPCODE_DATA8.
	Block	This field should be ignored and treated as reserved. The block number of data packet.
	Data	This field should be ignored and treated as reserved. The content of this data packet.
EFI_MTFTP4_ACK8_HEADER	OpCode	This field should be ignored and treated as reserved. For this packet type, OpCode = EFI_MTFTP4_OPCODE_ACK8.

continues on next page

Table 30.18 – continued from previous page

	Block	This field should be ignored and treated as reserved. The block number of the data packet that is being acknowledged.
EFI_MTFTP4_ERROR_HEADER	OpCode	For this packet type, OpCode = EFI_MTFTP4_OPCODE_ERROR.
	ErrorCode	The error number as defined by the MTFTPv4 packet error codes. Values for ErrorCode are defined below.
	ErrorMessage	Error message string.

```
//
// MTFTP Packet OpCodes
//
#define EFI_MTFTP4_OPCODE_RRQ    1
#define EFI_MTFTP4_OPCODE_WRQ    2
#define EFI_MTFTP4_OPCODE_DATA   3
#define EFI_MTFTP4_OPCODE_ACK    4
#define EFI_MTFTP4_OPCODE_ERROR  5
#define EFI_MTFTP4_OPCODE_OACK   6
#define EFI_MTFTP4_OPCODE_DIR    7
//This field should be ignored and treated as reserved.
#define EFI_MTFTP4_OPCODE_DATA8  8
//This field should be ignored and treated as reserved.
#define EFI_MTFTP4_OPCODE_ACK8   9
```

Following is a description of the fields in the above definition.

EFI_MTFTP4_OPCODE_RRQ	The MTFTPv4 packet is a read request.
EFI_MTFTP4_OPCODE_WRQ	The MTFTPv4 packet is a write request.
EFI_MTFTP4_OPCODE_DATA	The MTFTPv4 packet is a data packet.
EFI_MTFTP4_OPCODE_ACK	The MTFTPv4 packet is an acknowledgement packet.
EFI_MTFTP4_OPCODE_ERROR	The MTFTPv4 packet is an error packet.
EFI_MTFTP4_OPCODE_OACK	The MTFTPv4 packet is an option acknowledgement packet.
EFI_MTFTP4_OPCODE_DIR	The MTFTPv4 packet is a directory query packet.
EFI_MTFTP4_OPCODE_DATA8	This field should be ignored and treated as reserved. The MTFTPv4 packet is a data packet with a big block number.
EFI_MTFTP4_OPCODE_ACK8	This field should be ignored and treated as reserved. The MTFTPv4 packet is an acknowledgement packet with a big block number.

```
//
// MTFTP ERROR Packet ErrorCodes
```

(continues on next page)

(continued from previous page)

```
//
#define EFI_MTFTP4_ERRORCODE_NOT_DEFINED         0
#define EFI_MTFTP4_ERRORCODE_FILE_NOT_FOUND      1
#define EFI_MTFTP4_ERRORCODE_ACCESS_VIOLATION    2
#define EFI_MTFTP4_ERRORCODE_DISK_FULL           3
#define EFI_MTFTP4_ERRORCODE_ILLEGAL_OPERATION   4
#define EFI_MTFTP4_ERRORCODE_UNKNOWN_TRANSFER_ID 5
#define EFI_MTFTP4_ERRORCODE_FILE_ALREADY_EXISTS 6
#define EFI_MTFTP4_ERRORCODE_NO_SUCH_USER        7
#define EFI_MTFTP4_ERRORCODE_REQUEST_DENIED      8
```

EFI_MTFTP4_ERRORCODE_NOT_DEFINED	The error code is not defined. See the error message in the packet (if any) for details.
EFI_MTFTP4_ERRORCODE_FILE_NOT_FOUND	The file was not found.
EFI_MTFTP4_ERRORCODE_ACCESS_VIOLATION	There was an access violation.
EFI_MTFTP4_ERRORCODE_DISK_FULL	The disk was full or its allocation was exceeded.
EFI_MTFTP4_ERRORCODE_ILLEGAL_OPERATION	The MTFTPv4 operation was illegal.
EFI_MTFTP4_ERRORCODE_UNKNOWN_TRANSFER_ID	The transfer ID is unknown.
EFI_MTFTP4_ERRORCODE_FILE_ALREADY_EXISTS	The file already exists.
EFI_MTFTP4_ERRORCODE_NO_SUCH_USER	There is no such user.
EFI_MTFTP4_ERRORCODE_REQUEST_DENIED	The request has been denied due to option negotiation.

Status Codes Returned

EFI_SUCCESS	An MTFTPv4 OACK packet was received and is in the *Packet*.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *Filename* is **NULL**. • *OptionCount* is not zero and *OptionList* is **NULL**. • One or more options in *OptionList* have wrong format. • *PacketLength* is **NULL**. • One or more IPv4 addresses in *OverrideData* are not valid unicast IPv4 addresses if *OverrideData* is not **NULL** and the addresses are not set to all zero.
EFI_UNSUPPORTED	• One or more options in the *OptionList* are in the unsupported list of structure *EFI_MTFTP4_MODE_DATA*.
EFI_NOT_STARTED	The EFI MTFTPv4 Protocol driver has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) has not finished yet.
EFI_ACCESS_DENIED	The previous operation has not completed yet.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_TFTP_ERROR	An MTFTPv4 ERROR packet was received and is in the *Packet*.

continues on next page

Table 30.21 – continued from previous page

EFI_NETWORK_UNREACHABLE	An ICMP network unreachable error packet was received and the *Packet* is set to **NULL**.
EFI_HOST_UNREACHABLE	An ICMP host unreachable error packet was received and the *Packet* is set to **NULL**.
EFI_PROTOCOL_UNREACHABLE	An ICMP protocol unreachable error packet was received and the *Packet* is set to **NULL**.
EFI_PORT_UNREACHABLE	An ICMP port unreachable error packet was received and the *Packet* is set to **NULL**.
EFI_ICMP_ERROR	Some other ICMP ERROR packet was received and the *Packet* is set to **NULL**.
EFI_PROTOCOL_ERROR	An unexpected MTFTPv4 packet was received and is in the *Packet*.
EFI_TIMEOUT	No responses were received from the MTFTPv4 server.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.
EFI_NO_MEDIA	There was a media error.

30.3.6 EFI_MTFTP4_PROTOCOL.ParseOptions()

Summary

Parses the options in an MTFTPv4 OACK packet.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP4_PARSE_OPTIONS)(
  IN EFI_MTFTP4_PROTOCOL       *This,
  IN UINT32                    PacketLen,
  IN EFI_MTFTP4_PACKET         *Packet,
  OUT UINT32                   *OptionCount,
  OUT EFI_MTFT4P_OPTION        **OptionList OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_MTFTP4_PROTOCOL* instance.

PacketLen
Length of the OACK packet to be parsed.

Packet
Pointer to the OACK packet to be parsed. Type *EFI_MTFTP4_PACKET* is defined in *EFI_MTFTP4_PROTOCOL .GetInfo()*.

OptionCount
Pointer to the number of options in following *OptionList*.

OptionList
Pointer to *EFI_MTFTP4_OPTION* storage. Call the EFI Boot Service *FreePool()* to release the *OptionList* if the options in this *OptionList* are not needed any more. Type *EFI_MTFTP4_OPTION* is defined in *EFI_MTFTP4_PROTOCOL .GetInfo()*.

Description

The *ParseOptions()* function parses the option fields in an MTFTPv4 OACK packet and returns the number of options that were found and optionally a list of pointers to the options in the packet.

If one or more of the option fields are not valid, then *EFI_PROTOCOL_ERROR* is returned and **OptionCount* and **OptionList* stop at the last valid option.

Status Codes Returned

EFI_SUCCESS	The OACK packet was valid and the *OptionCount* and *OptionList* parameters have been updated.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *PacketLen* is 0. • *Packet* is **NULL** or *Packet* is not a valid MTFTPv4 packet. • *OptionCount* is **NULL**.
EFI_NOT_FOUND	No options were found in the OACK packet.
EFI_OUT_OF_RESOURCES	Storage for the *OptionList* array cannot be allocated.
EFI_PROTOCOL_ERROR	One or more of the option fields is invalid.

30.3.7 EFI_MTFTP4_PROTOCOL.ReadFile()

Summary

Downloads a file from an MTFTPv4 server.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP4_READ_FILE)(
  IN EFI_MTFTP4_PROTOCOL       *This,
  IN EFI_MTFTP4_TOKEN          *Token
  );
```

Parameters

This

Pointer to the *EFI_MTFTP4_PROTOCOL* instance.

Token

Pointer to the token structure to provide the parameters that are used in this operation. Type *EFI_MTFTP4_TOKEN* is defined in "Related Definitions" below.

Description

The *ReadFile()* function is used to initialize and start an MTFTPv4 download process and optionally wait for completion. When the download operation completes, whether successfully or not, the *Token.Status* field is updated by the EFI MTFTPv4 Protocol driver and then *Token.Event* is signaled (if it is not **NULL**).

Data can be downloaded from the MTFTPv4 server into either of the following locations:

- A fixed buffer that is pointed to by *Token.Buffer*
- A download service function that is pointed to by *Token.CheckPacket*

If both *Token.Buffer* and *Token.CheckPacket* are used, then *Token.CheckPacket* will be called first. If the call is successful, the packet will be stored in *Token.Buffer*.

Related Definitions

```
//*******************************************************
// EFI_MTFTP4_TOKEN
//*******************************************************
typedef struct {
  EFI_STATUS                  Status;
  EFI_EVENT                   Event;
  EFI_MTFTP4_OVERRIDE_DATA    *OverrideData;
  UINT8                       *Filename;
  UINT8                       *ModeStr;
  UINT32                      OptionCount;
  EFI_MTFTP4_OPTION           *OptionList;
  UINT64                      BufferSize;
  VOID                        *Buffer;
  VOID                        *Context;
  EFI_MTFTP4_CHECK_PACKET     CheckPacket;
  EFI_MTFTP4_TIMEOUT_CALLBACK TimeoutCallback;
  EFI_MTFTP4_PACKET_NEEDED    PacketNeeded;
}   EFI_MTFTP4_TOKEN;
```

Status

The status that is returned to the caller at the end of the operation to indicate whether this operation completed successfully. Defined *Status* values are listed below.

Event

The event that will be signaled when the operation completes. If set to **NULL**, the corresponding function will wait until the read or write operation finishes. The type of *Event* must be *EVT_NOTIFY_SIGNAL*. The Task Priority Level (TPL) of *Event* must be lower than or equal to *TPL_CALLBACK*.

OverrideData

If not **NULL**, the data that will be used to override the existing configure data. Type *EFI_MTFTP4_OVERRIDE_DATA* is defined in *EFI_MTFTP4_PROTOCOL .GetInfo()*.

Filename

Pointer to the null-terminated ASCII file name string.

ModeStr

Pointer to the null-terminated ASCII mode string. If **NULL**, "octet" is used.

OptionCount

Number of option/value string pairs.

OptionList

Pointer to an array of option/value string pairs. Ignored if *OptionCount* is zero. Both a remote server and this driver implementation should support these options. If one or more options are unrecognized by this implementation, it is sent to the remote server without being changed. Type *EFI_MTFTP4_OPTION* is defined in *EFI_MTFTP4_PROTOCOL .GetInfo()*.

BufferSize

On input, the size, in bytes, of *Buffer*. On output, the number of bytes transferred

Buffer

Pointer to the data buffer. Data that is downloaded from the MTFTPv4 server is stored here. Data that is uploaded to the MTFTPv4 server is read from here. Ignored if *BufferSize* is zero.

Context

Pointer to the context that will be used by *CheckPacket, TimeoutCallback* and *PacketNeeded.*

CheckPacket

Pointer to the callback function to check the contents of the received packet. Type *EFI_MTFTP4_CHECK_PACKET* is defined below.

TimeoutCallback

Pointer to the function to be called when a timeout occurs. Type *EFI_MTFTP4_TIMEOUT_CALLBACK* is defined below.

PacketNeeded

Pointer to the function to provide the needed packet contents. Only used in *WriteFile()* operation. Type *EFI_MTFTP4_PACKET_NEEDED* is defined below.

The *EFI_MTFTP4_TOKEN* structure is used for both the MTFTPv4 reading and writing operations. The caller uses this structure to pass parameters and indicate the operation context. After the reading or writing operation completes, the EFI MTFTPv4 Protocol driver updates the *Status* parameter and the *Event* is signaled if it is not **NULL**. The following table lists the status codes that are returned in the *Status* parameter.

Status Codes Returned

EFI_SUCCESS	The data file has been transferred successfully.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_BUFFER_TOO_SMALL	BufferSize is not large enough to hold the downloaded data in downloading process.
EFI_ABORTED	Current operation is aborted by user.
EFI_NETWORK_UNREACHABLE	An ICMP network unreachable error packet was received.
EFI_NETWORK_UNREACHABLE	AnICMP host unreachable error packet was received.
EFI_NETWORK_UNREACHABLE	An ICMP protocol unreachable error packet was received.
EFI_NETWORK_UNREACHABLE	An ICMP port unreachable error packet was received .
EFI_ICMP_ERROR	Some other ICMP ERROR packet was received.
EFI_TIMEOUT	No responses were received from the MTFTPv4 server.
EFI_TFTP_ERROR	An MTFTPv4 ERROR packet was received.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.
EFI_NO_MEDIA	There was a media error.

```
//**********************************************************
// EFI_MTFTP4_CHECK_PACKET
//**********************************************************
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP4_CHECK_PACKET)(
  IN EFI_MTFTP4_PROTOCOL       *This,
  IN EFI_MTFTP4_TOKEN          *Token,
  IN UINT16                    PacketLen,
  IN EFI_MTFTP4_PACKET         *Packet
  );
```

This

Pointer to the *EFI_MTFTP4_PROTOCOL* instance.

Token

The token that the caller provided in the *EFI_MTFTP4_PROTOCOL .ReadFile(), WriteFile()* or *ReadDirectory()* function. Type *EFI_MTFTP4_TOKEN* is defined in *EFI_MTFTP4_PROTOCOL.ReadFile()*.

PacketLen

Indicates the length of the packet.

Packet

Pointer to an MTFTPv4 packet. Type *EFI_MTFTP4_PACKET* is defined in *EFI_MTFTP4_PROTOCOL .GetInfo()*.

EFI_MTFTP4_CHECK_PACKET is a callback function that is provided by the caller to intercept the *EFI_MTFTP4_OPCODE_DATA* or *EFI_MTFTP4_OPCODE_DATA8* packets processed in the *EFI_MTFTP4_PROTOCOL .ReadFile()* function, and alternatively to intercept *EFI_MTFTP4_OPCODE_OACK* or *EFI_MTFTP4_OPCODE_ERROR* packets during a call to *EFI_MTFTP4_PROTOCOL.ReadFile()*, *WriteFile()* or *ReadDirectory()*. Whenever an MTFTPv4 packet with the type described above is received from a server, the EFI MTFTPv4 Protocol driver will call *EFI_MTFTP4_CHECK_PACKET* function to let the caller have an opportunity to process this packet. Any status code other than *EFI_SUCCESS* that is returned from this function will abort the transfer process.

```
//*******************************************************
// EFI_MTFTP4_TIMEOUT_CALLBACK
//*******************************************************
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP4_TIMEOUT_CALLBACK)(
  IN EFI_MTFTP4_PROTOCOL         *This,
  IN EFI_MTFTP4_TOKEN            *Token
  );
```

This

Pointer to the *EFI_MTFTP4_PROTOCOL* instance.

Token

The token that is provided in the *EFI_MTFTP4_PROTOCOL .ReadFile()* or *EFI_MTFTP4_PROTOCOL.WriteFile()* or *EFI_MTFTP4_PROTOCOL.ReadDirectory()* functions by the caller. Type *EFI_MTFTP4_TOKEN* is defined in *EFI_MTFTP4_PROTOCOL.ReadFile()*.

EFI_MTFTP4_TIMEOUT_CALLBACK is a callback function that the caller provides to capture the timeout event in the *EFI_MTFTP4_PROTOCOL .ReadFile()*, *EFI_MTFTP4_PROTOCOL.WriteFile()* or *EFI_MTFTP4_PROTOCOL.ReadDirectory()* functions. Whenever a timeout occurs, the EFI MTFTPv4 Protocol driver will call the *EFI_MTFTP4_TIMEOUT_CALLBACK* function to notify the caller of the timeout event. Any status code other than *EFI_SUCCESS* that is returned from this function will abort the current download process.

```
//*******************************************************
// EFI_MTFTP4_PACKET_NEEDED
//*******************************************************
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP4_PACKET_NEEDED)(
  IN EFI_MTFTP4_PROTOCOL         *This,
  IN EFI_MTFTP4_TOKEN            *Token,
  IN OUT UINT16                  *Length,
  OUT VOID                       **Buffer
  );
```

This

Pointer to the *EFI_MTFTP4_PROTOCOL* instance.

Token

The token provided in the *EFI_MTFTP4_PROTOCOL .WriteFile()* by the caller.

Length

Indicates the length of the raw data wanted on input, and the length the data available on output.

Buffer

Pointer to the buffer where the data is stored.

EFI_MTFTP4_PACKET_NEEDED is a callback function that the caller provides to feed data to the *EFI_MTFTP4_PROTOCOL .WriteFile()* function. *EFI_MTFTP4_PACKET_NEEDED* provides another mechanism for the caller to provide data to upload other than a static buffer. The EFI MTFTP4 Protocol driver always calls *EFI_MTFTP4_PACKET_NEEDED* to get packet data from the caller if no static buffer was given in the initial call to *EFI_MTFTP4_PROTOCOL.WriteFile()* function. Setting **Length* to zero signals the end of the session. Returning a status code other than *EFI_SUCCESS* aborts the session.

Status Codes Returned

EFI_SUCCESS	The data file is being downloaded.
EFI_INVALID_PARAMETER	One or more of the parameters is not valid. • *This* is **NULL**. • *Token* is **NULL**. • *Token.Filename* is **NULL**. • *Token.OptionCount* is not zero and *Token.OptionList* is **NULL**. • One or more options in *Token.OptionList* have wrong format. • *Token.Buffer* and *Token.CheckPacket* are both **NULL**. • One or more IPv4 addresses in *Token.OverrideData* are not valid unicast IPv4 addresses if *Token.OverrideData* is not **NULL** and the addresses are not set to all zero.
EFI_UNSUPPORTED	• One or more options in the *Token.OptionList* are in the unsupported list of structure *EFI_MTFTP4_MODE_DATA*.
EFI_NOT_STARTED	The EFI MTFTPv4 Protocol driver has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_ALREADY_STARTED	This *Token* is being used in another MTFTPv4 session.
EFI_ACCESS_DENIED	The previous operation has not completed yet.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.
EFI_NO_MEDIA	There was a media error.

30.3.8 EFI_MTFTP4_PROTOCOL.WriteFile()

Summary

Sends a data file to an MTFTPv4 server. May be unsupported in some EFI implementations.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP4_WRITE_FILE)(
  IN EFI_MTFTP4_PROTOCOL       *This,
  IN EFI_MTFTP4_TOKEN          *Token
  );
```

Parameters

This

Pointer to the *EFI_MTFTP4_PROTOCOL* instance.

Token

Pointer to the token structure to provide the parameters that are used in this function. Type *EFI_MTFTP4_TOKEN* is defined in *EFI_MTFTP4_PROTOCOL .ReadFile()*.

Description

The *WriteFile()* function is used to initialize an uploading operation with the given option list and optionally wait for completion. If one or more of the options is not supported by the server, the unsupported options are ignored and a standard TFTP process starts instead. When the upload process completes, whether successfully or not, *Token.Event* is signaled, and the EFI MTFTPv4 Protocol driver updates *Token.Status*.

The caller can supply the data to be uploaded in the following two modes:

- Through the user-provided buffer
- Through a callback function

With the user-provided buffer, the *Token.BufferSize* field indicates the length of the buffer, and the driver will upload the data in the buffer. With an *EFI_MTFTP4_PACKET_NEEDED* callback function, the driver will call this callback function to get more data from the user to upload. See the definition of *EFI_MTFTP4_PACKET_NEEDED* for more information. These two modes cannot be used at the same time. The callback function will be ignored if the user provides the buffer.

Status Codes Returned

EFI_SUCCESS	The upload session has started.
EFI_UNSUPPORTED	The operation is not supported by this implementation.

continues on next page

Table 30.25 – continued from previous page

EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *Token* is **NULL**. • *Token.Filename* is **NULL**. • *Token.OptionCount* is not zero and *Token.OptionList* is **NULL**. • One or more options in *Token.OptionList* have wrong format. • *Token.Buffer* and *Token.PacketNeeded* are both **NULL**. • One or more IPv4 addresses in *Token.OverrideData* are not valid unicast IPv4 addresses if *Token.OverrideData* is not **NULL** and the addresses are not set to all zero.
EFI_UNSUPPORTED	• One or more options in the *Token.OptionList* are in the unsupported list of structure *EFI_MTFTP4_MODE_DATA*.
EFI_NOT_STARTED	The EFI MTFTPv4 Protocol driver has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_ALREADY_STARTED	This *Token* is already being used in another MTFTPv4 session.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_ACCESS_DENIED	The previous operation has not completed yet.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.
EFI_NO_MEDIA	There was a media error.

30.3.9 EFI_MTFTP4_PROTOCOL.ReadDirectory()

Summary

Downloads a data file “directory” from an MTFTPv4 server. May be unsupported in some EFI implementations.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP4_READ_DIRECTORY)(
  IN EFI_MTFTP4_PROTOCOL       *This,
  IN EFI_MTFTP4_TOKEN          *Token
  );
```

Parameters

This

Pointer to the *EFI_MTFTP4_PROTOCOL* instance.

Token

Pointer to the token structure to provide the parameters that are used in this function. Type *EFI_MTFTP4_TOKEN* is defined in *EFI_MTFTP4_PROTOCOL .ReadFile()*.

Description

The *ReadDirectory()* function is used to return a list of files on the MTFTPv4 server that are logically (or operationally) related to *Token.Filename*. The directory request packet that is sent to the server is built with the option list that was provided by caller, if present.

The file information that the server returns is put into either of the following locations:

- A fixed buffer that is pointed to by *Token.Buffer*
- A download service function that is pointed to by *Token.CheckPacket*

If both *Token.Buffer* and *Token.CheckPacket* are used, then *Token.CheckPacket* will be called first. If the call is successful, the packet will be stored in *Token.Buffer*.

The returned directory listing in the *Token.Buffer* or *EFI_MTFTP4_PACKET* consists of a list of two or three variable-length ASCII strings, each terminated by a null character, for each file in the directory. If the multicast option is involved, the first field of each directory entry is the static multicast IP address and UDP port number that is associated with the file name. The format of the field is *ip:ip:ip:ip:port*. If the multicast option is not involved, this field and its terminating null character are not present.

The next field of each directory entry is the file name and the last field is the file information string. The information string contains the file size and the create/modify timestamp. The format of the information string is *filesize yyyy-mm-dd hh:mm:ss:ffff*. The timestamp is Coordinated Universal Time (UTC; also known as Greenwich Mean Time [GMT]).

Status Codes Returned

EFI_SUCCESS	The MTFTPv4 related file "directory" has been downloaded.
EFI_UNSUPPORTED	The EFI MTFTPv4 Protocol driver does not support this function.
EFI_INVALID_PARAMETER	One or more of these conditions is **TRUE**: • *This* is **NULL**. • *Token* is **NULL**. • *Token.Filename* is **NULL**. • *Token.OptionCount* is not zero and *Token.OptionList* is **NULL**. • One or more options in *Token.OptionList* have wrong format. *Token.Buffer* and *Token.CheckPacket* are both **NULL*. • One or more IPv4 addresses in *Token.OverrideData* are not valid unicast IPv4 addresses if *Token.OverrideData* is not **NULL** and the addresses are not set to all zero.
EFI_UNSUPPORTED	One or more options in the *Token.OptionList* are in the unsupported list of structure *EFI_MTFTP4_MODE_DATA*.
EFI_NOT_STARTED	The EFI MTFTPv4 Protocol driver has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_ALREADY_STARTED	This *Token* is already being used in another MTFTPv4 session.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_ACCESS_DENIED	The previous operation has not completed yet.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.
EFI_NO_MEDIA	There was a media error.

30.3.10 EFI_MTFTP4_PROTOCOL.POLL()

Summary

Polls for incoming data packets and processes outgoing data packets.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP4_POLL) (
  IN EFI_MTFTP4_PROTOCOL     *This
  );
```

Parameters

This

Pointer to the *EFI_MTFTP4_PROTOCOL* instance.

Description

The *Poll()* function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the *Poll()* function more often.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_NOT_STARTED	This EFI MTFTPv4 Protocol instance has not been started.
EFI_NO_MAPPING	When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_TIMEOUT	Data was dropped out of the transmit and/or receive queue. Consider increasing the polling rate.

30.4 EFI MTFTPv6 Protocol

This section defines the EFI MTFTPv6 Protocol interface that is built upon the EFI UDPv6 Protocol.

30.4.1 MTFTP6 Service Binding Protocol

30.4.1.1 EFI_MTFTP6_SERVICE_BINDING_PROTOCOL

Summary

The EFI MTFTPv6 Service Binding Protocol is used to locate communication devices that are supported by an EFI MTFTPv6 Protocol driver and to create and destroy instances of the EFI MTFTPv6 Protocol child instance that can use the underlying communications device.

GUID

```
#define EFI_MTFTP6_SERVICE_BINDING_PROTOCOL_GUID \
  {0xd9760ff3,0x3cca,0x4267,\
    {0x80,0xf9,0x75,0x27,0xfa,0xfa,0x42,0x23}}
```

Description

A network application or driver that requires MTFTPv6 I/O services can use one of the protocol handler services, such as *BS->LocateHandleBuffer()*, to search for devices that publish an EFI MTFTPv6 Service Binding Protocol GUID. Each device with a published EFI MTFTPv6 Service Binding Protocol GUID supports the EFI MTFTPv6 Protocol service and may be available for use.

After a successful call to the *EFI_MTFTP6_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the newly created child EFI MTFTPv6 Protocol driver instance is in the un-configured state; it is not ready to transfer data.

Before a network application terminates execution, every successful call to the *EFI_MTFTP6_SERVICE_BINDING_PROTOCOL.CreateChild()* function must be matched with a call to the *EFI_MTFTP6_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

Each instance of the EFI MTFTPv6 Protocol driver can support one file transfer operation at a time. To download two files at the same time, two instances of the EFI MTFTPv6 Protocol driver need to be created.

30.4.2 MTFTP6 Protocol

30.4.2.1 EFI_MTFTP6_PROTOCOL

Summary

The EFI MTFTPv6 Protocol provides basic services for client-side unicast and/or multicast TFTP operations.

GUID

```
#define EFI_MTFTP6_PROTOCOL_GUID \
  {0xbf0a78ba,0xec29,0x49cf,\
    0xa1,0xc9,0x7a,0xe5,0x4e,0xab,0x6a,0x51}}
```

Protocol Interface Structure

```
typedef struct _EFI_MTFTP6_PROTOCOL {
  EFI_MTFTP6_GET_MODE_DATA   GetModeData;
  EFI_MTFTP6_CONFIGURE       Configure;
  EFI_MTFTP6_GET_INFO        GetInfo;
  EFI_MTFTP6_PARSE_OPTIONS   ;
  EFI_MTFTP6_READ_FILE       ReadFile;
  EFI_MTFTP6_WRITE_FILE      WriteFile;
  EFI_MTFTP6_READ_DIRECTORY  ReadDirectory;
  EFI_MTFTP6_POLL            Poll;
}  EFI_MTFTP6_PROTOCOL;
```

Parameters

GetModeData

Reads the current operational settings. See the *GetModeData()* function description.

Configure

Initializes, changes, or resets the operational settings for this instance of the EFI MTFTPv6 Protocol driver. See the *Configure()* function description.

GetInfo
Retrieves information about a file from an MTFTPv6 server. See the *GetInfo()* function description. Parses the options in an MTFTPv6 OACK (options acknowledgement) packet. See the *()* function description.

ReadFile
Downloads a file from an MTFTPv6 server. See the *ReadFile()* function description.

WriteFile
Uploads a file to an MTFTPv6 server. This function may be unsupported in some EFI implementations. See the *WriteFile()* function description.

ReadDirectory
Downloads a related file directory from an MTFTPv6 server. This function may be unsupported in some EFI implementations. See the *ReadDirectory()* function description.

Poll
Polls for incoming data packets and processes outgoing data packets. See the *Poll()* function description.

Description

The *EFI_MTFTP6_PROTOCOL* is designed to be used by UEFI drivers and applications to transmit and receive data files. The EFI MTFTPv6 Protocol driver uses the underlying EFI UDPv6 Protocol driver and EFI IPv6 Protocol driver.

30.4.2.2 EFI_MTFTP6_PROTOCOL.GetModeData()

Summary

Read the current operational settings.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_GET_MODE_DATA)(
 IN EFI_MTFTP6_PROTOCOL          *This,
   OUT EFI_MTFTP6_MODE_DATA      *ModeData
 );
```

Parameters

This
Pointer to the *EFI_MTFTP6_PROTOCOL* instance.

ModeData
The buffer in which the EFI MTFTPv6 Protocol driver mode data is returned. Type *EFI_MTFTP6_MODE_DATA* is defined in “Related Definitions” below.

Description

The *GetModeData* () function reads the current operational settings of this EFI MTFTPv6 Protocol driver instance.

Related Definitions

```
//*******************************************************
// EFI_MTFTP6_MODE_DATA
//*******************************************************
typedef struct {
  EFI_MTFTP6_CONFIG_DATA     ConfigData;
  UINT8                      SupportedOptionCount;
```

(continues on next page)

(continued from previous page)

```
  UINT8                        **SupportedOptions;
}  EFI_MTFTP6_MODE_DATA;
```

ConfigData
The configuration data of this instance. Type *EFI_MTFTP6_CONFIG_DATA* is defined below.

SupportedOptionCount
The number of option strings in the following *SupportedOptions* array.

SupportedOptions
An array of null-terminated ASCII option strings that are recognized and supported by this EFI MTFTPv6 Protocol driver implementation. The buffer is read only to the caller and the caller should NOT free the buffer.

The *EFI_MTFTP6_MODE_DATA* structure describes the operational state of this instance.

```
//*******************************************************
// EFI_MTFTP6_CONFIG_DATA
//*******************************************************
typedef struct {
  EFI_IPv6_ADDRESS     StationIp;
  UINT16               LocalPort;
  EFI_IPv6_ADDRESS     ServerIp;
  UINT16               InitialServerPort;
  UINT16               TryCount;
  UINT16               TimeoutValue;
}  EFI_MTFTP6_CONFIG_DATA;
```

StationIp
The local IP address to use. Set to zero to let the underlying IPv6 driver choose a source address. If not zero it must be one of the configured IP addresses in the underlying IPv6 driver.

LocalPort
Local port number. Set to zero to use the automatically assigned port number.

ServerIp
The IP address of the MTFTPv6 server.

InitialServerPort
The initial MTFTPv6 server port number. Request packets are sent to this port. This number is almost always 69 and using zero defaults to 69.

TryCount
The number of times to transmit MTFTPv6 request packets and wait for a response.

TimeoutValue
The number of seconds to wait for a response after sending the MTFTPv6 request packet.

The *EFI_MTFTP6_CONFIG_DATA* structure is used to retrieve and change MTFTPv6 session parameters.

Status Codes Returned

EFI_SUCCESS	The configuration data was successfully returned.
EFI_OUT_OF_RESOURCES	The required mode data could not be allocated.
EFI_INVALID_PARAMETER	*This* is **NULL** or *ModeData* is **NULL**.

30.4.2.3 EFI_MTFTP6_PROTOCOL.Configure()

Summary

Initializes, changes, or resets the default operational setting for this EFI MTFTPv6 Protocol driver instance.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_CONFIGURE)(
  IN EFI_MTFTP6_PROTOCOL       *This,
  IN EFI_MTFTP6_CONFIG_DATA    *MtftpConfigData OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_MTFTP6_PROTOCOL* instance.

MtftpConfigData
Pointer to the configuration data structure. Type *EFI_MTFTP6_CONFIG_DATA* is defined in *EFI_MTFTP6_PROTOCOL.GetModeData()*.

Description

The *Configure* () function is used to set and change the configuration data for this EFI MTFTPv6 Protocol driver instance. The configuration data can be reset to startup defaults by calling *Configure* () with *MtftpConfigData* set to NULL. Whenever the instance is reset, any pending operation is aborted. By changing the EFI MTFTPv6 Protocol driver instance configuration data, the client can connect to different MTFTPv6 servers. The configuration parameters in *MtftpConfigData* are used as the default parameters in later MTFTPv6 operations and can be overridden in later operations.

Status Codes Returned

EFI_SUCCESS	The EFI MTFTPv6 Protocol instance was configured successfully.
EFI_INVALID_PARAMETER	One or more following conditions are **TRUE**: • *This* is **NULL**. • *MtftpConfigData.StationIp* is neither zero nor one of the configured IP addresses in the underlying IPv6 driver. • *MtftpCofigData.ServerIp* is not a valid IPv6 unicast address.
EFI_ACCESS_DENIED	• The configuration could not be changed at this time because there is some MTFTP background operation in progress. • *MtftpCofigData.LocalPort* is already in use.
EFI_NO_MAPPING	The underlying IPv6 driver was responsible for choosing a source address for this instance, but no source address was available for use.
EFI_OUT_OF_RESOURCES	The EFI MTFTPv6 Protocol driver instance data could not be allocated.
EFI_DEVICE_ERROR	An unexpected system or network error occurred. The EFI MTFTPv6 Protocol driver instance is not configured.

30.4.2.4 EFI_MTFTP6_PROTOCOL.GetInfo()

Summary

Get information about a file from an MTFTPv6 server.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_GET_INFO)(
  IN EFI_MTFTP6_PROTOCOL       *This,
  IN EFI_MTFTP6_OVERRIDE_DATA  *OverrideData OPTIONAL,
  IN UINT8                     *Filename,
  IN UINT8                     *ModeStr OPTIONAL,
  IN UINT8                     OptionCount,
  IN EFI_MTFTP6_OPTION         *OptionList OPTIONAL,
  OUT UINT32                   *PacketLength,
  OUT EFI_MTFTP6_PACKET        **Packet OPTIONAL
  );
```

Parameters

This
Pointer to the *EFI_MTFTP6_PROTOCOL* instance.

OverrideData
Data that is used to override the existing parameters. If **NULL**, the default parameters that were set in the *EFI_MTFTP6_PROTOCOL. Configure* () function are used. Type *EFI_MTFTP6_OVERRIDE_DATA* is defined in “Related Definitions” below.

Filename
Pointer to an null-terminated ASCII file name string.

ModeStr
Pointer to an null-terminated ASCII mode string. If **NULL**, octet will be used.

OptionCount
Number of option/value string pairs in *OptionList* .

OptionList
Pointer to array of option/value string pairs. Ignored if *OptionCount* is zero. Type *EFI_MTFTP6_OPTION* is defined in “Related Definitions” below.

PacketLength
The number of bytes in the returned packet.

Packet
The pointer to the received packet. This buffer must be freed by the caller. Type *EFI_MTFTP6_PACKET* is defined in “Related Definitions” below.

Description

The *GetInfo()* function assembles an MTFTPv6 request packet with options, sends it to the MTFTPv6 server, and may return an MTFTPv6 OACK, MTFTPv6 ERROR, or ICMP ERROR packet. Retries occur only if no response packets are received from the MTFTPv6 server before the timeout expires.

Related Definitions

```
//**************************************************
// EFI_MTFTP_OVERRIDE_DATA
//**************************************************
typedef struct {
  EFI_IPv6_ADDRESS       ServerIp;
  UINT16                 ServerPort;
  UINT16                 TryCount;
  UINT16                 TimeoutValue;
}  EFI_MTFTP6_OVERRIDE_DATA;
```

ServerIp
IP address of the MTFTPv6 server. If set to all zero, the value that was set by the *EFI_MTFTP6_PROTOCOL.Configure()* function will be used.

ServerPort
MTFTPv6 server port number. If set to zero, it will use the value that was set by the *EFI_MTFTP6_PROTOCOL.Configure()* function.

TryCount
Number of times to transmit MTFTPv6 request packets and wait for a response. If set to zero, the value that was set by the *EFI_MTFTP6_PROTOCOL.Configure()* function will be used.

TimeoutValue
Number of seconds to wait for a response after sending the MTFTPv6 request packet. If set to zero, the value that was set by the *EFI_MTFTP6_PROTOCOL.Configure()* function will be used.

The *EFI_MTFTP6_OVERRIDE_DATA* structure is used to override the existing parameters that were set by the *EFI_MTFTP6_PROTOCOL.Configure()* function.

```
//**************************************************
// EFI_MTFTP6_OPTION
//**************************************************
typedef struct {
  UINT8           *OptionStr;
  UINT8           *ValueStr;
}   EFI_MTFTP6_OPTION;
```

OptionStr
Pointer to the null-terminated ASCII MTFTPv6 option string.

ValueStr
Pointer to the null-terminated ASCII MTFTPv6 value string.

```
#pragma pack(1)

//*********************************************
// EFI_MTFTP6_PACKET
//*********************************************
typedef union {
  UINT16                  OpCode;

#pragma pack()
```

Table 1 below describes the parameters that are listed in the MTFTPv6 packet structure definitions above. All the above structures are byte packed. The pragmas may vary from compiler to compiler. The MTFTPv6 packet structures are also used by the following functions:

- *EFI_MTFTP6_PROTOCOL.ReadFile()*
- *EFI_MTFTP6_PROTOCOL.WriteFile()*
- *EFI_MTFTP6_PROTOCOL.ReadDirectory()*
- The EFI MTFTPv6 Protocol packet check callback functions

NOTE: **BYTE ORDER**: *Both incoming and outgoing MTFTPv6 packets are in network byte order. All other parameters defined in functions or data structures are stored in host byte order.*

Table 30.30: Descriptions of Parameters in MTFTPv6 PacketStructures

Data Structure	Parameter	Description
EFI_MTFTP6_PACKET	OpCode	Type of packets as defined by the MTFTPv6 packet opcodes. Opcode values are defined below.
	Rrq, Wrq	Read request or write request packet header. See the description for *EFI_MTFTP6_REQ_HEADER* below in this table.
	Oack	Option acknowledge packet header. See the description for *EFI_MTFTP6_OACK_HEADER* below in this table.
	Data	Data packet header. See the description for *EFI_MTFTP6_DATA_HEADER* below in this table.
	Ack	Acknowledgement packet header. See the description for *EFI_MTFTP6_ACK_HEADER* below in this table.
	Data8	This field should be ignored and treated as reserved. Data packet header with big block number. See the description for *EFI_MTFTP6_DATA8_HEADER* below in this table.

continues on next page

Table 30.30 – continued from previous page

	Ack8	This field should be ignored and treated as reserved. Acknowledgement header with big block number. See the description for *EFI_MTFTP6_ACK8_HEADER* below in this table.
	Error	Error packet header. See the description for *EFI_MTFTP6_ERROR_HEADER* below in this table.
EFI_MTFTP6_REQ_HEADER	OpCode	For this packet type, *OpCode* = *EFI_MTFTP6_OPCODE_RRQ* for a read request or *OpCode* = *EFI_MTFTP6_OPCODE_WRQ* for a write request.
	Filename	The file name to be downloaded or uploaded.
EFI_MTFTP6_OACK_HEADER	OpCode	For this packet type *OpCode* = *EFI_MTFTP6_OPCODE_OACK*.
	Data	The option strings in the option acknowledgement packet.
EFI_MTFTP6_DATA_HEADER	OpCode	For this packet type *OpCode* = *EFI_MTFTP6_OPCODE_DATA*.
	Block	Block number of this data packet.
	Data	The content of this data packet.
EFI_MTFTP6_ACK_HEADER	OpCode	For this packet type *OpCode* = *EFI_MTFTP6_OPCODE_ACK*.
	Block	The block number of the data packet that is being acknowledged.
EFI_MTFTP6_DATA8_HEADER	OpCode	This field should be ignored and treated as reserved. For this packet type, *OpCode* = *EFI_MTFTP6_OPCODE_DATA8*.
	Block	This field should be ignored and treated as reserved. The block number of data packet.
	Data	This field should be ignored and treated as reserved. The content of this data packet.
EFI_MTFTP6_ACK8_HEADER	OpCode	For this packet type *OpCode* = *EFI_MTFTP6_OPCODE_ACK8*.
	Block	The block number of the data packet that is being
EFI_MTFTP6_ERROR_HEADER	OpCode	For this packet type *OpCode* = *EFI_MTFTP6_OPCODE_ERROR*.
	ErrorCode	The error number as defined by the MTFTPv6 packet error codes. Values for *ErrorCode* are defined below.
	ErrorMessage	Error message string.

```
//
// MTFTP Packet OpCodes
//
#define EFI_MTFTP6_OPCODE_RRQ     1
#define EFI_MTFTP6_OPCODE_WRQ     2
#define EFI_MTFTP6_OPCODE_DATA    3
#define EFI_MTFTP6_OPCODE_ACK     6
```

(continues on next page)

(continued from previous page)

```
#define EFI_MTFTP6_OPCODE_ERROR  5
#define EFI_MTFTP6_OPCODE_OACK   6
#define EFI_MTFTP6_OPCODE_DIR    7
//This field should be ignored and treated as reserved.
#define EFI_MTFTP4_OPCODE_DATA8  8
//This field should be ignored and treated as reserved.
#define EFI_MTFTP4_OPCODE_ACK8   9
```

Following is a description of the fields in the above definition.

Table 30.31: MTFTP Packet OpCode Descriptions

MTFTP Packet OpCode	Description
EFI_MTFTP6_OPCODE_RRQ	The MTFTPv6 packet is a read request.
EFI_MTFTP6_OPCODE_WRQ	The MTFTPv6 packet is a write request.
EFI_MTFTP6_OPCODE_DATA	The MTFTPv6 packet is a data packet.
EFI_MTFTP6_OPCODE_ACK	The MTFTPv6 packet is an acknowledgement packet.
EFI_MTFTP6_OPCODE_ERROR	The MTFTPv6 packet is an error packet.
EFI_MTFTP6_OPCODE_OACK	The MTFTPv6 packet is an option acknowledgement packet.
EFI_MTFTP6_OPCODE_DIR	The MTFTPv6 packet is a directory query packet.
EFI_MTFTP6_OPCODE_DATA8	This field should be ignored and treated as reserved. The MTFTPv6 packet is a data packet with a big block number.
EFI_MTFTP6_OPCODE_ACK8	This field should be ignored and treated as reserved. The MTFTPv6 packet is an acknowledgement packet with a big block number.

```
//
// MTFTP ERROR Packet ErrorCodes
//
#define EFI_MTFTP6_ERRORCODE_NOT_DEFINED         0
#define EFI_MTFTP6_ERRORCODE_FILE_NOT_FOUND      1
#define EFI_MTFTP6_ERRORCODE_ACCESS_VIOLATION    2
#define EFI_MTFTP6_ERRORCODE_DISK_FULL           3
#define EFI_MTFTP6_ERRORCODE_ILLEGAL_OPERATION   4
#define EFI_MTFTP6_ERRORCODE_UNKNOWN_TRANSFER_ID 5
#define EFI_MTFTP6_ERRORCODE_FILE_ALREADY_EXISTS 6
#define EFI_MTFTP6_ERRORCODE_NO_SUCH_USER        7
#define EFI_MTFTP6_ERRORCODE_REQUEST_DENIED      8
```

Table 30.32: MTFTP ERROR Packet ErrorCode Descriptions

MTFTP ERROR Packet ErrorCodes	Description
E FI_MTFTP6_ERRORCODE_NOT_DEFINED	The error code is not defined. See the error message in the packet (if any) for details.
EFI_ MTFTP6_ERRORCODE_FILE_NOT_FOUND	The file was not found.
EFI_MT FTP6_ERRORCODE_ACCESS_VIOLATION	There was an access violation.
EFI_MTFTP6_ERRORCODE_DISK_FULL	The disk was full or its allocation was exceeded.

continues on next page

Table 30.32 – continued from previous page

EFI_MTF TP6_ERRORCODE_ILLEGAL_OPERATION	The MTFTPv6 operation was illegal.
EFI_MTFTP 6_ERRORCODE_UNKNOWN_TRANSFER_ID	The transfer ID is unknown.
EFI_MTFTP 6_ERRORCODE_FILE_ALREADY_EXISTS	The file already exists.
EF I_MTFTP6_ERRORCODE_NO_SUCH_USER	There is no such user.
EFI_ MTFTP6_ERRORCODE_REQUEST_DENIED	The request has been denied due to option negotiation.

Status Codes Returned

EFI_SUCCESS	An MTFTPv6 OACK packet was received and is in the *Packet*.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *Filename* is **NULL**. • *OptionCount* is not zero and *OptionList* is **NULL**. • One or more options in OptionList have wrong format. • *PacketLength* is **NULL**. • *OverrideData.ServerIp* is not a valid unicast IPv6 address and not set to all zero.
EFI_UNSUPPORTED	One or more options in the *OptionList* are unsupported by this implementation.
EFI_NOT_STARTED	The EFI MTFTPv6 Protocol driver has not been started.
EFI_NO_MAPPING	The underlying IPv6 driver was responsible for choosing a source address for this instance, but no source address was available for use.
EFI_ACCESS_DENIED	The previous operation has not completed yet.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_TFTP_ERROR	An MTFTPv6 ERROR packet was received and is in the *Packet*.
EFI_NETWORK_UNREACHABLE	An ICMP network unreachable error packet was received and the *Packet* is set to **NULL**.
EFI_NETWORK_UNREACHABLE	An ICMP host unreachable error packet was received and the *Packet* is set to **NULL**.
EFI_NETWORK_UNREACHABLE	An ICMP protocol unreachable error packet was received and the *Packet* is set to **NULL**.
EFI_NETWORK_UNREACHABLE	An ICMP port unreachable error packet was received and the *Packet* is set to **NULL**.
EFI_ICMP_ERROR	Some other ICMP ERROR packet was received and the *Packet* is set to **NULL**.
EFI_PROTOCOL_ERROR	An unexpected MTFTPv6 packet was received and is in the *Packet*.
EFI_TIMEOUT	No responses were received from the MTFTPv6 server.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.

30.4.2.5 EFI_MTFTP6_PROTOCOL.ParseOptions()

Summary

Parse the options in an MTFTPv6 OACK packet.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_PARSE_OPTIONS)(
  IN EFI_MTFTP6_PROTOCOL          *This,
  IN UINT32                       PacketLen,
  IN EFI_MTFTP6_PACKET            *Packet,
  OUT UINT32                      *OptionCount,
  OUT EFI_MTFTP6_OPTION           **OptionList OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_MTFTP6_PROTOCOL* instance.

PacketLen

Length of the OACK packet to be parsed.

Packet

Pointer to the OACK packet to be parsed. Type *EFI_MTFTP6_PACKET* is defined in *EFI_MTFTP6_PROTOCOl.GetInfo()* .

OptionCount

Pointer to the number of options in the following *OptionList*.

OptionList

Pointer to *EFI_MTFTP6_OPTION* storage. Each pointer in the *OptionList* points to the corresponding MTFTP option buffer in the *Packet*. Call the EFI Boot Service *FreePool()* to release the *OptionList* if the options in this *OptionList* are not needed any more. Type *EFI_MTFTP6_OPTION* is defined in *EFI_MTFTP6_PROTOCOL.GetInfo()*.

Description

The *ParseOptions*() function parses the option fields in an MTFTPv6 OACK packet and returns the number of options that were found and optionally a list of pointers to the options in the packet.

If one or more of the option fields are not valid, then *EFI_PROTOCOL_ERROR* is returned and * *OptionCount* and * *OptionList* stop at the last valid option.

Status Codes Returned

EFI_SUCCESS	The OACK packet was valid and the *OptionCount* and *OptionList* parameters have been updated.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *PacketLen* is 0. • *Packet* is **NULL** or *Packet* is not a valid MTFTPv6 packet. • *OptionCount* is **NULL**.
EFI_NOT_FOUND	No options were found in the OACK packet.

continues on next page

Table 30.34 – continued from previous page

EFI_OUT_OF_RESOURCES	Storage for the *OptionList* array can not be allocated.
EFI_PROTOCOL_ERROR	One or more of the option fields is invalid.

30.4.2.6 EFI_MTFTP6_PROTOCOL.ReadFile()

Summary

Download a file from an MTFTPv6 server.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_READ_FILE)(
  IN EFI_MTFTP6_PROTOCOL       *This,
  IN EFI_MTFTP6_TOKEN          *Token
  );
```

Parameters

This

Pointer to the *EFI_MTFTP6_PROTOCOL* instance.

Token

Pointer to the token structure to provide the parameters that are used in this operation. Type *EFI_MTFTP6_TOKEN* is defined in “Related Definitions” below.

Description

The *ReadFile()* function is used to initialize and start an MTFTPv6 download process and optionally wait for completion. When the download operation completes, whether successfully or not, the *Token.Status* field is updated by the EFI MTFTPv6 Protocol driver and then *Token.Event* is signaled if it is not **NULL**.

Data can be downloaded from the MTFTPv6 server into either of the following locations:

- A fixed buffer that is pointed to by *Token.Buffer*
- A download service function that is pointed to by *Token.CheckPacket*

If both *Token.Buffer* and *Token.CheckPacket* are used, then *Token.CheckPacket* will be called first. If the call is successful, the packet will be stored in *Token.Buffer*.

Related Definitions

```
//*******************************************************
// EFI_MTFTP6_TOKEN
//*******************************************************
typedef struct {
  EFI_STATUS                  Status;
  EFI_EVENT                   Event;
  EFI_MTFTP6_OVERRIDE_DATA    OverrideData;
  UINT8                       *Filename;
  UINT8                       *ModeStr;
  UINT32                      OptionCount;
  EFI_MTFTP6_OPTION           OptionList;
  UINT64                      BufferSize;
  VOID                        *Buffer;
```

(continues on next page)

(continued from previous page)

```
  VOID                          *Context;
  EFI_MTFTP6_CHECK_PACKET       CheckPacket;
  EFI_MTFTP6_TIMEOUT_CALLBACK TimeoutCallback;
  EFI_MTFTP6_PACKET_NEEDED      PacketNeeded;
}  EFI_MTFTP6_TOKEN;
```

Status

The status that is returned to the caller at the end of the operation to indicate whether this operation completed successfully. Defined *Status* values are listed below.

Event

The event that will be signaled when the operation completes. If set to **NULL**, the corresponding function will wait until the read or write operation finishes. The type of *Event* must be *EVT_NOTIFY_SIGNAL*.

OverrideData

If not **NULL**, the data that will be used to override the existing configure data. Type *EFI_MTFTP6_OVERRIDE_DATA* is defined in *EFI_MTFTP6_PROTOCOL* .GetInfo().

Filename

Pointer to the null-terminated ASCII file name string.

ModeStr

Pointer to the null-terminated ASCII mode string. If **NULL**, octet is used.

OptionCount

Number of option/value string pairs.

OptionList

Pointer to an array of option/value string pairs. Ignored if *OptionCount* is zero. Both a remote server and this driver implementation should support these options. If one or more options are unrecognized by this implementation, it is sent to the remote server without being changed. Type *EFI_MTFTP6_OPTION* is defined in *EFI_MTFTP6_PROTOCOL*.GetInfo().

BufferSize

On input, the size, in bytes, of *Buffer*. On output, the number of bytes transferred.

Buffer

Pointer to the data buffer. Data that is downloaded from the MTFTPv6 server is stored here. Data that is uploaded to the MTFTPv6 server is read from here. Ignored if *BufferSize* is zero.

Context

Pointer to the context that will be used by *CheckPacket*, *TimeoutCallback* and *PacketNeeded*.

CheckPacket

Pointer to the callback function to check the contents of the received packet. Type *EFI_MTFTP6_CHECK_PACKET* is defined below.

TimeoutCallback

Pointer to the function to be called when a timeout occurs. Type *EFI_MTFTP6_TIMEOUT_CALLBACK* is defined below.

PacketNeeded

Pointer to the function to provide the needed packet contents. Only used in *WriteFile()* operation. Type *EFI_MTFTP6_PACKET_NEEDED* is defined below.

The EFI_MTFTP6_TOKEN structure is used for both the MTFTPv6 reading and writing operations.

The caller uses this structure to pass parameters and indicate the operation context. After the reading or writing operation completes, the EFI MTFTPv6 Protocol driver updates the Status parameter and the Event is signaled if it is not NULL. The following table lists the status codes that are returned in the Status parameter.

Status Codes Returne in the Status Parameter

EFI_SUCCESS	The data file has been transferred successfully.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_BUFFER_TOO_SMALL	*BufferSize* is not zero but not large enough to hold the downloaded data in downloading process.
EFI_ABORTED	Current operation is aborted by user.
EFI_NETWORK_UNREACHABLE	An ICMP network unreachable error packet was received.
EFI_NETWORK_UNREACHABLE	An ICMP host unreachable error packet was received.
EFI_NETWORK_UNREACHABLE	An ICMP protocol unreachable error packet was received.
EFI_NETWORK_UNREACHABLE	An ICMP port unreachable error packet was received.
EFI_ICMP_ERROR	Some other ICMP ERROR packet was received.
EFI_TIMEOUT	No responses were received from the MTFTPv6 server.
EFI_TFTP_ERROR	An MTFTPv6 ERROR packet was received.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.

```
//*******************************************************
// EFI_MTFTP6_CHECK_PACKET
//*******************************************************
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_CHECK_PACKET)(
  IN EFI_MTFTP6_PROTOCOL       *This,
  IN EFI_MTFTP6_TOKEN          *Token,
  IN UINT16                    PacketLen,
  IN EFI_MTFTP6_PACKET         *Packet
  );
```

This

Pointer to the *EFI_MTFTP6_PROTOCOL* instance.

Token

The token that the caller provided in the *EFI_MTFTP6_PROTOCOl.ReadFile()*, *WriteFile()* or *ReadDirectory()* function. Type *EFI_MTFTP6_TOKEN* is defined in *EFI_MTFTP6_PROTOCOL.ReadFile()*.

PacketLen

Indicates the length of the packet.

Packet

Pointer to an MTFTPv6 packet. Type *EFI_MTFTP6_PACKET* is defined in *EFI_MTFTP6_PROTOCOL.GetInfo()*.

EFI_MTFTP6_CHECK_PACKET is a callback function that is provided by the caller to intercept the *EFI_MTFTP6_OPCODE_DATA* or *EFI_MTFTP6_OPCODE_DATA8* packets processed in the *EFI_MTFTP6_PROTOCOL.ReadFile()* function, and alternatively to intercept *EFI_MTFTP6_OPCODE_OACK* or *EFI_MTFTP6_OPCODE_ERROR* packets during a call to *EFI_MTFTP6_PROTOCOL.ReadFile()*, *WriteFile()* or *ReadDirectory()*. Whenever an MTFTPv6 packet with the type described above is received from a server, the EFI MTFTPv6 Protocol driver will call *EFI_MTFTP6_CHECK_PACKET* function to let the caller have an opportunity to process this packet. Any status code other than *EFI_SUCCESS* that is returned from this function will abort the transfer process.

```
//******************************************************
// EFI_MTFTP6_TIMEOUT_CALLBACK
//******************************************************
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_TIMEOUT_CALLBACK)(
  IN EFI_MTFTP6_PROTOCOL           *This,
  IN EFI_MTFTP6_TOKEN              *Token
  );
```

This

Pointer to the *EFI_MTFTP6_PROTOCOL* instance.

Token

The token that is provided in the
EFI_MTFTP6_PROTOCOL.ReadFile() or
EFI_MTFTP6_PROTOCOL.ReadDirectory() functions by the caller. Type
EFI_MTFTP6_TOKEN is defined in
EFI_MTFTP6_PROTOCOL.ReadFile().

EFI_MTFTP6_TIMEOUT_CALLBACK is a callback function that the caller provides to capture the timeout event in the *EFI_MTFTP6_PROTOCOL.ReadFile()*, *EFI_MTFTP6_PROTOCOL.WriteFile()* or *EFI_MTFTP6_PROTOCOL.ReadDirectory()* functions. Whenever a timeout occurs, the EFI MTFTPv6 Protocol driver will call the *EFI_MTFTP6_TIMEOUT_CALLBACK* function to notify the caller of the timeout event. Any status code other than *EFI_SUCCESS* that is returned from this function will abort the current download process.

```
//******************************************************
// EFI_MTFTP6_PACKET_NEEDED
//******************************************************
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_PACKET_NEEDED)(
  IN EFI_MTFTP6_PROTOCOL       *This,
  IN EFI_MTFTP6_TOKEN          Token,
  IN OUT UINT16                *Length,
  OUT VOID                     **Buffer
  );
```

This

Pointer to the *EFI_MTFTP6_PROTOCOL* instance.

Token

The token provided in the *EFI_MTFTP6_PROTOCOL.WriteFile()* by the caller.

Length

Indicates the length of the raw data wanted on input, and the length the data available on output.

Buffer

Pointer to the buffer where the data is stored.

EFI_MTFTP6_PACKET_NEEDED is a callback function that the caller provides to feed data to the *EFI_MTFTP6_PROTOCOL.WriteFile()* function. *EFI_MTFTP6_PACKET_NEEDED* provides another mechanism for the caller to provide data to upload other than a static buffer. The EFI MTFTP6 Protocol driver always calls *EFI_MTFTP6_PACKET_NEEDED* to get packet data from the caller if no static buffer was given in the initial call to

EFI_MTFTP6_PROTOCOL.WriteFile() function. Setting **Length* to zero signals the end of the session. Returning a status code other than *EFI_SUCCESS* aborts the session.

Status Codes Returned

EFI_SUCCESS	The data file is being downloaded.
EFI_INVALID_PARAMETER	One or more of the parameters is not valid. • *This* is **NULL**. • *Token* is **NULL**. • *Token.Filename* is **NULL**. • *Token.OptionCount* is not zero and *Token.OptionList* is **NULL**. • One or more options in *Token.OptionList* have wrong format. • *Token.Buffer* and *Token.CheckPacket* are both **NULL**. • *Token.OverrideData.ServerIp* is not a valid unicast IPv6 address and not set to all zero.
EFI_UNSUPPORTED	One or more options in the *Token.OptionList* are not supported by this implementation.
EFI_NOT_STARTED	The EFI MTFTPv6 Protocol driver has not been started.
EFI_NO_MAPPING	The underlying IPv6 driver was responsible for choosing a source address for this instance, but no source address was available for use.
EFI_ALREADY_STARTED	This *Token* is being used in another MTFTPv6 session.
EFI_ACCESS_DENIED	The previous operation has not completed yet.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.
EFI_NO_MEDIA	There was a media error.

30.4.2.7 EFI_MTFTP6_PROTOCOL.WriteFile()

Summary

Send a file to an MTFTPv6 server. May be unsupported in some implementations.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_WRITE_FILE)(
  IN EFI_MTFTP6_PROTOCOL       *This,
  IN EFI_MTFTP6_TOKEN          *Token
  );
```

Parameters

This

Pointer to the *EFI_MTFTP6_PROTOCOL* instance.

Token

Pointer to the token structure to provide the parameters that are used in this function. Type *EFI_MTFTP6_TOKEN* is defined in *EFI_MTFTP6_PROTOCOL.ReadFile()*.

Description

The *WriteFile()* function is used to initialize an uploading operation with the given option list and optionally wait for completion. If one or more of the options is not supported by the server, the unsupported options are ignored and a standard TFTP process starts instead. When the upload process completes, whether successfully or not, *Token.Event* is signaled, and the EFI MTFTPv6 Protocol driver updates *Token.Status*.

The caller can supply the data to be uploaded in the following two modes:

- Through the user-provided buffer
- Through a callback function

With the user-provided buffer, the *Token.BufferSize* field indicates the length of the buffer, and the driver will upload the data in the buffer. With an *EFI_MTFTP6_PACKET_NEEDED* callback function, the driver will call this callback function to get more data from the user to upload. See the definition of *EFI_MTFTP6_PACKET_NEEDED* for more information. These two modes cannot be used at the same time. The callback function will be ignored if the user provides the buffer.

Status Codes Returned

EFI_SUCCESS	The upload session has started.
EFI_UNSUPPORTED	The operation is not supported by this implementation.
EFI_INVALID_PARAMETER	One or more of the following conditions is **TRUE**: • *This* is **NULL**. • *Token* is **NULL**. • *Token.Filename* is **NULL**. • *Token.OptionCount* is not zero and *Token.OptionList* is **NULL**. • One or more options in Token.OptionList have wrong format. • *Token.Buffer* and *Token.PacketNeeded* are both **NULL**. • *Token.OverrideData.ServerIp* is not a valid unicast IPv6 address and not set to all zero.
EFI_UNSUPPORTED	One or more options in the Token.OptionList are not supported by this implementation.
EFI_NOT_STARTED	The EFI MTFTPv6 Protocol driver has not been started.
EFI_NO_MAPPING	The underlying IPv6 driver was responsible for choosing a source address for this instance, but no source address was available for use.
EFI_ALREADY_STARTED	This *Token* is already being used in another MTFTPv6 session.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_ACCESS_DENIED	The previous operation has not completed yet.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.
EFI_NO_MEDIA	There was a media error.

30.4.2.8 EFI_MTFTP6_PROTOCOL.ReadDirectory()

Summary

Download a data file directory from an MTFTPv6 server. May be unsupported in some implementations.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_READ_DIRECTORY)(
```

(continues on next page)

(continued from previous page)

```
  IN EFI_MTFTP6_PROTOCOL          *This,
  IN EFI_MTFTP6_TOKEN             *Token
);
```

Parameters

This

Pointer to the *EFI_MTFTP6_PROTOCOL* instance.

Token

Pointer to the token structure to provide the parameters that are used in this function. Type *EFI_MTFTP6_TOKEN* is defined in *EFI_MTFTP6_PROTOCOL.ReadFile()*.

Description

The *ReadDirectory()* function is used to return a list of files on the MTFTPv6 server that are logically (or operationally) related to *Token.Filename*. The directory request packet that is sent to the server is built with the option list that was provided by caller, if present.

The file information that the server returns is put into either of the following locations:

- A fixed buffer that is pointed to by *Token.Buffer*
- A download service function that is pointed to by Token.CheckPacket

If both *Token.Buffer* and *Token.CheckPacket* are used, then *Token.CheckPacket* will be called first. If the call is successful, the packet will be stored in Token.Buffer.

The returned directory listing in the *Token.Buffer* or *EFI_MTFTP6_PACKET* consists of a list of two or three variable-length ASCII strings, each terminated by a null character, for each file in the directory. If the multicast option is involved, the first field of each directory entry is the static multicast IP address and UDP port number that is associated with the file name. The format of the field is *ip:ip:ip:ip:port*. If the multicast option is not involved, this field and its terminating null character are not present.

The next field of each directory entry is the file name and the last field is the file information string. The information string contains the file size and the create/modify timestamp. The format of the information string is *filesize yyyy-mm-dd hh:mm:ss:ffff*. The timestamp is Coordinated Universal Time (UTC; also known as Greenwich Mean Time [GMT]).

Status Codes Returned

EFI_SUCCESS	The MTFTPv6 related file "directory" has been downloaded.
EFI_UNSUPPORTED	The EFI MTFTPv6 Protocol driver does not support this function.
EFI_INVALID_PARAMETER	One or more of these conditions is **TRUE**: • *This* is **NULL**. • *Token* is **NULL**. • *Token.Filename* is **NULL**. • *Token.OptionCount* is not zero and *Token.OptionList* is **NULL**. • One or more options in *Token.OptionList* have wrong format. • *Token.Buffer* and *Token.CheckPacket* are both **NULL**. • *Token.OverrideData.ServerIp* is not a valid unicast IPv6 address and not set to all zero.
EFI_UNSUPPORTED	One or more options in the Token.OptionList are not supported by this implementation.
EFI_NOT_STARTED	The EFI MTFTPv6 Protocol driver has not been started.

continues on next page

Table 30.38 – continued from previous page

EFI_NO_MAPPING	The underlying IPv6 driver was responsible for choosing a source address for this instance, but no source address was available for use.
EFI_ALREADY_STARTED	This *Token* is already being used in another MTFTPv6 session.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated.
EFI_ACCESS_DENIED	The previous operation has not completed yet.
EFI_DEVICE_ERROR	An unexpected network error or system error occurred.

30.4.2.9 EFI_MTFTP6_PROTOCOL.Poll()

Summary

Polls for incoming data packets and processes outgoing data packets.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_POLL) (
  IN EFI_MTFTP6_PROTOCOL    *This
  );
```

Parameters

This

Pointer to the *EFI_MTFTP6_PROTOCOL* instance.

Description

The *Poll()* function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the *Poll()* function more often.

Status Codes Returned

EFI_SUCCESS	Incoming or outgoing data was processed.
EFI_NOT_STARTED	This EFI MTFTPv6 Protocol instance has not been started.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_DEVICE_ERROR	An unexpected system or network error occurred.
EFI_TIMEOUT	Data was dropped out of the transmit and/or receive queue. Consider increasing the polling rate.

CHAPTER

THIRTYONE

EFI REDFISH SERVICE SUPPORT

31.1 EFI Redfish Discover Protocol

31.1.1 Overview

The purpose of the EFI Redfish Discover is to provide a mechanism for EFI Redfish clients to acquire the DMTF Redfish® services provided on the platform or network. See the Redfish Developer Hub at https://redfish.dmtf.org/ for official Redfish schema and specifications. Redfish services can be discovered according to Redfish Host Interface (SMBIOS type 42) reported on platform, or optionally using Simple Service Discovery Protocol (SSDP) message over UDP port 1900 to search Redfish services which were joined well-known multicast group addresses. EFI Redfish Discover driver discovers Redfish services and creates EFI REST EX protocol instance for each Redfish service it found. It also configures EFI REST EX protocol instance according to the Redfish service information described in Redfish Host Interface or the response of UPnP M-SEARCH request (defined in UPnP Device Architecture, which can be obtained at "Links to UEFI-Related Documents" http://uefi.org/uefi).

EFI Redfish Discover Protocol behaves as a middle protocol which abstracts the creation and configuration of EFI REST EX instance from EFI Redfish clients.

- EFI Redfish Discover Protocol uses EFI UDP protocol to send SSDP message to verify or discover Redfish services. For the Redfish service reported by SMBIOS type 42h, EFI Redfish Discover Protocol can optionally unicast M-SEARCH request to Redfish service in order to verify the existence of service.
- EFI Redfish Discover Protocol can optionally provide the functionality of discovering Redfish services through each network interface installed on platform. Prior to acquiring the list of ready-to-use EFI REST EX protocol instances, the consumer of this protocol can get the network interface list and decide which interface is used for the multicast transmission. EFI Redfish Discover Protocol multicasts M-SEARCH request to multicast group addresses then collects M-SEARCH responses from Redfish services in asynchronous or synchronous manner.
- EFI Redfish Discover Protocol provides the information of each network interface installed on platform through GetNetworkInterfaceList()function. The information such as MAC address, subnet ID, subset mask and VLAN ID of network interface could be utilized by upper-layer EFI application or driver to identify network interface used for Redfish service discovery. EFI Redfish Discover Protocol abstracts EFI network stack to user which means this protocol should not require user to configure UDP before utilizing services. Network configuration of network interface such as station IP address, subnet ID, subnet mask and other operational parameters should be configured through system firmware specific implementation (for example system utility). This protocol should simply use UDP default station properties.

Multicast across internetworks is handled by multicast router and is not in the scope of EFI Redfish Discover Protocol. The implementation of upper-layer user interface is system firmware design-specific.

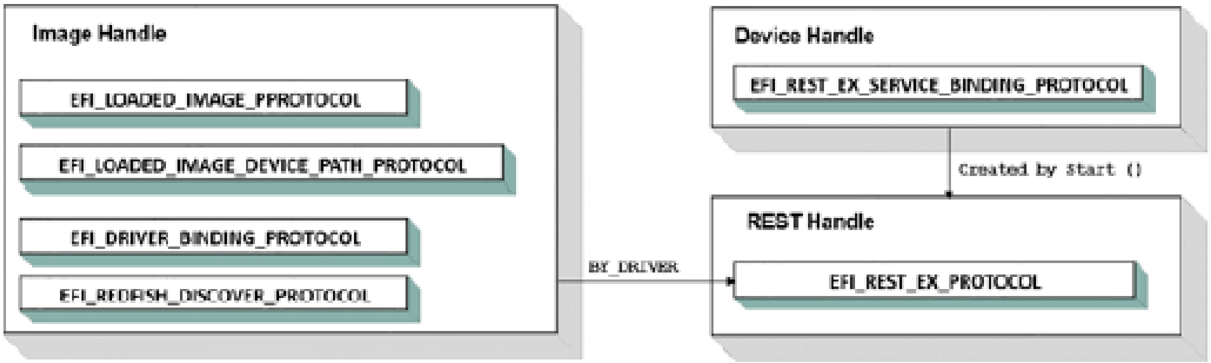
- EFI Redfish Discovery Protocol is the helper driver to discover Redfish services on platform or network. The upper level EFI Redfish client could provide its own implementation of how to utilize information returned from this protocol. Such as network interface selection UI, create Redfish host interface (SMBIOS type 42h) according to Redfish services information, configure system BIOS setting using Redfish service or etc.

31.1.2 EFI Redfish Discover Driver

A Redfish Discover Driver installs the Redfish Discover Protocol and EFI Driver Binding Protocol in its driver entry point.

The Driver Binding Protocol contains three services. These are *Supported()*, *Start()*, and *Stop()*. *Supported()* tests to see if the Redfish Discover Driver can manage a device handle. A Redfish Discover Driver can manage device handle that contain the EFI REST EX Service Binding Protocol, EFI UDP4 Service Binding Protocol or EFI UDP6 Service Binding Protocol, so a Redfish Discover Driver must look for these three protocols on the device handle that is being tested, and return success if any of them is presented.

The *Start()* function tells the Redfish Discover Driver to start managing a device driver. The device handle should support at least one of the service binding protocols checked in *Supported()*.The Redfish Discover Driver should create a child handle for each service binding protocol, and open these children with *BY_DRIVER* attribute.



The *Stop()* function tells the Redfish Discover Driver to stop managing a device driver. The *Stop()* function can destroy one or more of the device handles (or its child handles) that being managed by Redfish Discover Driver. A Redfish Discover Driver should stop the in-process discovery and destroy corresponding child handle which was created in a previous call to *Start()*, or in *AcquireRedfishService()*.

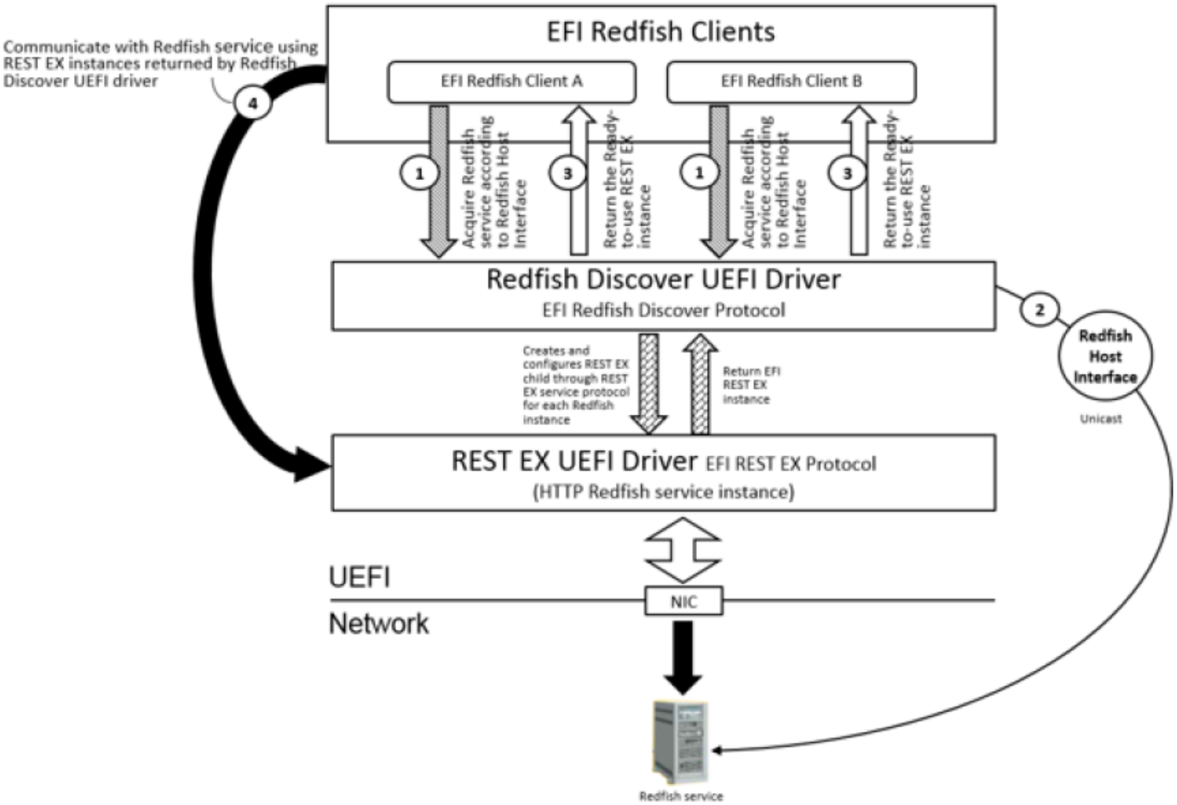
31.1.3 EFI Redfish Discover Client

An EFI Redfish client invokes EFI Redfish Discover Protocol to acquire the ready-to-use EFI REST EX protocol instance.

Below is the conceptual figure of mechanism of EFI Redfish Discover Protocol. The first scenario is unicast M-SEARCH to verify Redfish service reported in SMBIOS type 42h. ..

1. EFI Redfish client invokes EFI Redfish Discover Protocol to acquire ready-to-use EFI REST EX for communicating with Redfish services reported in Redfish Host Interface (SMBIOS type 42h)
2. EFI Redfish Discover Protocol optionally verifies the existence of Redfish service by unicasting M-SEARCH to Redfish service according to the Redfish service information provided in Redfish Host Interface.
3. 3EFI Redfish Discover Protocol creates and configures REST EX instance for Redfish service according to the Redfish service information provided in Redfish Host Interface.
4. EFI Redfish clients communicate with Redfish service using EFI REST EX instance returned from EFI Redfish Discover protocol.

EFI Redfish client passes *EFI_REDFISH_DISCOVERED_TOKEN* and the discovery options to EFI Redfish Discover Protocol. *EFI_EVENT* is created by EFI Redfish client for retrieving *EFI_REDFISH_DISCOVERED_LIST* once EFI Redfish Discover Protocol optionally verifies Redfish service reported by Redfish Host Interface. EFI Redfish client

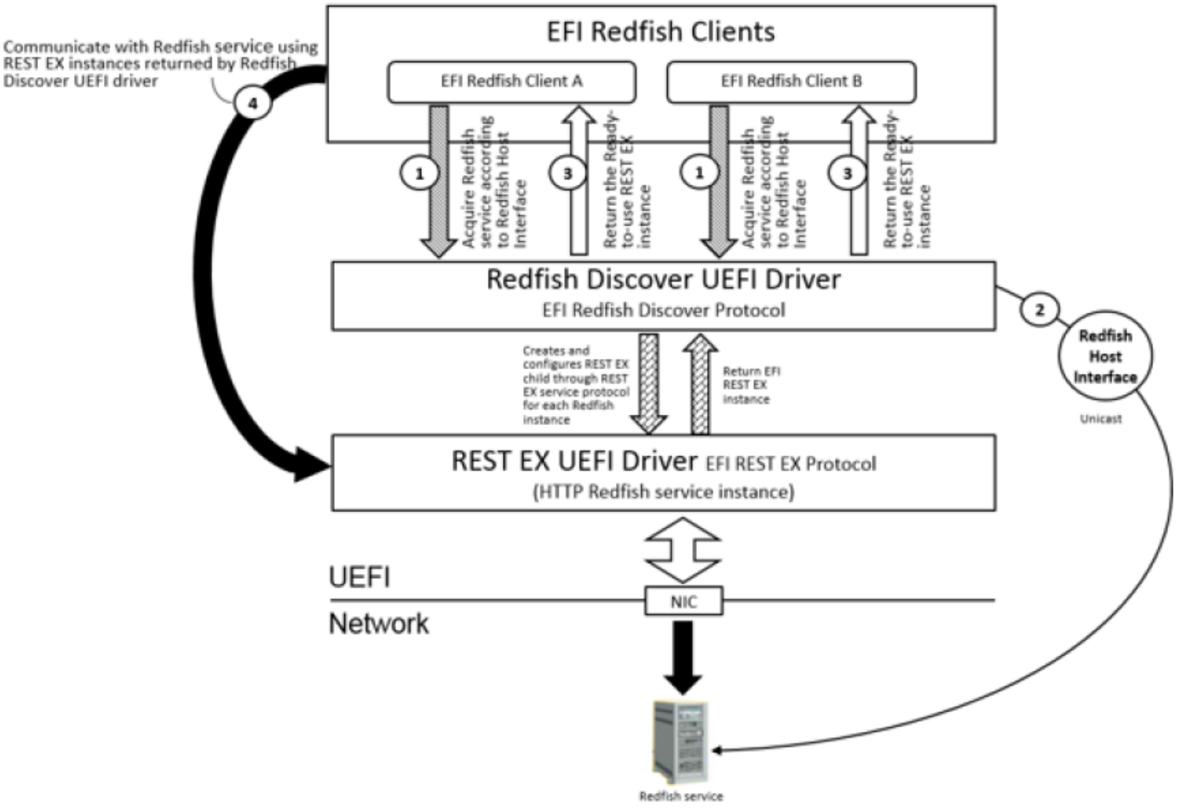


can listen to the notification of verified Redfish service in asynchronous or synchronous according to the setting of options indicated in *EFI_REDFISH_DISCOVER_FLAG*.

The second scenario is optionally provided by EFI Redfish Discover Protocol, which is multicast M-SEARCH to discover Redfish services.

1. EFI Redfish client gets the list of network interfaces if it would like to discover Redfish services on the certain network.
2. EFI Redfish client invokes EFI Redfish Discover Protocol to acquire ready-to-use EFI REST EX for communicating with Redfish services.
3. EFI Redfish Discover Protocol discovers Redfish services through SSDP over UDP.
4. EFI Redfish clients communicate with Redfish service using EFI REST EX instance returned from EFI Redfish Discover protocol.

EFI Redfish client passes *EFI_REDFISH_DISCOVERED_TOKEN* and the discovery options to EFI Redfish Discover Protocol. *EFI_EVENT* is created by EFI Redfish client for retrieving *EFI_REDFISH_DISCOVERED_LIST* when any time EFI Redfish Discover Protocol discovers new Redfish service. EFI Redfish client can listen to the notification of new found Redfish service in asynchronous or synchronous according to the setting of options indicated in *EFI_REDFISH_DISCOVER_FLAG*. Setting *Timeout* to zero in *EFI_REDFISH_DISCOVERED_TOKEN* to waiting for the new discovered Redfish service in synchronously, otherwise asynchronous notification happens when new Redfish service is discovered by EFI Redfish Discover Protocol.



31.1.4 EFI Redfish Discover Protocol

Summary

This protocol is utilized by EFI Redfish clients to acquire the list of Redfish services provided on platform or network.

Protocol GUID

```
#define EFI_REDFISH_DISCOVER_PROTOCOL_GUID \
  {0x5db12509, 0x4550, 0x4347,
  {0x96, 0xb3, 0x73, 0xc0, 0xff, 0x6e, 0x86, 0x9f}}
```

Protocol Interface Structure

```
typedef struct _EFI_REDFISH_DISCOVER_PROTOCOL {
  EFI_REDFISH_DISCOVER_NETWORK_LIST              GetNetworkInterfaceList;
  EFI_REDFISH_DISCOVER_ACQUIRE_SERVICE           AcquireRedfishService;
  EFI_REDFISH_DISCOVER_ABORT_ACQUIRE             AbortAcquireRedfishService;
  EFI_REDFISH_DISCOVER_RELEASE_SERVICE           ReleaseRedfishService;
}   EFI_REDFISH_DISCOVER_PROTOCOL;
```

Parameters

GetNetworkInterfaceList
Get the list of network interfaces on which Redfish services could be discovered.

AcquireRedfishService
Acquire the list of Redfish services.

AbortAcquireRedfishService
Abort Redfish services acquire process.

ReleaseRedfishService
Release Redfish services acquired from AcquireRedfishService().

Description

EFI Redfish Discover Protocol provides a mechanism for EFI Redfish clients to acquire the Redfish services provided on the platform or network as described before.

31.1.4.1 EFI_REDFISH_DISCOVER_PROTOCOL.GetNetworkInterfaceList()

Summary

Get the currently available list of network interfaces on which Redfish services could be discovered.

Protocol Interface

```
typedef
EFI_STATUS
(EFIAPI *EFI_REDFISH_DISCOVER_NETWORK_LIST)(
  IN EFI_REDFISH_DISCOVER_PROTOCOL              *This,
  IN EFI_HANDLE                                 ImageHandle,
  OUT UINTN                                     *NumberOfNetworkInterfaces,
  OUT EFI_REDFISH_DISCOVER_NETWORK_INTERFACE    **NetworkInterfaces
);
```

Parameters

This
This is the *EFI_REDFISH_DISCOVER_PROTOCOL* instance.

ImageHandle
EFI image to get network list. The image handle is caller's image handle.

NumberOfNetworkInterfaces
Number of network interfaces in NetworkInterfaces.

NetworkInterfaces
It's an array of instances. The number of entries in NetworkInterfaces is indicated by NumberOfNetworkInterfaces. Caller has to release the memory allocated by Redfish discover protocol with a call to EFI_BOOT_SERVICES.FreePool().

Description

This function is used to get the list of network interfaces which can be used to send SSDP message over UDP protocol for the Redfish services discovery. The entry in NetworkInterfaces could be used as the parameter to *EFI_REDFISH_DISCOVER_PROTOCOL*.AcquireRedfishService function for discovering Redfish service on specific network interface.

Related Description

```
//**********************************************************
// EFI_REDFISH_DISCOVER_NETWORK_INTERFACE
//**********************************************************
typedef struct {
  EFI_MAC_ADDRESS                MacAddress;
  BOOLEAN                        IsIpv6;
```

(continues on next page)

(continued from previous page)

```
  EFI_IP_ADDRESS                SubnetId;
  UINT8                         SubnetPrefixLength;
  UINT16                        VlanId;
} EFI_REDFISH_DISCOVER_NETWORK_INTERFACE;
```

Parameters

MacAddress

MAC address of this network interface.

IsIpv6

If TRUE, indicates the network interface is running IPv6. Otherwise the network interface is running IPv4.

SubnetId

Subnet of this network.

SubnetPrefixLength

Subnet prefix-length for IPv4 and IPv6.

VlanId

VLAN ID of this network interface.

Status Codes Returned

EFI_SUCCESS	Network interface is returned in *NetworkInterfaces* and the number of network interfaces is returned in *NumbermOfNetworkInterfaces* successfully.
EFI_INVALID_PARAMETER	One of below parameters is NULL. *ImageHandle*, *NumberOfNetworkInterfaces*, and *NetworkInterfaces*
EFI_UNSUPPORTED	Unable to return network interface list.
EFI_NOT_FOUND	No network interfaces are found.
EFI_OUT_OF_RESOURCE	Not enough resources to return network interfaces to caller.

31.1.4.2 EFI_REDFISH_DISCOVER_PROTOCOL.AcquireRedfishService()

Summary

This function acquires the list of discovered Redfish services.

Protocol Interface

```
typedef
EFI_STATUS
  (EFIAPI *EFI_REDFISH_DISCOVER_ACQUIRE_SERVICE)(
    IN EFI_REDFISH_DISCOVER_PROTOCOL              *This,
    IN EFI_HANDLE                                 ImageHandle,
    IN EFI_REDFISH_DISCOVER_NETWORK_INTERFACE     *TargetNetworkInterface OPTIONAL,
    IN EFI_REDFISH_DISCOVER_FLAG                  Flags,
    IN EFI_REDFISH_DISCOVERED_TOKEN               *Token
);
```

Parameters

This

This is the *EFI_REDFISH_DISCOVER_PROTOCOL* instance.

ImageHandle

EFI image acquires Redfish service discovery. The image handle is caller's image handle.

TargetNetworkInterface

The target Network Interface which is used to discover Redfish services. Set to NULL to discover Redfish services on all network interfaces.

Flags

Options of Redfish service discovery.

Token

EFI_REDFISH_DISCOVERED_TOKEN instance. The memory of *EFI_REDFISH_DISCOVERED_LIST* and the strings in *EFI_REDFISH_DISCOVERED_INFORMATION* are all allocated by *AcquireRedfishService()* and must be freed when caller invokes *ReleaseRedfishService()*.

Description

This function is used to acquire the list of Redfish services which are discovered according to Redfish Host Interface or through SSDP over UDP. Redfish services discovery through SSDP over UDP could be achieved via network interface specified in TargetNetworkInterface or via all network interfaces if TargetNetworkInterface is specified as NULL. *EFI_REDFISH_DISCOVERED_LIST* is returned to EFI Redfish client by signaling the EFI event created by client. Each of EFI handle in *EFI_REDFISH_DISCOVERED_LIST* has the corresponding EFI REST EX instance installed on it. Each REST EX instance is a child instance which is created through EFI REST EX service binding protocol and used by EFI Redfish client for communicating with specific Redfish service. In AcquireRedfishService(), UDP child is created and opened to do SSDP discovery. This UDP child will be destroyed right away after the discovery is done. AcquireRedfishService()also creates and opens REST EX child to configures REST EX instance according to Redfish service information retuned in M-SEARCH response or Redfish Host Interface. REST EX child must be closed after REST EX child is configured. EFI Redfish client must open REST EX instance from RedfishRestExHandle returned in *EFI_REDFISH_DISCOVERED_INFORMATION* and close REST EX instance once EFI Redfish client is no longer communicating with Redfish service.

Related Description

```
//*******************************************************
// EFI_REDFISH_DISCOVER_FLAG
//*******************************************************

#define EFI_REDFISH_DISCOVER_HOST_INTERFACE       0x00000001
#define EFI_REDFISH_DISCOVER_SSDP                 0x00000002
#define EFI_REDFISH_DISCOVER_SSDP_UDP6            0x00000004
#define EFI_REDFISH_DISCOVER_KEEP_ALIVE           0x00000008
#define EFI_REDFISH_DISCOVER_RENEW                0x00000010
#define EFI_REDFISH_DISCOVER_VALIDATION           0x80000000
#define EFI_REDFISH_DISCOVER_DURATION_MASK        0x0f000000
```

EFI_REDFISH_DISCOVER_FLAG is used to indicate the options when EFI Redfish clients acquire Redfish discover list through this protocol. Redfish Discover Protocol discovers Redfish service according to Redfish Host Interface when *EFI_REDFISH_DISCOVER_HOST_INTERFACE* is set to *TRUE*. Redfish Discover Protocol also optionally discovers Redfish services using SSDP UPnP M-SEARCH request through UDP Port 1900. Redfish Discover Protocol returns *EFI_INVALID_PARAMETER* if none of *EFI_REDFISH_DISCOVER_HOST_INTERFACE* and *EFI_REDFISH_DISCOVER_SSDP* is set to *TRUE*. Set *EFI_REDFISH_DISCOVER_SSDP_UDP6* to indicate using IPv6 as internet protocol. For the Redfish service discovery according to Redfish Host Interface, Redfish service information like IP address is descripted in Redfish Host Interface. EFI Redfish client can set

EFI_REDFISH_DISCOVER_VALIDATION to *TRUE* to ask Redfish Discover Protocol to validate this Redfish service using IP address described in Redfish Host Interface. Redfish Discover Protocol unicasts UPnP M-SEARCH request to the target Redfish service and verify the response message to determine if the target Redfish service is existing or not. *EFI_REDFISH_DISCOVER_VALIDATION* doesn't affect the SSDP discovery. For Redfish SSDP discovery, the responses of the multicast UPnP M-SEARCH request imply the valid Redfish services are existing.

According to UPnP device architecture, the maximum waiting time of the response to UPnP M-SEARCH request is indicated in MX message header. The value is greater or equal to 1 to less than 5 inclusive in second. In order to give the chance to those Redfish services which do not respond to M-SEARCH in time, set *EFI_REDFISH_DISCOVER_KEEP_ALIVE* to *TRUE* to tell Redfish Discover Protocol keeps to sending multicast M-SEARCH request. The duration of periodical multicast request is declared in *EFI_REDFISH_DISCOVER_DURATION_MASK*. The value indicated in *EFI_REDFISH_DISCOVER_DURATION_MASK* means 2 to the power of duration. The valid value of duration is greater or equal to 3 and less or equal to 15. The corresponding duration is 8 to 2^15 seconds. Minimum duration is set to 8 seconds in order to keep the duration out of scope of MX value defined in UPnP device architecture. Duration is only valid when *EFI_REDFISH_DISCOVER_KEEP_ALIVE* is set to *TRUE* and *EFI_REDFISH_DISCOVER_SSDP* is set to *TRUE*.

Redfish Discover Protocol maintains an internal database of Redfish services it found. It also maintains the EFI image which owns the EFI REST EX instance of discovered Redfish services. Redfish Discover Protocol only signals EFI Redfish client with new found of Redfish services instead of notifying EFI Redfish client the duplicate Redfish services found earlier, unless *EFI_REDFISH_DISCOVER_RENEW* is set to TRUE. Set *EFI_REDFISH_DISCOVER_RENEW* to *TRUE* forces Redfish Discover Protocol to notify EFI Redfish clients all found Redfish services, even the Redfish service which was already discovered and notified previously.

```
//*******************************************************
// EFI_REDFISH_DISCOVERED_TOKEN
//*******************************************************
#define REDFISH_DISCOVER_TOKEN_SIGNATURE SIGNATURE_32 ('R', 'F', 'T', 'S')
typedef struct {
  UINT32                        Signature
  EFI_REDFISH_DISCOVERED_LIST   DiscoveredList;
  EFI_EVENT                     Event;
  UINTN                         Timeout;
}   EFI_REDFISH_DISCOVERED_TOKEN;
```

Description

EFI_REDFISH_DISCOVERED_TOKEN is created by EFI Redfish client and passed to *AcquireRedfishService()*.

Parameters

Signature
The token signature should be the value of REDFISH_DISCOVER_TOKEN_SIGNATURE defined above.

DiscoveredList
Structure of *EFI_REDFISH_DISCOVERED_LIST* to retrieve the discovered Redfish services.

Event
EFI event at the *TPL_CALLBACK* level created by EFI Redfish client, which is used to be notified when Redfish services are discovered or any errors occurred during discovery.

Timeout
The timeout value declared in *EFI_REDFISH_DISCOVERED_TOKEN* determines the seconds to drop discovery process. Basically, the nearby Redfish services must give the response in >=1 and <= 5 seconds. The valid timeout value used for the asynchronous discovery is >= 1 and <= 5 seconds. Set the timeout to zero means to discover Redfish service synchronously.

```
//*******************************************************
// EFI_REDFISH_DISCOVERED_LIST
//*******************************************************
typedef struct {
  UINTN                               NumberOfServiceFound;
  EFI_REDFISH_DISCOVERED_INSTANCE     *RedfishInstances;
}   EFI_REDFISH_DISCOVERED_LIST;
```

Description

The content of *EFI_REDFISH_DISCOVERED_LIST* is filled by *AcquireRedfishService()* before signaling Event. *NumberOfServiceFound* must be set to 0 and RedfishInstances must be NULL when client invokes *AcquireRedfishService()*. The memory block for *RedfishInstances* is allocated by the EFI Redfish Discover Protocol,and will be freed by the EFI Redfish Discover Protocol as well in *ReleaseRedfishService()*.

Parameters

NumberOfServiceFound
Number of Redfish services are discovered.

RedfishInstances
Pointer to *EFI_REDFISH_DISCOVERED_INSTANCE*, number of Redfish services are discovered is indicated in NumberOfServiceFound.

```
//*******************************************************
// EFI_REDFISH_DISCOVERED_INSTANCE
//*******************************************************
typedef struct {
  EFI_STATUS                             Status;
  EFI_REDFISH_DISCOVERED_INFORMATION     Information;
}   EFI_REDFISH_DISCOVERED_INSTANCE;
```

Description

This structure describes the status and the information of discovered Redfish service.

Parameters

Status
EFI status code of Redfish service discovery.

Information
The information of Redfish service discovered. The information is only valid when Status is EFI_SUCCESS. Refer to below description of *EFI_REDFISH_DISCOVERED_INSTANCE*.

```
//*******************************************************
// EFI_REDFISH_DISCOVERED_INFORMATION
//*******************************************************
typedef struct {
  EFI_HANDLE                 RedfishRestExHandle;
  BOOLEAN                    IsIPv6;
  EFI_IP_ADDRESS             RedfishHostIpAddress;
  UINT16                     RedfishVersion;
  CHAR16                     *Location;
  CHAR16                     *Uuid;
  CHAR16                     *Os;
  CHAR16                     *OsVersion;
```

(continues on next page)

(continued from previous page)

```
  CHAR16                      *Product;
  CHAR16                      *ProductVersion;
  BOOLEAN                     UseHttps;
}   EFI_REDFISH_DISCOVERED_INFORMATION;
```

Description

This structure describes each Redfish service information. The corresponding EFI REST EX protocol instance is also created and configured by EFI Redfish Discover Protocol for EFI Redfish client. The memory allocated for the information in this structure will be freed by EFI Redfish Discover Protocol in *ReleaseRedfishService()*.

Parameters

RedfishRestExHandle
EFI handle which has EFI REST EX protocol instance installed on it. The EFI REST EX protocol instance is already configured by EFI Redfish Discover Protocol through *EFI_REST_EX_PROTOCOL .Configure()* according to the Redfish host information discovered through Redfish Host Interface or SSDP.

IsIPv6
Indicates the Redfish service is reached via IPv6 protocol.

RedfishHostIpAddress
Redfish service host IP address.

RedfishVersion
Redfish service version. The high byte of RedfishVersion is the major Redfish service version, low byte is the minor Redfish version. For example 0x100 is Redfish service. Redfish service version is acquired from “ST” header in the response of M-SEARCH request.

Location
Redfish service host location, this information is acquired from “Server” header returned in the response of M-SEARCH request.

Uuid
The UUID of Redfish service, this information is acquired from “USN” header defined in UPnP Device Architecture specification.

Os
The OS provides Redfish service, this information is acquired from “Server” header returned in the response of M-SEARCH request. Below is the response in “Server” header defined in UPnP Device Architecture specification. SERVER:OS/version UPnP/1.1 product/version *OsVersion* Redfish service OS version, this information is acquired from “Server” header returned in the response of M-SEARCH request. Below is the response in “Server” header defined in UPnP Device Architecture specification. SERVER:OS/version UPnP/1.1 product/version

Product
Product name, this information is extracted from “Server” header returned in the response of M-SEARCH request. Below is the response in “Server” header defined in UPnP Architecture Device specification. SERVER:OS/version UPnP/1.1 product/version

ProductVersion
Product version, this information is acquired from “Server” header returned in the response of M-SEARCH request. Below is the response in “Server” header defined in UPnP Device Architecture specification. | SERVER:OS/version UPnP/1.1 product/version *UseHttps* Indicates the Redfish service is reached via HTTPS protocol.

Status Codes Returned

EFI_SUCCESS	Acquire for Redfish service list is successful.
EFI_INVALID_PARAMATER	One or more of the following is TRUE: *This* is **NULL**. *ImageHandle* is **NULL**. *Flags* is 0 or the improper bit combination of option is set in Flag. *Token* is **NULL**. *Token->Timeout* is greater than 5 seconds. *Token->Event* is **NULL**. On input, • *Token->DiscoveredList.NumberOfServiceFound* is not 0, or • *Token-> DiscoveredList->RedfishInstances* is not **NULL**.
Others	Fail to acquire the list of Redfish service.

31.1.4.3 EFI_REDFISH_DISCOVER_PROTOCOL.AbortAcquireRedfishService()

Summary

This function aborts Redfish service discovery on the given network interface.

Protocol Interface

```
typedef
EFI_STATUS
(EFIAPI *EFI_REDFISH_DISCOVER_ABORT_ACQUIRE)(
  IN EFI_REDFISH_DISCOVER_PROTOCOL              *This,
  IN *EFI_REDFISH_DISCOVER_NETWORK_INTERFACE    *TargetNetworkInterface OPTIONAL
);
```

Parameters

This

This is the *EFI_REDFISH_DISCOVER_PROTOCOL* instance.

TargetNetworkInterface

The target Network Interface on which Redfish services discovery is in process. NULL to abort Redfish service discovery on all network interfaces.

Description

In *AbortAcquireRedfishService()*, to abort the in-process Redfish service, discovery is required for preventing unexpected behaviors from happening. This function has to cancel in-process SSDP, the unicast over Udp4/Udp6, close Udp4/Udp6 protocol and destroy the Udp4/Udp6 child. Also closes REST EX opened for configuring REST EX child instance.

Status Codes Returned

EFI_SUCCESS	Redfish service discovery is aborted.
EFI_INVALID_PARAMETER	One or more of the following is **TRUE**: - *This* is **NULL**.

31.1.4.4 EFI_REDFISH_DISCOVER_PROTOCOL.ReleaseRedfishService()

Summary

This function releases the list of Redfish services discovered previously.

Protocol Interface

```
typedef
EFI_STATUS
(EFIAPI *EFI_REDFISH_DISCOVER_RELEASE_SERVICE)(
  IN    EFI_REDFISH_DISCOVER_PROTOCOL        *This,
  IN    EFI_REDFISH_DISCOVERED_LIST          *List
);
```

Parameters

This

This is the *EFI_REDFISH_DISCOVER_PROTOCOL* instance.

List

The pointer to *EFI_REDFISH_DISCOVERED_LIST* which lists the Redfish services to release.

Description

The Redfish services which listed in List will be released in *ReleaseRedfishService()*. All memory blocks which were allocated for Redfish service information will be freed in this function. EFI REST EX protocol instance which was created in *AcquireRedfishService()* will be also destroyed in *ReleaseRedfishService()*. The Redfish service listed in **List* is not required to be identical or in the same order with *EFI_REDFISH_DISCOVERED_LIST* retuned from *AcquireRedfishService()*. List is flexible to list any Redfish services which were discovered by *AcquireRedfishService()* earlier. In ReleaseRedfishService(), free the resource allocated for the discovered Redfish service indicated in *EFI_REDFISH_DISCOVERED_LIST*.

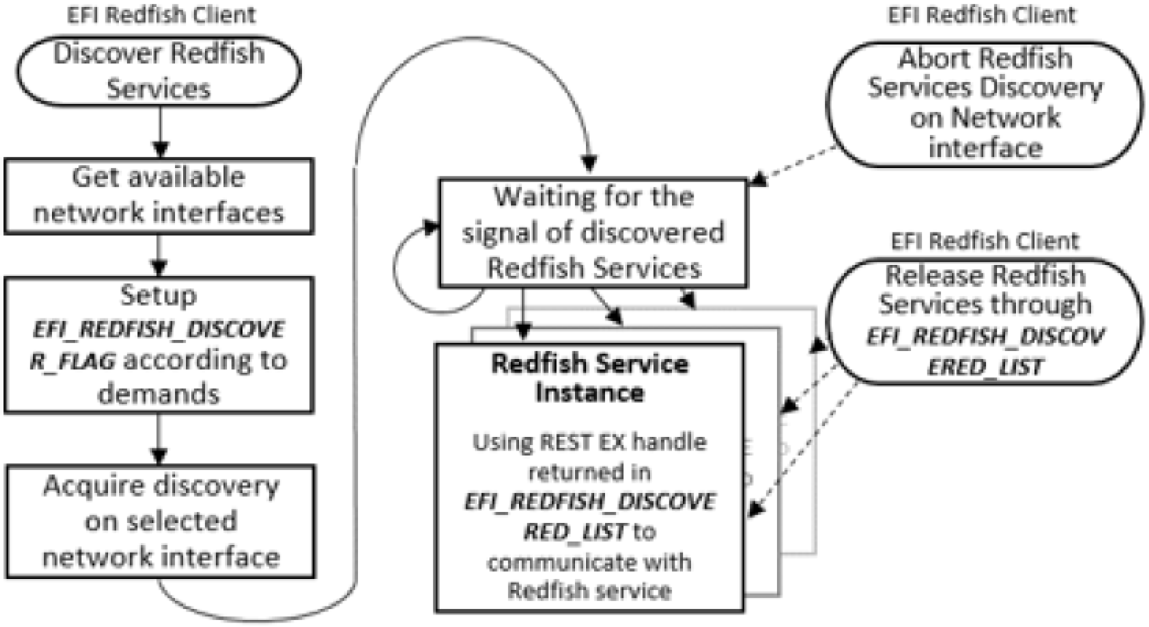
Status Codes Returned

EFI_SUCCESS	The Redfish services listed in **List* are released successfully.
EFI_INVALID_PARAMETER	One or more of the following is **TRUE**: - *This* is **NULL**. - *List* is **NULL**. - Invalid settings in *List.

31.1.5 Implementation Examples

31.1.5.1 Processes to Discover Redfish Services

The following flowchart delineates the EFI Redfish client processes of utilizing EFI Discover Protocol to discover Redfish service, abort discovery and release discovered Redfish service instance.



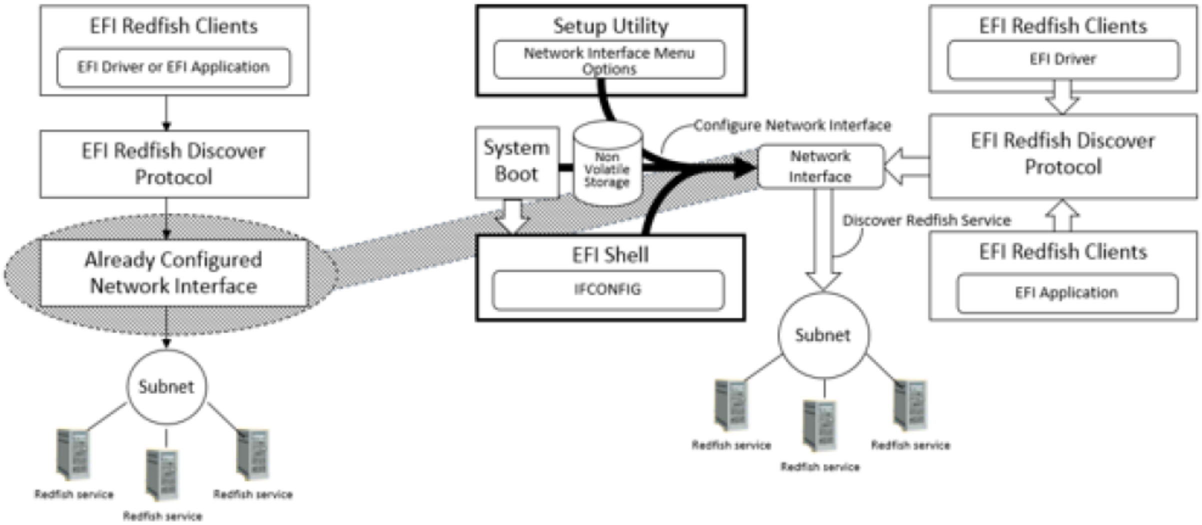
31.1.5.2 Network Interface Configuration

The EFI Redfish Discover Protocol provides a Redfish service discovery function to discover Redfish service through SMBIOS type 42 or optionally discover Redfish service on specific network interface. EFI Redfish Clients (EFI driver or EFI Application) can utilize the discover function to acquire Redfish service and manipulate Redfish properties to manage a system. For example, applying BIOS settings on the systems managed by Redfish Service. The system could be the one that runs EFI Redfish Client, or other systems on the network. If Redfish service is discovered according to SMBIOS type 42, then the platform developer has to create an SMBIOS type 42 entry with host (station) and Redfish Service information (Refer to DSP0270, Redfish Host Interface Specification). Besides discovering Redfish service using SMBIOS type 42, Redfish services can be also discovered by using SSDP over UDP. However, the network interface must be configured using either DHCP or static configuration prior to discovery of Redfish services. If the network interface is configured statically, then at least the IP address and Subnet mask must be configured for the station. The VLAN ID and new route entry may need to be configured depending on the networking environment if necessary.

Below is the implementation example for configuring network interface. Network interface could be configured in platform-implementation method. For example, platform developer can provide HII network options in BIOS setup utility. Network interface could be configured in statically or dynamically (DHCP) manner and the configuration could be stored in EFI variables or any platform non-volatile storage which may consumed by network stacks when each time system boot. This makes sure certain network interface is configured properly before EFI Redfish Clients utilizing EFI Redfish Discover Protocol.

The alternative of configuring network stack is system boots to EFI Shell and execute ifconfig shell command. This configures the settings of certain network interfaces. After this, network interface is ready to process Redfish service discovery by EFI Redfish Clients. However, this method requires user to configure network interface when each time system boot to EFI shell, unless other implementations of ifconfig EFI shell command is provided.

Once EFI Redfish Client is launched, it gets network interface information using EFI Redfish Discover protocol. EFI Redfish Client may provide selection UI of network interfaces for Redfish service discovery. EFI Redfish Client could manipulate Redfish properties such as BIOS Attributes on the discovered Redfish services for system management or deployment. EFI Redfish Client can also optionally maintain the information, location and other properties of discovered Redfish services in non-volatile storage for next system boots afterward.



31.2 EFI Redfish JSON Structure Converter

31.2.1 The Guidance of Writing EFI Redfish JSONStructure Converter

To provide interoperability between the Redfish service and the EFI environment, EFI Redfish JSON structure converters for each Redfish schema namespace should be implemented for EFI Redfish clients. This recommendation of writing EFI Redfish JSON structure converters is necessary to unify the implementation and capability of the converters.

- One converter supports one Redfish schema resource type; write the converter based on Redfish resource type. Using Redfish schema as an example:

  — AccountService.v1_0_0.json: RedfishAccountService_V1_0_0_Dxe driver

  — AttributeRegistry.v1_2_0.json: RedfishAttributeRegistry_V1_2_0_Dxe driver

  — EthernetInterface.v1_4_0.json : EthernetInterface_V1_4_0_Dxe driver

- Redfish JSON structure converter can be delivered in source code package or binary (library or EFI driver) format.
- A C header file must be released with the Redfish JSON structure converter package. The package could be provisioned to conform to any EFI implementation, such as EFI EDKII open source.
- Provide documents which can describe the usage of structure members defined in REST JSON structure.
- The documentation can be published with a source code package, binary package, web site, online help, etc.
- Write the converter as an EFI DXE driver, and utilize *EFI_REST_JSON_STRUCTURE_PROTOCOL* to register the converter to provide the corresponding *EFI_REST_JSON_STRUCTURE_PROTOCOL* functions:

— *ToStructure()*

— *ToJson()*

— *DestoryStructure()*

- FI_REST_JSON_RESOURCE_TYPE_IDENTIFIER

Namespace

ResourceTypeName:
String to Redfish schema resource type.

MajorVersion:
String to Redfish schema major version, NULL string for non version controlled schema.

MinorVersion:
String to Redfish schema minor version, NULL string for non version controlled schema.

ErrataVersion:
String to Redfish schema errata version, NULL string for non version controlled schema. Datatype

Datatype

String to data type defined in Redfish schema

Examples

AccountService.v1_0_0.json

Namespace

ResourceTypeName: “AccountService” MajorVersion:”1” MinorVersion:”0” ErrataVErsion:”0”

Datatype: “AccountService”

Namespace

ResourceTypeName: “ComputerSystemCollection” MajorVersion:NULL MinorVersion:NULL ErrataVErsion:NULL

Datatype: “ComputerSystemCollection”

- Determine Redfish resource type according to the given JsonRsrcIdentifier. If the given JsonRsrcIdentifier is non-NULL, the Redfish resource structure converter must convert the JSON resource to the Redfish JSON structure according to the resource type and revision specified in JsonRsrcIdentifier. The converter should not refer to the resource type and revision according to Redfish namespace and datatype indicated in “odata.type” in JSON text resource. This prevents from the returned structure format is different with what consumer expects.
- Automatically determine the Redfish resource type. If the given JsonRsrcIdentifier is NULL, the EFI Redfish JSON structure converter should check the namespace and datatype indicated in “odata.type” in the JSON text resource. Parse this identifier property to retrieve the corresponding Redfish schema name space and data type, then decode the JSON text resource into the corresponding structure. EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER in JsonStructure returned to consumer should be filled with the correct Redfish schema resource type information following the guidance mentioned above.
- All structure members for Redfish schema must be declared as C pointers. With this, the converter consumer can get the partial Redfish JSON properties from the converter. The consumer just initializes certain structure members, and the converter producer only converts non-NULL pointers in the given structure into corresponding Redfish JSON properties in text format.

31.2.2 The Guidance of Using EFI Redfish JSON Structure Converter

The consumer of EFI Redfish JSON structure converter utilizes EFI_REST_JSON_STRUCTURE_PROTOCOL for converting Redfish JSON resource to Redfish JSON structure and vice versa.

Refer to the converter document to include the C header file of the Redfish JSON structure converter into the build process. For example, include the converter's EDKII package into an EFI module INF file for the C header file reference, or follow the build rule of other EFI implementations.

There are two ways for a consumer to convert JSON resources using the EFI_REST_JSON_STRUCTURE_PROTOCOL:

- Setup the crorect Redfish namespace and datatype in EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER. This makes sure the EFI REST JSON Structure Protocol uses the exact converter that the consumer prefers for the conversion. In this case, the Redfish namespace and datatype indicated in "odata.type" in the EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER is set to NULL. This means the converter may recognize the Redfish namespace and datatype indicated in "odata.type" in the JSON text resource, and converts it to the C structure it supports. In this case, the consumer has to be careful when using a C structure pointer to refer to the Redfish JSON structure.
- EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER set to NULL means the returned structure format may not be in the same form as the consumer's expectation. The consumer then has to check the EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER for the Redfish namespace and datatype, and use the correct prototype for structure reference.

CHAPTER

THIRTYTWO

SECURE BOOT AND DRIVER SIGNING

32.1 Secure Boot

This protocol is intended to provide access for generic authentication information associated with specific device paths. The authentication information is configurable using the defined interfaces. Successive configuration of the authentication information will overwrite the previously configured information. Once overwritten, the previous authentication information will not be retrievable.

32.1.1 EFI_AUTHENTICATION_INFO_PROTOCOL

Summary

This protocol is used on any device handle to obtain authentication information associated with the physical or logical device.

GUID

```
#define EFI_AUTHENTICATION_INFO_PROTOCOL_GUID \
{0x7671d9d0,0x53db,0x4173,\
{0xaa,0x69,0x23,0x27,0xf2,0x1f,0x0b,0xc7}}
```

Protocol Interface Structure

```
typedef struct _EFI_AUTHENTICATION_INFO_PROTOCOL {
  EFI_AUTHENTICATION_INFO_PROTOCOL_GET            Get;
  EFI_AUTHENTICATION_INFO_PROTOCOL_SET            Set;
}   EFI_AUTHENTICATION_INFO_PROTOCOL;
```

Parameters

Get()
Used to retrieve the Authentication Information associated with the controller handle

Set()
Used to set the Authentication information associated with the controller handle

Description

The *EFI_AUTHENTICATION_INFO_PROTOCOL* provides the ability to get and set the authentication information associated with the controller handle.

32.1.2 EFI_AUTHENTICATION_INFO_PROTOCOL.Get()

Summary

Retrieves the Authentication information associated with a particular controller handle.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_AUTHENTICATION_INFO_PROTOCOL_GET) (
  IN EFI_AUTHENTICATION_INFO_PROTOCOL       *This,
  IN EFI_HANDLE                             ControllerHandle,
  OUT VOID                                  **Buffer
  );
```

Parameters

This

Pointer to the *EFI_AUTHENTICATION_INFO_PROTOCOL*

ControllerHandle

Handle to the Controller

Buffer

Pointer to the authentication information. This function is responsible for allocating the buffer and it is the caller's responsibility to free buffer when the caller is finished with buffer.

Description

This function retrieves the Authentication Node for a given controller handle.

Status Codes Returned

EFI_SUCCESS	Successfully retrieved Authentication information for the given *ControllerHandle*
EFI_INVALID_PARAMETER	No matching Authentication information found for the given *ControllerHandle*
EFI_DEVICE_ERROR	The authentication information could not be retrieved due to a hardware error.

32.1.3 EFI_AUTHENTICATION_INFO_PROTOCOL.Set()

Summary

Set the Authentication information for a given controller handle.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_AUTHENTICATION_INFO_PROTOCOL_SET) (
IN EFI_AUTHENTICATION_INFO_PROTOCOL **This,
IN EFI_HANDLE *ControllerHandle
IN VOID **Buffer
);
```

Parameters

This

Pointer to the *EFI_AUTHENTICATION_INFO_PROTOCOL*

ControllerHandle

Handle to the controller.

Buffer

Pointer to the authentication information.

Description

This function sets the authentication information for a given controller handle. If the authentication node exists corresponding to the given controller handle this function overwrites the previously present authentication information.

Status Codes Returned

EFI_SUCCESS	Successfully set the Authentication node information for the given *ControllerHandle*.
EFI_UNSUPPORTED	If the platform policies do not allow setting of the Authentication information.
EFI_DEVICE_ERROR	The authentication node information could not be configured due to a hardware error.
EFI_OUT_OF_RESOURCES	Not enough storage is available to hold the data.

32.1.4 Authentication Nodes

The authentication node is associated with specific controller paths. There can be various types of authentication nodes, each describing a particular authentication method and associated properties.

32.1.5 Generic Authentication Node Structures

An authentication node is a variable length binary structure that is made up of variable length authentication information. The Table below defines the generic structure. The Authentication type GUID defines the corresponding authentication node.

Table 32.2: Generic Authentication Node Structure

Mnemonic	Byte Offset	Byte Length	Description
Type GUID	0	16	Authentication Type GUID
Length	16	2	Length of this structure in bytes.
Specific Authentication Data	18	n	Specific Authentication Data. Type defines the authentication method and associated type of data. Size of the data is included in the length.

All Authentication Nodes are byte-packed data structures that may appear on any byte boundary. All code references to Authentication Nodes must assume all fields are UNALIGNED. Since every Authentication Node contains a length field in a known place, it is possible to traverse Authentication Node of unknown type.

32.1.6 CHAP (using RADIUS) Authentication Node

This Authentication Node type defines the CHAP authentication using RADIUS information.

GUID

```
#define EFI_AUTHENTICATION_CHAP_RADIUS_GUID \
{0xd6062b50,0x15ca,0x11da,\
{0x92,0x19,0x00,0x10,0x83,0xff,0xca,0x4d}}
```

Node Definition

Table 32.3: CHAP Authentication Node Structure using RADIUS

Mnemonic	Byte Offset	Byte Length	Description
Type	0	16	EFI_A UTHENTICATION_C HAP_RADIUS_GUID
Length	16	2	Length of this structure in bytes. Total length is 58+P+Q+R+S+T
RADIUS IP Address	18	16	Radius IPv4 or IPv6 Address
Reserved	34	2	Reserved
NAS IP Address	36	16	NAS IPv4 or IPv6 Address

32.2 UEFI Driver Signing Overview

This section describes a means of generating a digital signature for a UEFI executable, embedding that digital signature within the UEFI executable and verifying that the digital signature is from an authorized source. The UEFI specification provides a standard format for executables. These executables may be located on un-secured media (such as a hard drive or unprotected flash device) or may be delivered via a un-secured transport layer (such as a network) or originate from a un-secured port (such as ExpressCard device or USB device). In each of these cases, the system provider may decide to authenticate either the origin of the executable or its integrity (i.e., it has not been tampered with). This section describes a means of doing so.

32.2.1 Digital Signatures

As a rule, digital signatures require two pieces: the data (often referred to as the message) and a public/private key pair. In order to create a digital signature, the message is processed by a hashing algorithm to create a hash value. This hash value is, in turn, encrypted using a signature algorithm and the private key to create the digital signature.

In order to verify a signature, two pieces of data are required: the original message and the public key. First, the hash must be calculated exactly as it was calculated when the signature was created. Then the digital signature is decoded using the public key and the result is compared against the computed hash. If the two are identical, then you can be sure that message data is the one originally signed and it has not been tampered with.

32.2.2 Embedded Signatures

The signatures used for digital signing of UEFI executables are embedded directly within the executable itself. Within the header is an array of directory entries. Each of these entries points to interesting places within the executable image. The fifth data directory entry contains a pointer to a list of certificates along with the length of the certificate areas. Each certificate may contain a digital signature used for validating the driver. The following diagram illustrates how certificates are embedded in the PE/COFF file:

Within the PE/COFF optional header is a data directory. The 5th entry, if filled, points to a list of certificates. Normally, these certificates are appended to the end of the file.

32.2.3 Creating Image Digests from Images

One of the pieces required for creating a digital signature is the image digest. For a detailed description on how to create image digests from PE/COFF images, refer to the “Creating the PE Image Hash” section of the Microsoft Authenticode Format specification (see References).

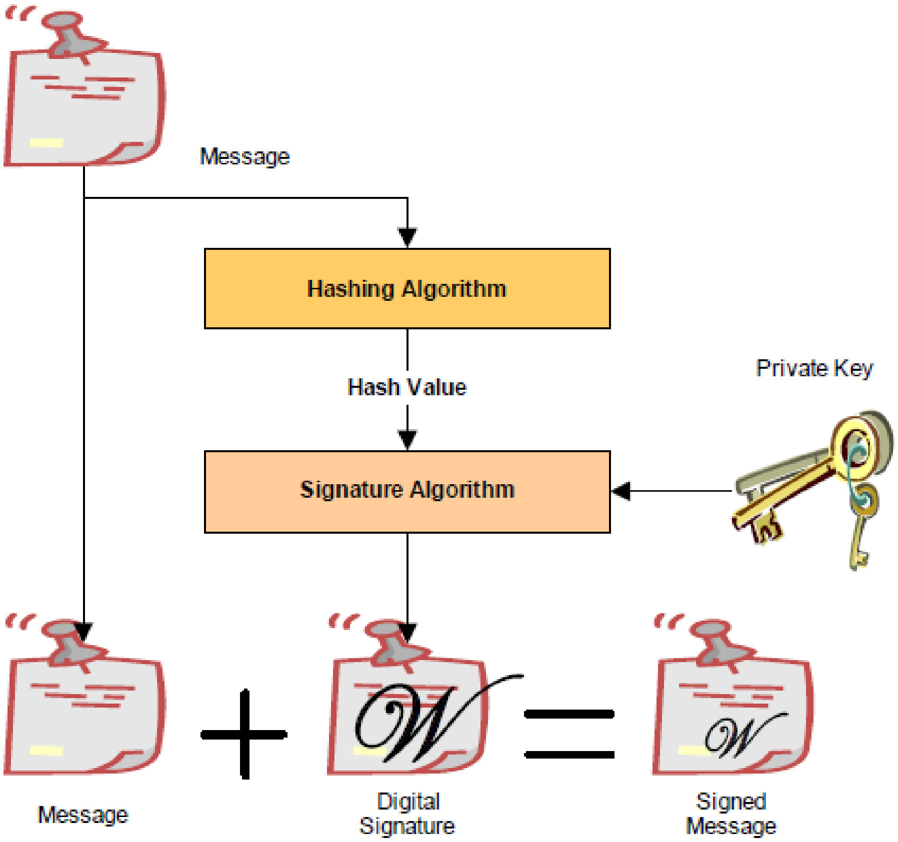

Fig. 32.1: Creating A Digital Signature

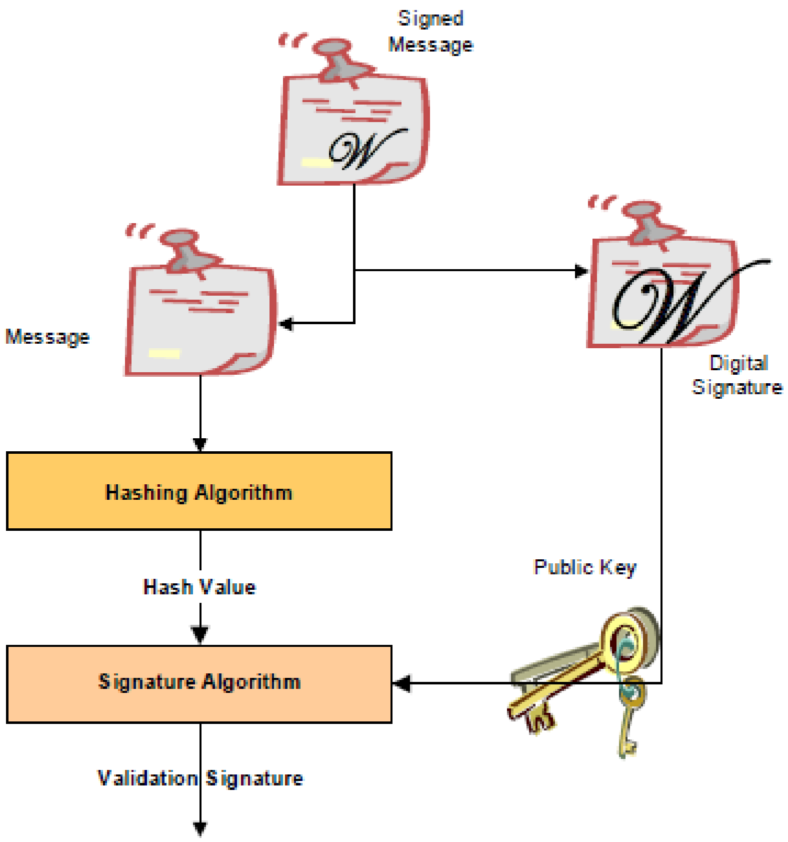

Fig. 32.2: Veriying a Digital Signature

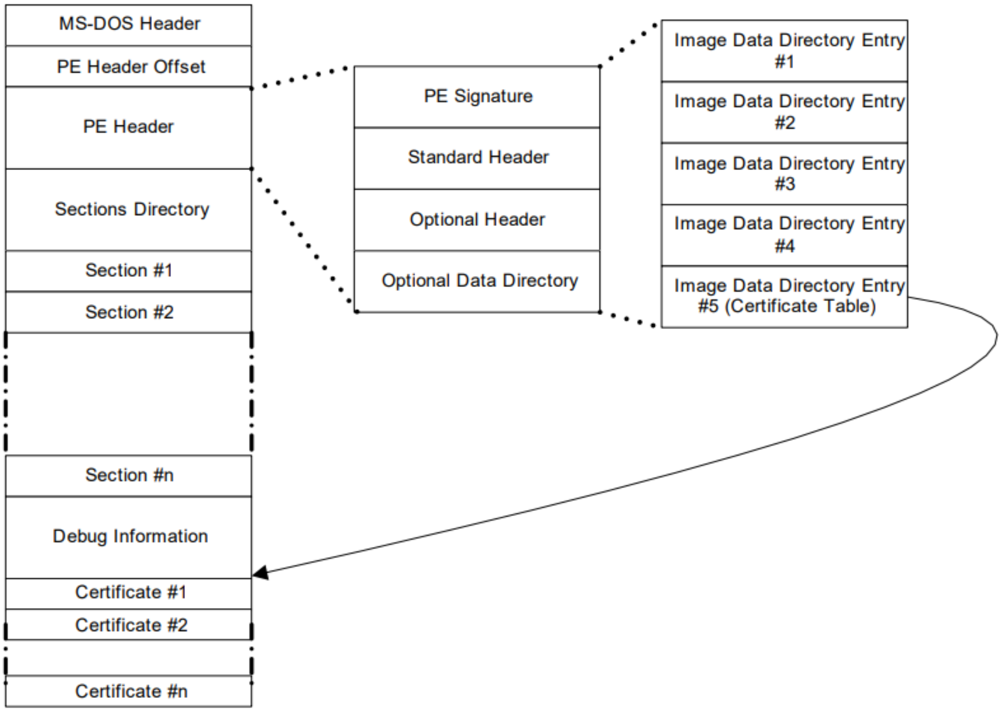

Fig. 32.3: Embedded Digital Certificates

32.2.4 Code Definitions

This section describes data structures used for signing UEFI executables.

32.2.4.1 WIN_CERTIFICATE

Summary

The *WIN_CERTIFICATE* structure is part of the PE/COFF specification.

Prototype

```
typedef struct _WIN_CERTIFICATE {
  UINT32             dwLength;
  UINT16             wRevision;
  UINT16             wCertificateType;
  //UINT8            bCertificate[ANYSIZE_ARRAY];
} WIN_CERTIFICATE;
```

dwLength
The length of the entire certificate, including the length of the header, in bytes.

wRevision
The revision level of the *WIN_CERTIFICATE* structure. The current revision level is 0x0200.

wCertificateType
The certificate type. See *WIN_CERT_TYPE_xxx* for the UEFI certificate types. The UEFI specification reserves the range of certificate type values from 0x0EF0 to 0x0EFF.

bCertificate

The actual certificate. The format of the certificate depends on *wCertificateType*. The format of the UEFI certificates is defined below.

Related Definitions

```
#define WIN_CERT_TYPE_PKCS_SIGNED_DATA    0x0002
#define WIN_CERT_TYPE_EFI_PKCS115         0x0EF0
#define WIN_CERT_TYPE_EFI_GUID            0x0EF1
```

Description

This structure is the certificate header. There may be zero or more certificates.

- If the wCertificateType field is set to *WIN_CERT_TYPE_EFI_PKCS115*, then the certificate follows the format described in *WIN_CERTIFICATE_EFI_PKCS1_15*.
- If the *wCertificateType* field is set to *WIN_CERT_TYPE_EFI_GUID*, then the certificate follows the format described in *WIN_CERTIFICATE_UEFI_GUID*.
- If the *wCertificateType* field is set to *WIN_CERT_TYPE_PKCS_SIGNED_DATA* then the certificate is formatted as described in the Authenticode specification.

These certificates can be validated using the contents of the signature database described in *Signature Database* . The following table illustrates the relationship between the certificates and the signature types in the database.

NOTE: *In the case of a* WIN_CERT_TYPE_PKCS_SIGNED_DATA (*or* WIN_CERT_TYPE_EFI_GUID *where* CertType = EFI_CERT_TYPE_PKCS7_GUID) *certificate, a match can occur against an entry in the authorized signature database (or the forbidden signature database; UEFI Image Variable GUID & Variable Name) at any level of the chain of X.509 certificates present in the certificate, and matches can occur against any of the applicable signature types defined in (Firmware/OS Key Exchange: Passing Public Keys .*

Table 32.5: PE/COFF Certificates Types and UEFI Signature Database Certificate Types

Image Certificate Type	Verified Using Signature Database Type
WIN_CERT_TYPE_EFI_PKCS115 (*Signature* Size = 256 bytes)	*EFI_CERT_RSA2048_GUID* (public key)
WIN_CERT_TYPE_EFI_GUID (*CertType* = EFI_CERT_TYPE_RSA2048_SHA256_GUID*)	*EFI_CERT_RSA2048_GUID* (public key).
WIN_CERT_TYPE_EFI_GUID (CertType = EFI_CERT_TYPE_PKCS7_GUID)*	*EFI_CERT_X509_GUID* *EFI_CERT_RSA2048_GUID* (when applicable) *EFI_CERT_X509_SHA256_GUID* (when applicable) *EFI_CERT_X509_SHA384_GUID* (when applicable) *EFI_CERT_X509_SHA512_GUID* (when applicable)

continues on next page

Table 32.5 – continued from previous page

WIN_CERT_TYPE_PKCS_SIGNED_DATA	*EFI_CERT_X509_GUID* *EFI_CERT_RSA2048_GUID* (when applicable) *EFI_CERT_X509_SHA256_GUID* (when applicable) *EFI_CERT_X509_SHA384_GUID* (when applicable) *EFI_CERT_X509_SHA512_GUID* (when applicable)
(Always applicable regardless of whether a certificate is present or not)	*EFI_CERT_SHA1_GUID*, *EFI_CERT_SHA224_GUID*, *EFI_CERT_SHA256_GUID*, *EFI_CERT_SHA384_GUID*, *EFI_CERT_SHA512_GUID* In this case, the database contains the hash of the image.

32.2.4.2 WIN_CERTIFICATE_EFI_PKCS1_15

Summary

Certificate which encapsulates the RSASSA_PKCS1-v1_5 digital signature.

Prototype

```
typedef struct _WIN_CERTIFICATE_EFI_PKCS1_15 {
   WIN_CERTIFICATE            Hdr;
   EFI_GUID                   HashAlgorithm;
// UINT8                      Signature[ANYSIZE_ARRAY];
} WIN_CERTIFICATE_EFI_PKCS1_15;
```

Hdr

This is the standard *WIN_CERTIFICATE* header, where *wCertificateType* is set to *WIN_CERT_TYPE_EFI_PKCS1_15*.

HashAlgorithm

This is the hashing algorithm which was performed on the UEFI executable when creating the digital signature. It is one of the enumerated values pre-defined in *EFI Hash Algorithms*. See *EFI_HASH_ALGORITHM_x*.

Signature

This is the actual digital signature. The size of the signature is the same size as the key (2048-bit key is 256 bytes) and can be determined by subtracting the length of the other parts of this header from the total length of the certificate as found in *Hdr.dwLength*.

Description

The *WIN_CERTIFICATE_UEFI_PKCS1_15* structure is derived from *WIN_CERTIFICATE* and encapsulates the information needed to implement the RSASSA-PKCS1-v1_5 digital signature algorithm as specified in RFC2437, sections 8-9.

32.2.4.3 WIN_CERTIFICATE_UEFI_GUID

Summary

Certificate which encapsulates a GUID-specific digital signature.

Prototype

```
typedef struct _WIN_CERTIFICATE_UEFI_GUID {
  WIN_CERTIFICATE             Hdr;
  EFI_GUID                    CertType;
  UINT8                       CertData[ANYSIZE_ARRAY];
}   WIN_CERTIFICATE_UEFI_GUID;
```

Hdr

This is the standard *WIN_CERTIFICATE* header, where *wCertificateType* is set to *WIN_CERT_TYPE_EFI_GUID*.

CertType

This is the unique id which determines the format of the *CertData*.

CertData

This is the certificate data. The format of the data is determined by the *CertType*.

Related Definitions

```
#define EFI_CERT_TYPE_RSA2048_SHA256_GUID
    {0xa7717414, 0xc616, 0x4977, \
  {0x94, 0x20, 0x84, 0x47, 0x12, 0xa7, 0x35, 0xbf}}
#define EFI_CERT_TYPE_PKCS7_GUID
  {0x4aafd29d, 0x68df, 0x49ee, \
  {0x8a, 0xa9, 0x34, 0x7d, 0x37, 0x56, 0x65, 0xa7}}
typedef struct _EFI_CERT_BLOCK_RSA_2048_SHA256 {
  EFI_GUID                 HashType;
  UINT8                    PublicKey[256];
  UINT8                    Signature[256];
} EFI_CERT_BLOCK_RSA_2048_SHA256;
```

PublicKey

The RSA exponent e for this structure is 0x10001.

Signature

This signature block is PKCS 1 version 1.5 formatted.

Description

The *WIN_CERTIFICATE_UEFI_GUID* certificate type allows new types of certificates to be developed for driver authentication without requiring a new certificate type. The *CertType* defines the format of the *CertData*, which length is defined by the size of the certificate less the fixed size of the *WIN_CERTIFICATE_UEFI_GUID* structure.

- If *CertType* is *EFI_CERT_TYPE_RSA2048_SHA256_GUID* then the structure which follows has the format specified by *EFI_CERT_BLOCK_RSA_2048_SHA256*.
- If *CertType* is *EFI_CERT_TYPE_PKCS7_GUID* then the *CertData* component shall contain a DER-encoded PKCS #7 version 1.5 [RFC2315] *SignedData* value.

32.3 Firmware/OS Key Exchange: Creating Trust Relationships

This section describes a means of creating a trust relationship between the platform owner, the platform firmware, and an operating system. This trust relationship enables the platform firmware and one or more operating systems to exchange information in a secure manner. The trust relationship uses two types of asymmetric key pairs:

Platform Key (PK)

The platform key establishes a trust relationship between the platform owner and the platform firmware. The platform owner enrolls the public half of the key (PKpub) into the platform firmware. The platform owner can later use the private half of the key (PKpriv) to change platform ownership or to enroll a Key Exchange Key. For UEFI, the recommended Platform Key format is RSA-2048. See "Enrolling The Platform Key" and "Clearing The Platform Key" for more information.

Key Exchange Key (KEK)

Key exchange keys establish a trust relationship between the operating system and the platform firmware. Each operating system (and potentially, each 3rd party application which need to communicate with platform firmware) enrolls a public key (KEKpub) into the platform firmware. See "Enrolling Key Exchange Keys" for more information.

While no Platform Key is enrolled, the SetupMode variable *shall* be equal to 1. While SetupMode == 1, the platform firmware *shall not* require authentication in order to modify the Platform Key, Key Enrollment Key, OsRecoveryOrder, OsRecovery####, and image security databases.

After the Platform Key is enrolled, the SetupMode variable shall be equal to 0. While SetupMode == 0, the platform firmware *shall* require authentication in order to modify the Platform Key, Key Enrollment Key, OsRecoveryOrder, OsRecovery####, and image security databases.

While no Platform Key is enrolled, and while the variable AuditMode == 0, the platform is said to be operating in setup mode.

After the Platform Key is enrolled, and while the variable AuditMode == 0, the platform is operating in user mode. The platform will continue to operate in user mode until the Platform Key is cleared, or the system is transitioned to either Audit or Deployed Modes. See "Clearing The Platform Key," "Transitioning to Audit Mode," and "Transitioning to Deployed Mode" for more information.

Audit Mode enables programmatic discovery of signature list combinations that successfully authenticate installed EFI images without the risk of rendering a system unbootable. Chosen signature lists configurations can be tested to ensure the system will continue to boot after the system is transitioned out of Audit Mode. Details on how to transition to Audit Mode are detailed below in the section "Transitioning to Audit Mode." After transitioning to Audit Mode, signature enforcement is disabled such that all images are initialized and enhanced Image Execution Information Table (IEIT) logging is performed including recursive validation for multi-signed images.

Deployed Mode is the most secure mode. For details on transitioning to Deployed Mode see the section "Transitioning to Deployed Mode" below. By design, both User Mode and Audit Mode support unauthenticated transitions to Deployed Mode. However, to move from Deployed Mode to any other mode requires a secure platform-specific method, or deleting the PK, which is authenticated.

Secure Boot Mode transitions to User Mode or Deployed Mode shall take effect immediately. Mode transitions to Setup Mode or Audit Mode may either take effect immediately (recommended) or after a reset. For implementations that require a reset, the mode transition shall be processed prior to the initialization of the SecureBoot variable, and the SetVariable() workflow shall be as follows:

1. If the variable has an authenticated attribute, it shall be authenticated as specified, and failure will result in immediate termination of this workflow by returning the appropriate error.
2. Check secure storage to determine if a Secure Boot Mode transition is already queued. If a transition is already queued, terminate this workflow by returning EFI_ALREADY_STARTED
3. Queue the request to secure storage

4. The Secure Boot Mode and Policy variables SHALL remain unchanged
5. Return EFI_WARN_RESET_REQUIRED.
6. After reboot, if the transition is successful, Secure Boot Mode and Policy variables will change accordingly. If the transition to lower security modes is rejected or fail, the workflow is terminated and the Secure Boot Mode and Policy variables remain unchanged

32.3.1 Enrolling The Platform Key

The platform owner enrolls the public half of the Platform Key (PKpub) by calling the UEFI Boot Service *SetVariable()* as specified in *Using the EFI_VARIABLE_AUTHENTICATION_3 descriptor*. If the platform is in setup mode, then the new PKpub may be signed with its PKpriv counterpart. If the platform is in user mode, then the new PKpub must be signed with the current PKpriv. When the platform is in setup mode, a successful enrollment of a Platform Key shall cause the platform to immediately transition to user mode.

The authenticated PK variable can always be read but can only be written if the platform is in setup mode, or if the platform is in user mode and the provided PKpub is signed with the current PKpriv.

The name and GUID of the Platform Key variable are specified in *Globally Defined Variables* “Globally Defined Variables” The variable has the format of a signature database as described in “Signature Database” below, with exactly one entry.

The platform vendor may provide a default PKpub in the PKDefault variable described in *Globally Defined Variables*. This variable is formatted identically to the Platform Key variable. If present, this key may optionally be used as the public half of the Platform Key when transitioning from setup mode to user mode. If so, it may be read, placed within an *EFI_VARIABLE_AUTHENTICATION2* structure and copied to the Platform Key variable using the *SetVariable()* call.

32.3.2 Clearing The Platform Key

The platform owner clears the public half of the Platform Key (PKpub) by deleting the Platform Key variable using UEFI Runtime Service *SetVariable()*. The data buffer submitted to the *SetVariable()* must be signed with the current PKpriv; *Exception for Machine Check, INIT, and NMI* for details. The name and GUID of the Platform Key variable are specified in *Globally Defined Variables*, “Globally Defined Variables” The platform key may also be cleared using a secure platform-specific method. When platform key is cleared, the global variable SetupMode must also be updated to 1.

32.3.3 Transitioning to Audit Mode

To enter Audit Mode, a new UEFI variable AuditMode is set to 1. Entering Audit Mode has the side effect of changing SetupMode == 1, PK is cleared, and the new DeployedMode == 0.

NOTE: *The AuditMode variable is only writable before* ExitBootServices() *is called when the system is* **not** *in Deployed Mode*. See *Secure Boot Modes* *for more details.*

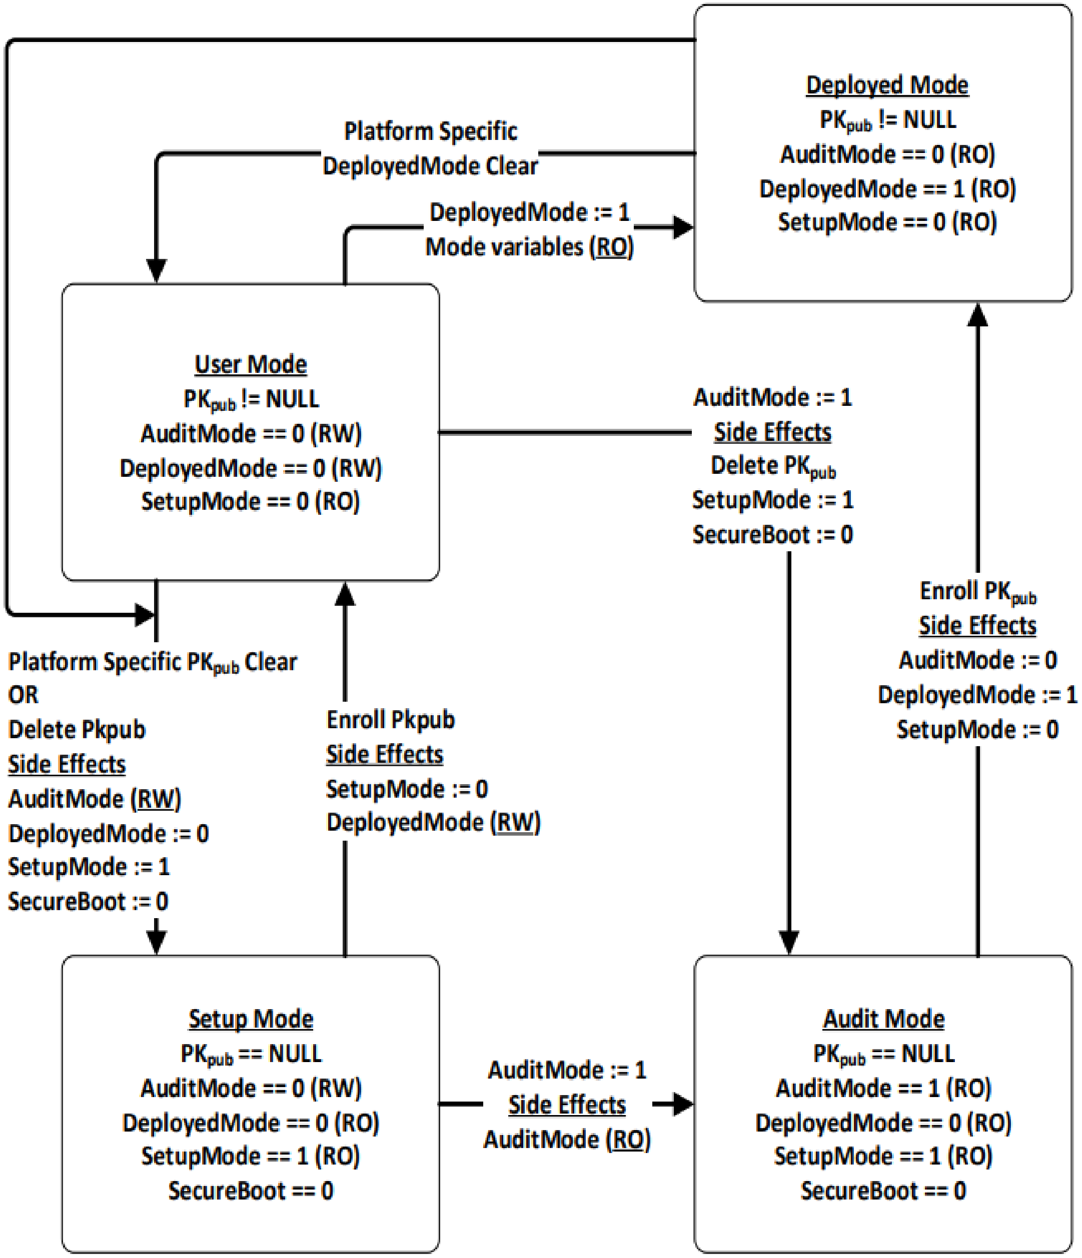

Fig. 32.4: Secure Boot Modes

32.3.4 Transitioning to Deployed Mode

To enter Deployed Mode from Audit Mode, set the variable PK. To enter Deployed Mode from User Mode, set the variable DeployedMode to 1. This transition takes effect immediately with no reset required. Entering Deployed Mode has the side effect of changing SetupMode == 0, AuditMode == 0 and is made read-only, and DeployedMode == 1 and is made read-only. See *Secure Boot Modes* for more details.

32.3.5 Enrolling Key Exchange Keys

Key exchange keys are stored in a signature database as described in "Signature Database" below. The signature database is stored as an authenticated UEFI variable.

The platform owner enrolls the key exchange keys by either calling *SetVariable()* as specified in *Using the EFI_VARIABLE_AUTHENTICATION_3 descriptor* with the *EFI_VARIABLE_APPEND_WRITE* attribute set and the *Data* parameter containing the new key(s), or by reading the database using *GetVariable(),* appending the new key exchange key to the existing keys and then writing the database using *SetVariable()* as specified in *Using the EFI_VARIABLE_AUTHENTICATION_3 descriptor* without the *EFI_VARIABLE_APPEND_WRITE* attribute set.

The authenticated UEFI variable that stores the key exchange keys (KEKs) can always be read but only be written if:

- The platform is in user mode and the provided variable data is signed with the current PK_{priv}; *or* if
- The platform is in setup mode (in this case the variable can be written without a signature validation, but the *SetVariable()* call needs to be formatted in accordance with the procedure for authenticated variables in *Using the EFI_VARIABLE_AUTHENTICATION_3 descriptor*)

The name and GUID of the Key Exchange Key variable are specified in *Globally Defined Variables*, "Globally Defined Variables." The platform vendor may provide a default set of Key Exchange Keys in the KEKDefault variable described in *Globally Defined Variables*. If present, these keys (or a subset) may optionally be used when performing the initial enrollment of Key Exchange Keys. If any are to be used, they may be parsed from the variable and enrolled as described above.

32.3.6 Platform Firmware Key Storage Requirements

This section describes the platform firmware storage requirements of the different types of keys.

Platform Keys:
The public key must be stored in non-volatile storage which is tamper and delete resistant.

Key Exchange Keys:
The public key must be stored in non-volatile storage which is tamper resistant. Careful consideration should be given to the security and configuration of any out-of-band management agent (e.g. hypervisor or service processor) such that the platform cannot exploit the management agent in order to circumvent Secure Boot.

32.4 Firmware/OS Key Exchange: Passing Public Keys

This section describes a means of passing public keys from the OS to the platform firmware so that these keys can be used to securely pass information between the OS and the platform firmware. Typically, the OS has been unable to communicate sensitive information or enforce any sort of policy because of the possibility of spoofing by a malicious software agent. That is, the platform firmware has been unable to trust the OS. By enrolling these public keys, authorized by the platform owner, the platform firmware can now check the signature of data passed by the operating system. Of course if the malicious software agent is running as part of the OS, such as a rootkit, then any communication between the firmware and operating system still remains the subject of spoofing as the malicious code has access to the key exchange key.

32.4.1 Signature Database

32.4.1.1 EFI_SIGNATURE_DATA

Summary

The format of a signature database.

Prototype

```
#pragma pack(1)
typedef struct _EFI_SIGNATURE_DATA {
  EFI_GUID                 SignatureOwner;
  UINT8                    SignatureData [_];
}   EFI_SIGNATURE_DATA;

typedef struct _EFI_SIGNATURE_LIST {
  EFI_GUID                 SignatureType;
  UINT32                   SignatureListSize;
  UINT32                   SignatureHeaderSize;
  UINT32                   SignatureSize;
//   UINT8                 SignatureHeader [SignatureHeaderSize];
//   EFI_SIGNATURE_DATA    Signatures [__][SignatureSize];
}   EFI_SIGNATURE_LIST;
#pragma pack()
```

Members

SignatureListSize
Total size of the signature list, including this header.

SignatureType
Type of the signature. GUID signature types are defined in “Related Definitions” below.

SignatureHeaderSize
Size of the signature header which precedes the array of signatures.

SignatureSize
Size of each signature. Must be at least the size of *EFI_SIGNATURE_DATA*.

SignatureHeader
Header before the array of signatures. The format of this header is specified by the *SignatureType*.

Signatures
An array of signatures. Each signature is *SignatureSize* bytes in length. The format of the signature is defined by the *SignatureType*.

SignatureOwner
An identifier which identifies the agent which added the signature to the list.

Description

The signature database consists of zero or more signature lists. The size of the signature database can be determined by examining the size of the UEFI variable.

Each signature list is a list of signatures of one type, identified by *SignatureType*. The signature list contains a header and then an array of zero or more signatures in the format specified by the header. The size of each signature in the signature list is specified by *SignatureSize*.

Each signature has an owner *SignatureOwner*, which is a GUID identifying the agent which inserted the signature in the database. Agents might include the operating system or an OEM-supplied driver or application. Agents may examine this field to understand whether they should manage the signature or not.

```
#define EFI_CERT_SHA256_GUID \
  { 0xc1c41626, 0x504c, 0x4092, \
  { 0xac, 0xa9, 0x41, 0xf9, 0x36, 0x93, 0x43, 0x28 } };
```

This identifies a signature containing a SHA-256 hash. The *SignatureHeader* size shall always be 0. The *SignatureSize* shall always be 16 (size of *SignatureOwner* component) + 32 bytes.

```
#define EFI_CERT_RSA2048_GUID \
  { 0x3c5766e8, 0x269c, 0x4e34, \
  { 0xaa, 0x14, 0xed, 0x77, 0x6e, 0x85, 0xb3, 0xb6 } };
```

This identifies a signature containing an RSA-2048 key. The key (only the modulus since the public key exponent is known to be 0x10001) shall be stored in big-endian order.

The *SignatureHeader* size shall always be 0. The *SignatureSize* shall always be 16 (size of *SignatureOwner* component) + 256 bytes.

```
#define EFI_CERT_RSA2048_SHA256_GUID \
  { 0xe2b36190, 0x879b, 0x4a3d, \
  { 0xad, 0x8d, 0xf2, 0xe7, 0xbb, 0xa3, 0x27, 0x84 } };
```

This identifies a signature containing a RSA-2048 signature of a SHA-256 hash. The *SignatureHeader* size shall always be 0. The *SignatureSize* shall always be 16 (size of *SignatureOwner* component) + 256 bytes.

```
#define EFI_CERT_SHA1_GUID \
  { 0x826ca512, 0xcf10, 0x4ac9, \
  { 0xb1, 0x87, 0xbe, 0x01, 0x49, 0x66, 0x31, 0xbd } };
```

This identifies a signature containing a SHA-1 hash. The *SignatureSize* shall always be 16 (size of *SignatureOwner* component) + 20 bytes.

```
#define EFI_CERT_RSA2048_SHA1_GUID \
  { 0x67f8444f, 0x8743, 0x48f1, \
  { 0xa3, 0x28, 0x1e, 0xaa, 0xb8, 0x73, 0x60, 0x80 } };
```

This identifies a signature containing a RSA-2048 signature of a SHA-1 hash. The *SignatureHeader* size shall always be 0. The *SignatureSize* shall always be 16 (size of *SignatureOwner* component) + 256 bytes.

```
#define *EFI_CERT_X509_GUID* \
  { 0xa5c059a1, 0x94e4, 0x4aa7, \
  { 0x87, 0xb5, 0xab, 0x15, 0x5c, 0x2b, 0xf0, 0x72 } };
```

This identifies a signature based on a DER-encoded X.509 certificate. If the signature is an X.509 certificate then verification of the signature of an image should validate the public key certificate in the image using certificate path verification, up to this X.509 certificate as a trusted root. The *SignatureHeader* size shall always be 0. The *SignatureSize* may vary but shall always be 16 (size of the *SignatureOwner* component) + the size of the certificate itself.

NOTE: *This means that each certificate will normally be in a separate* EFI_SIGNATURE_LIST.

```
#define EFI_CERT_SHA224_GUID \
  { 0xb6e5233, 0xa65c, 0x44c9, \
  {0x94, 0x07, 0xd9, 0xab, 0x83, 0xbf, 0xc8, 0xbd} };
```

This identifies a signature containing a SHA-224 hash. The *SignatureHeader* size shall always be 0. The *SignatureSize* shall always be 16 (size of *SignatureOwner* component) + 28 bytes.

```
#define EFI_CERT_SHA384_GUID \
  { 0xff3e5307, 0x9fd0, 0x48c9, \
  {0x85, 0xf1, 0x8a, 0xd5, 0x6c, 0x70, 0x1e, 0x01}};
```

This identifies a signature containing a SHA-384 hash. The *SignatureHeader* size shall always be 0. The *SignatureSize* shall always be 16 (size of *SignatureOwner* component) + 48 bytes.

```
#define EFI_CERT_SHA512_GUID \
  { 0x93e0fae, 0xa6c4, 0x4f50, \
  {0x9f, 0x1b, 0xd4, 0x1e, 0x2b, 0x89, 0xc1, 0x9a}}
```

This identifies a signature containing a SHA-512 hash. The *SignatureHeader* size shall always be 0. The *SignatureSize* shall always be 16 (size of *SignatureOwner* component) + 64 bytes.

```
#define EFI_CERT_X509_SHA256_GUID \
  { 0x3bd2a492, 0x96c0, 0x4079, \
  { 0xb4, 0x20, 0xfc, 0xf9, 0x8e, 0xf1, 0x03, 0xed } };
```

Prototype

#pragma pack()
```

Members

ToBeSignedHash
The SHA256 hash of an X.509 certificate's To-Be-Signed contents.

TimeOfRevocation
The time that the certificate shall be considered to be revoked.

This identifies a signature containing the SHA256 hash of an X.509 certificate's To-Be-Signed contents, and a time of revocation. The *SignatureHeader* size shall always be 0. The *SignatureSize* shall always be 16 (size of the *SignatureOwner* component) + 48 bytes for an *EFI_CERT_X509_SHA256* structure. If the *TimeOfRevocation* is non-zero, the certificate should be considered to be revoked from that time and onwards, and otherwise the certificate shall be considered to always be revoked.

ToBeSignedHash
The SHA512 hash of an X.509 certificate's To-Be-Signed contents.

TimeOfRevocation
The time that the certificate shall be considered to be revoked.

This identifies a signature containing the SHA512 hash of an X.509 certificate's To-Be-Signed contents, and a time of revocation. The *SignatureHeader* size shall always be 0. The *SignatureSize* shall always be 16 (size of the *SignatureOwner* component) + 80 bytes for an *EFI_CERT_X509_SHA512* structure. If the *TimeOfRevocation* is non-zero, the certificate should be considered to be revoked from that time and onwards, and otherwise the certificate shall be considered to always be revoked.

```
#define EFI_CERT_EXTERNAL_MANAGEMENT_GUID \
  { 0x452e8ced, 0xdfff, 0x4b8c, \
  { 0xae, 0x01, 0x51, 0x18, 0x86, 0x2e, 0x68, 0x2c } };
```

This *SignatureType* describes a pseudo-signature which will not facilitate authentication. It is only meaningful within a signature list used for authenticating writes through *SetVariable(),* and is only effective if it is the only signature present in that signature list. It allows a signature list to be populated without providing any means for *SetVariable()* to succeed. This signature type is intended for use on a platform with an external out-of-band management agent (e.g. hypervisor or service processor). When a platform is configured such that only signatures of this *SignatureType* are available for authenticating writes to a variable, that variable may only be modified by the external management agent using a platform-specific interface.

When a write may be authenticated using any signature from multiple signature lists, the presence of this signature in one of those signature lists does not inhibit the use of signatures present in the other signature lists. For example, if this signature is placed in PK, an attempt to write to db using *SetVariable()* will still succeed if it is signed by a valid KEKpriv, but a write to PK or KEK through *SetVariable()* cannot succeed because no PKpriv exists.

The *SignatureHeader* size shall always be 0. The *SignatureSize* shall always be 16 (size of *SignatureOwner* component) + 1 byte. The one byte of *SignatureData* exists only for compatibility reasons; It should be written as zero, and any value read should be ignored.

32.4.2 Image Execution Information Table

Summary

When *AuditMode==0,* if the image's signature is not found in the authorized database, or is found in the forbidden database, the image will not be started and instead, information about it will be placed in the EFI_IMAGE_EXECUTION_INFO_TABLE (see section 32.5.3.1). {cross-reference needed}

When *AuditMode==1, an EFI_IMAGE_EXECUTION_INFO element is created in the EFI_IMAGE_EXECUTION_INFO_TABLE for every certificate found in the certificate table of every image that is validated.*

Additionally for every image, an element will be created in the table for every EFI_CERT_SHAXXX that is supported by the platform. The contents of* *Action for each element are determined by comparing that specific element's Signature (which will contain exactly 1 EFI_SIGNATURE_DATA) to the currently-configured image security databases and policies, and shall be either *EFI_IMAGE_EXECUTION_AUTH_SIG_PASSED , EFI_IMAGE_EXECUTION_AUTH_SIG_FAILED* , EFI_iMAGE)EXECUTION_AUTH_SIG_NOT_FOUND, EFI_IMAGE_EXECUTION_AUTH_SIG_FOUND, or *EFI_IMAGE_EXECUTION_POLICY_FAILED.*

Finally, because the system is in Audit Mode, all modules are initialized even if they fail to authenticate, and the *EFI_IMAGE_EXECUTION_INITIALIZED* bit shall be set in *Action* for all elements.

Prototype

```
typedef struct {
  EFI_IMAGE_EXECUTION_ACTION     Action;
  UINT32                         InfoSize;
// CHAR16                        Name [__];
// EFI_DEVICE_PATH_PROTOCOL      DevicePath;
// EFI_SIGNATURE_LIST            Signature;
} EFI_IMAGE_EXECUTION_INFO;
```

Parameters

Action

Describes the action taken by the firmware regarding this image. Type EFI_IMAGE_EXECUTION_ACTION is described in "Related Definitions" below.

InfoSize

Size of all of the entire structure.

Name

If this image was a UEFI device driver (for option ROM, for example) this is the null-terminated, user-friendly name for the device. If the image was for an application, then this is the name of the application. If this cannot be determined, then a simple NULL character should be put in this position.

DevicePath

Image device path. The image device path typically comes from the Loaded Image Device Path Protocol installed on the image handle. If image device path cannot be determined, a simple end-of-path device node should be put in this position.

Signature

Zero or more image signatures. If the image contained no signatures, then this field is empty.The type *WIN_CERTIFICATE* is defined in chapter 26.

Prototype

```
typedef struct {
  UINTN                       NumberOfImages;
  EFI_IMAGE_EXECUTION_INFO    InformationInfo[__]
}   EFI_IMAGE_EXECUTION_INFO_TABLE;
```

NumberOfImages

Number of *EFI_IMAGE_EXECUTION_INFO* structures.

InformationInfo

NumberOfImages instances of *EFI_IMAGE_EXECUTION_INFO* structures.

Related Definitions

```
typedef UINT32 EFI_IMAGE_EXECUTION_ACTION;

#define EFI_IMAGE_EXECUTION_AUTHENTICATION      0x00000007

#define EFI_IMAGE_EXECUTION_AUTH_SIG_FAILED     0x00000001
#define EFI_IMAGE_EXECUTION_AUTH_SIG_PASSED     0x00000002
#define EFI_IMAGE_EXECUTION_AUTH_SIG_NOT_FOUND  0x00000003
```

(continues on next page)

(continued from previous page)

```
#define EFI_IMAGE_EXECUTION_AUTH_SIG_FOUND       0x00000004
#define EFI_IMAGE_EXECUTION_POLICY_FAILED        0x00000005

#define EFI_IMAGE_EXECUTION_INITIALIZED          0x00000008
```

Description

This structure describes an image in the EFI System Configuration Table. It is only required in the case where image signatures are being checked and the image was not initialized because its signature failed, when AuditMode==1, or was not found in the signature database *and* an authorized user or the owner would not authorize its execution. It may be used in other cases as well.

In these cases, the information about the image is copied into the EFI System Configuration Table. Information about other images which were successfully initialized may also be included as well, but this is not required.

The *Action* field describes what action the firmware took with regard to the image and what other information it has about the image, including the device which it is related to.

First, this field describes the results of the firmware's attempt to authenticate the image.

Table 32.6: Authentication Attempt Status Codes

Authentication attempt status	Condition met
EFI_IMAGE_EXECUTION_AUTH_UNTESTED	The image contained no certificates
EFI_IMAGE_EXECUTION_AUTH_SIG_FAILED	**The image has at least one certificate, and either:** • An image certificate is in the forbidden database, **or** • A digest of an image certifcate is in the forbidden database, **or** • The image signature check failed.
EFI_IMAGE_EXECUTION_AUTH_SIG_PASSED	**The image has at least one certificate, and either:** • An image certifcate is in authroized database. • The image digest is in the authorized database.
EFI_IMAGE_EXECUTION_AUTH_SIG_NOT_FOUND	**The image has at least one certifcate, and:** • the image certificate is not found in the authorized database, **and** • the image digest is not in the authorized database.
EFI_IMAGE_EXECUTION_AUTH_SIG_FOUND	The image has at least one certificate, and the image digest is in the forbidden database.
EFI_IMAGE_EXECUTION_POLICY_FAILED	Authentication failed because of (unspecified) firmware security policy.

Second, this field describes whether the image was initialized or not.

This table can be used by an agent which executes later to audit which images were not loaded and perhaps query other sources to discover whether the image should be authorized. If so, the agent can use the method described in "Signature

Database Update" to update the Signature Database with the image's signature. Switching the system into Audit Mode generates a more verbose table which provides additional insights to this agent.

If an attempt to boot a legacy non-UEFI OS takes place when the system is in User Mode, the OS load shall fail and a corresponding *EFI_IMAGE_EXECUTION_INFO* entry shall be created with Action set to *EFI_IMAGE_EXECUTION_AUTH_UNTESTED,* Name set to the NULL-terminated "Description String" from the BIOS Boot Specification Device Path and DevicePath set to the BIOS Boot Specification Device Path (*BIOS Boot Specification Device Path*).

32.5 UEFI Image Validation

32.5.1 Overview

This section describes a way to use the platform ownership model described in the previous section and the key exchange mechanism to allow the firmware to authenticate a UEFI image, such as an OS loader or an option ROM, using the digital signing mechanisms described here.

The hand-off between the platform firmware and the operating system is a critical part of ensuring secure boot. Since there are large numbers of operating systems and a large number of minor variations in the loaders for those operating systems, it is difficult to carry all possible keys or signatures within the firmware as it ships. This requires some sort of update mechanism, to identify the proper loader. But, as with any update mechanism, there is the risk of allowing malicious software to "authenticate" itself, posing as the real operating system.

Likewise, there are a large number of potential 3rd-party UEFI applications, drivers and option ROMs and it is difficult to carry all possible keys or signatures within the firmware as it ships.

The mechanism described here requires that the platform firmware maintain a signature database, with entries for each authorized UEFI image (the authorized UEFI signature database). The signature database is a single UEFI Variable.

It also requires that the platform firmware maintain a signature database with entries for each forbidden UEFI image. This signature database is also a single UEFI variable.

The signature database is checked when the UEFI Boot Manager is about to start a UEFI image. If the UEFI image's signature is not found in the authorized database, or is found in the forbidden database, the UEFI image will be deferred and information placed in the Image Execution Information Table. In the case of OS Loaders, the next boot option will be selected. The signature databases may be updated by the firmware, by a pre-OS application or by an OS application or driver.

If a firmware supports the *EFI_CERT_X509_SHA*_GUID* signature types, it should support the RFC3161 timestamp specification. Images whose signature matches one of these types in the forbidden signature database shall only be considered forbidden if the firmware either does not support timestamp verification, or the signature type has a time of revocation equal to zero, or the timestamp does not pass verification against the authorized timestamp and forbidden signature databases, or finally the signature type's time of revocation is less than or equal to the time recorded in the image signature's timestamp. If the timestamp's signature is authorized by the authorized timestamp database and the time recorded in the timestamp is less than the time of revocation, the image shall not be considered forbidden provided it is not forbidden by any other entry in the forbidden signature database. Finally, this requires that firmware supporting timestamp verification must support the authorized timestamp database and have a suitable time stamping authority certificate in that database.

32.5.2 Authorized User

An *authorized user* (for the purposes of UEFI image security) is one who possesses a key exchange key (KEKpriv). This key is used to sign updates to the signature databases.

32.5.3 Signature Database Update

The Authorized, Forbidden, Timestamp, and Recovery signature databases are stored as UEFI authenticated variables (see Variable Services in *Exception for Machine Check, INIT, and NMI*) with the GUID

EFI_IMAGE_SECURITY_DATABASE_GUID and the names
EFI_IMAGE_SECURITY_DATABASE,
EFI_IMAGE_SECURITY_DATABASE1,
EFI_IMAGE_SECURITY_DATABASE2, and
EFI_IMAGE_SECURITY_DATABASE3, respectively.

These authenticated UEFI variables that store the signature databases (db, dbx, dbr, or dbt) can always be read but can only be written if:

- The platform is in user mode and the provided variable data is signed with the private half of a previously enrolled key exchange key (KEKpriv *), or the platform private key (PK_{priv});

  or if

- The platform is in setup mode (in this case the variables can be written without a signature validation, but the *SetVariable()* call needs to be formatted in accordance with the procedure for authenticated variables in *Using the EFI_VARIABLE_AUTHENTICATION_3 descriptor*)

The signature databases are in the form of Signature Databases, as described in “Signature Database” above.

The platform vendor may provide a default set of entries for the Signature Database in the dbDefault, dbxDefault, dbtDefault, and dbrDefault variables described in *Globally Defined Variables*. If present, these keys (or a subset) may optionally be used when performing the initial enrollment of signature database entries. If any are to be used, they may be parsed from the variable and enrolled as described below.

If, when adding a signature to the signature database, *SetVariable()* returns *EFI_OUT_OF_RESOURCES,* indicating there is no more room, the updater may discard the new signature or it may decide to discard one of the database entries. These authenticated UEFI variables that store the signature databases (db, or dbx, dbt, or dbr) can always be read but can only be written if:

The following diagram illustrates the process for adding a new signature by the OS or an application that has access to a previously enrolled key exchange key using *SetVariable()*. In the diagram, the *EFI_VARIABLE_APPEND_WRITE* attribute is not used. If *EFI_VARIABLE_APPEND_WRITE* had been used, then steps 2 and 3 could have been omitted and step 7 would have included setting the *EFI_VARIABLE_APPEND_WRITE* attribute.

1. The procedure begins by generating a new signature, in the format described by the Signature Database.
2. Call *GetVariable()* using *EFI_IMAGE_SECURITY_DATABASE_GUID* for the*VendorGuid* parameter and *EFI_IMAGE_SECURITY_DATABASE* for the VariableName parameter.
3. If the variable exists, go to step 5.
4. Create an empty authorized signature database.
5. Create a new buffer which contains the authorized signature database, along with the new signature appended to the end.

6. Sign the new signature database using the private half of the Key Exchange Key as described in *SetVariable()*.
7. Update the authorized signature database using the UEFI Runtime Service *SetVariable()*.
8. If there was no error, go to step 11.
9. If there was an error because of no more resources, determine whether the database can be shrunk any more. The algorithm by which an agent decides which signatures may be safely removed is agent-specific. In most cases, agents should not remove signatures where the SignatureOwner field is not the agent's. If not, then go to step 11, discarding the new signature.
10. If the signature database could be shrunk further, then remove the entries and go to step 6.
11. Exit.

32.5.3.1 Using The Image Execution Information Table

During the process of loading UEFI images, the firmware must gather information about which UEFI images were not started. The firmware may additionally gather information about UEFI images which were started. The information is used to create the IEFI_IMAGE_EXECUTION_INFO_TABLE, which is added to the EFI System Configuration Table and assigned the GUID *EFI_IMAGE_SECURITY_DATABASE_GUID*.

For each UEFI image, the following information is collected:

- The image hash.
- The user-friendly name of the UEFI image (if known)
- The device path
- The action taken on the device (was it initialized or why was it rejected).

For more information, see the Image Execution Information Table definition above (*Image Execution Information Table*).

32.5.3.2 Firmware Policy

The firmware may approve UEFI images for other reasons than those specified here. For example: whether the image is in the system flash, whether the device providing the UEFI image is secured (in a case, etc.) or whether the image contains another type of platform-supported digital signature.

32.5.3.3 Authorization Process

This section describes the process by which an unknown UEFI image might be authorized to run. Implementations are not required to support all portions of this. For example, an implementation might defer all UEFI image or none.

1. Reset. This is when the platform begins initialization during boot.
2. Key Store Initialization. During the firmware initialization and before any signed UEFI images are initialized, the platform firmware must validate the signature database.
3. UEFI Image Validation Succeeded? During initialization of an UEFI image, the UEFI Boot Manager decides whether or not the UEFI image should be initialized. By comparing the calculated UEFI image signature against that in one of the signature databases, the firmware can determine if there is a match.

The security database *db* must either contain an entry with a hash value of the image (with a supported hash type), or it must contain an entry with a certificate against which an entry in the image's certificate table can be verified. In either case verification must not succeed if the security database dbx contains any record with:

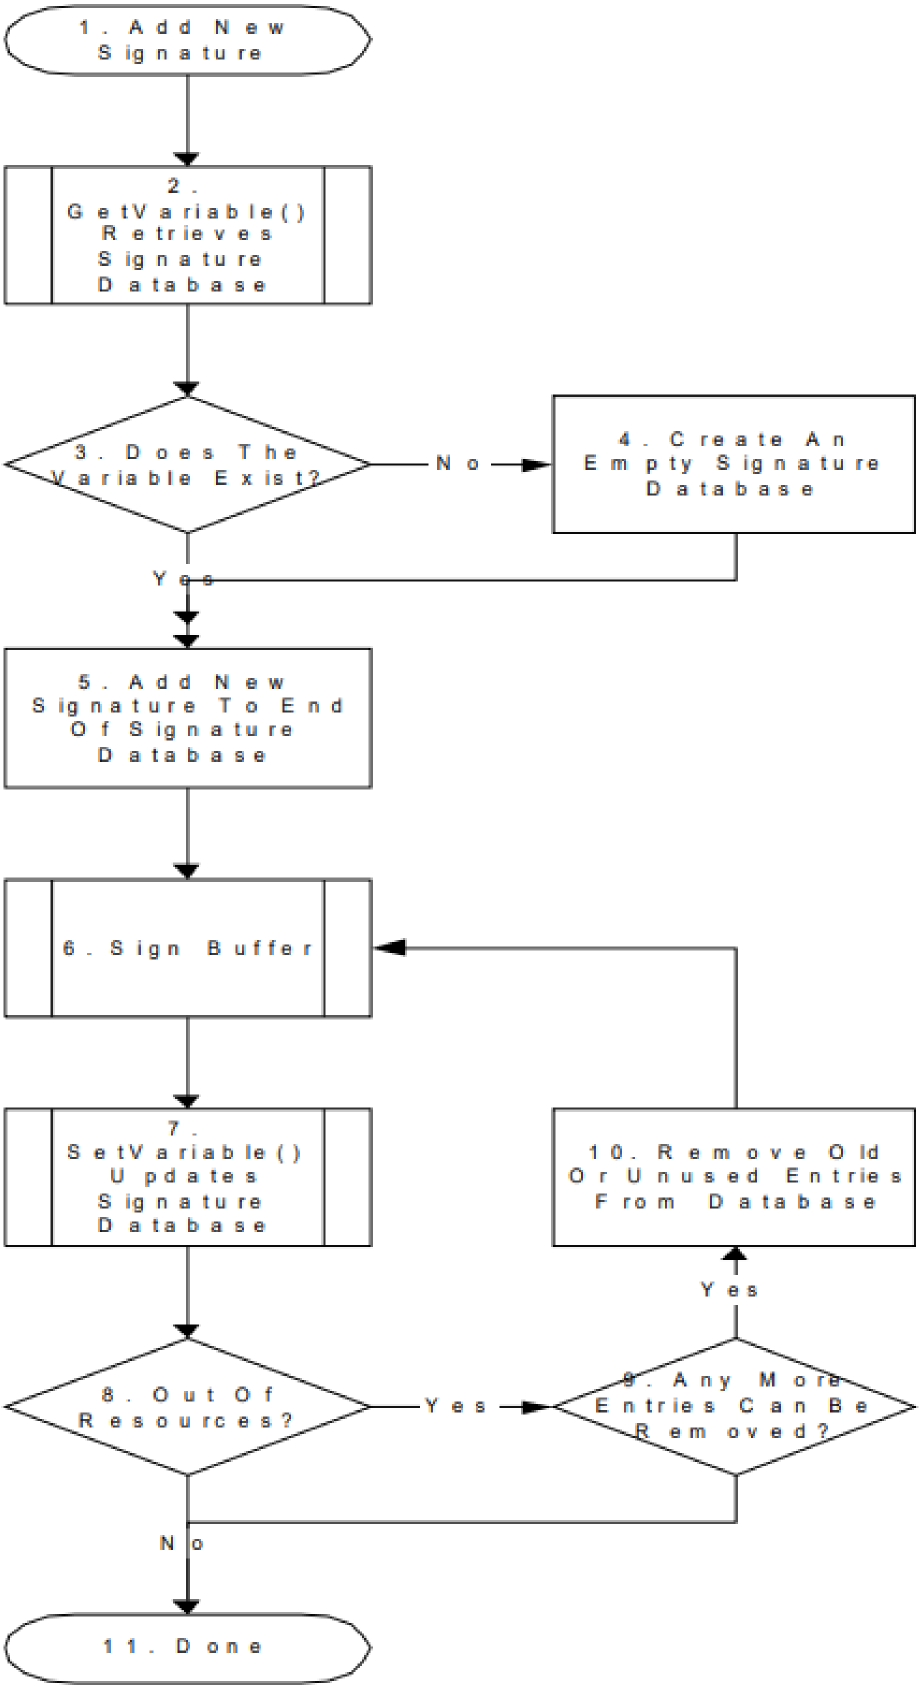

Fig. 32.6: Process for Adding a New Signature by the OS

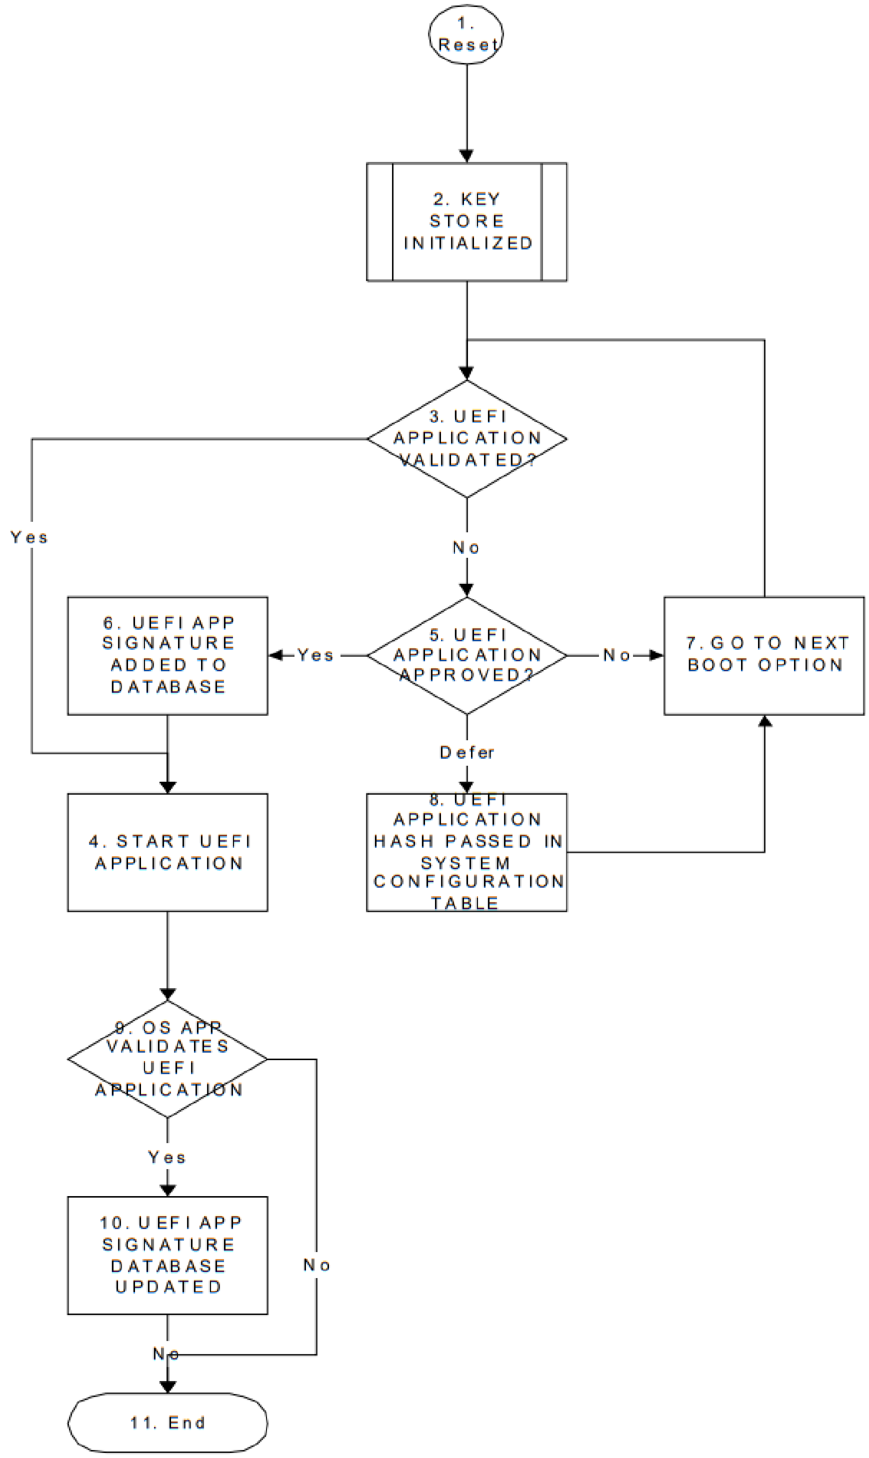

Fig. 32.7: Authorization Process Flow

– A. Any entry with *SignatureListType* of *EFI_CERT_SHA256_GUID* with any *SignatureData* containing the SHA-256 hash of the binary.

– B. Any entry with *SignatureListType* of *EFI_CERT_X509_SHA256, EFI_CERT_X509_SHA384,* or *EFI_CERT_X509_SHA512,* with any SignatureData which reflects the To-Be-Signed hash included in any certificate in the signing chain of the signature being verified.

– C. Any entry with *SignatureListType* of *EFI_CERT_X509_GUID,* with *SignatureData* which contains a certificate with the same Issuer, Serial Number, and To-Be-Signed hash included in any certificate in the signing chain of the signature being verified.

Multiple signatures are allowed to exist in the binary's certificate table (as per PE/COFF Section "Attribute Certificate Table"). Only one hash or signature is required to be present in *db* in order to pass validation, so long as neither the SHA-256 hash of the binary nor any present signature is reflected in dbx.

Then, based on this match or its own policy, the firmware can decide whether or not to launch the UEFI image.

4. Start UEFI Image. If the UEFI Image is approved, then it is launched normally.
5. UEFI Image Not Approved. If the UEFI image was not approved the platform firmware may use other methods to discover if the UEFI image is authorized, such as consult a disk-based catalog or ask an authorized user. The result can be one of three responses: Yes, No or Defer.
6. UEFI Image Signature Added To Signature Database. If the user approves of the UEFI image, then the UEFI image's signature is saved in the firmware's signature database. If user approval is supported, then the firmware be able to update of the Signature Database. For more information, see Signature Database Update.
7. Go To Next Boot Option. If an UEFI image is rejected, then the next boot option is selected normally and go to step 3. This is in the case where the image is listed as a boot option.
8. UEFI Image Signature Passed In System Configuration Table. If user defers, then the UEFI image signature is copied into the Image Execution Information Table in the EFI System Configuration Table which is available to the operating system.
9. OS Application Validates UEFI Image. An OS application determines whether the image is valid.
10. UEFI Image Signature Added To Signature Database. For more information, see Signature Database Update.
11. End.

32.6 Code Definitions

32.6.1 UEFI Image Variable GUID & Variable Name

Summary

Constants used for UEFI signature database variable access.

Prototype

```
#define EFI_IMAGE_SECURITY_DATABASE_GUID \
  { 0xd719b2cb, 0x3d3a, 0x4596, \
  { 0xa3, 0xbc, 0xda, 0xd0, 0x0e, 0x67, 0x65, 0x6f }}
#define EFI_IMAGE_SECURITY_DATABASE L"db"
#define EFI_IMAGE_SECURITY_DATABASE1 L"dbx"
#define EFI_IMAGE_SECURITY_DATABASE2 L"dbt"
#define EFI_IMAGE_SECURITY_DATABASE3 L"dbr"
```

Description

- This GUID and name are used when calling the EFI Runtime Services *GetVariable()* and *SetVariable()*.
- The *EFI_IMAGE_SECURITY_DATABASE_GUID* and *EFI_IMAGE_SECURITY_DATABASE* are used to retrieve and change the authorized signature database.
- The *EFI_IMAGE_SECURITY_DATABASE_GUID* and *EFI_IMAGE_SECURITY_DATABASE1* are used to retrieve and change the forbidden signature database.
- The *EFI_IMAGE_SECURITY_DATABASE_GUID* and *EFI_IMAGE_SECURITY_DATABASE2* are used to retrieve and change the authorized timestamp signature database.
- The *EFI_IMAGE_SECURITY_DATABASE_GUID* and *EFI_IMAGE_SECURITY_DATABASE3* are used to retrieve and change the authorized recovery signature database.
- Firmware shall support the *EFI_VARIABLE_APPEND_WRITE* flag () *Exception for Machine Check, INIT, and NMI*) for the UEFI signature database variables.
- The signature database variables db, dbt, dbx, and dbr must be stored in tamper-resistant non-volatile storage.

CHAPTER

THIRTYTHREE

HUMAN INTERFACE INFRASTRUCTURE OVERVIEW

This section defines the core code and services that are required for an implementation of the Human Interface Infrastructure (HII). This specification does the following:

- Describes the basic mechanisms to manage user input
- Provides code definitions for the HII-related protocols, functions, and type definitions that are architecturally required by the UEFI Specification

33.1 Goals

This chapter describes the mechanisms by which UEFI-compliant systems manage user input. The major areas described include the following:

- String and font management.
- User input abstractions (for keyboards and mice)
- Internal representations of the forms (in the HTML sense) that are used for running a preboot setup.
- External representations (and derivations) of the forms that are used to pass configuration information to runtime applications, and the mechanisms to allow the results of those applications to be driven back into the firmware. General goals include:
- Simplified localization, the process by which the interface is adapted to a particular language.
- A “forms” representation mechanism that is rich enough to support the complex configuration issues encountered by platform developers, including stock keeping unit (SKU) management and interrelationships between questions in the forms.
- Definition of a mechanism to allow most or all the configuration of the system to be performed during boot, at runtime, and remotely. Where possible, the forms describing the configuration should be expressed using existing standards such as XML.
- Ability for the different drivers (including those from add-in cards) and applications to contribute forms, strings, and fonts in a uniform manner while still allowing innovation in the look and feel for Setup.

Support user-interface on a wide range of display devices:

- Local text display
- Local graphics display
- Remote text display
- Remote graphics display
- Web browser

- OS-present GUI

Support automated configuration without a display.

33.2 Design Discussion

This section describes the basic concepts behind the Human Interface Infrastructure. This is a set of protocols that allow a UEFI driver to provide the ability to register user interface and configuration content with the platform firmware. Unlike legacy option ROMs, the configuration of drivers and controllers is delayed until a platform management utility chooses to use the services of these protocols. UEFI drivers are not allowed to perform setup-like operations outside the context of these protocols. This means that a driver is not allowed to interact with the user outside the context of this protocol.

The following example shows a basic platform configuration or "setup" model. The drivers and applications install elements (such as fonts, strings, images and forms) into the HII Database, which acts as a central repository for the entire platform. The Forms Browser uses these elements to render the user interface on the display devices and receive information from the user via HID devices. When complete, the changes made by the user in the Forms Browser are saved, either to the UEFI global variable storage–(*GetVariable()* and *SetVariable()*– or to variable storage provided by the individual drivers.

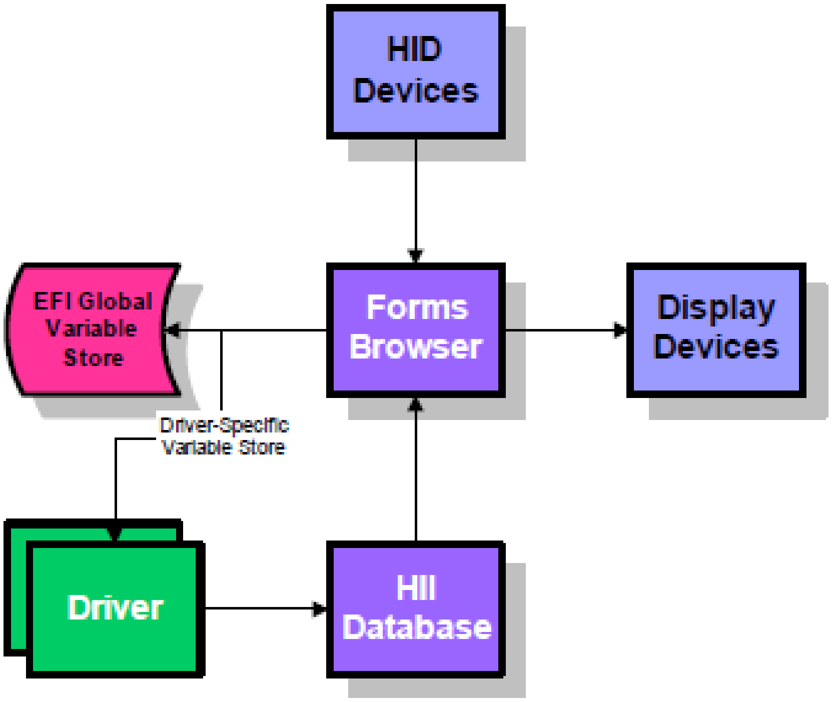

Fig. 33.1: Platform Configuration Overview

33.2.1 Drivers And Applications

The user interface elements in the form of package lists are carried by the drivers and applications. Drivers and applications can create the package lists dynamically, or they can be pre-built and carried as resources in the driver/application image.

If they are stored as resources, then an editor can be used to modify the user interface elements without recompiling. For example, display elements can be modified or deleted, new languages added, and default values modified.

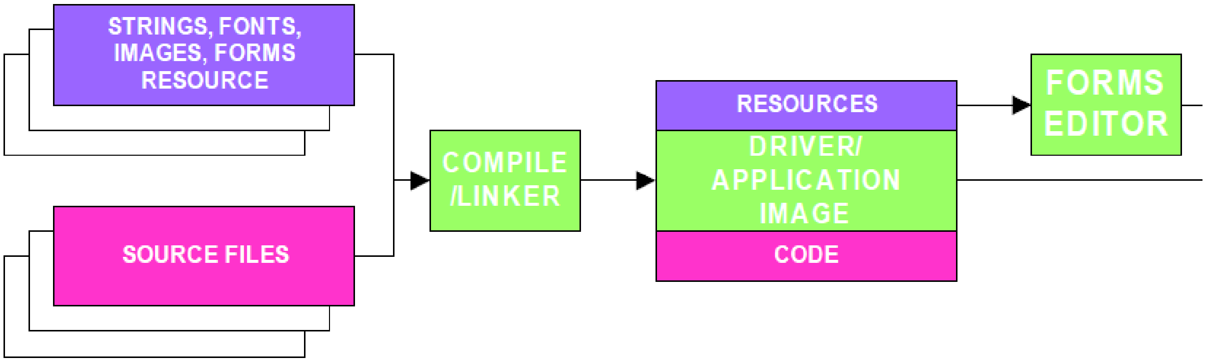

Fig. 33.2: HII Resources In Drivers & Applications

The means by which the string, font, image and form resources are created is beyond the scope of this specification. The following diagram shows a few possible implementations. In both cases, the GUI design is an optional element and the user-interface elements are stored within a text-based resource file. Eventually, this source file is converted into a RES file (PE/COFF Resource Section) which can be linked with the main application.

33.2.1.1 Platform and Driver Configuration

The intent is for this specification to enable the configuration of various target components in the system. The normally arduous task of managing user interface and configuration can be greatly simplified for the consumers of such functionality by enabling the platform to comprehend some standard user interactions.

33.2.1.2 Pre-O/S applications

There are various scenarios where a platform component must interact in some fashion with the user. Examples of this are when presenting a user with several choices of information (e.g. boot menu) and sending information to the display (e.g. system status, logo, etc.).

33.2.1.3 Description of User Interface Components

Various components listed in this specification are described in greater detail in their own sections. The user interface is composed of several distinct components illustrated below.

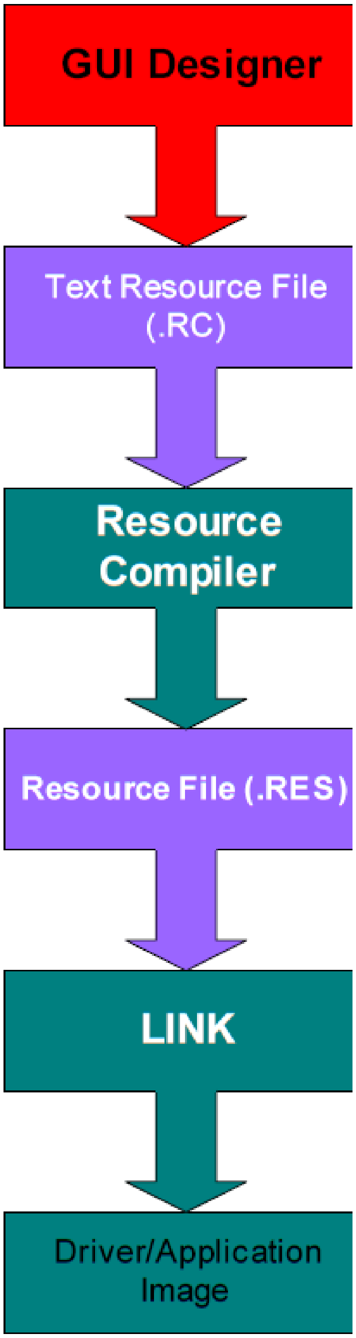

Fig. 33.3: Creating UI Resources With Resource Files

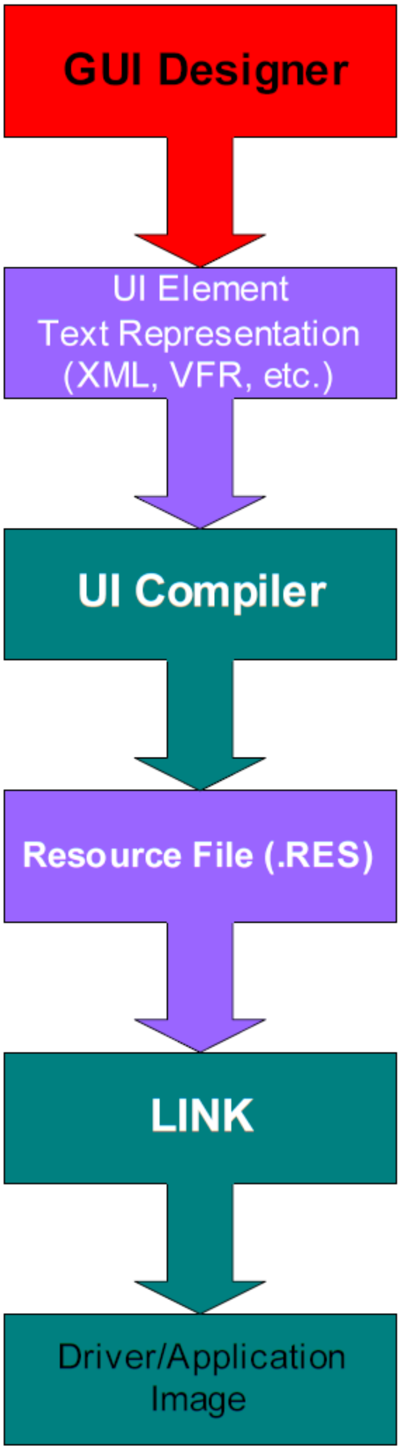

Fig. 33.4: Creating UI Resources With Intermediate Source Representation

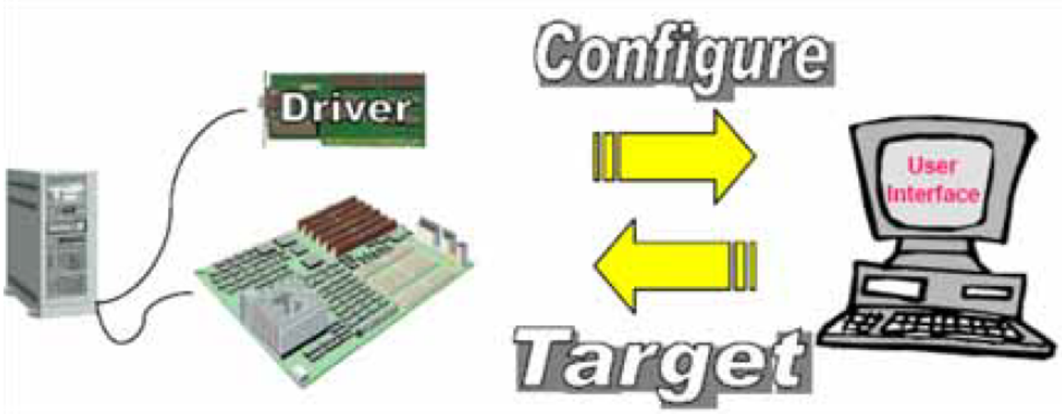

Fig. 33.5: The Platform and Standard User Interactions

Fig. 33.6: User and Platform Component Interaction

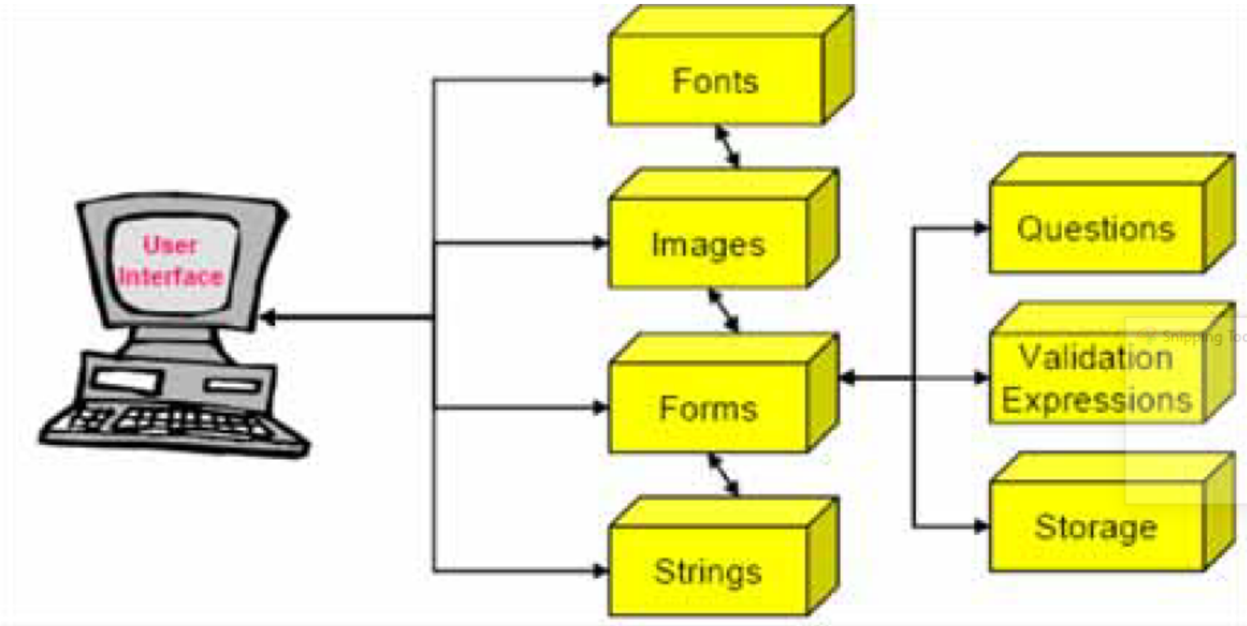

Fig. 33.7: User Interface Components

33.2.1.4 Forms

This component describes what type of content needs to be displayed to the user by means of a binary encoding (i.e., Internal Forms Representation) and also has added context information such as how to validate certain input and further describes where to store such input if it is intended to be non-volatile. Applications such as a browser or script engine may use the information with the forms to validate configuration setting values with or without a user interface.

33.2.1.5 Strings

The strings are the text-based (UCS-2 encoded) representations of the information typically being referenced by the forms. The intent of this infrastructure is also to seamlessly enable multiple language support. To that end the strings have the appropriate language designators to differentiate one language from another.

33.2.1.6 Images/Fonts

Since most content is typically intended to have the ability to be rendered on the local system, the human interface infrastructure also supports the ability for images and fonts to be accepted and used by the underlying user interface components.

33.2.1.7 Consumers of the user interface data

The ultimate consumer of the user interface information will be some type of forms browser or forms processor. There are several usage scenarios which should be supported by this specification. These are illustrated below:

33.2.1.8 Connected forms browser/processor

The ability to have the forms processing engine render content when directly connected to the target platform should be apparent. From the forms processing engine perspective, this could be the local machine or a machine that is network attached. In either case, there is a constructed agent which feeds the material to the forms processor for purposes of rendering the user interface and interacting with the user. Note that a forms processor could simply act on the forms data without ever having to render the user interface and interact with the user. This situation is much more akin to script processing and should be a very supportable situation.

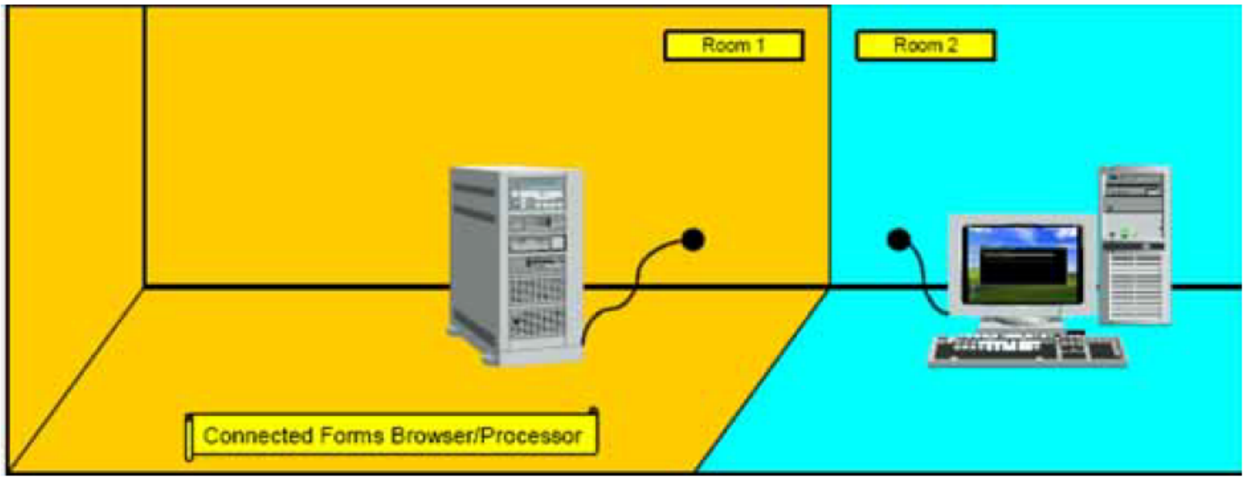

Fig. 33.8: Connected Forms Browser/Processor

33.2.1.9 Disconnected Forms Browser/Processor

By enabling the ability to import and export a platform's settings, this infrastructure can also enable the ability for offline configuration. In this instance, a forms processor can interpret a given platform's form data and enable (either through user interaction or through automated scripting) the changing of configuration settings. These settings can then be applied to the target platform when a connection is established.

33.2.1.10 O/S-Present Forms Browser/Processor

When it is desired that the forms data be used in the presence of an O/S, this specification describes a means by which to support this capability. By being able to encapsulate the data and export it through standard means such that an O/S agent (e.g. forms browser/processor) can retrieve it, O/S-present usage models can be made available for further value-add implementations.

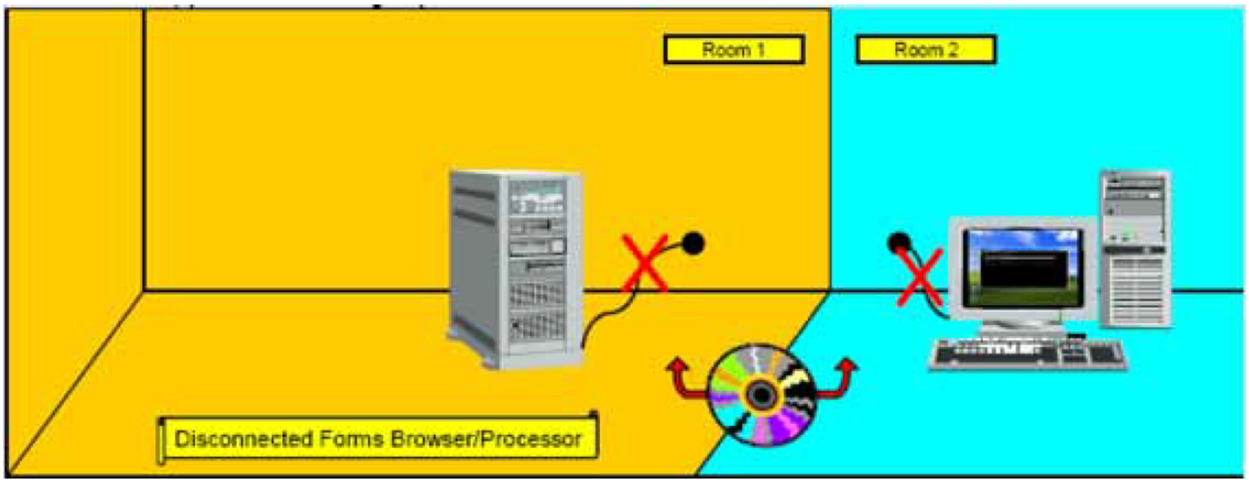

Fig. 33.9: Disconnected Forms Browser/Processor

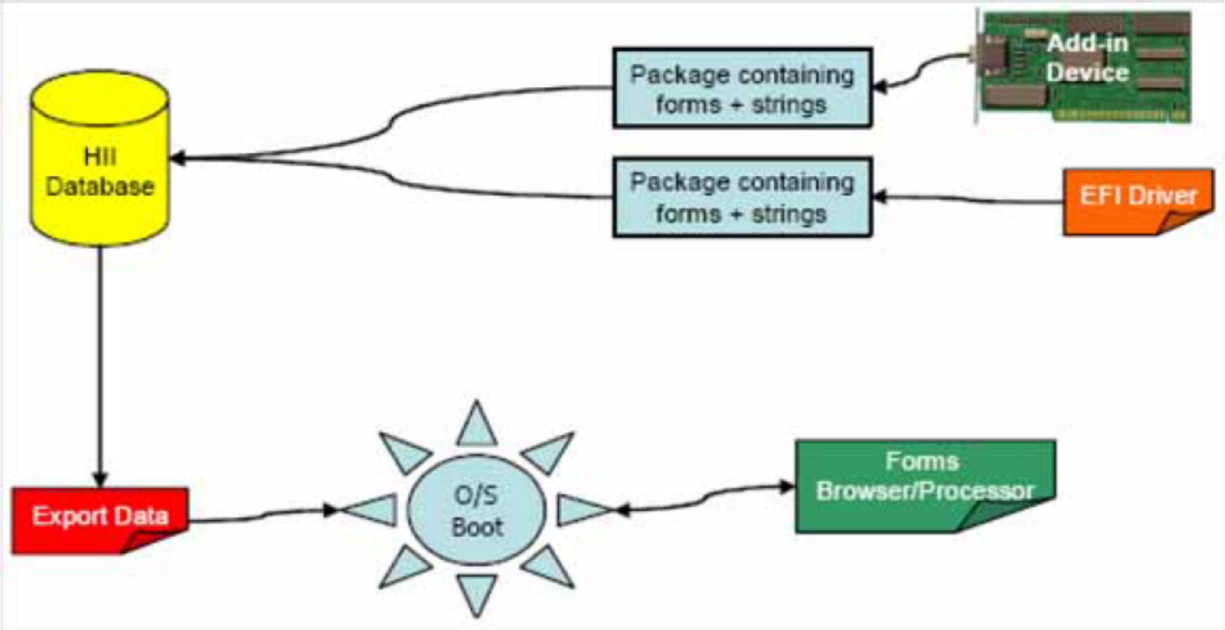

Fig. 33.10: O/S-Present Forms Browser/Processor

33.2.1.11 Where are the Results Stored

The forms data encodes how to store the changes per configuration question. The ability to save data to the platform as well as to a proprietary on-board store is provided. The premise is that each of the target non-volatile store components (e.g. motherboard, add-in device, etc.) would advertise an interface as described in this specification so that the forms browser/processor can route changes to the appropriate target.

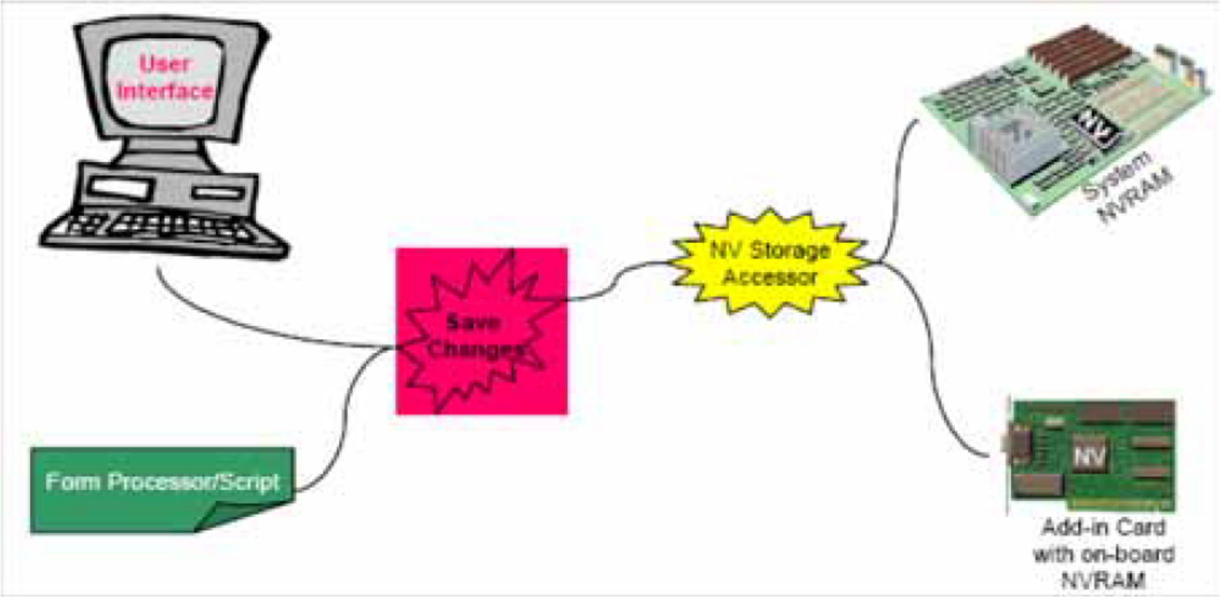

Fig. 33.11: **Platform Data Storage**

33.2.2 Localization

Localization is the process by which the interface is adapted to a particular language. The table below discusses issues with localization and provides possible solutions.

Table 33.1: Localization Issues

Issue	Example	Solution	Comment
Directional display	Right to left printing for Hebrew.	Printing direction is a function of the language.	The display engine may or may not support all display techniques. If a language supports a display mechanism that the display engine does not, the language that uses the font must be selected.
Punctuation	Punctuation is directional. A comma in a right-to-left language is different from a comma in a left-to-right language.	Character choice is the choice of the author or translator.	

continues on next page

Table 33.1 – continued from previous page

Line breakage	Rules vary from language to language.	The UEFI preboot GUI performs little or no formatting.	The runtime display depends on the runtime browser and is not defined here.
Date and time	Most Europeans would write July 4, 1776, as 4/7/1776 while the United States would write it 7/4/1776 and others would write 1776/7/4. The separator characters between the parts of both date and time vary as well.	Generally left to the creator of the user interface.	
Numbers	12,345.67 in one language is presented as 12.345,67 in another.	Print only integers and do not insert separator characters.	This solution is gaining acceptance around the world as more people use computers.

33.2.3 User Input

To limit the number of required glyphs, we must also limit the amount and type of user input.

User input generally comes from the following main types of devices:

- Keyboards
- Mouse-like pointing devices

Input from other devices, such as limited keys on a front panel, can be handled two ways:

- Treat the limited keys as special-purpose devices with completely unique interfaces.
- Programmatically make the limited keys mimic a keyboard or mouse-like pointing device.

Pointing devices require no localization. They are universally understood by the subset of the world population addressed in this specification. For example, if a person does not know how to use a mouse or other pointing device, it is probably not a good idea to allow that person to change a system's configuration.

On the other hand, keyboards are localized at the keycaps but not in the electronics. In other words, a French keyboard and a German keyboard might have very different keys but the software inside the keyboard–let alone the software in the system at the other end of the wire–cannot know which set of keycaps are installed.

This specification proposes to solve this issue by using the keys that are common between keyboards and ignoring language-specific keys. Keys that are available on USB keyboards in preboot mode include the following:

- Function keys (F1 - F12)
- Number keys (0-9)
- "Upside down T" cursor keys (the arrows, home, end, page up, page down)

- Numeric keypad keys
- The Enter, Space, Tab, and Esc keys
- Modifier keys (shifts, alts, controls, Windows*)
- Number lock

The scan codes for these keys do not vary from language to language. These keys are the standard keys used for browser navigation although most end-users are unaware of this fact. Help for form-entry-specific keys must be provided to enable a useful keys-only interface. The one case where other, language-specific keys may be used is to enter passwords. Because passwords are never displayed, there is no requirement to translate scan code to Unicode character codes (keyboard localization) or scan codes to font glyphs.

Additional data can be provided to enable a richer set of input characters. This input is necessary to support features such as arbitrary text input and passwords.

33.2.4 Keyboard Layout

33.2.4.1 Keyboard Mapping

UEFI's keyboard mapping loosely based definitions on ISO 9995. It bases the naming mechanism on the figure below. The keys highlighted in brown are the keys that nearly all keyboard layouts use for customizations. However, customization does not necessarily mean that all the keys are different. In fact, most of the keys are likely to be the same. When modifying the mapping, one can normally reference the keys in brown as the likely candidates (for whom to create modifications).

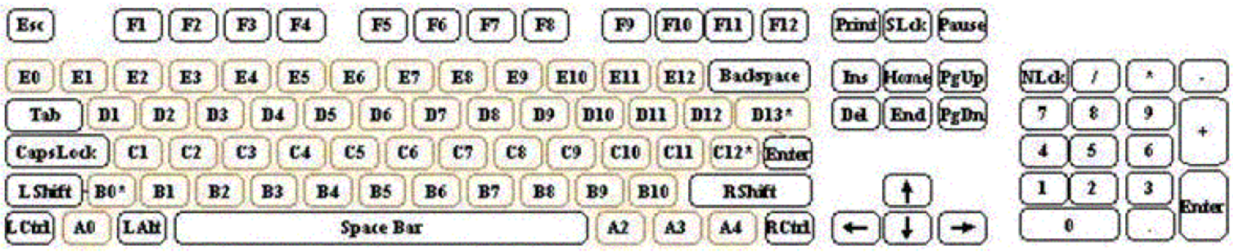

Fig. 33.12: **Keyboard Layout**

Instead of referencing keys in hardware-specific ways such as scan codes, the HII specification defines an *EFI_KEY* enumeration that allows for a simple method of referencing this hardware abstraction. Type *EFI_KEY* is defined in *EFI_HII_DATABASE_PROTOCOL.GetKeyboardLayout()*. It also provides a way to update the keyboard layout with a great deal of flexibility. Any of the keys can be mapped to any 16-bit Unicode character code or control code value.

When defining the values for a particular key, there are six elements that are pertinent to the key:

Key name — The EFI_KEY enumeration defines the names of the above keys.

Unicode Character Code — Defines the Unicode Character Code (if any) of the named key.

Shifted UnicodeCharacter Code — Defines the Unicode Character Code (if any) of the named key while the shift modifier key is being pressed

Alt-GR Unicode Character Code — Defines the Unicode Character Code (if any) of the named key while the Alt-GR modifier key (if any) is being pressed.

Shifted Alt-GR UnicodeCharacter Code — Defines the Unicode Character Code (if any) of the named key while the Shift and Alt-GR modifier key (if any) is being pressed.

Modifier key value — Defines the nonprintable special function that this key has assigned to it.

- Under normal circumstances, a key that has any Unicode character code definitions generally has a modifier key value of *EFI_NULL_MODIFIER*. This value means the key has no special function other than the printing of a character. An exception to the rule is if any of the Unicode character codes have a value of 0xFFFF. Although rarely used, this value is the one case in which a key might have both a printable character and an active control key value.

An example of this exception would be the numeric keypad's insert key. The definition for this key on a standard US keyboard is as follows:

```
Key = EfiKeyZero
Unicode = 0x0030 (basically a '0')
ShiftedUnicode = 0xFFFF (the exception to the rule)
AltGrUnicode = 0x0000
ShiftedAltGrUnicode = 0x0000
Modifier = EFI_INSERT_MODIFIER
```

This key is one of the few keys that, under normal circumstances, prints something out but also has a special function. These special functions are generally limited to the numeric keypad; however, this general limitation does not prevent someone from having the flexibility of defining these types of variations.

33.2.4.2 Modifier Keys

The definitions of the modifier keys allow for special functionality that is not necessarily accomplished by a printable character. Many of these modifier keys are flags to toggle certain state bits on and off inside of a keyboard driver. An example is **EFI_CAPS_LOCK_MODIFIER**. This state being active could alter what the typing of a particular key produces. Other control keys, such as **EFI_LEFT_ARROW_MODIFIER** and **EFI_END_MODIFIER**, affect the position of the cursor. One modifier key is likely unfamiliar to most people who exclusively use US keyboards, and that key is the **EFI_ALT_GR_MODIFIER** key. This key's primary purpose is to activate a secondary type of shift modifier that exposes additional printable characters on certain keys. In some keyboard layouts, this key does not exist and is normally the **EFI_RIGHT_ALT_MODIFIER** key. None of the other modifier key functions should be a mystery to someone familiar with the usage of a standard computer keyboard.

An example of a few descriptor entries would be as follows:

```
Layout = {
EfiKeyLCtrl,0,0,0,0, *EFI_LEFT_CONTROL_MODIFIER,* //Left control
                                                      // key
EfiKeyA0,0,0,0,0,EFI_NULL_MODIFIER, //Not defined
                     // windows key
EfiKeySpaceBar,0x0020,0x0020,0x0020,0x0020,EFI_NULL_MODIFIER
                     //(Space Bar)
}
```

See "Related Definitions" in *EFI_HII_DATABASE_PROTOCOL.GetKeyboardLayout()* for the defined modifier values.

33.2.4.3 Non-Spacing Keys

Non-spacing keys are a concept that provides the ability to *OR* together an accent key and another printable character. Non-spacing keys are defined as special types of modifier characters. They are typically accent keys that do not advance the cursor and in essence are a type of modifier key in that they maintain some level of state.

The way a person uses a non-spacing key is that the non-spacing key that maybe has the function of overlaying an umlaut (two dots) onto whatever the next character might be. The user presses the umlaut non-spacing key and follows it with a capital A, which yields an "Ä."

An example of a few descriptor entries would be as follows:

```
//
// If it's a dead key, we need to pass a list of physical key
// names, each with a unicode, shifted, altgr, shiftedaltgr
// character code. Each key name will have a Modifier value of
// EFI_NS_KEY_MODIFIER for the first entry, and then the list of
// EFI_NS_KEY_DEPENDENCY_MODIFIER physical key descriptions.
// This eventually will lead to the next normal non-modifier key
// definition.
//
// This requires defining an additional Modifier value of
// EFI_NS_KEY_DEPENDENCY_MODIFIER to signify
// EFI_NS_KEY_MODIFIER children definitions.
//
// The keyboard driver (consumer of the layouts) will know that
// any key definitions with the EFI_NS_KEY_DEPENDENCY_MODIFIER
// modifier do not redefine the value of the specified EFI_KEY.
// They are simply used as a special case augmentation to the
// original EFI_NS_KEY_MODIFIER.
//
// It is an error condition to define a
// EFI_NS_KEY_MODIFIER without having all the
// EFI_NS_KEY_DEPENDENCY_MODIFIER keys defined serially.
//
Layout = {
EfiKeyE0, 0, 0, 0, 0, EFI_NS_KEY_MODIFIER,
EfiKeyC1, 0x00E2, 0x00C2, 0, 0, EFI_NS_KEY_DEPENDENCY_MODIFIER,
EfiKeyD3, 0x00EA, 0x00CA, 0, 0, EFI_NS_KEY_DEPENDENCY_MODIFIER,
EfiKeyD8, 0x00EC, 0x00CC, 0, 0, EFI_NS_KEY_DEPENDENCY_MODIFIER,
EfiKeyD9, 0x00F4, 0x00D4, 0, 0, EFI_NS_KEY_DEPENDENCY_MODIFIER,
EfiKeyD7, 0x00FB, 0x00CB, 0, 0, EFI_NS_KEY_DEPENDENCY_MODIFIER
}
```

In the above example, a key located at E0 is designated as a dead key. Using a common German keyboard layout as the example, a circumflex accent "^" is defined as a dead key at the E0 location. The A, E, I, O, and U characters are valid keys that can be pressed after the dead key and will produce a valid printable character. These characters are located at C1, D3, D8, D9, and D7 respectively.

The results of the *Layout* definition provided above would allow for the production of the following characters: âÂêÊîÎôÔûÛ.

33.2.5 Forms

This specification describes how a UEFI driver or application may present a forms (or dialogs) based interface. The forms-based interface assumes that each window or screen consists of some window dressing (title & buttons) and a list of questions. These questions represent individual configuration settings for the application or driver, although several GUI controls may be used for one question.

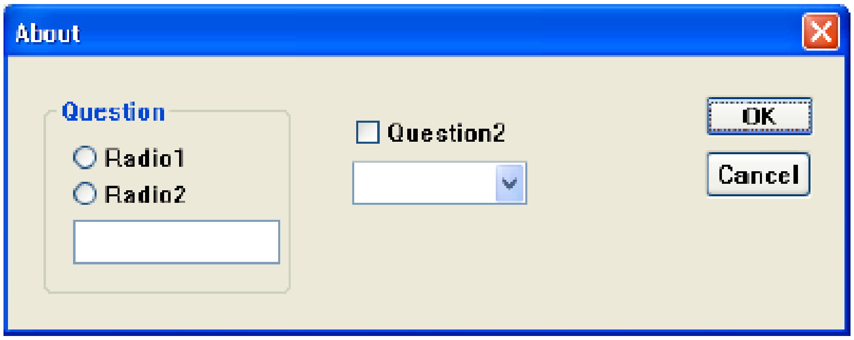

Fig. 33.13: **Forms-based Interface Example**

The forms are stored in the HII database, along with the strings, fonts and images. The various attributes of the forms and questions are encoded in IFR (Internal Forms Representation)–with each object and attribute a byte stream.

Other applications (so-called "Forms Processors") may use the information within the forms to validate configuration setting values without a user interface at all.

The Forms Browser provides a forms-based user interface which understands how to read the contents of the forms, interact with the user, and save the resulting values. The Forms Browser uses forms data installed by an application or driver during initialization in the HII database. The Forms Browser organizes the forms so that a user may navigate between the forms, select the individual questions and change the values using the HID and display devices. When the user has finished making modifications, the Forms Browser saves the values, either to the global EFI variable store or else to a private variable store provided by the driver or application.

33.2.5.1 Form Sets

Form sets are logically-related groups of forms.

Attributes

Each forms set has the following attributes:

Form Set Identifier – Uniquely identifies the form set within a package list using a GUID. The Form Set Identifier, along with a device path, uniquely identifies a form set in a system.

Form Set Class Identifier – Optional array of up to three GUIDs which identify how the form set should be used or classified. The list of standard form set classes is found in the "Related Definitions" section of *EFI_FORM_BROWSER2_PROTOCOL.SendForm()*.

Title – Title text for the form set.

Help – Help text for the form set.

Image – Optional title image for the form set.

Animation – Optional title animation for the form set.

Description

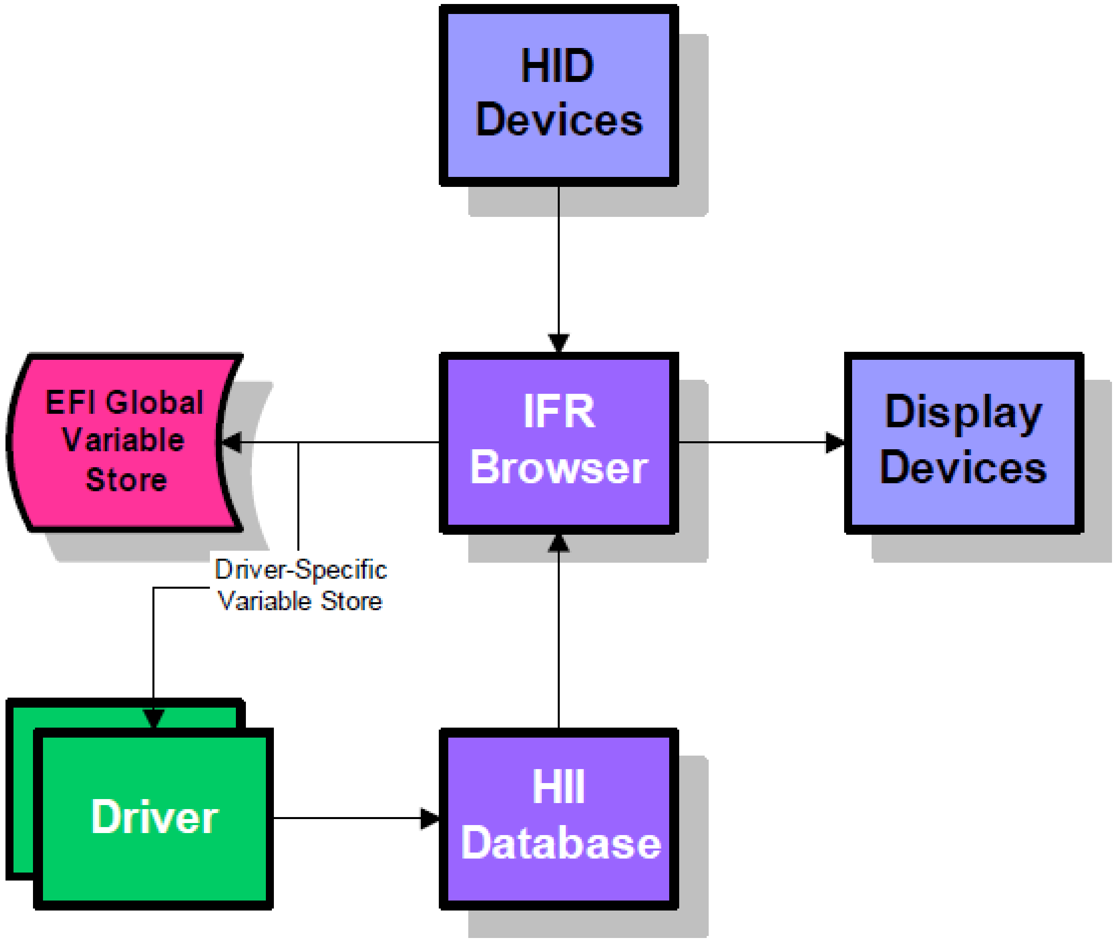

Fig. 33.14: **Platform Configuration Overview**

Within a form set, there is one parent form and zero or more child forms. The parent form is the first enabled, visible form in the form set. The child forms are the second or later enabled, visible forms in the form set. In general, the Forms Browser will provide a means to navigate to the parent form. A *Cross-Reference* is used to navigate between forms within a form set or between forms in different form sets.

Variable stores are declared within a form set. Variable stores describe the means for retrieval and storage of configuration settings, and location information within that variable store. For more information, see *Storage*.

Default stores are declared within a form set. Default stores group together different types of default settings (normal, manufacturing, etc.) and give them a name. See *Defaults* for more information.

The form set can control whether or not to process an individual form by nesting it inside of an *EFI_IFR_DISABLE_IF* expression. *Enable/Disable-1* for more information. The form set can control whether or not to display an individual form by nesting it inside of an *EFI_IFR_SUPPRESS_IF* expression.

Syntax

The form set consists of an **EFI_IFR_FORM_SET** object, where the body consists of

```
form-set := EFI_IFR_FORM_SET form-set-list
form-set-list := form form-set-list|
EFI_IFR_IMAGE form-set-list |
EFI_IFR_ANIMATION form-set-list |
EFI_IFR_VARSTORE form-set-list |
EFI_IFR_VARSTORE_EFI form-set-list |
EFI_IFR_VARSTORE_NAME_VALUE form-set-list |
EFI_IFR_DEFAULTSTORE form-set-list |
EFI_IFR_DISABLE_IF expression form-set-list |
<empty>
EFI_IFR_SUPPRESS_IF expression form-set-list | <empty>
```

33.2.5.2 Forms

Forms are logically-related groups of statements (including questions) designed to be displayed together.

Attributes

Each form has the following attributes:

Form Identifier — A 16-bit unsigned integer, which uniquely identifies the form within the form set. The Form Identifier, along with the device path and Form Set Identifier, uniquely identifies a form within a system.

Title — Title text for the form. The Forms Browser may use this text to describe the nature and purpose of the form in a window title.

Image — Optional title image for the form. The Forms Browser may use this image to display the nature and purpose of the form in a window title.

Animation — Optional title animation for the form set.

Modal — If a form is modal, then the on-form interaction must be completed prior to navigating to another form. See “User Interaction”, *User Interaction*.

The form can control whether or not to process a statement by nesting it inside of an *EFI_IFR_DISABLE_IF* expression. See *Enable/Disable-2* for more information.

The form can control whether a particular statement is selectable by nesting it inside of an *EFI_IFR_GRAY_OUT_IF* expression. Statements that cannot be selected are displayed by Form Browsers, but cannot be selected by a user. *EFI_IFR_GRAY_OUT_IF* causes statements to be displayed with some visual indication. See *Evaluation Of Selectable Statements* for more information.

The form can control whether to display a statement by nesting it inside of an *EFI_IFR_SUPPRESS_IF* expression. See *EFI_IFR_SUPPRESS_IF* for more information.

Syntax

The form consists of an *EFI_IFR_FORM* object, where the body consists of:

```
form := EFI_IFR_FORM form-tag-list |
EFI_IFR_FORM_MAP form-tag-list
form-tag-list := form-tag form-tag-list |
<empty>
form-tag := EFI_IFR_IMAGE |
EFI_IFR_ANIMATION |
EFI_IFR_LOCKED |
EFI_IFR_RULE |
EFI_IFR_MODAL_TAG |
statement |
question |
cond-statement-list |

<empty>
statement-list := statement statement-list |
question statement-list |
cond-statement-list |
<empty>

cond-statement-list := EFI_IFR_DISABLE_IF expression
statement-list |
EFI_IFR_SUPPRESS_IF expression statement-list |
EFI_IFR_GRAY_OUT_IF expression statement-list |
question-list := question question-list |
<empty>
```

Other unknown opcodes are permitted, but will be ignored.

33.2.5.2.1 Enable/Disable-1

Disabled forms will not be processed at all by a Forms Processor. Forms are enabled unless:

- The form nests inside an *EFI_IFR_DISABLE_IF* expression which evaluated to **FALSE**.
- The disabling of forms is evaluated during Forms Processor initialization and is not re-evaluated.

33.2.5.2.2 Modifiability

Forms can be locked so that a Forms Editor will not change it. Forms are unlocked unless:

- The form has an *EFI_IFR_LOCKED* in its scope. The locking of statement is evaluated only during Forms Editor initialization.

33.2.5.2.3 Visibility

Suppressed forms will not be displayed. Forms are visible unless:

- The form is disabled (*Questions*)
- The form is nested inside an *EFI_IFR_SUPPRESS_IF* expression which evaluates to **FALSE**.

33.2.5.3 Statements

All displayable items within the body of a form are statements. Statements provide information or capabilities to the user. Questions (*Questions*) are a specialized form of statement with a value. Statements are used only by Forms Browsers and are ignored by other Forms Processors.

Attributes

Statements have the following attributes:

Prompt — The text that will be displayed with the statement.

Help — The extended descriptive text that can be displayed with the statement.

Image — The optional image that will be displayed with the statement.

Animation — The optional animation that will be displayed with the statement.

Other than Questions, there are three types of statements:

- Static Text/Image
- Subtitle
- Cross-Reference

Syntax

```
statement:= subtitle | static-text | reset button
statement-tag-list := statement-tag statement-tag-list |
<empty>
statement-tag := EFI_IFR_IMAGE |
EFI_IFR_LOCKED
EFI_IFR_ANIMATION
```

33.2.5.3.1 Display

Statement display depends on the Forms Browser. Statements do not describe how the statement must be displayed but rather provide resources (such as text and images) for use by the Forms Browser. The Forms Browser uses this information to create the necessary user interface.

The Forms Browser may use the visibility (*Visibility-1*) or selectability (*Evaluation Of Selectable Statements*) of the statements to change the way the item is displayed. The *EFI_IFR_GRAY_OUT_IF* expression explicitly requires that nested statements have visual differentiation from normal statements.

33.2.5.3.2 Enable/Disable-2

Statements which have been disabled will not be processed at all by a Forms Processor. Statements are enabled unless:

- The parent statement or question is disabled.
- The statement is nested inside an *EFI_IFR_DISABLE_IF* expression which evaluated to **FALSE**.
- The disabling of statements is evaluated during Forms Browser initialization and is not re-evaluated.

33.2.5.3.3 Visibility-1

Suppressed statements will not be displayed. Statements are displayed unless:

- The parent statement or question is suppressed.
- The statement is disabled *Enable/Disable-1*
- The statement is nested inside an *EFI_IFR_SUPPRESS_IF* expression which evaluates to **FALSE**.

The suppression of the statements is evaluated during Forms Browser initialization. Subsequently, the suppression of statements is reevaluated each time a value in any question on the selected form has changed.

33.2.5.3.4 Evaluation of Selectable Statements

A user in a Forms Browser can choose statements which are selectable. Statements are selectable unless:

- The parent statement or question is not selectable.
- The statement is suppressed *Enable/Disable-2*
- The statement is nested inside an *EFI_IFR_GRAY_OUT_IF* expression which evaluated to **FALSE**.

The evaluation of selectable statements takes place during Forms Browser initialization. Subsequently, selectable statements are reevaluated each time a value in any question on the selected form has changed.

33.2.5.3.5 Modifiability

A statement can be locked so that a Forms Editor will not change it. Statements are unlocked unless:

- The parent form or parent statement/question is locked.
- The statement has an *EFI_IFR_LOCKED* in its scope.

The locking of a statement is evaluated only during Forms Editor initialization.

33.2.5.3.6 Static Text/Image

The Forms Browser displays the specified prompt, the specified text and (optionally) the image, but has no user interaction.

Syntax

```
static-text:= EFI_IFR_TEXT statement-tag-list
```

33.2.5.3.7 Subtitle

The subtitle is a means of visually grouping questions by providing a separator, some optional separating text, and an optional image.

Syntax

```
subtitle:= EFI_IFR_SUBTITLE statement-tag-list
```

33.2.5.3.8 Reset Button

Attributes

Reset Buttons have the following attributes:

Default Id — Specifies the default set to use when restoring defaults to the current form.

Syntax

```
reset button : = EFI_IFR_RESET_BUTTON statement-tag-list
```

33.2.5.4 Questions

Questions are statements which have a value. The value corresponds to a configuration setting for the platform or for a device. The question uniquely identifies the configuration setting, describes the possible values, the way the value is stored, and how the question should be displayed.

Attributes

Questions have the following attributes (in addition to those of statements):

Question Identifier — A 16-bit unsigned integer which uniquely identifies the question within the form set in which it appears. The Question Identifier, along with the device path and Form Set Identifier, uniquely identifies a question within a system.

Default Value — The value used when the user requests that defaults be loaded.

Manufacturing Value — The value used when the user requests that manufacturing defaults are loaded.

Value — Each question has a current value. See *Values* for more information.

Value Format — The format used to store a question's value.

Value Storage — The means by which values are stored. See *Storage Requirements* for more information.

Refresh Identifiers — Zero or more GUIDs associated with an event group initialized by the Forms Browser when the form set containing the question is opened. If the event group associated with the GUID is signaled (see *SignalEvent()*), then the question value will be updated from storage.

Refresh Interval — The minimum number of seconds that must pass before the Forms Browser will automatically update the current question value from storage. The default value is zero, indicating there will be no automatic refresh.

Validation — New values assigned to questions can be validated, using validation expressions, or, if connected, using a callback. See *Validation* for more information.

Callback — If set, the callback will be called when the question's value is changed. In some cases, the presence of these callbacks prevents the question's value from being edited while disconnected. The question can control whether a particular option can be displayed by nesting it inside of an *EFI_IFR_SUPPRESS_IF* expression. Form Browsers do not display Suppressed Options, but Suppressed Options may still be examined by Form Processors.

Syntax

```
question:= action-button | boolean | date | number | ordered-list | string | time |
cross-reference
question-tag-list:= question-tag question-tag-list |
<empty>
question-tag := statement-tag |
   EFI_IFR_INCONSISTENT_IF expression |
   EFI_IFR_NO_SUBMIT_IF expression |
   EFI_IFR_WARNING_IF expression |
   EFI_IFR_DISABLE_IF expression question-list |
   EFI_IFR_REFRESH_ID RefreshEventGroupId |
   EFI_IFR_REFRESH |
   EFI_IFR_VARSTORE_DEVICE
question-option-tag := EFI_IFR_SUPPRESS_IF expression |
   EFI_IFR_VALUE optional-expression |
   EFI_IFR_READ expression |
   EFI_IFR_WRITE expression |
   default |
   option
question-option-list := question-tag question-option-list |
   question-option-tag question-option-list |
   <empty>
```

Other unknown opcodes are permitted but are ignored.

33.2.5.4.1 Values

Question values are a data type listed in *Data Types*. During initialization of the Forms Processor or Forms Browser, the values of all enabled questions are retrieved. If the value cannot be retrieved, then the question's value is *Undefined*.

A question with the value of type *Undefined* will be suppressed. This suppression will be reevaluated based on Value Refresh or when any question value on the selected form is changed.

When the form is submitted, the modified values are written to Value Storage. When the form is reset, the question value is set to the default question value. If there is no default question value, the question value is unchanged.

When a question value is retrieved, the following process is used:

1. Set the this internal constant to have the samevalue as the one read from the question's storage.**
2. If present, change the current question value to the value returned by a question's nested *EFI_IFR_READ* operator.

When a question value is changed, the following process is used:

1. Set the this internal constant to have the samevalue as the current question value.
2. If present, evaluate the question's nested *EFI_IFR_WRITE* (*EFI_IFR_WRITE*) operator.
3. Write the value to the question's storage

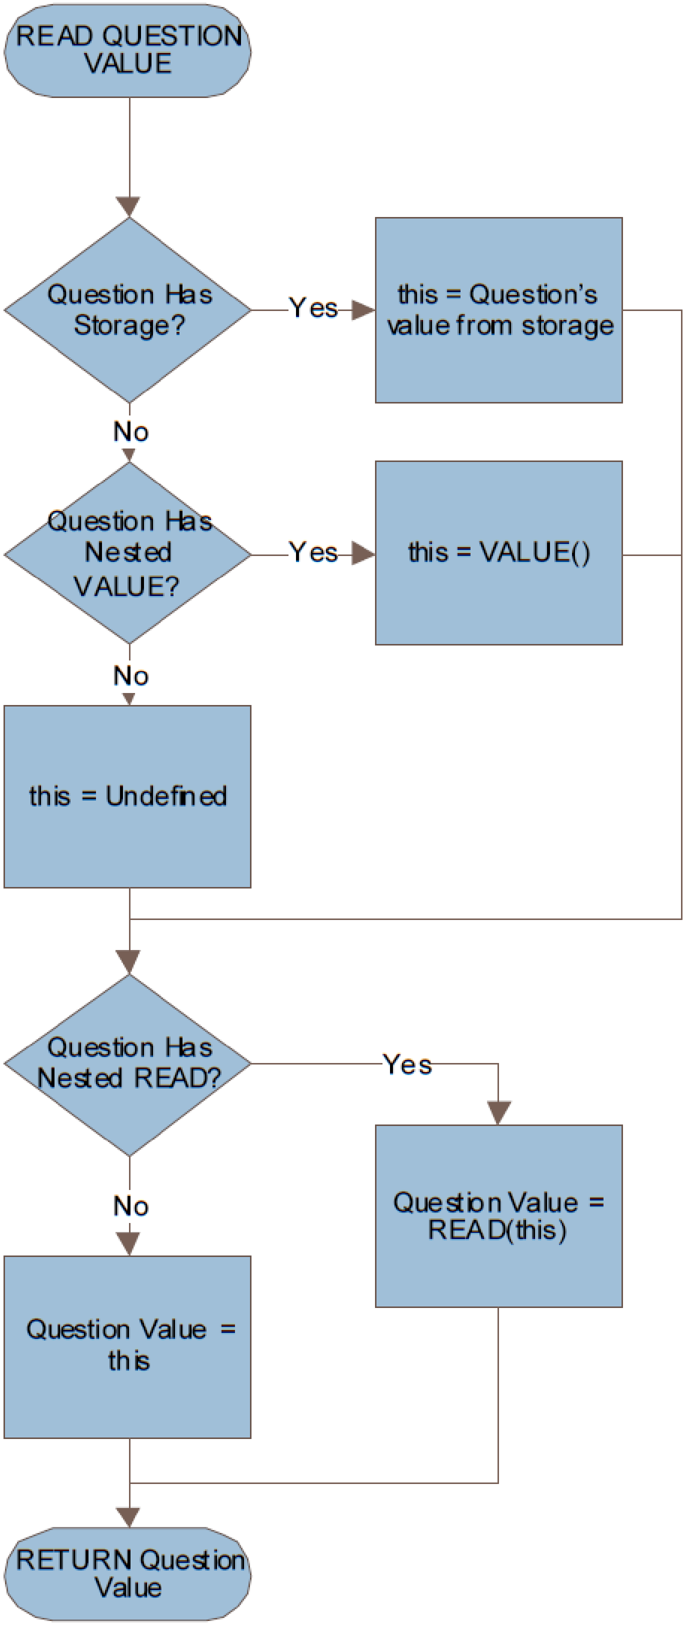

Fig. 33.15: Question Value Retrieval Process

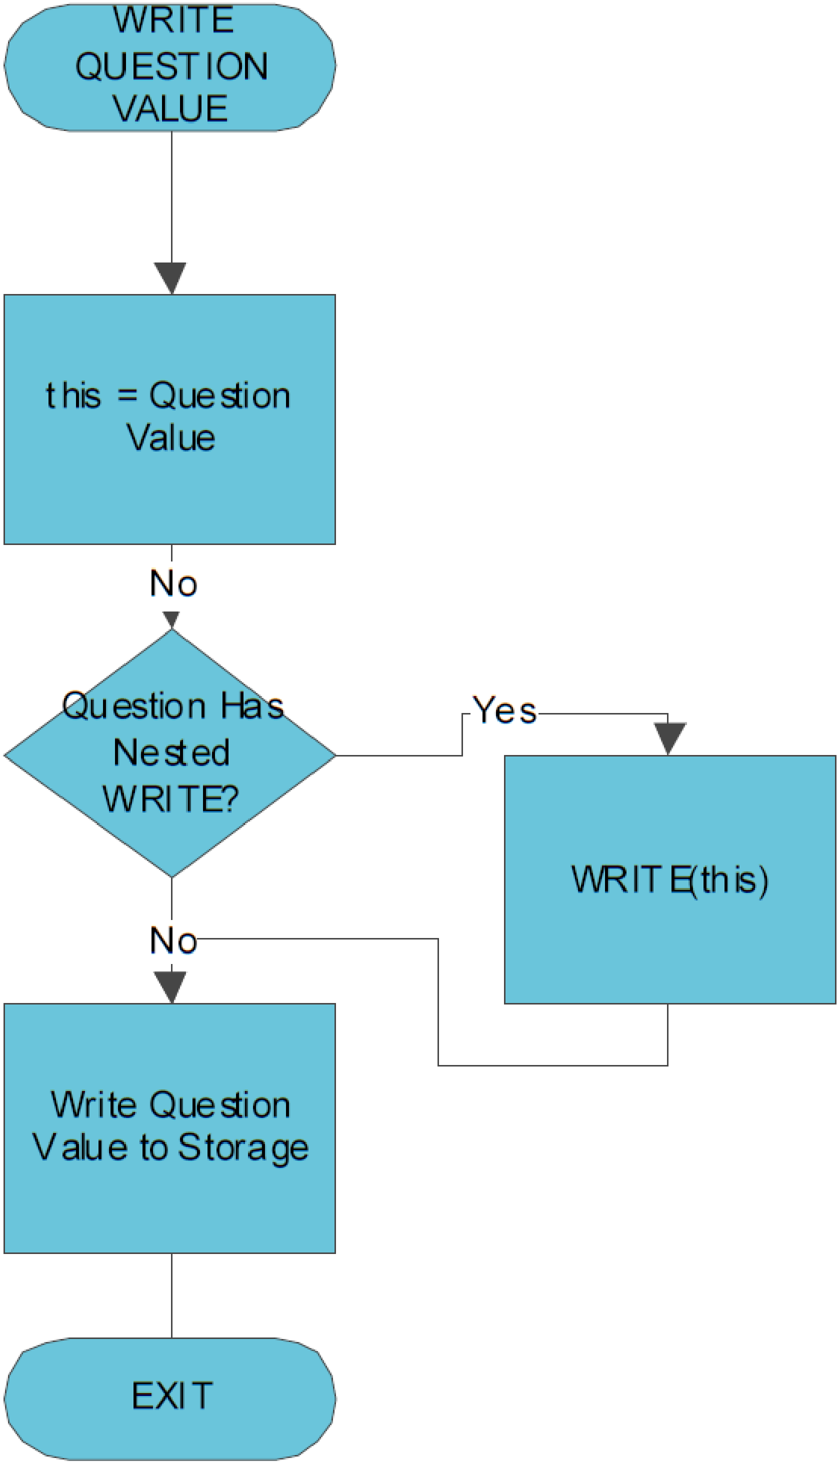

Fig. 33.16: Question Value Change Process

33.2.5.4.2 Storage Requirements

Question storage requirements describe the type and size of storage for the value. These storage requirements describe whether the question's value will be stored as an EFI global variable or using driver local storage. It also describes whether the value is packed together with other values in a buffer, or passed as a name-value pair. See *Storage* for more information.

33.2.5.4.3 Display

Question display depends on the Forms Browser. Questions do not describe how the question must be displayed. Instead, questions provide resources (such as text and images) and information about visibility and the ability to edit the question. The Forms Browser uses these to create the necessary user interface. Questions can have prompt text, help text and (optionally) an image. The prompt text usually describes the nature of the question. Help text is displayed either in a special display area or only at the request of the user. Questions can also have hints which describe how to visually organize the information

33.2.5.4.4 Action Button

Action buttons are buttons which cause a pre-defined configuration string to process immediately. There is no storage directly associated with the button.

Attributes

Action buttons have no additional attributes other than the common question attributes).

Storage — There is no storage associated with the action button.

Results — There are no results associated with the action button.If used in an expression, the question value will always be *Undefined.*

Syntax

```
action-button:= EFI_IFR_ACTION question-tag-list
```

33.2.5.4.5 Boolean

Boolean questions are those that allow a choice between **TRUE** and **FALSE**. The question's value is Boolean. In general, construct questions so that the prompt text asks questions resulting in 'yes/enabled/on' is 'true' and 'no/disabled/off' is 'false'.

Boolean questions may be displayed as a check box, two radio buttons, a selection list, a list box, or a drop list box.

Attributes

Boolean questions have no additional attributes other than the common question attributes:

Storage — If the boolean question uses Buffer storage or EFI Variable (see *Storage*), then the size is exactly one byte, with the **FALSE** condition is zero and the **TRUE** value is 1.

Results — The results are represented as either 0 (*FALSE*) or 1 (*TRUE*).

Syntax

```
boolean := EFI_IFR_CHECKBOX question-option-list
```

33.2.5.4.6 Date

Date questions allow modification of part or all of a standard calendar date. The format of the date display depends on the Forms Browser and any localization.

Attributes

Date questions have the following attributes:

Year Suppressed — The year will not be displayed or updated.

Month Suppressed — The month will not be displayed or updated.

Day Suppressed — The day will not be displayed or updated.

UEFI Storage — In addition to normal question Value Storage, Date questions can optionally be instructed to save the date to either the system time or system wake-up time using the UEFI runtime services *SetTime()* or *SetWakeupTime()*. In this case, the date and time will be read first, the modifications made and changes will be written back.

Conversion to and from strings to a date depends on the system localization.

The date value is stored an *EFI_HII_TIME* structure. The TimeZone field is always set to *EFI_UNSPECIFIED_TIMEZONE*. The Daylight field is always set to zero. The contents of the other fields are undetermined.

Storage — If the date question uses Buffer storage or EFI Variable storage (*Storage*), then the stored result will occupy exactly the size of *EFI_HII_DATE*.

Results — Results for date questions are represented as a hex dump of the *EFI_HII_DATE* structure. If used in a question, the value will be a buffer containing the contents of the *EFI_HII_DATE* structure.

Syntax

```
date := EFI_IFR_DATE question-option-list
```

33.2.5.4.7 Number

Number questions allow modification of an integer value up to 64-bits. Number questions can also specify pre-defined options.

Attributes

Number questions have the following attributes:

Radix — Hint describes the output radix of numbers. The possible values are unsigned decimal, signed decimal or hexadecimal. Numbers displayed in hexadecimal will be prefixed by ‘0x’

Minimum Value — The minimum unsigned value which can be accepted for this question.

Maximum Value — The maximum unsigned value which can be accepted for this question.

Skip Value — Defines the minimum increment between values.

Storage — If the number question uses Buffer storage or EFI Variable storage (*Storage*), then the buffer size specified by must be 1, 2, 4 or 8. Also, the Forms Processor will do implicit error checking to make sure that the signed or unsigned value can be stored in the Buffer without lost of significant bits. For example, if the buffer size is 1 byte, then the largest unsigned integer value would be 255. Likewise, the largest signed integer value would be 127 and the smallest signed integer value would be -128. The Forms Processor will automatically detect this as an error and generate an appropriate error.

Results — The results are represented as string versions of unsigned hexadecimal values.

Syntax

```
number := EFI_IFR_NUMERIC question-option-list |
EFI_IFR_ONE_OF question-option-list
```

33.2.5.4.8 Set

Sets are questions where n containers can be filled with any of m pre-defined choices. This supports both lists where a given value can only appear in one of the slots or where the same choice can appear many times.

Each of the containers takes the form of an option which a name, a value and (optionally) an image.

Attributes

Set questions have the following attributes:

Container Count — Specifies the number of available selectable options.

Unique — If set, then each choice may be used at most, once.

NoEmpty — All slots must be filled with a non-zero value.

Storage — The set questions are stored as a Buffer with one byte for each Container.

Results

Each Container value is represented as two characters, one for each nibble. All hexadecimal characters (a-f) are in lower-case.

The results are represented as a series of Container values, starting with the lowest Container.

Syntax

```
ordered-list := EFI_IFR_ORDERED_LIST question-option-list
```

Options

Set questions treat the values specified by nested *EFI_IFR_ONE_OF_OPTION* values as the value for a single Container, not the entire question storage. This is different from other question types.

Defaults

Set questions treat the default values specified by nested *EFI_IFR_DEFAULT* or *EFI_IFR_ONE_OF_OPTION* opcodes as the default value for all Containers. The default values must be of type *EFI_IFR_TYPE_BUFFER,* with each byte in the buffer corresponding to a single Container value, starting with the first container. If the buffer contains fewer bytes than *MaxContainers,* then the remaining Containers will be set to a value of 0.

Default values returned from the ALTCFG section when *ExtractConfig()* is called fill the storage starting with the first container.

33.2.5.4.9 String

String questions allow modification of a string.

Attributes

String questions have the following attributes:

Minimum Length — Hint describes the minimum length of the string, in characters.

Maximum Length — Hint describes the maximum length of the string, in characters.

Multi-Line — Hint describes that the string might contain multiple lines.

Output Mask — If set, the text entered will not be displayed.

Storage — The string questions are stored as a *NULL* -terminated string. If the time question uses Buffer or EFI Variable storage (*Storage*), then the buffer size must exceed the size of the NULL-terminated string. If the string is shorter than the length of the buffer, the remainder of the buffer is filled with *NULL* characters.

Results — Results for string questions are represented as hex dump of the string, including the terminating *NULL* character.

Syntax

```
string := EFI_IFR_STRING question-option-list |
EFI_IFR_PASSWORD question-option-list
```

33.2.5.4.10 Cross-Reference

Cross-reference questions provide a selectable means by which users navigate to other forms and/or other questions. The form and question can be in the current form set, another form set or even in a form associated with a different device. If the specified form or question does not exist, the button is not selectable, is grayed-out, or is suppressed.

Attributes

Cross references can have the following attributes:

Form Identifier — The identifier of the target form.

Form Set Identifier — Optionally specifies an alternate form-set which contains the target form. If specified, then the focus will be on form within the form set specified by Form Identifier. If the Form Identifier is not specified, then the first form in the Form Set is used.

Question Identifier — Optionally specifies the question identifier of the target question on the target form. If specified then focus will be placed on the question specified by this question identifier. Otherwise, the focus will be on the first question within the specified form.

Device Path — Optionally, the device path which contains the Form Identifier. Otherwise, the device path associated with the form set containing this cross-reference will be used.

Storage — Storage is optional for a cross-reference question. It is only present when the cross-reference question does not supply any target (i.e., REF5). If the question uses Buffer or EFI Variable storage (*Storage*), then the buffer size must be exactly the size of the *EFI_HII_REF* structure.

Results — Results for cross-reference questions are represented as a hex dump of the question identifier, form identifier, form set GUID and null-terminated device path text. If used in a question, the question value will be a buffer containing the *EFI_HII_REF* structure..

Syntax

```
*cross-reference* := *EFI_IFR_REF* *statement-tag-list*
```

33.2.5.4.11 Time

Time questions allow modification of part or all of a time. The format of the time display depends on the Forms Browser and any localization.

Attributes

Time questions have the following attributes:

Hour Suppressed — The hour will not be displayed or updated.

Minute Suppressed — The minute will not be displayed or updated.

Second Suppressed — The second will not be displayed or updated.

UEFI Storage — In addition to normal question Value Storage, time questions can be instructed to save the time to either the system time or system wake-up time using the UEFI runtime services *SetTime* or *SetWakeupTime*. In these instances, the date and time is read first, the modifications made and changes are then written back.

Conversion to and from strings to a time depends on the system localization.

The time value is stored as part of an *EFI_HII_TIME* structure. The contents of the other fields are undetermined.

Storage — If the time question uses Buffer or EFI Variable storage (*Storage*), then the buffer size must be exactly the size of the *EFI_HII_TIME* structure..

Results — Results for time questions are represented as a hex dump of the *EFI_HII_TIME* structure. If used in a question, the value will be a buffer containing the contents of the *EFI_HII_TIME* structure.

Syntax

```
time := EFI_IFR_TIME question-option-list
```

33.2.5.5 Options

Use Options within questions to give text or graphic description of a particular question value. They may also describe the choices in the set data type.

Attributes

Options have the following attributes:

Text — The text for the option.

Image — The optional image for the option.

Animation — The optional animation for the option.

Value — The value for the option.

Default — If set, this is the option selected when the user asks for the defaults. Only one visible option can have this bit set within a question's scope.

Manufacturing Default — If set, this is the option selected when manufacturing defaults are set. Only one visible option can have this bit set within a question's scope.

Syntax

```
option:= EFI_IFR_ONE_OF_OPTION option-tag-list
option-tag-list := option-tag option-tag-list |
<empty>
```

(continues on next page)

(continued from previous page)

```
option-tag:= EFI_IFR_IMAGE
EFI_IFR_ANIMATION
```

33.2.5.5.1 Visibility

Options which have been suppressed will not be displayed. Options are displayed unless:

- The parent question is suppressed.
- The option is nested inside an *EFI_IFR_SUPPRESS_IF* expression which evaluated to **FALSE**.

The suppression of the options is evaluated each time the option is displayed.

33.2.5.6 Storage

Question values are stored in Variable Stores, which are application, platform or device repositories for configuration settings. In many cases, this is non-volatile storage. In other cases, it holds only the current behavior of a driver or application.

Question values are retrieved from the variable store when the form is initialized. They are updated periodically based on question settings and stored back in the variable store when the form is submitted.

It is possible for a question to have no associated Variable Store. This happens when the VarStoreId associated with the question is set to zero and, for Date/Time questions, the UEFI Storage is disabled. For questions with no associated Variable Store, the question must either support the RETRIEVE and CHANGED callback actions (*EFI_HII_CONFIG_ACCESS_PROTOCOL.CallBack()*) or contain an embedded READ or WRITE opcode: *EFI_HII_IFR_READ_OP* and *EFI_IFR_WRITE_OP* (*EFI_IFR_READ* and *EFI_IFR_WRITE*).

Because the value associated with a question contained in a Variable Store can be shared by multiple questions, the questions must all treat the shared information as compatible data types.There are four types of variable stores:

Buffer Storage — With buffer storage, the application, platform or driver provides the definition of a buffer which contains the values for one or more questions. The size of the entire buffer is defined in the *EFI_IFR_VARSTORE* definition. Each question defines a field in the buffer by providing an offset within the buffer and the size of the required storage. These variable stores are exposed by the app/driver using the *EFI_HII_CONFIG_ACCESS_PROTOCOL,* which is installed on the same handle as the package list. Question values are retrieved via *EFI_HII_CONFIG_ACCESS_PROTOCOL.ExtractConfig()* and updated via *EFI_HII_CONFIG_ACCESS_PROTOCOL.RouteConfig().* Rather than access the buffer as a whole, Buffer Storage Variable Stores access each field independently, via a list of one or more (field offset, value) pairs encoded as variable length text strings as defined for the *EFI_HII_CONFIG_ACCESS_PROTOCOL.*

Name/Value Storage — With name/value storage, the application provides a string which contains the encoded values for a single question. These variable stores are exposed by the app/driver using the *EFI_HII_CONFIG_ACCESS_PROTOCOL,* which is installed on the same handle as the package list.

EFI Variable Storage — This is a specialized form of Buffer Storage, which uses the EFI runtime services *GetVariable()* and *SetVariable()* to access the entire buffer defined for the Variable Store as a single binary object.

EFI Date/Time Storage — For date and time-related questions, the question values can be retrieved using the EFI runtime services *GetTime()* and *GetWakeupTime()* and stored using the EFI runtime services *SetTime()* and *SetWakeupTime().*

The following table summarizes the types of information needed for each type of storage and where it is retrieved from.

Table 33.2: Information for Types of Storage

Storage Type	Information Type	Where It Comes From
None	Driver Handle	Handle specified with *NewPackageList()* or derived from *EFI_IFR_VARSTORE_DEVICE.DevicePath*
Buffer Storage	Driver Handle	Handle specified with *NewPackageList()* or derived from *EFI_IFR_VARSTORE_DEVICE.DevicePath*
	Variable ID	Variable store specified by *EFI_IFR_QUESTION_HEADER* .*VarStoreId* *EFI_IFR_VARSTORE_DEVICE.DevicePath*
	Variable Name	Variable store specified by *EFI_IFR_QUESTION_HEADER* .*VarStoreId*
	Variable Store Offset	Variable store offset specified by *EFI_IFR_QUESTION_HEADER.VarOffset.*
Name/Value Storage	Driver Handle	Handle specified with *NewPackageList()* or derived from *EFI_IFR_VARSTORE_DEVICE.DevicePath*
	Variable ID	Variable store specified by *EFI_IFR_QUESTION_HEADER.VarStoreId.*
	Variable Name	Variable name specified by *EFI_IFR_QUESTION_HEADER* .*VarStoreInfo.VarName*.
EFI Variable Storage	Driver Handle	None
	Variable ID	Variable store specified by *EFI_IFR_QUESTION_HEADER* .*VarStoreId*.
	EFI_Variable GUID (for Variable Services)	EFI variable GUID specified by *EFI_IFR_VARSTORE_EFI.Guid.*
	EFI_Variable Name (for Variable Services)	EFI variable name specified by *EFI_IFR_VARSTORE_EFI.Name.*
	Variable Name	Variable name specified by *EFI_IFR_QUESTION_HEADER.VarStoreId.*
	Variable Store Offset	Variable store offset specified by *EFI_IFR_QUESTION_HEADER.VarStoreInfo.VarOffset.*
EFI Date/Time Storage	Driver Handle	None
	Variable ID	None
	Variable Name	None

33.2.5.7 Expressions

This section describes the expressions used in various expressions in IFR. The expressions are encoded using normal IFR opcodes, but in RPN (Reverse Polish Notation) where the operands occur before the operator.

The opcodes fall into these categories:

Unary operators. — Functions taking a single sub-expression.

Binary operators. — Functions taking two sub-expressions.

Ternary operators. — Functions taking three sub-expressions.

Built-in functions. — Operators taking zero or more sub-expressions.

Constants. — Numeric and string constants.

Question Values. — Specified by their question identifier.

All integer operations are performed at 64-bit precision.

33.2.5.7.1 Expression Encoding

Expressions are usually encoded within the scope of another binary object. If the expression consists of more than a single opcode, the first opcode should open a scope (*Header.Scope* = 1) and use an *EFI_IFR_END* opcode to close the scope in order to make sure they can be skipped,

33.2.5.7.2 Expression Stack

When evaluating expressions, the Forms Processor uses a stack to hold intermediate values. Each operator either pushes a value on the stack, pops a value from the stack, or both. For example, the *EFI_IFR_ONE* operator pushes the integer value 1 on the expression stack. The *EFI_IFR_ADD* operator pops two integer values from the expression stack, adds them together, and pushes the result back on the stack.

After evaluating an expression, there should be only one value left on the expression stack.

33.2.5.7.3 Rules

Rules are pre-defined expressions attached to the form. These rules may be used in any expression within the form's scope. Each rule is given a unique identifier (0-255) when it is created by *EFI_IFR_RULE*. This same identifier is used when the rule is referred to in an expression with *EFI_IFR_RULE_REF*.

To save space, rules are intended to allow manual or automatic extraction of common sub-expressions from form expressions.

33.2.5.7.4 Data Types

The expressions use five basic data types:

Boolean — **TRUE** or **FALSE**.

Unsigned Integer — 64-bit unsigned integer.

String — Null-terminated string.

Buffer — Fixed size array of unsigned 8-bit integers.

Undefined — Undetermined value. Used when the value cannot be calculated or for run-time errors.

Data conversion is not implicit. Explicit data conversion can be performed using the *EFI_IFR_TO_STRING* , *EFI_IFR_TO_UINT* and *EFI_IFR_TO_BOOLEAN* .

The Date and Time question values are converted to the *Buffer* data type filled with the *EFI_HII_DATE* and *EFI_HII_TIME* structure contents (respectively).

The Ref question values are converted to the Buffer data type and filled with the *EFI_HII_REF* and structure contents.

Syntax

```
The expressions have the following syntax:
expression := built-in-function |
constant |
expression unary-op |
expression expression binary-op |
expression expression expression ternary-op
expression-pair-list
```

(continues on next page)

(continued from previous page)

```

EFI_IFR_TO_STRING |
EFI_IFR_TO_UINT |
EFI_IFR_TO_UPPER |
EFI_IFR_TO_LOWER
ternary-op := EFI_IFR_CONDITIONAL |
EFI_IFR_FIND |
EFI_IFR_MID |
EFI_IFR_TOKEN |
EFI_IFR_SPAN
```

33.2.5.8 Defaults

To ensure consistent behavior when a platform attempts to restore settings to defaults, each question op-code must have an active default setting. Defaults are pre-defined question values. The question values may be changed to their defaults either through a Forms Processor-defined means or when the user selects an *EFI_IFR_RESET_BUTTON* statement (*Reset Button*).

Each question may have zero or more default values, with each default value used for different purposes. For example, there might be a “standard” default value, a default value used for manufacturing and a “safe” default value. A group of default values used to configure a platform or device for a specific purpose is called default store.

Default Stores

There are three standard default stores:

Standard Defaults — These are the defaults used to prepare the system/device for normal operation.

Manufacturing Defaults — These are the defaults used to prepare the system/device for manufacturing.

Safe Defaults — These are the defaults used to boot the system in a “safe” or low-risk mode.

Attributes — Default stores have the following attributes:

Name

Each default store has a user-readable name

Identifier

A 16-bit unsigned integer. The values between 0x0000 and 0x3fff are reserved for use by the UEFI specification. The values between 0x4000 and 0x7fff are reserved for platform providers. The values between 0x8000 and 0xbfff are reserved for hardware vendors. The values between 0xc000 and 0xffff are reserved for firmware vendors.

```
#define EFI_HII_DEFAULT_CLASS_STANDARD          0x0000
#define EFI_HII_DEFAULT_CLASS_MANUFACTURING     0x0001
#define EFI_HII_DEFAULT_CLASS_SAFE              0x0002
#define EFI_HII_DEFAULT_CLASS_PLATFORM_BEGIN    0x4000
#define EFI_HII_DEFAULT_CLASS_PLATFORM_END      0x7fff
#define EFI_HII_DEFAULT_CLASS_HARDWARE_BEGIN    0x8000
#define EFI_HII_DEFAULT_CLASS_HARDWARE_END      0xbfff
#define EFI_HII_DEFAULT_CLASS_FIRMWARE_BEGIN    0xc000
#define EFI_HII_DEFAULT_CLASS_FIRMWARE_END      0xffff
```

Users of these ranges are encouraged to use the specification defined ranges for maximum interoperability. Questions or platforms may support defaults for only a sub-set of the possible default stores. Support for default store 0 ("standard") is recommended.

Defaulting

When retrieving the default values for a question, the Forms Processor uses one of the following (listed from highest priority to lowest priority):

1. The value returned from the *Callback()* memberfunction of the Config Access protocol associated with the question when called with the *Action* set to one of the*EFI_BROWSER_ACTION_DEFAULT_x* values (*EFI HII Configuration Access Protocol*) . It is recommended that this form only be used for questionswhere the default value alters dynamically at runtime.**
2. The value returned in the *Response* parameter of the *ConfigAccess()* member function (using the ALTCFG form). See *String Syntax* .
3. The value specified by an *EFI_IFR_DEFAULT* opcodes appear within the scope of a question. (*EFI_IFR_DEFAULT*)
4. One of the Options (*Options*) has its Standard Default or Manufacturing Default attribute set.
5. For Boolean questions, the Standard Default or Manufacturing Default values in the Flags field. (*Boolean*).

Syntax

```
Default := EFI_IFR_DEFAULT
default-tag := EFI_IFR_VALUE |
      <empty>
```

33.2.5.9 Validation

Validation is the process of determining whether a value can be applied to a configuration setting. Validation takes place at three different points in the editing process: edit-level, question-level and form-level.

33.2.5.9.1 Edit-Level Validation

First, it takes place while the value is being edited with a Forms Browser. The Forms Browser may optionally reject values selected by the user which would fail Question-Level validation. For example, the Forms Browser may limit the length of strings entered so that they meet the Minimum and Maximum Length.

33.2.5.9.2 Question-Level Validation

Second, it takes place when the value has changed, normally when the user attempts to leave the control, navigate between the portions of the control or selects one of the option values. At this point, an error occurs if:

- For a String (*String*), if the string length is less than the Minimum Length, then the Forms Processor generates an error.
- For a String (*String*), if the string length is greater than the Maximum Length, then the Forms Processor generates an error.
- For a Number (*Number*), if the number cannot fit in the specified variable storage without loss of significant bits, then the Forms Processor generates an error.
- For all questions, if an *EFI_IFR_INCONSISTENT_IF* evaluates to **TRUE**, then the Forms Processor will display the specified error text.

- For all questions, if an *EFI_IFR_WARNING_IF* evaluates to **TRUE**, then the Forms Processor will display the specified warning text.

33.2.5.9.3 Form-Level Validation

Third, it takes place when exiting the form or when the values are submitted. The error occurs under two conditions:

- For all questions, if an *EFI_IFR_NO_SUBMIT_IF* evaluates to **TRUE**, then the Forms Processor will display the specified error text.
- If a Forms Processor such as a script processor performs Form-Level validation, where the concept of a form is not maintained, then the Form-Level validation must occur before processing question values from other forms or before completion of the configuration session.

33.2.5.10 Forms Processing

Forms Processors interpret the IFR in order to extract information about configuration settings. This section describes how the IFR should be interpreted and how errors should be handled.

33.2.5.10.1 Error Handling

The Forms Processor may encounter problems in interpreting the IFR. This section describes the standard ways of handling these issues:

Unknown Opcodes. — Unknown opcodes have a type which is not recognized by the Forms Processor. In general, the Forms Processor ignores the opcode, along with any nested opcodes.

Malformed Opcodes. — Malformed objects have a length which is less than the minimum length for that object type. In this case, the entire form is disabled.

Extended Opcodes. — Extended objects have a length longer than that expected by the Forms Processor. In this case, the Forms Processor interprets the object normally and ignores the extra data.

Malformed Forms Sets — Malformed forms sets occur when an object's length would cause it extend beyond the end of the forms set, or when the end of the forms set occurs while a scope is still open. In this case, the entire forms set is ignored.

Reserved Bits Set. — The Forms Processor should ignore all set reserved bits.

33.2.5.11 Forms Editing

This section describes considerations for Forms Editors, which are a specialized Forms Processor which can create and manipulate form lists, forms and questions in their binary form.

33.2.5.11.1 Locking

Locking indicates that a question or statement,–along with its related options, prompts, help text or images–should not be moved or edited. A statement or question is locked when the *IFR_LOCKED* opcode is found within its scope.

UEFI-compliant Forms Editors must allow statements or questions within an image to be locked, but should not allow them to be unlocked. UEFI-compliant Forms Editors must not allow modification of locked statements or questions or any of their associated data (including options, text or images).

NOTE: *This mechanism cannot prevent unauthorized modification. However, it does clearly state the intent of the driver creator that they should not be modified.*

33.2.5.11.2 Moving Forms

When forms are moved between form sets, the related data (such as forms, variable stores and default stores) need to have their references renumbered to avoid conflicts with identifiers in the new form set. For forms, these include:

- *EFI_IFR_FORM* or *EFI_IFR_FORM_MAP* (and all references in *EFI_IFR_REF*)
- *EFI_IFR_DEFAULTSTORE* (and all references in *EFI_IFR_DEFAULT*)
- *EFI_IFR_VARSTORE_x* (and all references within question headers)

33.2.5.11.3 Moving Questions

When questions are moved between form sets, the related data (such as images and strings) need to be moved and references to results-processing and storage may need to be revised. For example:

String and Images. — If the question is being moved to another form set, then all strings and images associated with the question must be moved to the package list containing the form set and removed from the current one.

Form Set. — If the question is moved to a package list installed by a different driver, then the *EFI_IFR_VAR_STORAGE_DEVICE* (*EFI_IFR_VARSTORE_DEVICE*) should be nested in the scope of the question, describing the driver installation device path.

Question References. — If a question value in another form set is referred to in any expressions (such as *EFI_IFR_INCONSISTENT_IF* or *EFI_IFR_NO_SUBMIT_IF* or *EFI_IFR_WARNING_IF*) using either *EFI_IFR_QUESTION_REF2* (*EFI_IFR_Question_REF2*) or *EFI_IFR_QUESTION_REF1* (*EFI_IFR_Question_REF1*) then these must be converted to a form of *EFI_IFR_QUESTION_REF3* (*EFI_IFR_Question_REF3*) specifying the EFI_GUID of the form set and/or the device path of the package list containing the form set wherein the question referred to is defined.

When questions are moved between forms, whether in the same form list or another form list, question behavior reliant on the current form may need revision. One example is the use of *EFI_IFR_RULE_REF* in expressions. Here, rules are shortcuts for common expressions used in a form. If a question is moved to another form, the references to any rules in expressions must be replaced by the expression itself.

33.2.5.12 Forms Processing & Security Privileges

The IFR provides a way for a Forms Processor to identify which forms, statements, questions and even question values are available only to users with specific privilege levels and enforce those privilege levels.

Setup access security privileges are described in terms of GUIDs. The current user profile either has the specified privilege or it does not. The *EFI_IFR_SECURITY* opcode returns whether or not the current user profile has the specified setup access privilege. Combined with the expressions such as *EFI_IFR_DISABLE_IF, EFI_IFR_SUPPRESS_IF, EFI_IFR_GRAY_OUT_IF, EFI_IFR_WARNING_IF, EFI_IFR_INCONSISTENT_IF* and *EFI_IFR_NOSUBMIT_IF,* the author of a form can control access to specific forms, statements and questions, or even control whether specific values are valid.

Forms Processors on systems with multiple setup-related user privilege levels must support report these correctly when processing the *EFI_IFR_SECURITY* opcode.

Forms Processors on systems which support the UEFI User Authentication proposal must correctly inquire from the current user profile whether or not it has security privileges on *EFI_USER_INFO_ACCESS_SETUP* and *User Manager Protocol* on *EFI_USER_MANAGER_PROTOCOL.GetInfo()*).

Forms Processors on systems which support re-identification during the platform configuration process must support reevaluation of the *EFI_IFR_SUPPRESS_IF* and *EFI_IFR_GRAY_OUT_IF* upon receipt of notification that the current user profile has been changed by using the UEFI Boot Service *CreateEventEx()* and the *EFI_USER_PROFILE_CHANGED_EVENT_GUID.*

33.2.6 Strings

Strings in the UEFI environment are defined using UCS-2, which is a 16-bit-per-character representation. For user-interface purposes, strings are one of the types of resources which can be installed into the HII Database (*HII Database*).

In order to facilitate localization, users reference strings by an identifier unique to the package list which the driver installed. Each identifier may have several translations associated with it, such as English, French, and Traditional Chinese. When displaying a string, the Forms Browser selects the actual text to display based on the current platform language setting.

The actual text for each language is stored separately (in a separate package), which makes it possible to add and remove language support just by including or excluding the appropriate package.

Each string may have font information, including the font family name, font size and font style, associated with it. Not all platforms or displays can support fonts and styles beyond the system default font (*Fonts*), so the font information associated with the string should be viewed as a set of hints.

33.2.6.1 Configuration Language Paradigm

This specification uses the RFC 4646 language naming scheme to identify the language that a given string is associated with. Since RFC 4646 allows for the same Primary language tags to contain a large variation of subtags (e.g. regions), a best matching language algorithm is defined in RFC 4647. Callers of interfaces that require RFC 4646 language codes to retrieve a Unicode string, must use the RFC 4647 algorithm to lookup the Unicode string with the closest matching RFC 4646 language code.

Since the majority of strings discussed in this specification are associated with generating a user interface, the languages that are typically associated with strings have commonly defined languages such as en-US, zh-Hant, and it-IT. The RFC 4646 standard also reserves for private use languages prefixed with a value of “x”.

NOTE: *This specification defines for its own purposes one of these private use areas as a special-purpose language that components can use for extracting information out of. Assume that any private-use languages encountered by a compliant implementation will likely consider those languages as configuration languages, and the associated behavior*

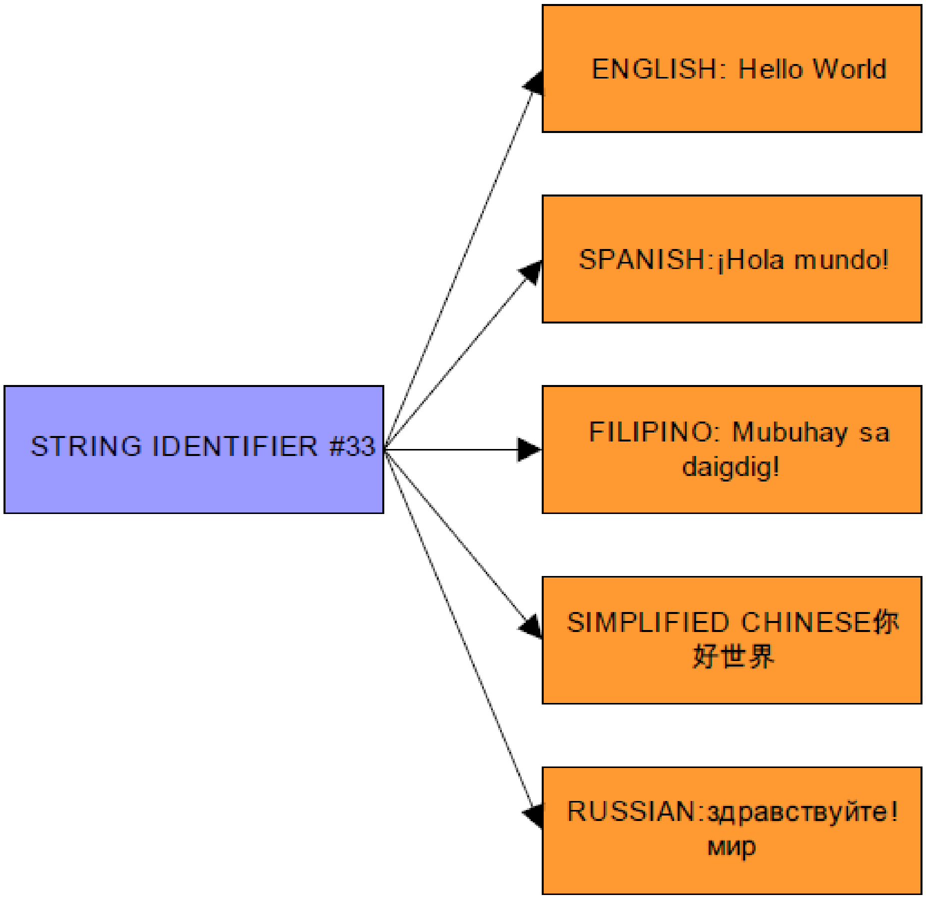

Fig. 33.17: **String Identifiers**

when referencing those languages will be platform specific. *Working with a UEFI Configuration Language describes an example of such a use*.

33.2.6.2 Unicode Usage

This section describes how different aspects of the Unicode specification related to the strings within this specification.

33.2.6.2.1 Private Use Area

Unicode defines a private use area of 6500 characters that may be defined for local uses. Suggested uses include Egyptian Hieroglyphics; see *Developing International Software For Windows 95* and Windows NT** for more information. UEFI prohibits use of this area in a UEFI environment. This is because a centralized font database accumulated from the various drivers (a valid implementation) would end up with collisions in the private use area, and, generally, an XML browser could not display these characters.

33.2.6.2.2 Surrogate Area

The Unicode specification has two 16-bit character representations: UCS-2 and UTF-16. The UEFI specification uses UCS-2. The primary difference is that UTF-16 defines surrogate areas (see page 56 in *Professional XML*) that allow for expanded character representations of the 16-bit Unicode. These character representations are very similar to Double Byte Character Set (DBCS)–2048 Unicode values split into two groups (D800-DBFF and DC00-DFFF). They are defined as having 16 additional bits of value to make up the character, for a total of about one million extra characters. UEFI does not support surrogate characters.

33.2.6.2.3 Non-Spacing Characters

Unicode uses the concept of a nonspacing character. These glyphs are used to add accents, and so on, to other characters by what amounts to logically OR'ing the glyph over the previous glyph. There does not appear to be any predictable range in the Unicode encoding to determine nonspacing characters, yet these characters appear in many languages. Further, these characters enable spelling of several languages including many African languages and Vietnamese.

33.2.6.2.4 Common Control Codes

This specification allows the encoding of font display information within the strings using special control characters. These control codes are meant as display hints, and different platforms may ignore them, depending on display capabilities.

In single-byte encoding, these are in the form *0x7F 0xyy* or *0x7F 0x0y 0xzz*. Single-byte encoding is used only when coupled with the Standard Compression Scheme for Unicode, described in *String Encoding*.

In double-byte encoding, these are in the form *0xF6yy, 0xF7zz* or *0xF8zz*. When converted to UCS-2, all control codes should use the *0xFxyy* form.

Table 33.3: Common Control Codes for Font Display Information

Value	Description	Single-Byte Encoding	Double-Byte Encoding
0x00	Font Family Select. The subsequent text will be displayed in the font specified by the following byte.	0x7F 0x00 0xzz	0xF7zz

continues on next page

Table 33.3 – continued from previous page

0x01	Font Size Select. The subsequent text will be displayed in the point size, in half points, specified by the following byte.	0x7F 0x01 0xzz	0xF8zz
0x20	Bold On.	0x7F 0x20	0xF620
0x21	Bold Off	0x7F 0x21	0xF621
0x22	Italic On	0x7F 0x22	0xF622
0x23	Italic Off	0x7F 0x23	0xF623
0x24	Underline On	0x7F 0x24	0xF624
0x25	Underline Off	0x7F 0x25	0xF625
0x26	Emboss ON	0x7F 0x26	0xF626
0x27	Emboss OFF	0x7F 0x27	0xF627
0x28	Shadow ON	0x7F 0x28	0xF628
0x29	Shadow OFF	0x7F 0x29	0xF629
0x2A	DblUnderline ON	0x7F 0x2A	0xF62A
0x2B	DblUnderline OFF	0x7F 0x2B	0xF62B

33.2.6.2.5 Line Breaks

This section describes the use of control characters to determine where break opportunities within strings. These guidelines are based on Unicode Technical Report #14, but are significantly simplified.

Spaces

In general, any of the following space characters is a line-break opportunity:

0020	SPACE
1680	OGHAM SPACE MARK
2000	EN QUAD
2001	EM QUAD
2002	EN SPACE
2003	EM SPACE
2004	THREE-PER-EM SPACE
2005	FOUR-PER-EM SPACE
2006	SIX-PER-EM SPACE
2008	PUNCTUATION SPACE
2009	THIN SPACE
200A	HAIR SPACE
205F	MEDIUM MATHEMATICAL SPACE

When a space is desired without a line-break opportunity, one of the following spaces should be used:

00A0	NO-BREAK SPACE (NBSP)
202F	NARROW NO-BREAK SPACE (NNBSP)

In-Word Break Opportunities

In some cases, allowing line-breaks in a word is desirable. These line break opportunities should be explicitly described using one of the characters from the following list:

200B	ZERO WIDTH SPACE (ZWSP)

Hyphens

The following characters are hyphens and other characters which describe line break opportunities after the character.

058A	ARMENIAN HYPHEN
2010	HYPHEN
2012	FIGURE DASH
2013	EN DASH
0F0B	TIBETAN MARK INTERSYLLABIC TSHEG
1361	ETHIOPIC WORDSPACE
17D5	KHMER SIGN BARIYOOSAN

The following characters describe line break opportunities before and after them, but not between a pair of them:

2014	EM DASH

The following characters describe a hyphen which is not a line-breaking opportunity:

2011	NON-BREAKING HYPHEN (NBHY)

The following characters force a line-break:

Table 33.10: Mandatory Breaks

000A	NEW LINE
000C	FORM FEED
000D	CARRIAGE RETURN
2028	LINE SEPARATOR
2029	PARAGRAPH SEPARATOR

33.2.7 Fonts

This section describes how fonts are used within the UEFI environment.

UEFI describes a standard font, which is required for all systems which support text display on bitmapped output devices. The standard font (named 'system') is a fixed pitch font, where all characters are either narrow (8x19) or wide (16x19). UEFI also allows for display of other fonts, both fixed-pitch and variable-pitch. Platform support for these fonts is optional.

UEFI fonts are described using either the Simplified Font Package (*Simplified Font Package*) or the normal Font Package (*Font Package*).

33.2.7.1 Font Attributes

Fonts have the following attributes:

Font Name — The font name describes, in broad terms, the visual style of the font. For example, “Arial” or “Times New Roman” The standard font always has the name “sysdefault”.

Font Size — The font size describes the maximum height of the character cell, in p** — s. The standard font always has the font size of 19.

Font Style — The font style describes standard visual modifies to the base visual style of a font. Supported font styles include: bold, italic, underline, double-underline, embossed, outline and shadowed. Some font styles may also be simulated by the font rendering engine. The standard font always has no additional font styles.

33.2.7.2 Limiting Glyphs

Strings in the UEFI environment can be presented in environments with very different limitations. The most constrained environment is in the firmware phases prior to discovery of a boot device with a system partition. The main limitation in this environment is storage space. If unexpected strings could be displayed before system partition availability, the UEFI environment would have to store glyphs for all characters in a Unicode font. After system partition discovery, all glyphs could be made available.

Careful user interface design can limit to a manageable number, the quantity of unexpected characters that the system could be called on to display. Knowing what strings the firmware is going to display limits the number of glyphs it is required to carry.

In addition, carefully designed firmware can support a system where a limited number of strings are displayed before system partition availability. This may be done while enabling the input and display of large numbers of characters/glyphs using a full font file stored on the system partition. In such a situation, the designer must ensure that enough information can be displayed. The designer must also insure that the configuration can be changed using only information from firmware-based non-volatile storage to obtain access to a satisfactory system partition.

UEFI requires platform support of a font containing the basic Latin character set.

While the system firmware will carry this standard font, there might be times when a UEFI application or driver requires the printing of a character not contained within the platform firmware. In this case, a UEFI driver or application can carry this font data and add it to the font already present in the HII Database. New font glyphs are accepted when there is no font glyph definition for the Unicode character already in the specified font.

In addition the standard system font and fonts extended by UEFI applications or drivers, it is possible for drivers that implement the EFI HII Font Glyph Generator Protocol to render additional font glyphs with specific font name, style, and size information, and add the new font packages to the HII Database. That is when HII Font Ex searches the glyph block in the existing HII font packages, it will try to locate *EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL* protocol for generating the corresponding glyph block and inserting the new glyph block into HII font package if the glyph block information is not exist in any HII font package. The HII font package which the new glyph block inserted can be an existing HII font package or a new HII font package created by HII Font Ex according to the *EFI_FONT_DISPLAY_INFO* of character.

The figure below shows how fonts interact with the HII database and UEFI drivers, even if the font does not already exist in the database.

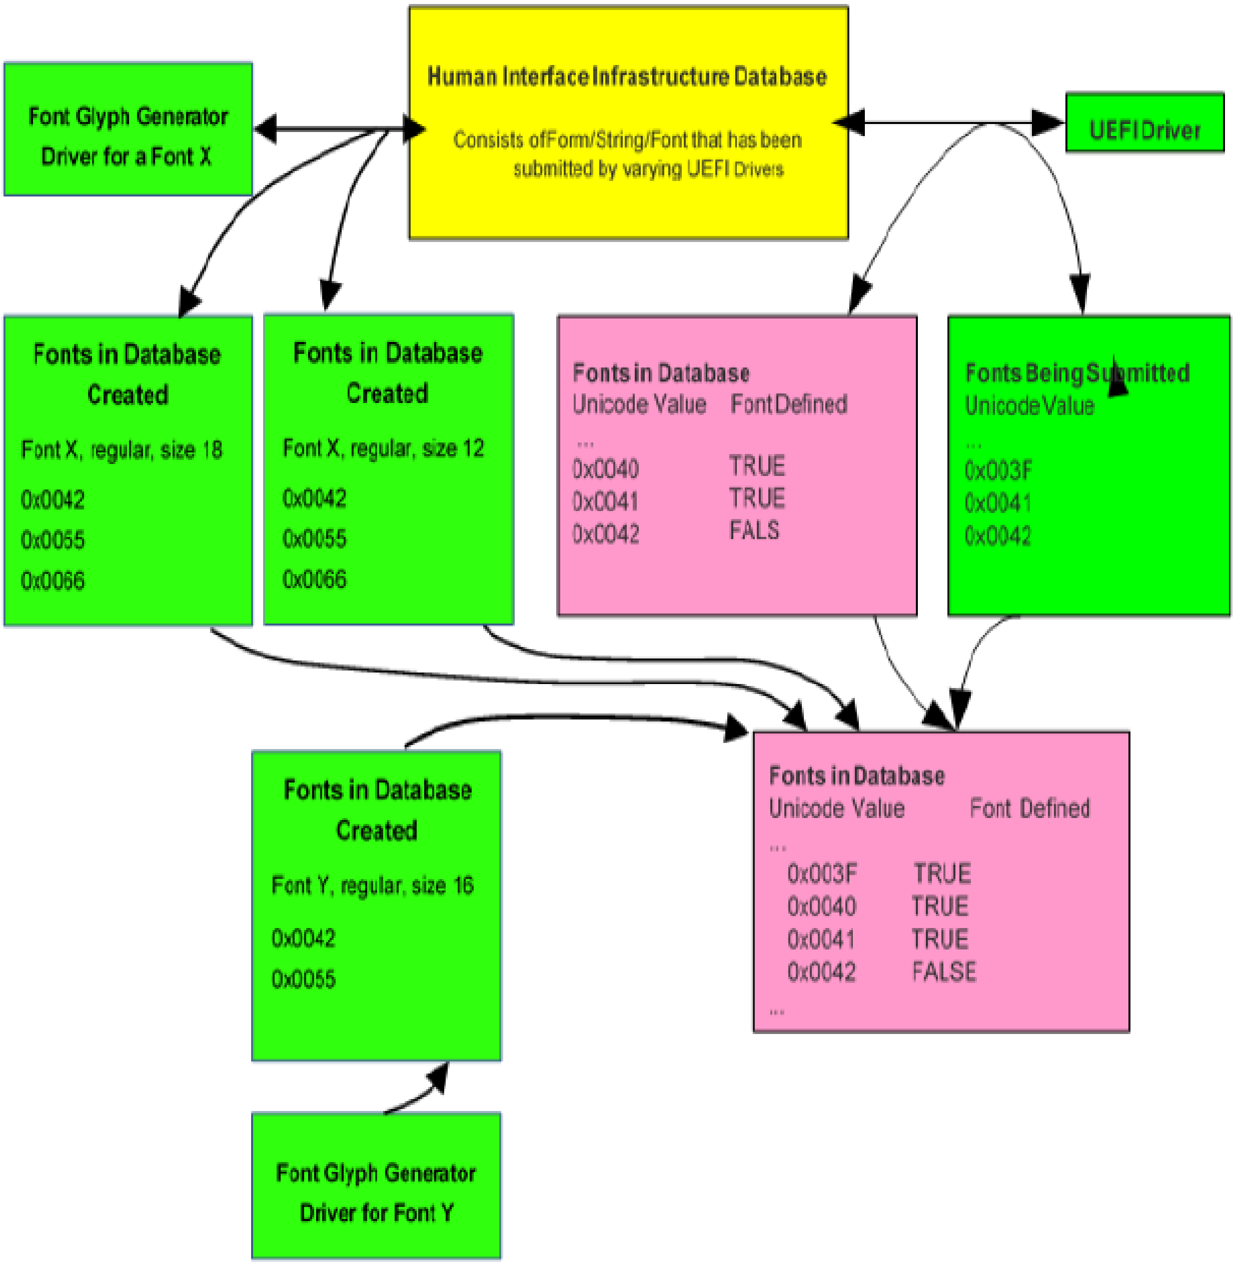

Fig. 33.18: Fonts

33.2.7.3 Fixed Font Description

To allow a UEFI application or driver to extend the existing fonts with additional characters, the UEFI driver must be able to provide characters that fit aesthetically with the system font. For this reason the capability to define attributes of different fonts and to suggest a reasonable default target for these parameters is important.

Fonts can vary in width, style, baseline, height, size, and so on. The fixed font definition includes white space and the glyph data, as well as the positioning of the glyph data. This prevents characters of different fixed fonts from being adjusted at runtime to fit aesthetically together. To provide UEFI drivers with a basic description of how to design fixed font characters, a subset of industry standard font terms are defined below:

baseline — The distance from upper left corner of cell to the base of the Caps (A, B, C,. . .)

cap_height — The distance from the base of the Caps to the top of the Caps

x_height — The distance from the baseline to the top of the lower case 'x'

descender — The distance some characters extended below the baseline (g, j, p, q, y)

ascender — The distance from the top of the lower case 'x' to the tall lower case characters (b, d, f, h, k, l)

The following figure illustrates the font description terms:

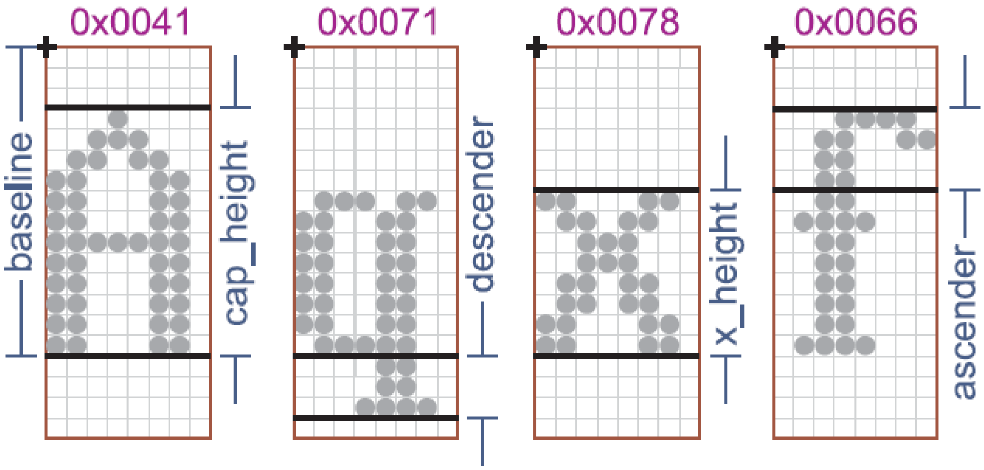

Fig. 33.19: Font Description Terms

This 8x19 system font example (above), follows the original VGA 8x16 definition and creating double wide vertical lines, giving a bold look to the font (style = bold). Along with matching the 8x19 base system font, if a UEFI driver wants to extend the DBCS (Double Byte Character Set) font, it must be aware of the parameters that describe the 16x19 font, as shown below.

This 16x19 font example (above) has a style of plain (single width vertical lines) instead of bold like the 8x19 font, since there is not enough horizontal resolution to cleanly define the DBCS glyphs. The 16x19 ASCII characters have also been designed in a style matching the DBCS characters, allowing them to fit aesthetically together. Note that the default 16x19 fixed width characters are not stored like 1-bit images, one row after another; but instead stored with the left column (19 bytes) first, followed by the right column (19 bytes) of character data. The figure below shows how the characters of the previous figure would be laid out in the font structure.

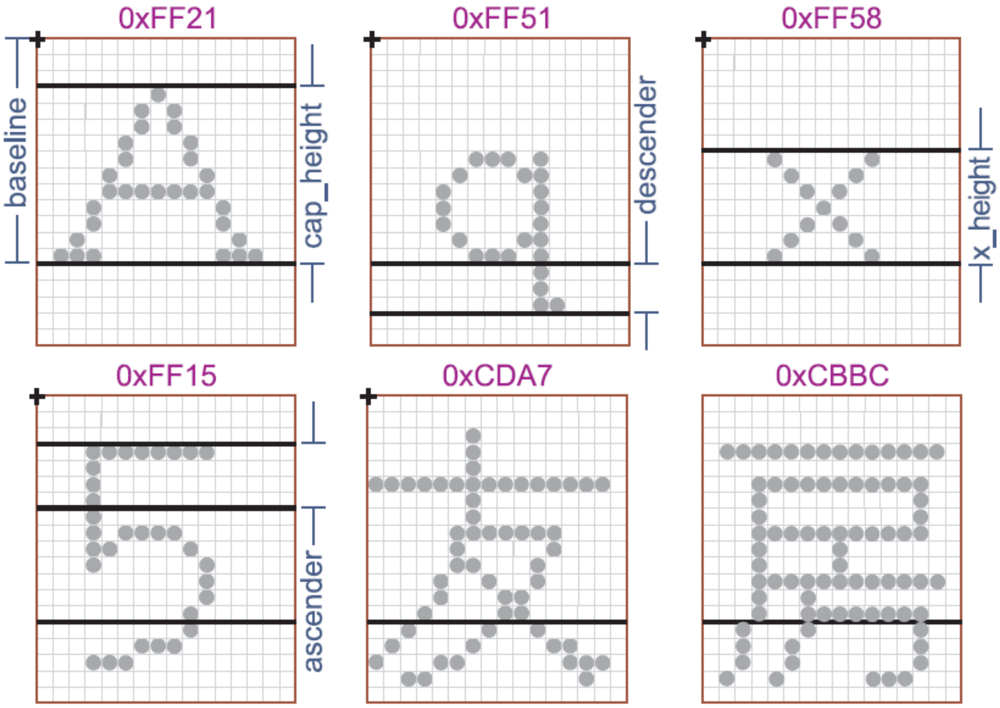

Fig. 33.20: 16 x 19 Font Parameters

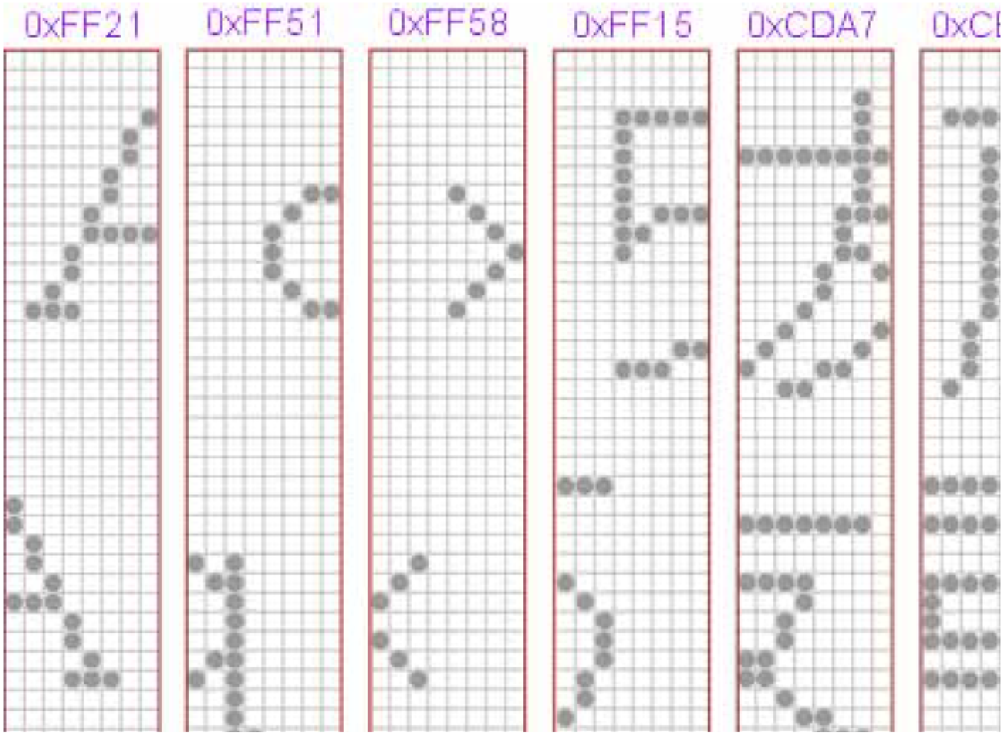

Fig. 33.21: **Font Structure Layout**

33.2.7.3.1 System Fixed Font Design Guidelines

To allow a UEFI application or driver to extend the fixed font character set, the UEFI system fonts must adhere, at least roughly, to the design guidelines in the table below:

Table 33.11: Guidelines for UEFI System Fonts

Term	8 x 19 Font	16 x 19 Font
baseline	15 pixels	14 pixels
cap_height	12 pixels	11 pixels
x_height	8 pixels	7 pixels
descender	3 pixels	4 pixels
ascender	4 pixels	4 pixels

In the table above lists the terms in priority order. The most critical guideline to match is the baseline, followed by cap_height and x_height. The terms descender and ascender are not as critical to the aesthetic look of the font as are the other terms. These font design parameters are only guidelines. Failing to match them will not prevent reasonable operation of a UEFI driver that attempting to extend the system font.

33.2.7.4 Proportional Fonts Description

Unlike the fixed fonts, proportional fonts do not have a predefined character cell; instead the character cell is created based on the characters that are being displayed in the current line. In a proportional font only the glyph data is defined, no whitespace. Instead, the proportional font defines five parameters (Width, Height, Offset_X, Offset_Y, & Advance), which allow the glyph data to be position in the character cell and calculate the origin of the next character.

In the figure below, you can see these parameters (in '[. . .]') for the characters shown, in addition you can see the actual byte storage (the padding to the nearest byte is shown shaded).

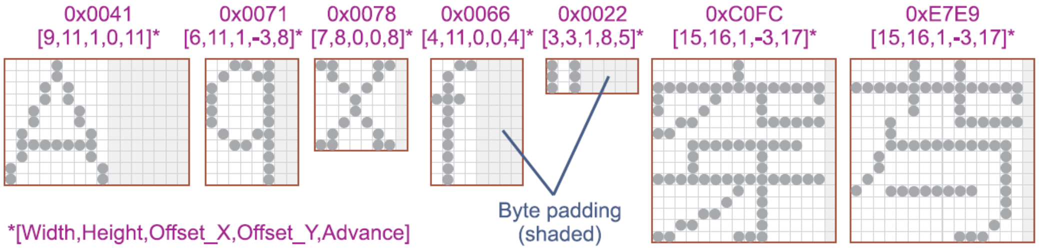

Fig. 33.22: Proportional Font Parameters and Byte Padding

To determine font *baseline,* scan all font glyphs calculating sum of Height and Offset_Y for each glyph. The largest value of the sum defines location of the *baseline.*

The font *line height* is calculated by adding *baseline* with the largest by absolute value negative Offset_Y among all the font glyphs.

33.2.7.4.1 Aligning Glyphs to the Baseline

To display a line of proportional glyphs, *baseline* and *line height* have to be determined. If all the characters to be displayed are from the same font, the baseline and *line height* are the *baseline* and *line height* of the font.

If the characters being displayed are from different fonts, scan glyphs of the characters to be displayed calculating sum of Height and Offset_Y for each glyph. The largest value of the sum defines location of the *baseline*.

The *line height* is calculated by adding *baseline* with the largest by absolute value negative Offset_Y among all the characters to be displayed.

As shown in the following figure, once the baseline value is found it is added to the starting position of the line to calculate the Origin. From the Origin, each and every glyph can be generated based on the individual glyph parameters, including the calculation of the next glyph's Origin.

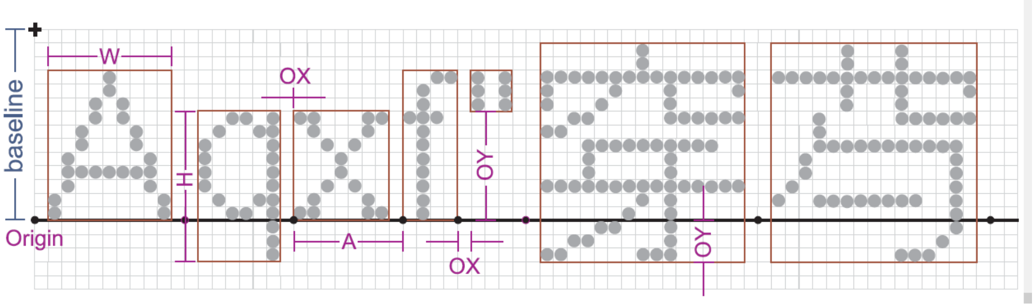

Fig. 33.23: Aligning Glyphs

The starting position (upper left hand corner) of the glyph is defined by (Origin_X + Offset_X), (Origin_Y - (Offset_Y + Height)). The Origin of the next glyph is defined by (Origin_X + Advance), (Origin_Y).

In addition to determining the line height and baseline values; the scan of the characters also calculates the line width by totaling up all of the advance values.

33.2.7.4.2 Proportional Font Design Guidelines

This method of aligning glyphs to a baseline allows one to place wildly different characters correctly position on a single line. However there still is a need for the system proportional fonts to roughly adhere to overall font height (19 pixels high character cells) and the placement of the baseline at the bottom of the Caps (if applicable or about 5 pixels up from the bottom of the character cell). These guidelines are not as critical as the fixed font guidelines, since the character cell height are defined at runtime, based on what else is displayed with that character.

33.2.8 Images

The format of the images to be stored in the Human Interface Infrastructure (HII) database have been created to conform to the industry standard 1-bit, 4-bit, 8-bit, and 24-bit video memory layouts. The 24-bit and 32-bit display systems have the exact same display capabilities and the exact same pixel definition. The difference is that the 32-bit pixels are DWORD aligned for improve CPU efficiency when accessing video memory. The extra byte that is inserted from the 24-bit and the 32-bit layout has no bearing on the actual screen.

Video memory is arranged left-to-right, and then top-to-bottom. In a 1-bit or monochrome display, the most significant bit of the first byte defines the screen's upper left most pixel. In a 4-bit or 16 color, display the most significant nibble of the first byte defines the screen's upper left most pixel. In a 8-bit or 256 color display, the first byte defines the screen's upper left most pixel.

In both the 24-bit and 32-bit TrueColor displays, the first three bytes defines the screen's upper left most pixel. The first byte is the pixel's blue component value, the next byte is the pixel's green component value, and the third byte is the pixel's red component value (B,G,R). Each color component value can vary from 0x00 (color off) to 0xFF (color full on), allowing 16.8 millions colors that can be specified. In the 32-bit TrueColor display modes, the fourth byte is a don't care.

33.2.8.1 Converting to a 32-bit Display

The UEFI recommended video mode for computer-like devices uses a 32-bit Linear Frame Buffer video mode. All images stored in the HII database will need conversion to 32-bit before display.

To display a 24-bit image into 32-bit video memory, a pixel of the image is retrieved (read DWORD value advance pixel offset by 3) and then written to the video memory (write DWORD value advance pixel offset by 4).

To display any of the non-TrueColor images (1-bit, 4-bit, and 8-bit), there is an extra step of indirection through the palette definition to get the TrueColor pixel value. First retrieve the palette index value by isolating the corresponding bits, then index into the associated palette to retrieve the 24-bit (B,G,R) color entry (read DWORD value), then write it to the video memory (write DWORD value advance pixel offset by 4). For this reason, the palette color entry definition is defined exactly the same as the image color pixel (B,G,R).

33.2.8.2 Non-TrueColor Displays

It is possible to display the HII database images on non-TrueColor video modes. You cannot however, display images beyond the bit depth of the target screen resolution. For example you would be able to display 1-bit, 4-bit, and 8-bit images in a 256 color video mode. To do this you must create a global palette (256 entries), by merging all images color needs to a best fit palette and then programming the hardware palette with that data.

The hardware palette color definition (R,G,B) is backwards from the screen pixel definition (B,G,R), and will have to be swapped before programming. In addition, the hardware palette may only support 6-bit of magnitude per color component instead of the 8-bit defined in the palette information section; therefore the values will have to be shifted before writing.

33.2.9 HII Database

The Human Interface Infrastructure (HII) database is the resource that serves as the repository of all the form, string, image and font data for the system. Drivers that contain information that is appropriate for the database will export this data to the HII database.

For example, one driver might contain all the motherboard-specific data (the traditional "Setup" for the system). Additionally, add-in cards may contain their own drivers, which, in turn, have their own Setup-related data. All of the drivers that contain Setup-related data would export their information to the HII database, as shown in the figure below.

33.2.10 Forms Browser

The UEFI Forms Browser is the service that reads the contents of the HII Database and interprets the forms data in order to present it to the user. For example, the Forms Browser can be used to gather all setup-related data and presents it to the user. This service also takes the user input and allows for changes to be saved into non-volatile storage.

The figure below shows the relationship between the HII database, UEFI drivers, and the UEFI Forms Browser.

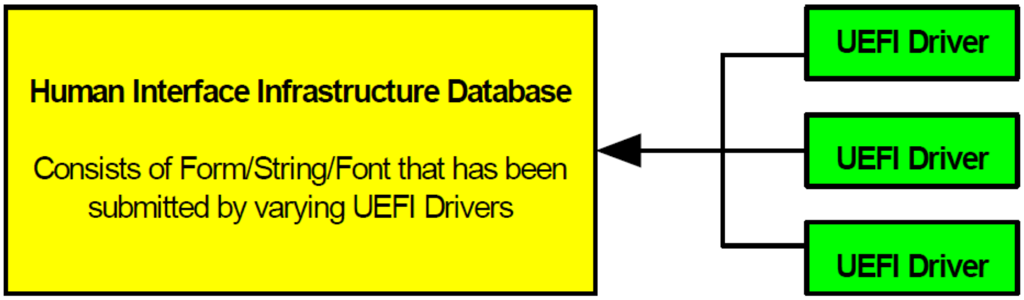

Fig. 33.24: HII Database

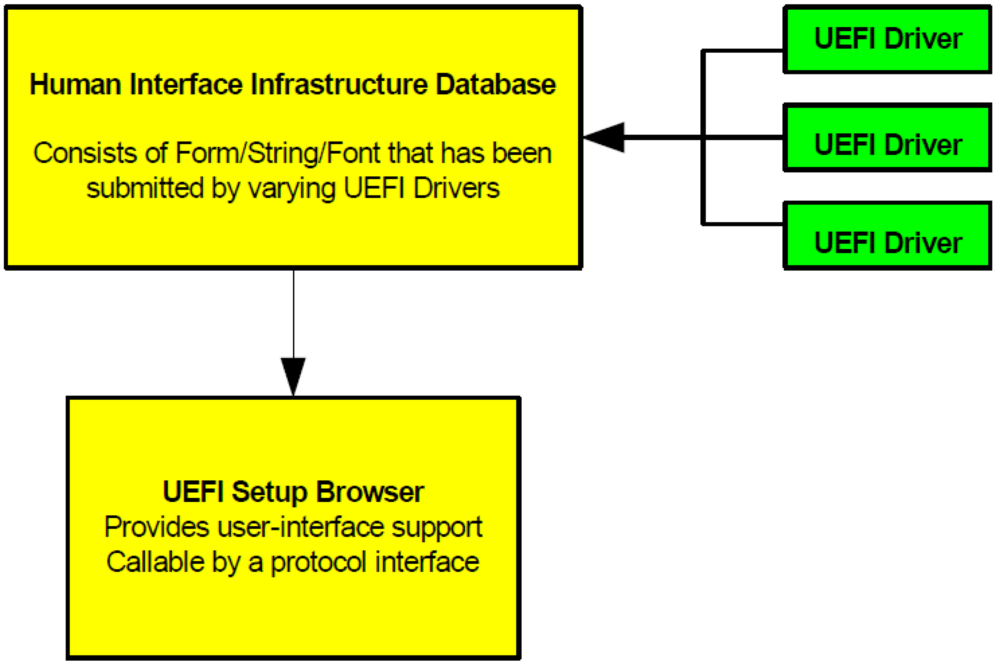

Fig. 33.25: Setup Browser

33.2.10.1 User Interaction

The Forms Browser implementer has great flexibility as to the type of actual user interface provided. For example, while required to support some forms of navigation (*EFI_FORM_BROWSER2_PROTOCOL.SendForm()* or the cross-reference question), it may optionally support additional navigation capabilities, such as a back button or a menu bar. This section describes the rules to which the Forms Browser user-interaction must conform.

33.2.10.1.1 Forms Browser Details

The forms browser maintains a collection of one or more forms. The forms browser is required to provide navigation for these forms if there is more than one (*EFI_FORM_BROWSER2_PROTOCOL* , "Form Browser Protocol").

The forms browser maintains one or more *active forms*. An active form is any form where the forms browser is maintaining a set of question values. A form is considered active after all question values have been read from storage and the* *EFI_BROWSER_ACTION_FORM_OPEN action has been sent to all questions on the form which require callback. A form is considered inactive after all question values have been either discarded or written to storage and the EFI_BROWSER_ACTION_FORM_CLOSE* action has been sent to all questions on the form which require callback.

The forms browser maintains a *selected* form. The selected form contains the selected question and indicates the primary area of user interaction.

The standards form navigation behaviors are:

Navigate Forms. — When the user chooses this required behavior, a new form is selected and, if any questions on the form are selectable (*Evaluation of Selectable Statements*), a question is selected. Forms browsers are required to provide navigation to (at least) the first form in all form sets when FormId is zero (*Form Browser Protocol*). This behavior cannot be selected if the current form is modal (see *Forms* , "Forms").

Exit Browser/Discard All. — When the user chooses this optional behavior, the question values for active forms are discarded, the active forms are deactivated and the forms browser exits with an action request of *EFI_BROWSER_ACTION_REQUEST_EXIT*. This behavior cannot be selected if the current form is modal (*Forms*).

Exit Browser/Submit All. — When the user chooses optional behavior, the question values are written to storage, the active forms are deactivated and the forms browser exits with an action request of *EFI_BROWSER_ACTION_REQUEST_SUBMIT* or *EFI_BROWSER_ACTION_REQUEST_RESET*. This behavior cannot be selected if the current form is modal (*Forms* , "Forms").

Default. — When the user chooses this optional behavior, the current question values for the questions on the focus form are updated from one of the default stores and then the *EFI_IFR_BROWSER_ACTION_REQUEST_DEFAULT_x* action is sent for each of the questions with the Callback attribute. This behavior can be initiated by a Reset Button question (*Reset Button*).

33.2.10.1.2 Selected Form

When a form is made active, the forms browser sends the *EFI_BROWSER_ACTION_FORM_OPEN* for all questions supporting callback, retrieves the current question values, saves those as the original question values and begins refreshing any questions that support it.

The forms browser maintains a current question value for each question on active forms. The current question value is the last value that the forms browser read from storage/callback (*Values*) or the last value committed by the user. The form is considered modified if any of the current question values are modified (see Questions, below). The forms browser refreshes the current question values of at least questions on the selected with a non-zero refresh interval.

The forms browser maintains a selected question on the selected form. The selected question is the primary focus of the user's interaction. When a form is selected, the forms browser must choose a selectable question (*Evaluation of Selectable Statements* , "Evaluation of Selectable Statements") as the selected question, if one is present on the form.

The standard active form behaviors are:

Exit Browser/Discard All. — *When the user chooses this required behavior, the question values for active forms are discarded, the active forms are deactivated and the forms browser exits with an action request of EFI_BROWSER_ACTION_REQUEST_EXIT . This behavior can be initiated by the function associated with a question with the Callback attribute.*

Exit Browser/ Submit All. — When the user chooses this required behavior, the current question values for active forms are validated (see nosubmitif, *EFI_IFR_NOT_EQUAL*) and, if successful, question values for active forms are written to storage, the active forms are deactivated and the forms browser exits with an action request of *EFI_BROWSER_ACTION_REQUEST_SUBMIT.* This behavior can be initiated by the function associated with a question with the Callback attribute.

Exit Browser/Discard All/Reset Platform. — *When the user chooses this required behavior, the question values for active forms are discarded, the active forms are deactivated and the form browser exits with an action request of EFI_BROWSER_ACTION_REQUEST_RESET . This behavior can be initiated by the function associated with a question with the Callback attribute.*

Exit Form/Submit Form. — Apply Form. When the user chooses this required behavior, the question values for the selected form are validated (see ->nosubmitif, BUGBUG<-) and, if successful, question values for the selected form are written to storage and the selected form is deselected. This behavior can be initiated by the function associated with a question with the Callback attribute.

Exit Form/Discard Form. — When the user chooses this required behavior, the question values for the selected form are discarded and the selected form is deselected. This behavior can be initiated by the function associated with a question with the Callback attribute.

Apply Form. — When the user chooses this required behavior, the question values for the selected form are validated (see nosubmitif, BUGBUG) and, if successful, question values for the selected form are written to storage. This behavior can be initiated by the function associated with a question with the Callback attribute.

Discard Form. — When the user chooses this required behavior, the question values for the selected form are discarded. This behavior can be initiated by the function associated with a question with the Callback attribute.

Default. — When the user chooses this required behavior, the current question values for the questions on the selected form are updated from a default store. This behavior can be initiated by a Reset Button question (see *Reset Button*).

Navigate To Question. — When the user chooses this required behavior, the selected question is deselected and another question on the same form is selected. The types of navigation provided between questions on the same form are beyond the scope of this specification.

Navigate To Form. — When the user chooses this required behavior, the selected form is deselected and the form specified by the question is selected. This behavior can be initiated by a Cross-Reference question. Note that this behavior is distinct from the Navigate Forms behavior described in Forms Navigation.

From these basic behaviors, more complex behaviors can be constructed. For example, a forms browser might check whether the form is modified and, if so, prompt the user to select between the Exit Browser/Discard All and Exit Browser/Submit All behaviors.

33.2.10.1.3 Selected Question

When the user navigates to a question or the forms browser selects a form with a selectable question, the forms browser places the question in the static state. When the user is choosing another question values for the selected question (by typing or from a menu or other means), the forms browser places the question in the changing state. When the user finalizes selection of a question value the forms browser returns the question to the static state.

The forms browser refreshes all questions in at least the selected form with a non-zero refresh interval that are not modified. Typically, a forms browser will not update the displayed question value while the selected question is in the changing state, but will when the selected question is in the static state. A question is considered modified if there is storage associated with the question (i.e., a variable store was specified) and the current question value is different from the original question value.

The standard active question behaviors are:

Change — When the user chooses this required behavior, the forms browser places the selected question in the changing state and allows the user to specify a new current question value for the active question. For example, selecting items in a drop box or beginning to type a new value in an edit box.

With some question types and user interface styles, this behavior is hidden from the user. For example, with check boxes or radio buttons as found in most windowed user-interfaces, the user changes and commits the value with one action. Likewise, with action buttons, selecting the action button implies both the question value and the commit action.

This behavior corresponds to the CHANGING browser action request for questions that support callback.

Commit — When the user chooses this required behavior, the forms browser validates the specified question value (see *EFI_IPF_INCONSISTENT_IF* , *EFI_IFR_INCONSISTENT_IF*) and, if successful, places the selected question in the static state and updates the current question value to that specified while in the changing state. If the selected question's current question value is different than the selected question's original question value, the selected question is considered modified. The form browser must then re-evaluate the modifiability, selectability and visibility of other questions in the selected form.

This behavior corresponds to the CHANGED browser action request for questions that support callback.

Discard — When the user chooses this required behavior, the forms browser places the question in the changed state.

33.2.11 Configuration Settings

In order to save user changes to configuration settings after the system reset or power-off, there must be some form of non-volatile storage available. There are two types of non-volatile storage: system non-volatile storage or add-in card non-volatile storage. Both types are supported.

In general, settings are not saved to non-volatile storage until the user specifically directs the Forms Browser to do so. There are exceptions, such as when operating in a batch or script mode, setting a system password, and updating the system date and time. The underlying platform support dictates whether or not hardware configuration changes are committed immediately.

As shown in the figure below, when a system reset occurs, the firmware's initialization routines will launch the UEFI drivers (e.g. option ROMs). Drivers enabled to take direction from a non-volatile setting read the updated settings during their initialization.

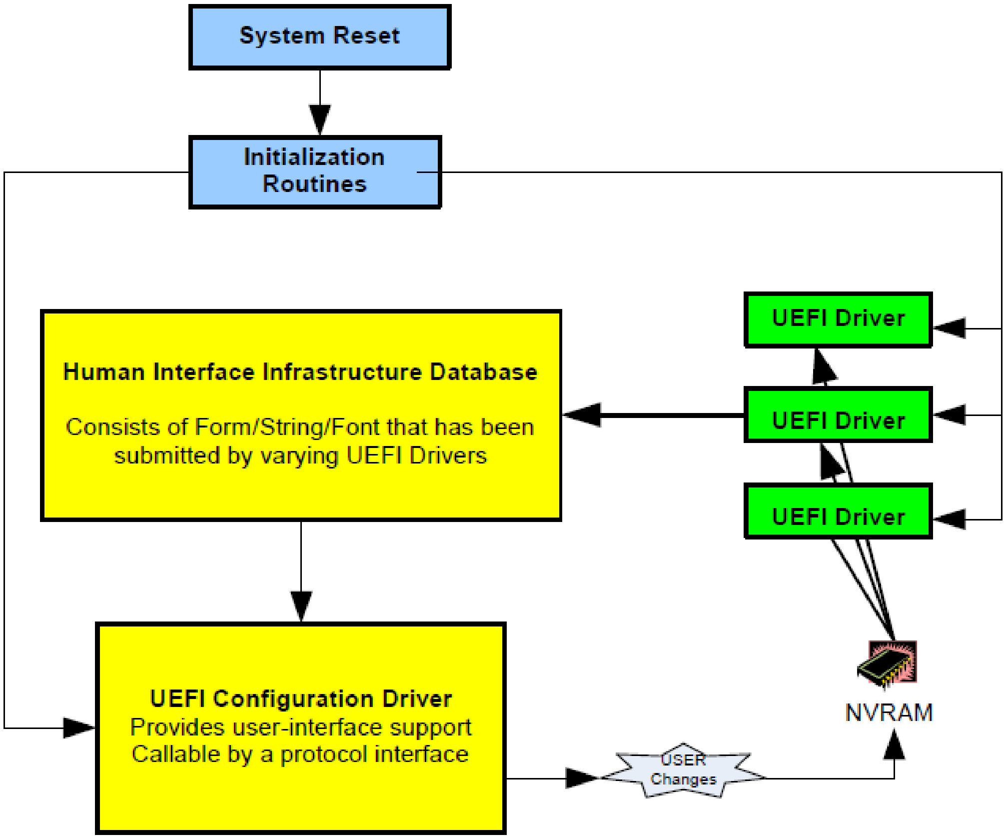

Fig. 33.26: Storing Configuration Settings

33.2.11.1 OS Runtime Utilization

Due to the static nature of the data that is contained in the HII Database and the fact that certain classes of non-volatile storage can be updated during OS run-time, it is possible for an application running under an OS to read the HII information, make configuration changes and even make changes.

The figure below shows how an OS makes use of the HII database during runtime. In this case, the contents of the HII Database is exported to a buffer. The pointer to the buffer is placed in the EFI System Configuration Table, where it can be retrieved by an OS application.

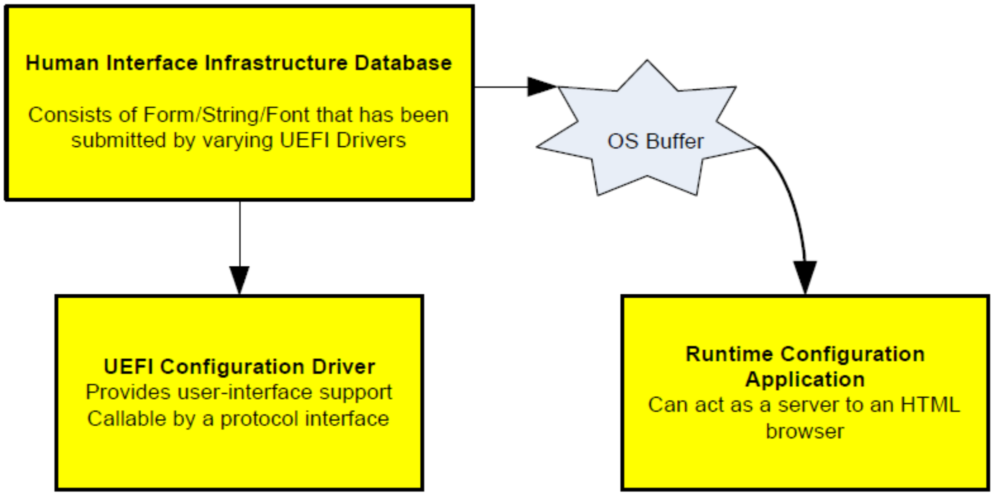

Fig. 33.27: OS Runtime Utilization

The process used to allow an OS application to use this is as follows:

Drivers/applications in the system register user interface data into the HII Database

When the platform transitions from pre-boot to runtime phases of operation, the HII *ExportPackageLists()* is called to export the contents of the HII Database into a runtime buffer.

This runtime buffer is advertised in the UEFI Configuration Table using the HII Database Protocol's GUID so that an OS application can find the data.

The HII *ExportConfig()* is called to export the current configuration into a runtime buffer.

This runtime buffer is advertised in the UEFI Configuration Table using the HII Configuration Routing Protocol's GUID so that an OS application can find the data.

When an O/S application wants to display pre-boot configuration content, it searches the UEFI Configuration Table for the HII Database Protocol's GUID entry and renders the contents from the runtime buffer which it points to.

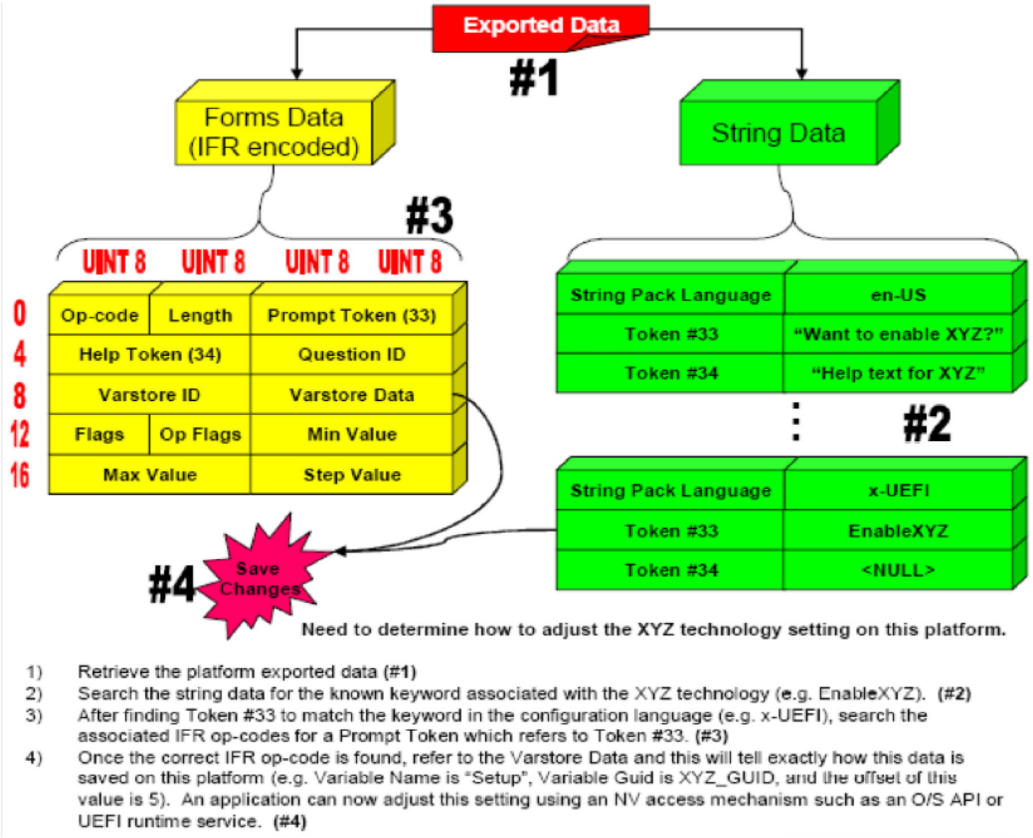
If the OS application needs to update the system configuration, the configuration information can be updated.

For those configuration settings which are stored in UEFI variables (i.e., using *GetVariable()* and *SetVariable()*), the application can update these using the abstraction provided by the operating system.

For those configuration settings which are not stored in UEFI variables, the OS application can use the UEFI Update-Capsule runtime service to change the configuration.

33.2.11.2 Working with a UEFI Configuration Language

By defining the concept of a language that may provide hints to a consumer that the string payload may contain pre-defined standard keyword content, the user of this solution can export their configuration data for evaluation. This evaluation enables the consumer to determine if a particular platform supports a given configuration language, and in-turn be able to adjust known settings that are stored in a platform-specific manner. An example of this is illustrated below which uses various component described in this and the other HII chapters of this specification. In the example, a fictional technology called XYZ exists, and this particular platform supports it. The question is, how does a standard application which is not privy to the platform's construction know how this setting is stored? To-date, this is not a reasonably solvable problem, but in the illustration below, this example shows how one might go about solving this issue.



Need to determine how to adjust the XYZ technology setting on this platform.

1) Retrieve the platform exported data **(#1)**
2) Search the string data for the known keyword associated with the XYZ technology (e.g. EnableXYZ). **(#2)**
3) After finding Token #33 to match the keyword in the configuration language (e.g. x-UEFI), search the associated IFR op-codes for a Prompt Token which refers to Token #33. **(#3)**
4) Once the correct IFR op-code is found, refer to the Varstore Data and this will tell exactly how this data is saved on this platform (e.g. Variable Name is "Setup", Variable Guid is XYZ_GUID, and the offset of this value is 5). An application can now adjust this setting using an NV access mechanism such as an O/S API or UEFI runtime service. **(#4)**

Fig. 33.28: Standard Application Obtaining Setting Example

33.2.12 Form Callback Logic

Since it has been the design intent that the forms processor not need to understand the underlying hardware implementations or design paradigms of the platform, there were certain needs that could only be met by calling a more platform knowledgeable component. In this case, the component would typically be associated with some hardware device (e.g. motherboard, add-in card, etc.). To facilitate this interaction, some formal interfaces were declared for more platform-specific components to advertise and the forms processor could then call.

Note that the need for the forms processor to call into an alternate component driver should be limited as much as possible. The two primary reasons for this are the cases where off-line or O/S-present configuration is important. The three flow charts which follow describe the typical decisions that a forms processor would make with regards to handling processes which necessitate a callback.

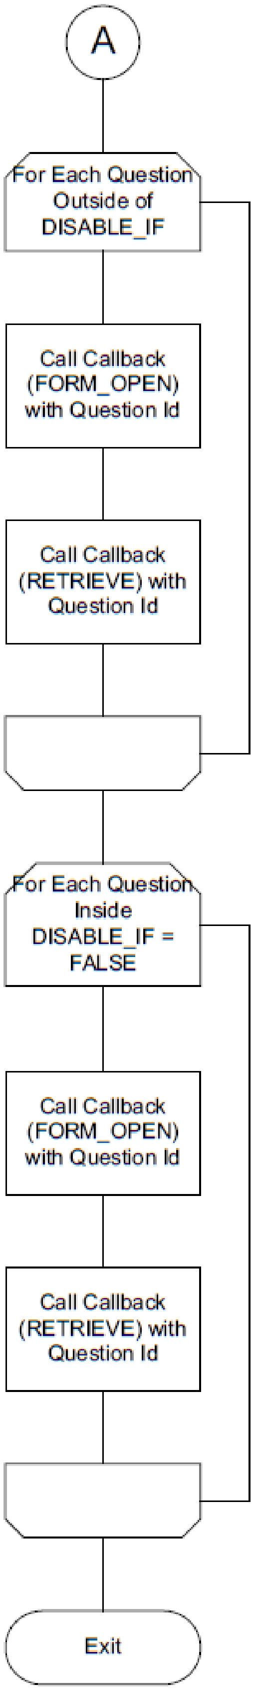


Fig. 33.29: **Typical Forms Processor Decisions Necessitating a Callback (1)**

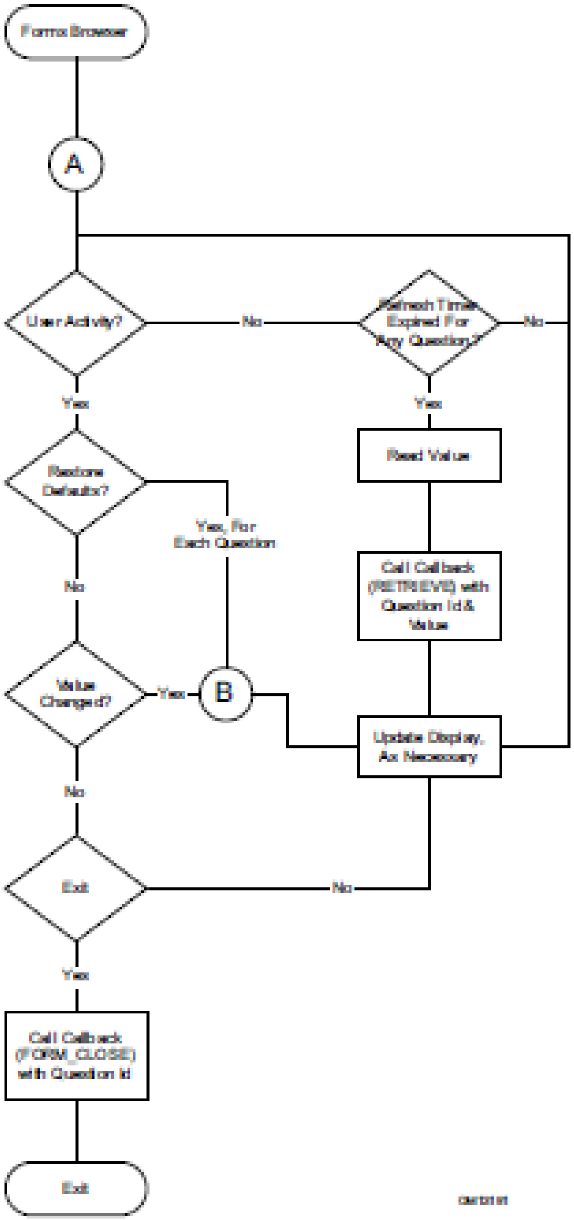

Fig. 33.30: **Typical Forms Processor Decisions Necessitatinga Callback (2)**

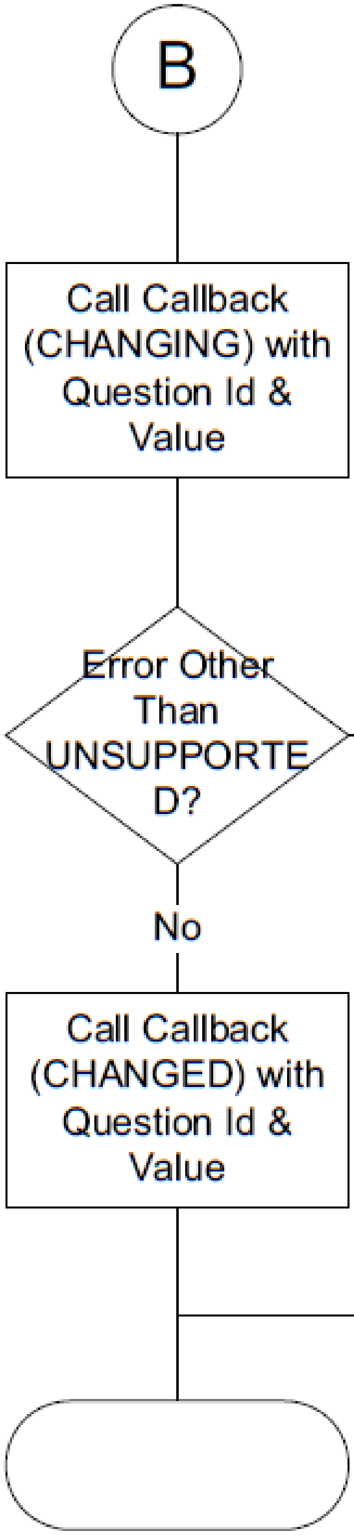

Fig. 33.31: **Typical Forms Processor Decisions Necessitatinga Callback (3)**

33.2.13 Driver Model Interaction

The ability for a UEFI driver to interact with a target controller is abstracted through the Configuration Access Protocol. If a particular piece of hardware managed by a controller needs configuration services, it is the responsibility of that controller to provide this configuration abstraction for the given device. Regardless of whether a device driver or bus driver is abstracting the hardware configuration, the interaction with a configured device is identical.

Note that the ability for a driver to provide these access protocols might be done fairly early in the initialization process. Depending on the hardware capabilities, one might be advantaged in providing configuration access very early so that being able to determine a given device's current settings can be done without a full enumeration of certain bus devices. Also note that the same recommendations that are made in the DriverBinding sections should still be maintained. These cover the Supported, Started, and Stopped functions.

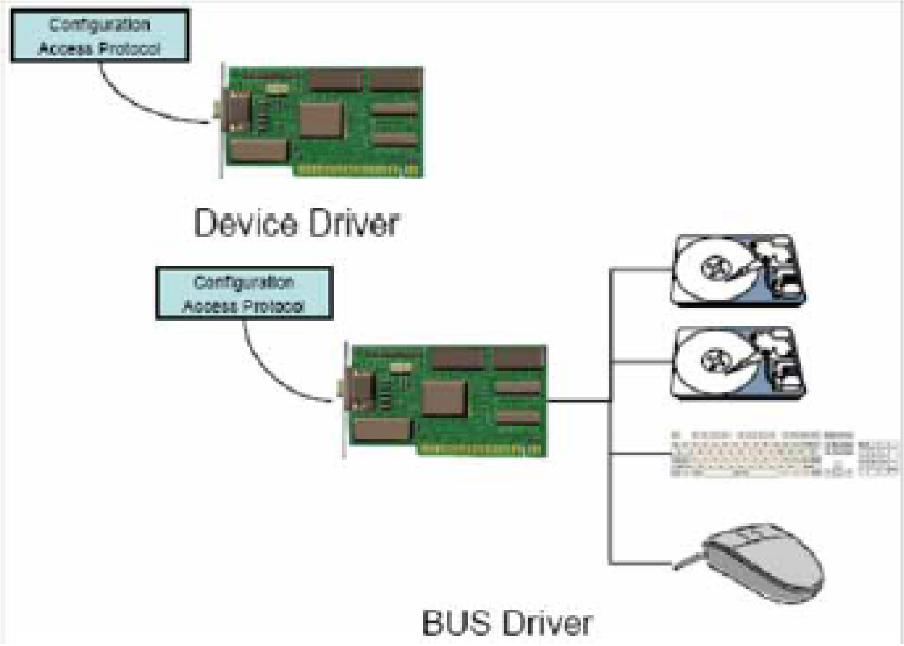

Fig. 33.32: Driver Model Interactions

33.2.14 Human Interface Component Interactions

The figure below depicts the model used inside a common deployment of HII to manage human interface components.

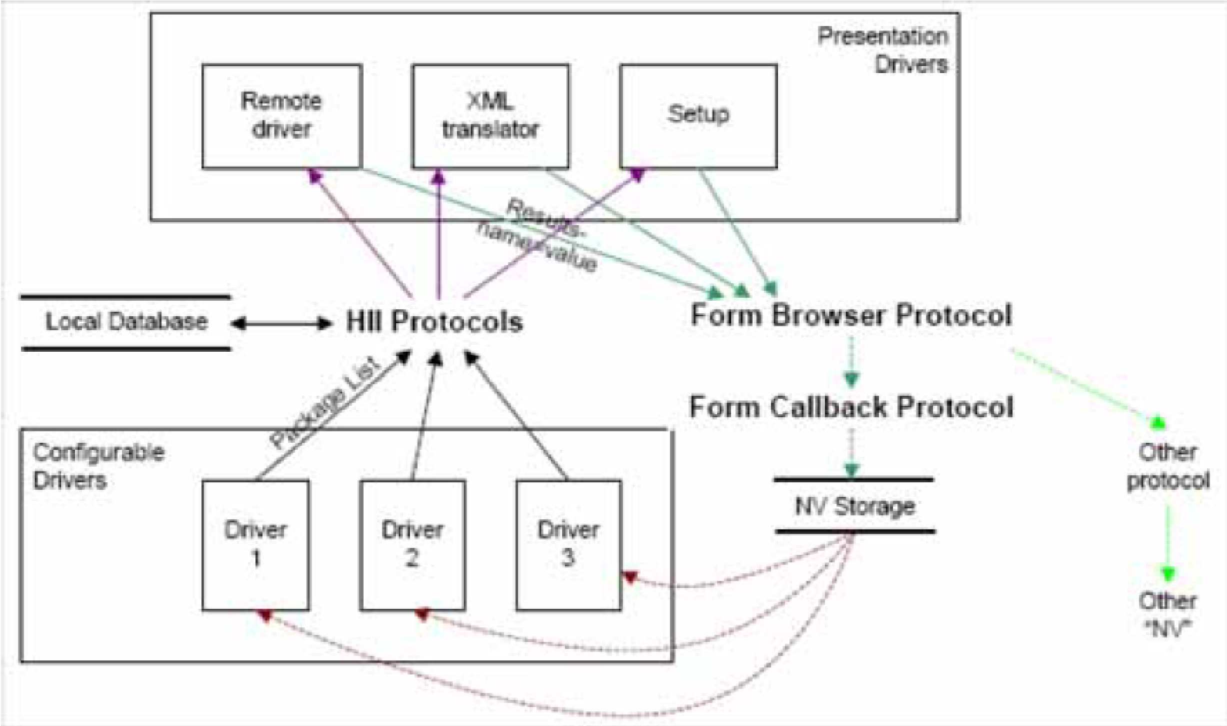

Fig. 33.33: Managing Human Interface Components

33.2.15 Standards Map Forms

Configuration settings are configuration settings. But the way in which they are controlled is driven by different requirements. For example, the UEFI HII infrastructure focuses primarily on the way in which the configuration settings can be browsed and manipulated by a user. Other standards such as the DMTF Command-Line Protocol, focus on the way in which configuration settings can be manipulated via text commands.

Each *configuration method* tends to view the configuration settings a different way. In the end, they are changing the same configuration setting, but their means of exposing the control differs. The means by which a configuration method (HII, DMTF, WMI, SNMP, etc.) exposes an individual configuration setting is called a *question.*

In many cases, there is a one-to-one mapping between the questions exposed by these different configuration methods. That is, a question, as exposed by one configuration method matches the semantic meaning of the configuration setting exactly.

However, in other cases, there is not a one-to-one mapping. These cases break down into three broad categories:

1. Value Shift. In this case, the configuration setting has the same scope as the question exposed by aconfiguration method, but the values used to describethem are different. It may be as simple as 1=5, 2=6, 3=7,etc. or something more complicated, where “ON”=1 and”OFF”=0.**
2. One-To-Many. In this case, the configuration setting maps to two or more questions exposed by a configuration meth od. For example the configuration setting might have the following enumerated values:

   a. 0 = Disable Serial Port
   b. 1 = Enable Serial Port, I/O Port 0x3F8, IRQ 4
   c. 2 = Enable Serial Port, I/O Port 0x2F8, IRQ 3
   d. 3 = Enable Serial Port, I/O Port 0x3E8, IRQ 4

But in the configuration method, the serial port is controlled by three separate questions:

- Question #1: 0 = disable, 1 = enable
- Question #2: I/O Port (disabled if Question #1 = 0)
- Question #3: IRQ (disabled if Question #1 = 0)

Changing the configuration method question #1 to a value of 0 requires that the configuration setting be set to 0. In this case, there is the possibly of data loss. After changing the configuration setting to 0, the information about the I/O port and IRQ are not preserved.

So, in order to change the configuration setting to the value of 1 would require three of the configuration method's questions to change value: Question #1=1, Question #2=0x3F8, Question #3=IRQ 4.

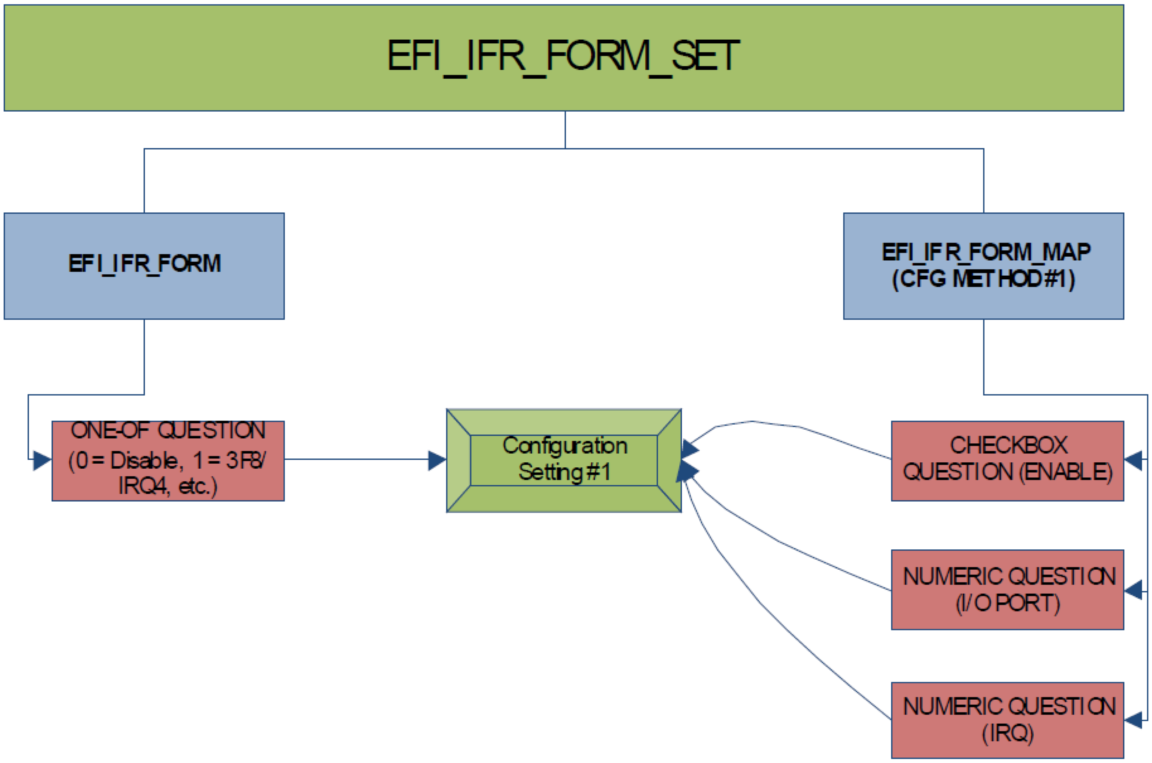

Fig. 33.34: EFI IFR Form Set configuration

3. Many-To-One. In this case, the conditions are reversed from the example described in #2 above. Now there are three configuration settings which map to a single configuration method question.

For example, the configuration settings are described using three separate questions:

a. Question #1: 0 = disable, 1 = enable
b. Question #2: I/O Port (disabled if Question #1 = 0)
c. Question #3: IRQ (disabled if Question #1 = 0).

But in the configuration method, the serial port is controlled by a single question with the following enumerated values:

a. 0 = Disable Serial Port
b. 1 = Enable Serial Port, I/O Port 0x3F8, IRQ 4
c. 2 = Enable Serial Port, I/O Port 0x2F8, IRQ 3
d. 3 = Enable Serial Port, I/O Port 0x3E8, IRQ 4
e. 4 = Enable Serial Port, I/O Port 0x2E8, IRQ 3

So, in order to change the configuration method to the value of 1 would require three configuration settings to change value: Question #1=1, Question #2=0x3F8, Question #3=IRQ 4.

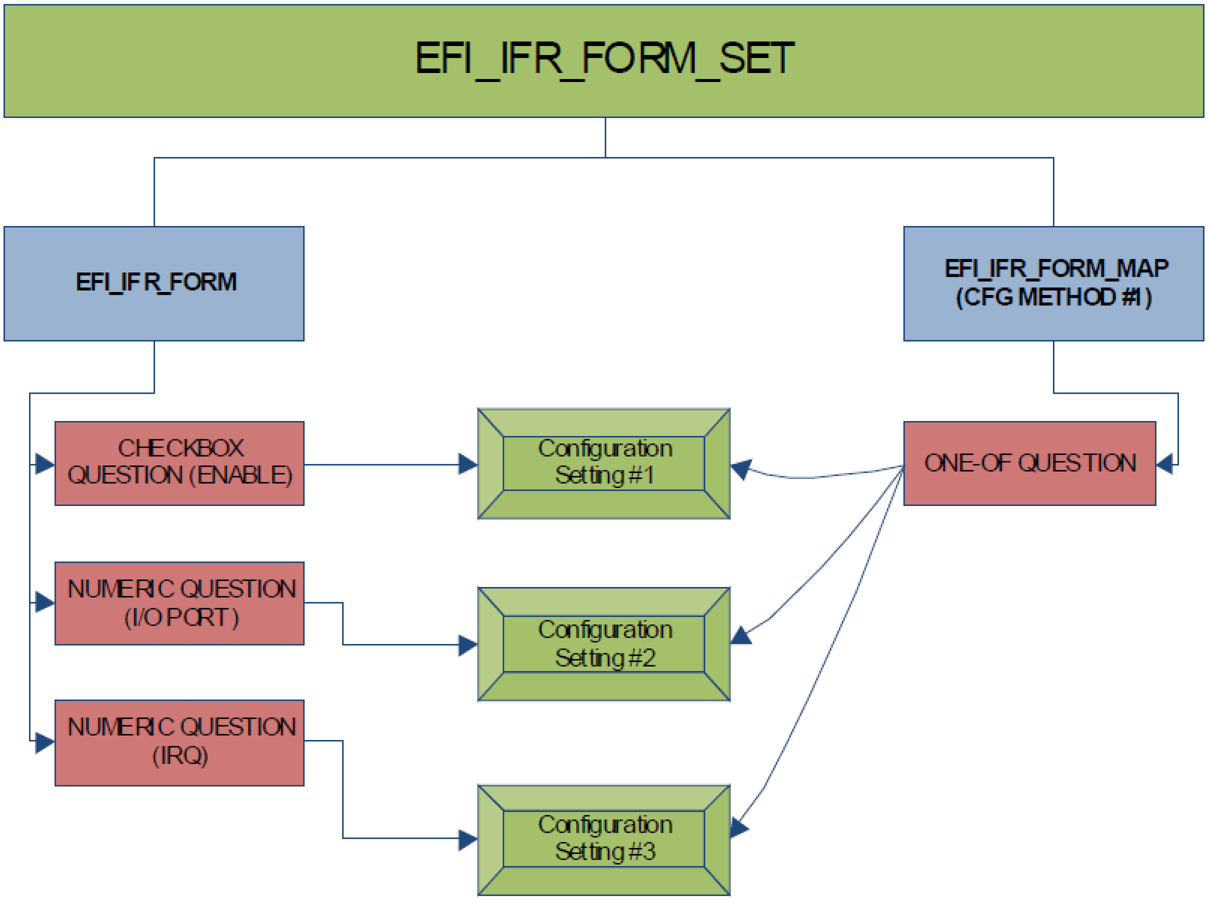

Fig. 33.35: **EFI IFR Form Set Question Changes**

Some configuration settings may involve more than one of these mappings.

Standards map forms describe the questions exposed by these other configuration methods and how they map back to the configuration settings exposed by the UEFI drivers. Each standards map form describes the mapping for a single configuration method, along with that configuration method's name and version.

The questions within standards map forms are encoded using IFR in the same fashion as those within other UEFI forms. The prompt strings for these questions are tied back to the names for those questions within the configuration method (e.g., DMTF CLP).

33.2.15.1 Create A Question's Value By Combing MultipleConfiguration Settings

Rather than reading directly from storage, these standards map questions retrieve their value using the *EFI_IFR_READ* (*EFI_IFR_Read*) operator. This operator can aggregate a value from more than one configuration settings using *EFI_IFR_GET* (*EFI_IFR_Get*). This operator can also change the type (integer, string, Boolean) of the value so that, say, a configuration setting with a type of integer can be represented in a standards map form as a string.

For example, to map a single question to three configuration settings (CS1, CS2 and CS3) as described in scenario #3 in *Strings* , above would have the following truth table:

Table 33.12: Truth Table: Mapping A Single Question To Three Configuration Settings

CS1	**CS2**	**CS3**	**Q**
FALSE	X	X	0
TRUE	0x3F8	4	1
TRUE	0x2F8	3	2
TRUE	0x3E8	4	3
TRUE	0x2E8	3	4
TRUE	any other value	any other value	*Undefined*

These become the following equations:

```
x0: Get (CS1) ? x1 : 0
x1: ((Get(CS2) & 0xF00) >> 8) == Get(CS3) + 1 ? x2 : Undefined
x2: Map(Get(CS2),0x3f8,1,0x2F8,2,0x3E8,3,0x2E8,4)
```

33.2.15.2 Changing Multiple Configuration Settings FromOne Question's Value

Rather than writing directly to storage, these standards map questions change their value using the *EFI_IFR_WRITE* (*EFI_IFR_Write*) operator. This operator can, in turn, use the *EFI_IFR_SET* (*EFI_IFR_Set*) operator to change one or more configuration settings. This operator can also change the type (integer, string, Boolean, etc.) of the value written so that, say, a configuration setting with a type of integer can be represented in a standards map form as a string question.

For example, in example #2 above, the following table applies:

Table 33.13: Multiple Configuration Settings Example #2

CS1	CS2	CS3	Q
FALSE	X	X	0
TRUE	0x3F8	4	1
TRUE	0x3E8	3	2
TRUE	0x2F8	4	3
TRUE	0x2E8	3	4

```
Set (CS1,Q != 0) &&
Set (CS2,Map(this,1,0x3F8,2,0x3E8,3,0x2F8,4,0x2E8)) &&
Set (CS3,Map(this,1,4,2,3,3,4,4,3)
```

33.2.15.3 Value Shifting

Value shifting is facilitated by the EFI_IFR_MAP (*EFI_IFR_Map*) operator. If this operator finds a value in a list, it replaces it with another value from the list, even if the other value is a different type.

For example, consider the following list of values

Table 33.14: Values

1	PEI Module
2	DXE Boot Service Driver
3	DXE Runtime Driver
10	UEFI Boot Service Driver
11	UEFI Runtime Driver
12	UEFI Application

If the integer value 10 were supplied, the value “UEFI Boot Service Driver” would be returned. If the integer value 20 were supplied, Undefined would be returned.

33.2.15.4 Prompts

In standards map forms, the prompts can be used as the key words for the configuration method. They should be specified in the language i-uefi unless there are multiple translations available. Other standards may use the question identifiers as the means of identifying the standard question.

33.3 Code Definitions

This section describes the binary encoding of the different package types:

- Font Package
- Simplified Font Package
- String Package
- Image Package
- Device Path Package
- Keyboard Layout Package
- GUID Package
- Forms Package

33.3.1 Package Lists and Package Headers

33.3.1.1 EFI_HII_PACKAGE_HEADER

Summary

The header found at the start of each package.

Prototype

```
typedef struct {
  UINT32            Length:24;
  UINT32            Type:8;
  UINT8             Data[... ];
}   EFI_HII_PACKAGE_HEADER;
```

Members

Length
The size of the package in bytes.

Type
The package type. See *EFI_HII_PACKAGE_TYPE_x,* below.

Data
The package data, the format of which is determined by *Type*.

Description

Each package starts with a header, as defined above, which indicates the size and type of the package. When added to a pointer pointing to the start of the header, *Length* points at the next package. The package lists form a package list when concatenated together and terminated with an *EFI_HII_PACKAGE_HEADER* with a *Type* of *EFI_HII_PACKAGE_END.*

The type *EFI_HII_PACKAGE_TYPE_GUID* is used for vendor-defined HII packages, whose contents are determined by the *Guid.*

The range of package types starting with *EFI_HII_PACKAGE_TYPE_SYSTEM_BEGIN* through *EFI_HII_PACKAGE_TYPE_SYSTEM_END* are reserved for system firmware implementers.

Related Definitions

```
#define EFI_HII_PACKAGE_TYPE_ALL            0x00
#define EFI_HII_PACKAGE_TYPE_GUID           0x01
#define EFI_HII_PACKAGE_FORMS               0x02
#define EFI_HII_PACKAGE_STRINGS             0x04

#define EFI_HII_PACKAGE_KEYBOARD_LAYOUT     0x09
#define EFI_HII_PACKAGE_ANIMATIONS          0x0A
#define EFI_HII_PACKAGE_END                 0xDF
#define EFI_HII_PACKAGE_TYPE_SYSTEM_BEGIN   0xE0
#define EFI_HII_PACKAGE_TYPE_SYSTEM_END 0xFF
```

Table 33.15: Package Types

Package Type	Description
EFI_HII_PACKAGE_TYPE_ALL	Pseudo-package type used when exporting package lists. See *ExportPackageList().*
EFI_HII_PACKAGE_TYPE_GUID	Package type where the format of the data is specified using a GUID immediately following the package header.
EFI_HII_PACKAGE_FORMS	Forms package.
EFI_HII_PACKAGE_STRINGS	Strings package
EFI_HII_PACKAGE_FONTS	Fonts package.

continues on next page

Table 33.15 – continued from previous page

EFI_HII_PACKAGE_IMAGES	Images package.
EFI_HII_PACKAGE_SIMPLE_FONTS	Simplified (8x19, 16x19) Fonts package
EFI_HII_PACKAGE_DEVICE_PATH	Binary-encoded device path.
EFI_HII_PACKAGE_END	Used to mark the end of a package list.
EFI_HII_PACKAGE_ANIMATIONS	Animations package.
EFI_HII_PACKAGE_TYPE_SYSTEM_BEGIN… EFI_HII_PACKAGE_TYPE_SYSTEM_END	Package types reserved for use by platform firmware implementations.

33.3.1.2 EFI_HII_PACKAGE_LIST_HEADER

Summary

The header found at the start of each package list.

Prototype

```
typedef struct {
  EFI_GUID           PackageListGuid;
  UINT32             PackagLength;
}   EFI_HII_PACKAGE_LIST_HEADER;
```

Members

PackageListGuid
The unique identifier applied to the list of packages which follows.

PackageLength
The size of the package list (in bytes), including the header.

Description

This header uniquely identifies the package list and is placed in front of a list of packages. Package lists with the same *PackageListGuid* value should contain the same data set. Updated versions should have updated GUIDs.

33.3.2 Simplified Font Package

The simplified font package describes the font glyphs for the standard 8x19 pixel (narrow) and 16x19 (wide) fonts. Other fonts should be described using the normal Font Package.

A simplified font package consists of a header and two types of glyph structures–standard-width (narrow) and wide glyphs.

33.3.2.1 EFI_HII_SIMPLE_FONT_PACKAGE_HDR

Summary

A simplified font package consists of a font header followed by a series of glyph structures.

Prototype

```
typedef struct _EFI_HII_SIMPLE_FONT_PACKAGE_HDR {
  EFI_HII_PACKAGE_HEADER                Header;
  UINT16                            NumberOfNarrowGlyphs;
  UINT16                            NumberOfWideGlyphs;
  EFI_NARROW_GLYPH                  NarrowGlyphs[];
  EFI_WIDE_GLYPH                    WideGlyphs[];
}   EFI_HII_SIMPLE_FONT_PACKAGE_HDR;
```

Members

Header

The header contains a *Length* and *Type* field. In the case of a font package, the type will be *EFI_HII_PACKAGE_SIMPLE_FONTS* and the length will be the total size of the font package including the size of the narrow and wide glyphs. See *EFI_HII_PACKAGE_HEADER*.

NumberOfNarrowGlyphs

The number of *NarrowGlyphs* that are included in the font package.

NumberOfWideGlyphs

The number of *WideGlyphs* that are included in the font package.

NarrowGlyphs

An array of *EFI_NARROW_GLYPH* entries. The number of entries is specified by *NumberOfNarrowGlyphs.*

WideGlyphs

An array of *EFI_WIDE_GLYPH* entries. The number of entries is specified by *NumberOfWideGlyphs.* To calculate the offset of *WideGlyphs,* use the offset of *NarrowGlyphs* and add the size of *EFI_NARROW_GLYPH* multiplied by the *NumberOfNarrowGlyphs.*

Description

The glyphs must be sorted by Unicode character code.

It is up to developers who manage fonts to choose efficient mechanisms for accessing fonts. The contiguous presentation can easily be used because narrow and wide glyphs are not intermixed, so a binary search is possible (hence the requirement that the glyphs be sorted by weight).

33.3.2.2 EFI_NARROW_GLYPH

Summary

The *EFI_NARROW_GLYPH* has a preferred dimension (w x h) of 8 x 19 pixels.

Prototype

```
typedef struct {
  CHAR16             UnicodeWeight;
  UINT8              Attributes;
  UINT8              GlyphCol1[EFI_GLYPH_HEIGHT];
}   EFI_NARROW_GLYPH;
```

Members

UnicodeWeight

The Unicode representation of the glyph. The term weight is the technical term for a character code.

Attributes

The data element containing the glyph definitions; see "Related Definitions" below.

GlyphCol1

The column major glyph representation of the character. Bits with values of one indicate that the corresponding pixel is to be on when normally displayed; those with zero are off.

Description

Glyphs are represented by two structures, one each for the two sizes of glyphs. The narrow glyph (*EFI_NARROW_GLYPH*) is the normal glyph used for text display.

Related Definitions

```
// Contents of EFI_NARROW_GLYPH.Attributes
#define EFI_GLYPH_NON_SPACING       0x01
#define EFI_GLYPH_WIDE              0x02
#define EFI_GLYPH_HEIGHT            19
#define EFI_GLYPH_WIDTH             8
```

Following is a description of the fields in the above definition:

EFI_GLYPH_NON_SPACING

This symbol is to be printed "on top of" (*OR* 'd with) the previous glyph beforedisplay.

EFI_GLYPH_WIDE

This symbol uses 16x19 formats rather than 8x19.

33.3.2.3 EFI_WIDE_GLYPH

Summary

The *EFI_WIDE_GLYPH* has a preferred dimension (w x h) of 16 x 19 pixels, which is large enough to accommodate logographic characters.

Prototype

```
typedef struct {
  CHAR16        UnicodeWeight;
  UINT8         Attributes;
  UINT8         GlyphCol1[EFI_GLYPH_HEIGHT];
  UINT8         GlyphCol2[EFI_GLYPH_HEIGHT];
  UINT8         Pad[3];
} EFI_WIDE_GLYPH;
```

Members

UnicodeWeight

The Unicode representation of the glyph. The term weight is the technical term for a character code.

Attributes

The data element containing the glyph definitions; see "Related Definitions" in *EFI_NARROW_GLYPH* for attribute values.

GlyphCol1 and GlyphCol2

The column major glyph representation of the character. Bits with values of one indicate that the corresponding pixel is to be on when normally displayed; those with zero are off.

Pad

Ensures that *sizeof (EFI_WIDE_GLYPH)* is twice the *sizeof (EFI_NARROW_GLYPH)*. The contents of *Pad* must be zero.

Description

Glyphs are represented via the two structures, one each for the two sizes of glyphs. The wide glyph (*EFI_WIDE_GLYPH*) is large enough to display logographic characters.

33.3.3 Font Package

The font package describes the glyphs for a single font with a single family, size and style. The package has two parts: a fixed header and the glyph blocks. All structures described here are byte packed.

33.3.3.1 Fixed Header

The fixed header consists of a standard record header and then the character values in this section, the flags (including the encoding method) and the offsets of the glyph information, the glyph bitmaps and the character map.

```
typedef struct _EFI_HII_FONT_PACKAGE_HDR {
  EFI_HII_PACKAGE_HEADER          Header;
  UINT32                          HdrSize;
  UINT32                          GlyphBlockOffset;
  EFI_HII_GLYPH_INFO              Cell;
  EFI_HII_FONT_STYLE              FontStyle;
  CHAR16                          FontFamily[];
}   EFI_HII_FONT_PACKAGE_HDR;
```

Header

The standard package header, where *Header.Type* = *EFI_HII_PACKAGE_FONTS.*

HdrSize

Size of this header.

GlyphBlockOffset

The offset, relative to the start of this header, of a series of variable-length glyph blocks, each describing information about the bitmap associated with a glyph.

Cell

This contains the measurement of the widest and tallest characters in the font (*Cell.Width* and *Cell.Height*). It also contains the default offset to the horizontal and vertical origin point of the character cell (*Cell.OffsetX* and *Cell.OffsetY*). Finally, it contains the default *AdvanceX.*

FontStyle

The design style of the font, 1 bit per style. See *EFI_HII_FONT_STYLE.*

FontFamily

The null-terminated string with the name of the font family to which the font belongs.

Related Definitions

```
typedef UINT32 EFI_HII_FONT_STYLE;
#define EFI_HII_FONT_STYLE_NORMAL       0x00000000
#define EFI_HII_FONT_STYLE_BOLD         0x00000001
#define EFI_HII_FONT_STYLE_ITALIC       0x00000002
#define EFI_HII_FONT_STYLE_EMBOSS       0x00010000
#define EFI_HII_FONT_STYLE_OUTLINE      0x00020000
#define EFI_HII_FONT_STYLE_SHADOW       0x00040000
#define EFI_HII_FONT_STYLE_UNDERLINE    0x00080000
#define EFI_HII_FONT_STYLE_DBL_UNDER    0x00100000
```

33.3.3.2 Glyph Information

For each Unicode character code, the glyph information gives the glyph bitmap, the character size and the position of the bitmap relative to the origin of the character cell. The glyph information is encoded as a series of blocks, each with a single byte header. The blocks must be processed in order.

Each block begins with a single byte, which contains the block type.

Prototype

```
typedef struct _EFI_HII_GLYPH_BLOCK {
  UINT8           BlockType;
  UINT8           BlockBody[];
}   EFI_HII_GLYPH_BLOCK;
```

Members

The following table describes the different block types:

Name	Value	Description
EFI_HII_GIBT_END	0x00	The end of the glyph information.
EFI_HII_GIBT_GLYPH	0x10	Glyph information for a single character value, bit-packed.
EFI_HII_GIBT_GLYPHS	0x11	Glyph information for multiple character values.
EFI_HII_GIBT_GLYPH_DEFAULT	0x12	Glyph information for a single character value, using the default character cell information.
EFI_HII_GIBT_GLYPHS_DEFAULT	0x13	Glyph information for multiple character values, using the default character cell information.
EFI_HII_GIBT_GLYPH_VARIABILITY	0x14	Glyph information for the _GIBT_GLYPH_VARIABILITY variable glyph.
EFI_HII_GIBT_DUPLICATE	0x20	Create a duplicate of an existing glyph but with a new character value.
EFI_HII_GIBT_SKIP2	0x21	Skip a number (1-65535) character values.
EFI_HII_GIBT_SKIP1	0x22	Skip a number (1-255) character values.
EFI_HII_GIBT_DEFAULTS	0x23	Set default glyph information for subsequent glyph blocks.
EFI_HII_GIBT_EXT1	0x30	For future expansion (one byte length field)

continues on next page

Table 33.16 – continued from previous page

EFI_HII_GIBT_EXT2	0x31	For future expansion (two byte length field)
EFI_HII_GIBT_EXT4	0x32	For future expansion (four byte length field)

Description

In order to recreate all glyphs, start at the first block and process them all until a *EFI_HII_GIBT_END* block is found. When processing the glyph blocks, each block refers to the current character value (*CharValueCurrent*), which is initially set to one (1).

Glyph blocks of an unknown type should be skipped. If they cannot be skipped, then processing halts.

Related Definitions

```
typedef struct _EFI_HII_GLYPH_INFO {
  UINT16          Width;
  UINT16          Height;
  INT16           OffsetX;
  INT16           OffsetY;
  INT16           AdvanceX;
}   EFI_HII_GLYPH_INFO;
```

Width
Width of the character or character cell, in pixels. For fixed-pitch fonts, this is the same as the advance.

Height
Height of the character or character cell, in pixels.

OffsetX
Offset to the horizontal edge of the character cell.

OffsetY
Offset to the vertical edge of the character cell.

AdvanceX
Number of pixels to advance to the right when moving from the *origin* of the current glyph to the origin of the next glyph.

33.3.3.2.1 EFI_HII_GIBT_DEFAULTS

Summary

Changes the default character cell information.

Prototype

```
typedef struct _EFI_HII_GIBT_DEFAULTS_BLOCK {
  EFI_HII_GLYPH_BLOCK             Header;
  EFI_HII_GLYPH_INFO              Cell;
}   EFI_HII_GIBT_DEFAULTS_BLOCK;
```

Members

Header
Standard glyph block header, where *Header.BlockType = EFI_HII_GIBT_DEFAULTS.*

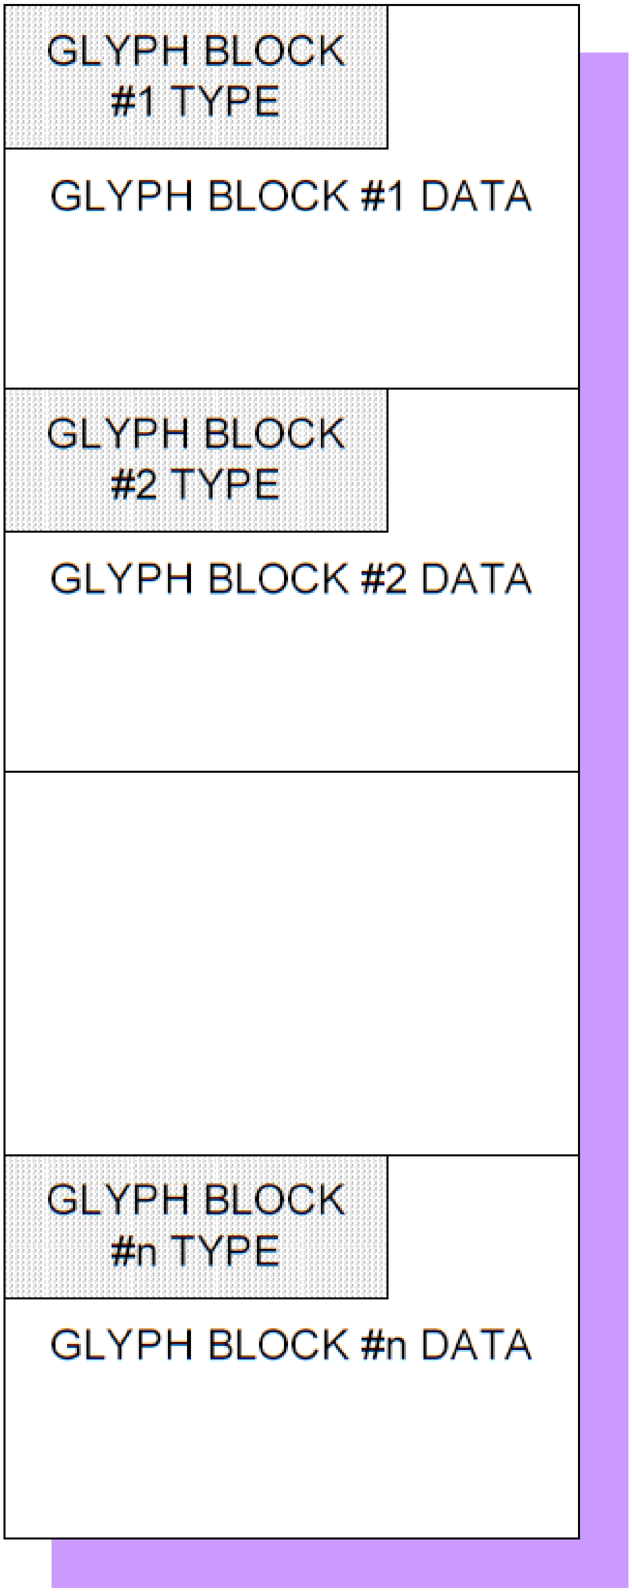

Fig. 33.36: Glyph Information Encoded in Blocks

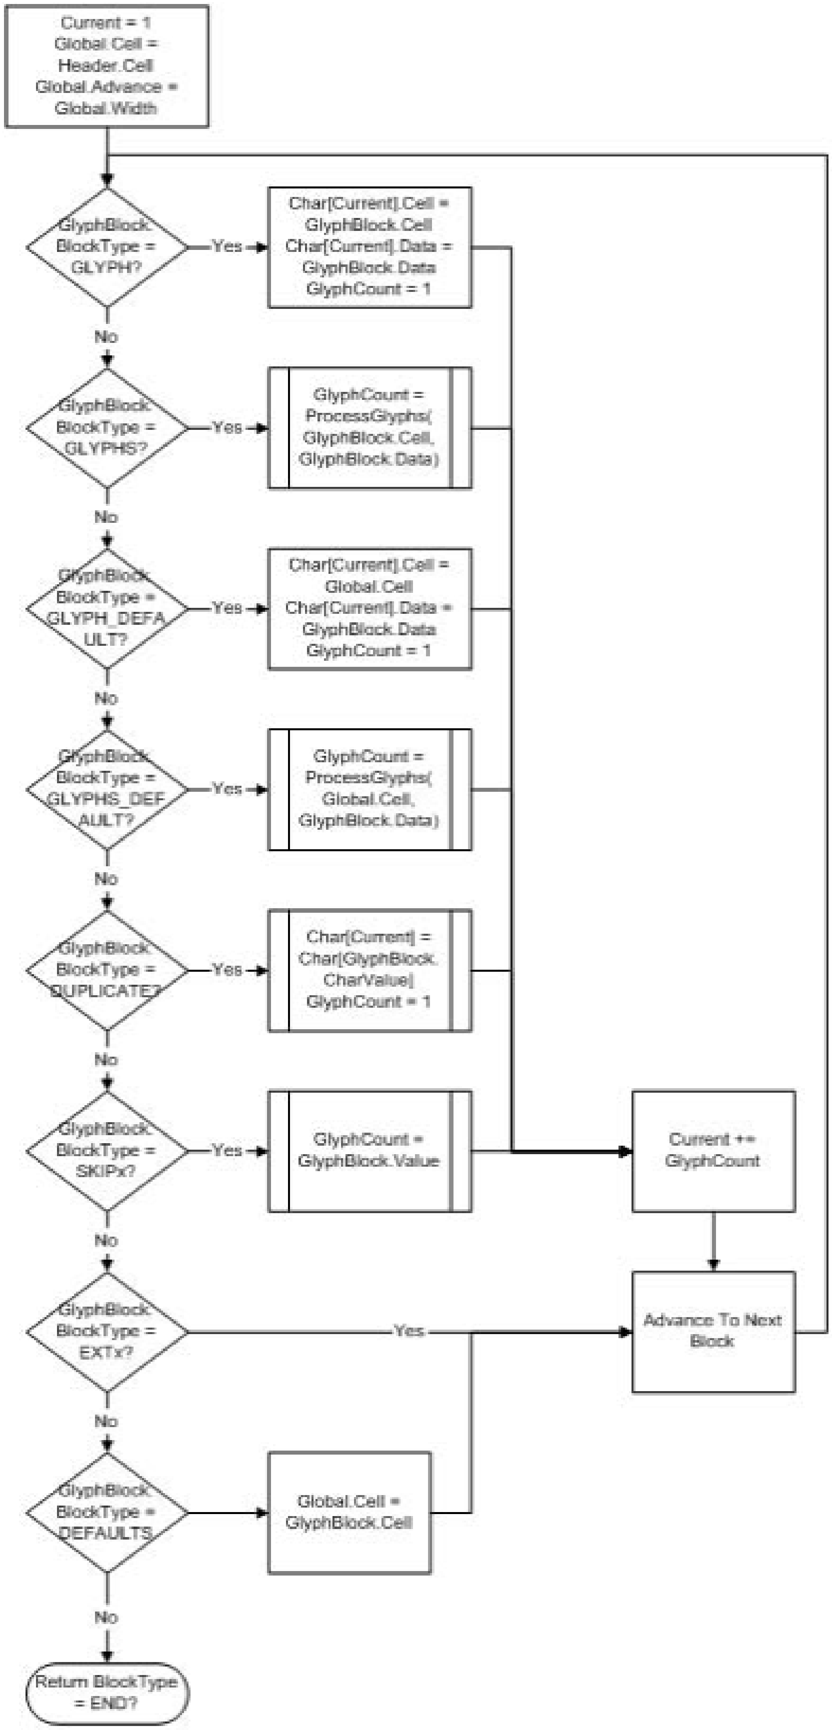

Fig. 33.37: Glyph Block Processing

Cell

The new default cell information which will be applied to all subsequent *GLYPH_DEFAULT* and *GLYPHS_DEFAULT* blocks.

Description

Changes the default cell information used for subsequent *EFI_HII_GIBT_GLYPH_DEFAULT* and *EFI_HII_GIBT_GLYPHS_DEFAULT* glyph blocks. The cell information described by *Cell* remains in effect until the next *EFI_HII_GIBT_DEFAULTS* is found. Prior to the first *EFI_HII_GIBT_DEFAULTS* block, the cell information in the fixed header are used.

33.3.3.2.2 EFI_HII_GIBT_DUPLICATE

Summary

Assigns a new character value to a previously defined glyph.

Prototype

```
typedef struct _EFI_HII_GIBT_DUPLICATE_BLOCK {
  EFI_HII_GLYPH_BLOCK          Header;
  CHAR16                       CharValue;
}   EFI_HII_GIBT_DUPLICATE_BLOCK;
```

Members

Header

Standard glyph block header, where *Header.BlockType* = *EFI_HII_GIBT_DUPLICATE.*

CharValue

The previously defined character value with the exact same glyph.

Description

Indicates that the glyph with character value *CharValueCurrent* has the same glyph as a previously defined character value and increments *CharValueCurrent* by one.

33.3.3.2.3 EFI_HII_GIBT_END

Summary

Marks the end of the glyph information.

Prototype

```
typedef struct _EFI_GLYPH_GIBT_END_BLOCK {
  EFI_HII_GLYPH_BLOCK                Header;
}   EFI_GLYPH_GIBT_END_BLOCK;
```

Members

Header

Standard glyph block header, where *Header.BlockType* = *EFI_HII_GIBT_END.*

Description

Any glyphs with a character value greater than or equal to *CharValueCurrent* are empty.

33.3.3.2.4 EFI_HII_GIBT_EXT1, EFI_HII_GIBT_EXT2,EFI_HII_GIBT_EXT4

Summary

Future expansion block types which have a length byte.

Prototype

```
typedef struct _EFI_HII_GIBT_EXT1_BLOCK {
 EFI_HII_GLYPH_BLOCK    Header;
  UINT8                 BlockType2;
  UINT8                 Length;
}   EFI_HII_GIBT_EXT1_BLOCK;

typedef struct _EFI_HII_GIBT_EXT2_BLOCK {
  EFI_HII_GLYPH_BLOCK   Header;
  UINT8                 BlockType2;
  UINT16                Length;
}   EFI_HII_GIBT_EXT2_BLOCK;

typedef struct _EFI_HII_GIBT_EXT4_BLOCK {
  EFI_HII_GLYPH_BLOCK   Header;
  UINT8                 BlockType2;
  UINT32                Length;
}   EFI_HII_GIBT_EXT4_BLOCK;
```

Members

Header

Standard glyph block header, where *Header.BlockType* = *EFI_HII_GIBT_EXT1, EFI_HII_GIBT_EXT2* or *EFI_HII_GIBT_EXT4.*

Length

Size of the glyph block, in bytes.

BlockType2

Indicates the type of extended block. Currently all extended block types are reserved for future expansion.

Description

These are reserved for future expansion, with length bytes included so that they can be easily skipped.

33.3.3.2.5 EFI_HII_GIBT_GLYPH

Summary

Provide the bitmap for a single glyph.

Prototype

```
typedef struct _EFI_HII_GIBT_GLYPH_BLOCK {
  EFI_HII_GLYPH_BLOCK             Header;
  EFI_HII_GLYPH_INFO              Cell;
  UINT8                           BitmapData[1];
}   EFI_HII_GIBT_GLYPH_BLOCK;
```

Members

Header

Standard glyph block header, where *Header.BlockType* = *EFI_HII_GIBT_GLYPH*.

Cell

Contains the width and height of the encoded bitmap (*Cell.Width* and *Cell.Height*), the number of pixels (signed) right of the character cell origin where the left edge of the bitmap should be placed (*Cell.OffsetX*), the number of pixels above the character cell origin where the top edge of the bitmap should be placed (*Cell.OffsetY*) and the number of pixels (signed) to move right to find the origin for the next character cell (*Cell.AdvanceX*).

GlyphCount

The number of glyph bitmaps.

BitmapData

The bitmap data specifies a series of pixels, one bit per pixel, left-to-right, top-to-bottom. Each glyph bitmap only encodes the portion of the bitmap enclosed by its character-bounding box, but the entire glyph is padded out to the nearest byte. The number of bytes per bitmap can be calculated as: ((*Cell.Width + 7)/8) * Cell.Height.*

Description

This block provides the bitmap for the character with the value *CharValueCurrent* and increments *CharValueCurrent* by one. Each glyph contains a glyph width and height, a drawing offset, number of pixels to advance after drawing and then the encoded bitmap.

33.3.3.2.6 EFI_HII_GIBT_HII_GLYPHS

Summary

Provide the bitmaps for multiple glyphs with the same cell information

Prototype

```
typedef struct _EFI_HII_GIBT_GLYPHS_BLOCK {
  EFI_HII_GLYPH_BLOCK            Header;
  EFI_HII_GLYPH_INFO             Cell;
  UINT16                         Count
  UINT8                          BitmapData[1];
}   EFI_HII_GIBT_GLYPHS_BLOCK;
```

Members

Header

Standard glyph block header, where *Header.BlockType* = *EFI_HII_GIBT_GLYPHS*.

Cell

Contains the width and height of the encoded bitmap (*Cell.Width* and *Cell.Height*), the number of pixels (signed) right of the character cell origin where the left edge of the bitmap should be placed (*Cell.OffsetX*), the number of pixels above the character cell origin where the top edge of the bitmap should be placed (*Cell.OffsetY*) and the number of pixels (signed) to move right to find the origin for the next character cell (*Cell.AdvanceX*).

BitmapData

The bitmap data specifies a series of pixels, one bit per pixel, left-to-right, top-to-bottom, for each glyph. Each glyph bitmap only encodes the portion of the bitmap enclosed by its character-bounding box. The number of bytes per bitmap can be calculated as: ((*Cell.Width + 7)/8) * Cell.Height.*

Description

Provides the bitmaps for the characters with the values *CharValueCurrent* through *CharValueCurrent* + *Count* -1 and increments *CharValueCurrent* by *Count.* These glyphs have identical cell information and the encoded bitmaps are exactly the same number of byes.

33.3.3.2.7 EFI_HII_GIBT_GLYPH_DEFAULT

Summary

Provide the bitmap for a single glyph, using the default cell information.

Prototype

```
typedef struct _EFI_HII_GIBT_GLYPH_DEFAULT_BLOCK {
  EFI_HII_GLYPH_BLOCK         Header;
  UINT8                       BitmapData[];
}   EFI_HII_GIBT_GLYPH_DEFAULT_BLOCK;
```

Members

Header
Standard glyph block header, where *Header.BlockType = EFI_HII_GIBT_GLYPH_DEFAULT.*

BitmapData
The bitmap data specifies a series of pixels, one bit per pixel, left-to-right, top-to-bottom. Each glyph bitmap only encodes the portion of the bitmap enclosed by its character-bounding box. The number of bytes per bitmap can be calculated as: ((*Global.Cell.Width + 7)/8) * Global.Cell.Height.*

Description

Provides the bitmap for the character with the value *CharValueCurrent* and increments *CharValueCurrent* by 1. This glyph uses the default cell information. The default cell information is found in the font header or the most recently processed *EFI_HII_GIBT_DEFAULTS.*

33.3.3.2.8 EFI_HII_GIBT_GLYPHS_DEFAULT

Summary

Provide the bitmaps for multiple glyphs with the default cell information

Prototype

```
  typedef struct _EFI_HII_GIBT_GLYPHS_DEFAULT_BLOCK {
    EFI_HII_GLYPH_BLOCK            Header;
    UINT16                         Count;
    UINT8                          BitmapData [];
  }   EFI_HII_GIBT_GLYPHS_DEFAULT_BLOCK;

**Members**
```

Header
Standard glyph block header, where *Header.BlockType = EFI_HII_GIBT_GLYPHS_DEFAULT.*

Count
Number of glyphs in the glyph block.

BitmapData
The bitmap data specifies a series of pixels, one bit per pixel, left-to-right, top-to-bottom, for each glyph. Each glyph bitmap only encodes the portion of the bitmap enclosed by its character-bounding box. The number of bytes per bitmap can be calculated as: ((*Global.Cell.Width + 7)/8) * Global.Cell.Height.*

Description

Provides the bitmaps for the characters with the values *CharValueCurrent* through *CharValueCurrent* + *Count* -1 and increments *CharValueCurrent* by *Count.* These glyphs use the default cell information and the encoded bitmaps have exactly the same number of byes.

33.3.3.2.9 EFI_HII_GIBT_SKIPx

Summary

Increments the current character value *CharValueCurrent* by the number specified.

Prototype

```
typedef struct _EFI_HII_GIBT_SKIP2_BLOCK {
  EFI_HII_GLYPH_BLOCK                Header;
  UINT16                             SkipCount;
}   EFI_HII_GIBT_SKIP2_BLOCK;

typedef struct _EFI_HII_GIBT_SKIP1_BLOCK {
  EFI_HII_GLYPH_BLOCK                Header;
  UINT8                              SkipCount;
}   EFI_HII_GIBT_SKIP1_BLOCK;
```

Members

Header Standard glyph block header, where *BlockType* = *EFI_HII_GIBT_SKIP1* or *EFI_HII_GIBT_SKIP2*.

SkipCount
The unsigned 8- or 16-bit value to add to *CharValueCurrent*.

Description

Increments the current character value *CharValueCurrent* by the number specified.

33.3.3.2.10 EFI_HII_GIBT_GLYPH_VARIABILITY

Related Definitions

```
//*************************************************************
// EFI_HII_GIBT_GLYPH_VARIABILITY (0x14)
//*************************************************************

typedef struct _EFI_HII_GIBT_VARIABILITY_BLOCK {
  EFI_HII_GLYPH_BLOCK            Header;
  EFI_HII_GLYPH_INFO             Cell;
  UINT8                          GlyphPackInBits;
  UINT8                          BitmapData [1];
}   EFI_HII_GIBT_VARIABILITY_BLOCK;
```

Members

Header
Standard glyph block header, where Blocktype = EFI_HII_GIBT_GLYPH_VARIABILITY.

Cell
Contains the width and height of the encoded bitmap (Cell.Width and Cell.Height), the number of pixels (signed)

right of the character cell origin where the left edge of the bitmap should be placed (Cell.OffsetX), the number of pixels above the character cell origin where the top edge of the bitmap should be placed (Cell.OffsetY) and the number of pixels (signed) to move right to find the origin for the next character cell (Cell.AdvanceX).

GlyphPackInBits

This describes the bit length for each pixel in glyph. With this, the length of BitmapData can be determined according to GlyphPackInBits, cell.with and cell.height.

The valid value is GIBT_VARIABILITY_BLOCK_1_BIT,

GIBT_VARIABILITY_BLOCK_2_BIT,
GIBT_VARIABILITY_BLOCK_4_BIT,
GIBT_VARIABILITY_BLOCK_8_BIT,
GIBT_VARIABILITY_BLOCK_16_BIT,
GIBT_VARIABILITY_BLOCK_24_BIT,
GIBT_VARIABILTY_BLOCK_32_BIT

HII Font Ex protocol has no idea about how to decode the bitmap of glyph if the glyph is declared as *EFI_HII_GIBT_GLYPH_VARIABLITY.* The bitmap decoding is resolved in *EFI_HII_FONT_GLPHY_GENERATOR_PROTOCOL.* This field is used to determine the length of entire glyph block.

BitmapData

The raw data of the glyph pixels. The format of the glyph pixel depends on the glyph generator. Only EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL knows how to draw the glyph.

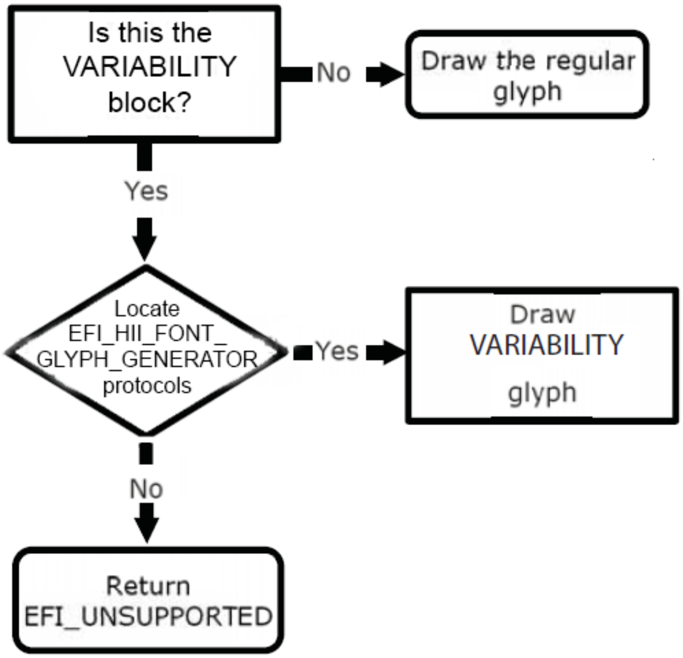

Fig. 33.38: EFI_HII_GIBT_GLYPH_VARIABLITY Glyph Drawing Processing

33.3.4 Device Path Package

Summary

The device path package is used to carry a device path associated with the package list.

Prototype

```
typedef struct _EFI_HII_DEVICE_PATH_PACKAGE {
  EFI_HII_PACKAGE_HEADER                  Header;
//EFI_DEVICE_PATH_PROTOCOL                DevicePath [];
}   EFI_HII_DEVICE_PATH_PACKAGE;
```

Parameters

Header
The standard package header, where *Header.Type = EFI_HII_PACKAGE_DEVICE_PATH.*

DevicePath
The Device Path description associated with the driver handle that provided the content sent to the HII database.

Description

This package is created by *NewPackageList()* when the package list is first added to the HII database by locating the *EFI_DEVICE_PATH_PROTOCOL* attached to the driver handle passed in to that function.

33.3.5 GUID Package

The GUID package is used to carry data where the format is defined by a GUID.

Prototype

```
typedef struct _EFI_HII_GUID_PACKAGE_HDR {
  EFI_HII_PACKAGE_HEADER            Header;
  EFI_GUID                          Guid;
// Data per GUID definition may follow
}   EFI_HII_GUID_PACKAGE_HDR;
```

Members

Header
The standard package header, where *Header.Type = EFI_HII_PACKAGE_TYPE_GUID.*

Guid
Identifier which describes the remaining data within the package.

Description

This is a free-form package type designed to allow extensibility by allowing the format to be specified using *Guid.*.

33.3.6 String Package

The Strings package record describes the mapping between string identifiers and the actual text of the strings themselves. The package consists of three parts: a fixed header, the string information and the font information.

33.3.6.1 Fixed Header

The fixed header consists of a standard record header and then the string identifiers contained in this section and the offsets of the string and language information.

Prototype

```
typedef struct _EFI_HII_STRING_PACKAGE_HDR {
EFI_HII_PACKAGE_HEADER     Header;
  UINT32                   HdrSize;
  UINT32                   StringInfoOffset;
  CHAR16                   LanguageWindow[16];
  EFI_STRING_ID            LanguageName;
  CHAR8                    Language [... ];
}   EFI_HII_STRING_PACKAGE_HDR;
```

Members

Header
The standard package header, where *Header.Type* = *EFI_HII_PACKAGE_STRINGS*.

HdrSize
Size of this header.

StringInfoOffset
Offset, relative to the start of this header, of the string information.

LanguageWindow
Specifies the default values placed in the static and dynamic windows before processing each SCSU-encoded string.

LanguageName
String identifier within the current string package of the full name of the language specified by *Language*.

Language
The null-terminated ASCII string that specifies the language of the strings in the package. The languages are described as specified by *Appendix M — Formats — Language Codes and Language Code Arrays*.

Related Definition

```
#define UEFI_CONFIG_LANG "x-UEFI"
#define UEFI_CONFIG_LANG_2 "x-i-UEFI"
```

33.3.6.2 String Information

For each string identifier, the string information gives the string's text and font. The string information is encoded as a series of blocks, each with a single byte header. The blocks must be processed in order, using the current string identifier (*StringIdCurrent*), which is set initially to one (1). Processing continues until an *EFI_SIBT_END* block is found.

The types of blocks are: string blocks, duplicate blocks, font blocks, and skip blocks. String blocks specify the text and font for the current string identifier and increment to the next string identifier. Duplicate blocks copy the text of a previous string identifier and increment to the next string identifier. Skip bocks skip string identifiers, leaving them blank.

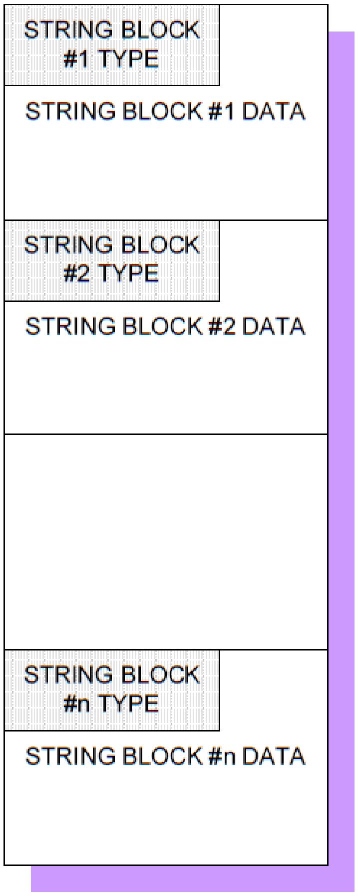

Fig. 33.39: String Information Encoded in Blocks

Each block begins with a single byte, which contains the block type.

```
typedef struct {
  UINT8           BlockType;
  UINT8           BlockBody[];
}   EFI_HII_STRING_BLOCK;
```

The following table describes the different block types:

Name	Value	Description
EFI_HII_SIBT_END	0x00	The end of the string information.
EFI_HII_SIBT_STRING_SCSU	0x10	Single string using default font information.
EFI_HII_SIBT_STRING_SCSU_FONT	0x11	Single string with font information.
EFI_HII_SIBT_STRINGS_SCSU	0x12	Multiple strings using default font information.
EFI_HII_SIBT_STRINGS_SCSU_FONT	0x13	Multiple strings with font information.
EFI_HII_SIBT_STRING_UCS2	0x14	Single UCS-2 string using default font information.
EFI_HII_SIBT_STRING_UCS2_FONT	0x15	Single UCS-2 string with font information
EFI_HII_SIBT_STRINGS_UCS2	0x16	Multiple UCS-2 strings using default font information.
EFI_HII_SIBT_STRINGS_UCS2_FONT	0x17	Multiple UCS-2 strings with font information.
EFI_HII_SIBT_DUPLICATE	0x20	Create a duplicate of an existing string.
EFI_HII_SIBT_SKIP2	0x21	Skip a certain number of string identifiers.
EFI_HII_SIBT_SKIP1	0x22	Skip a certain number of string identifiers.
EFI_HII_SIBT_EXT1	0x30	For future expansion (one byte length field)
EFI_HII_SIBT_EXT2	0x31	For future expansion (two byte length field)
EFI_HII_SIBT_EXT4	0x32	For future expansion (four byte length field)
EFI_HII_SIBT_FONT	0x40	Font information.

When processing the string blocks, each block type refers and modifies the current string identifier (*StringIdCurrent*).

33.3.6.2.1 EFI_HII_SIBT_DUPLICATE

Summary

Creates a duplicate of a previously defined string.

Prototype

```
typedef struct _EFI_HII_SIBT_DUPLICATE_BLOCK {
  EFI_HII_STRING_BLOCK               Header;
  EFI_STRING_ID                      StringId;
}   EFI_HII_SIBT_DUPLICATE_BLOCK;
```

Members

Header

Standard string block header, where *Header.BlockType = EFI_HII_SIBT_DUPLICATE.*

StringId

The string identifier of a previously defined string with the exact same string text.

Description

Indicates that the string with string identifier *StringIdCurrent* is the same as a previously defined string and increments *StringIdCurrent* by one.

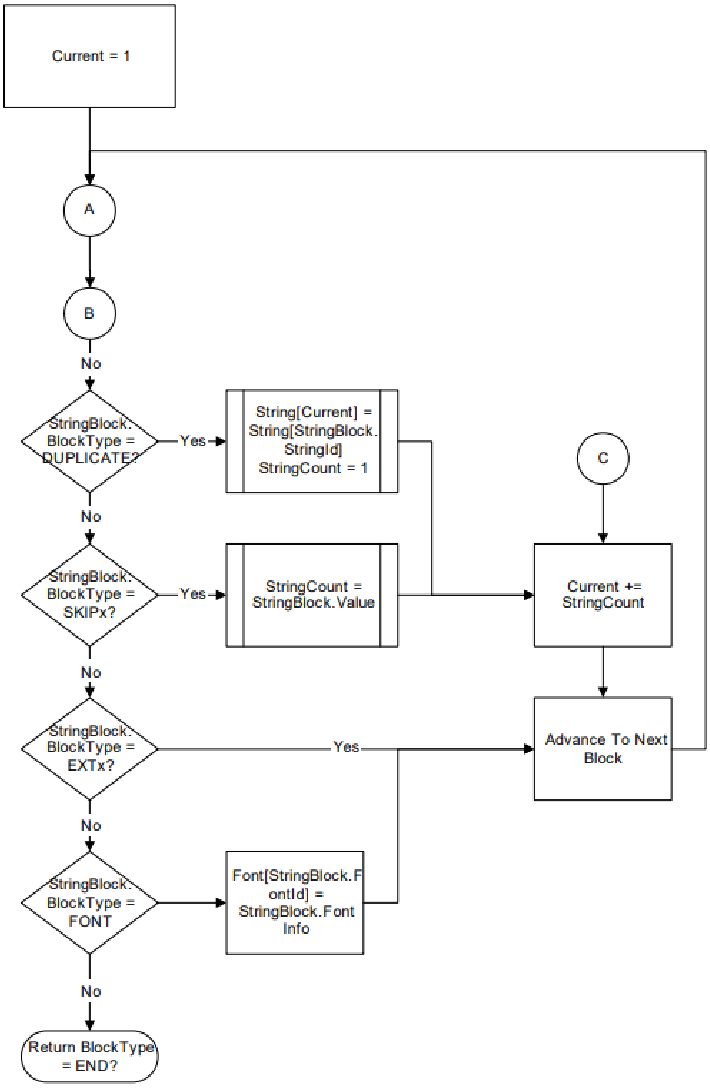

Fig. 33.40: String Block Processing: Base Processing

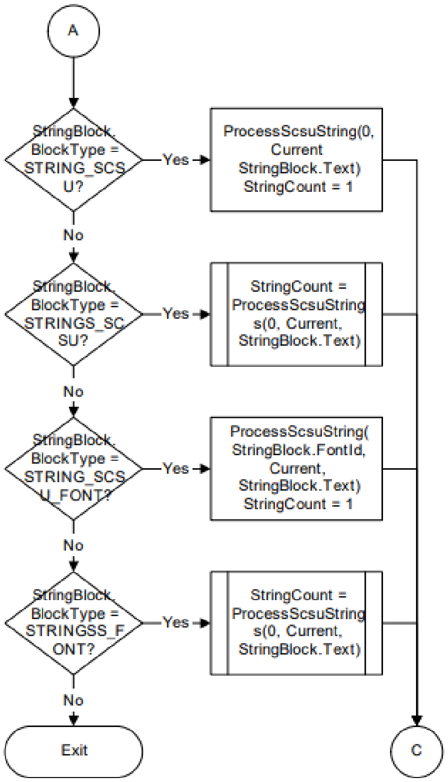

Fig. 33.41: String Block Processing: SCSU Processing

33.3.6.2.2 EFI_HII_SIBT_END

Summary

Marks the end of the string information.

Prototype

```
typedef struct _EFI_HII_SIBT_END_BLOCK {
  EFI_HII_STRING_BLOCK          Header;
}   EFI_HII_SIBT_END_BLOCK;
```

Members

Header

Standard extended header, where *Header.Header.BlockType* = *EFI_HII_SIBT_EXT2* and *Header.BlockType2* = *EFI_HII_SIBT_FONT.*

BlockType2

Indicates the type of extended block. See *String Information* for a list of all block types.

Description

Any strings with a string identifier greater than or equal to *StringIdCurrent* are empty.

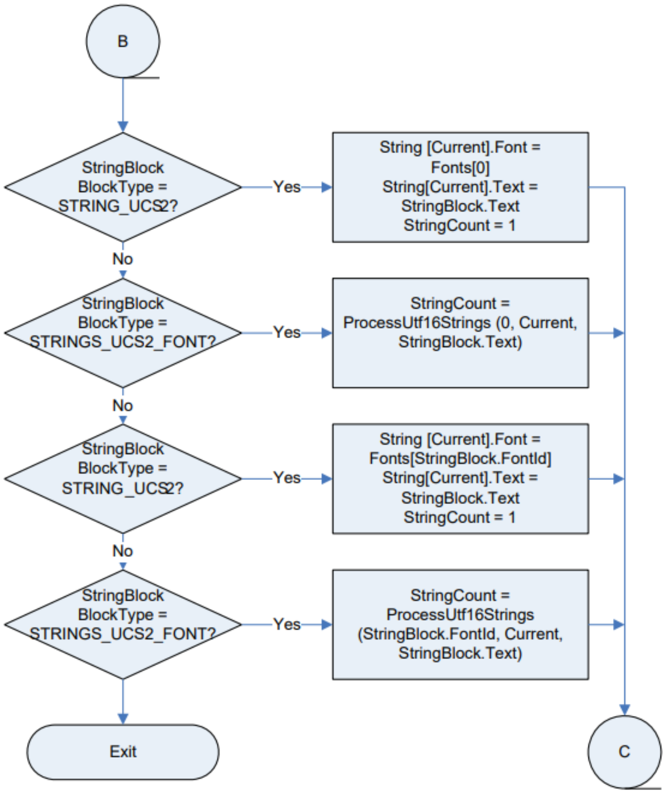

Fig. 33.42: **String Block Processing: UTF Processing**

33.3.6.2.3 EFI_HII_SIBT_EXT1, EFI_HII_SIBT_EXT2,EFI_HII_SIBT_EXT4

Summary

Future expansion block types which have a length byte.

Prototype

```
typedef struct _EFI_HII_SIBT_EXT1_BLOCK {
EFI_HII_STRING_BLOCK       Header;
  UINT8                    BlockType2;
  UINT8                    Length;
}   EFI_HII_SIBT_EXT1_BLOCK;

typedef struct _EFI_HII_SIBT_EXT2_BLOCK {
EFI_HII_STRING_BLOCK       Header;
  UINT8                    BlockType2;
  UINT16                   Length;
}   EFI_HII_SIBT_EXT2_BLOCK;

typedef struct _EFI_HII_SIBT_EXT4_BLOCK {
EFI_HII_STRING_BLOCK       Header;
  UINT8                    BlockType2;
  UINT32                   Length;
}   EFI_HII_SIBT_EXT4_BLOCK;
```

Members

Header

Standard string block header, where *Header.BlockType = EFI_HII_SIBT_EXT1, EFI_HII_SIBT_EXT2 or EFI_HII_SIBT_EXT4.*

Length

Size of the string block, in bytes.

BlockType2

Indicates the type of extended block. See *String Information* for a list of all block types.

Description

These are reserved for future expansion, with length bytes included so that they can be easily skipped.

33.3.6.2.4 EFI_HII_SIBT_FONT

Summary

Provide information about a single font.

Prototype

```
typedef struct _EFI_HII_SIBT_FONT_BLOCK {
  EFI_HII_SIBT_EXT2_BLOCK         Header;
  UINT8                           FontId;
  UINT16                          FontSize;
  EFI_HII_FONT_STYLE              FontStyle;
  CHAR16                          FontName[...];
} EFI_HII_SIBT_FONT_BLOCK;
```

Members

Header
Standard extended header, where *Header.BlockType2 = EFI_HII_SIBT_FONT.*

FontId
Font identifier, which must be unique within the string package.

FontSize
Character cell size, in pixels, of the font.

FontStyle
Font style. Type *EFI_HII_FONT_STYLE* is defined in "Related Definitions" in *EFI_HII_FONT_PACKAGE_HDR.*

FontName
Null-terminated font family name.

Description

Associates a font identifier *FontId* with a font name *FontName,* size *FontSize* and style *FontStyle.* This font identifier may be used with the string blocks. The font identifier 0 is the default font for those string blocks which do not specify a font identifier.

33.3.6.2.5 EFI_HII_SIBT_SKIP1

Summary

Skips string identifiers.

Prototype

```
typedef struct _EFI_HII_SIBT_SKIP1_BLOCK {
EFI_HII_STRING_BLOCK        Header;
UINT8                       SkipCount;
} EFI_HII_SIBT_SKIP1_BLOCK;
```

Members

Header
Standard string block header, where *Header.BlockType = EFI_HII_SIBT_SKIP1.*

SkipCount
The unsigned 8-bit value to add to *StringIdCurrent.*

Description

Increments the current string identifier *StringIdCurrent* by the number specified.

33.3.6.2.6 EFI_HII_SIBT_SKIP2

Summary

Skips string ids.

Prototype

```
typedef struct _EFI_HII_SIBT_SKIP2_BLOCK {
  EFI_HII_STRING_BLOCK            Header;
  UINT16                          SkipCount;
}   EFI_HII_SIBT_SKIP2_BLOCK;
```

Members

Header
Standard string block header, where *Header.BlockType* = *EFI_HII_SIBT_SKIP2*.

SkipCount
The unsigned 16-bit value to add to *StringIdCurrent*.

Description

Increments the current string identifier *StringIdCurrent* by the number specified.

33.3.6.2.7 EFI_HII_SIBT_STRING_SCSU

Summary

Describe a string encoded using SCSU, in the default font.

Prototype

```
typedef struct _EFI_HII_SIBT_STRING_SCSU_BLOCK {
  EFI_HII_STRING_BLOCK             Header;
  UINT8                            StringText[];
}   EFI_HII_SIBT_STRING_SCSU_BLOCK;
```

Members

Header
Standard header where *Header.BlockType* = *EFI_HII_SIBT_STRING_SCSU.*

StringText
The string text is a null-terminated string, which is assigned to the string identifier *StringIdCurrent.*

Description

This string block provides the SCSU-encoded text for the string in the default font with string identifier *StringIdCurrent* and increments *StringIdCurrent* by one.

33.3.6.2.8 EFI_HII_SIBT_STRING_SCSU_FONT

Summary

Describe a string in the specified font.

Prototype

```
typedef struct _EFI_HII_SIBT_STRING_SCSU_FONT_BLOCK {
  EFI_HII_STRING_BLOCK           Header;
  UINT8                          FontIdentifier;
  UINT8                          StringText[];
}   EFI_HII_SIBT_STRING_SCSU_FONT_BLOCK;
```

Members

Header

Standard string block header, where *Header.BlockType* = *EFI_HII_SIBT_STRING_SCSU_FONT.*

FontIdentifier

The identifier of the font to be used as the starting font for the entire string. The identifier must either be 0 for the default font or an identifier previously specified by an *EFI_HII_SIBT_FONT* block. Any string characters that deviates from this font family, size or style must provide an explicit control character. See *Common Control Codes* .

StringText

The string text is a null-terminated encoded string, which is assigned to the string identifier *StringIdCurrent.*

Description

This string block provides the SCSU-encoded text for the string in the font specified by *FontIdentifier* with string identifier *StringIdCurrent* and increments *StringIdCurrent* by one.

33.3.6.2.9 EFI_HII_SIBT_STRINGS_SCSU

Summary

Describe strings in the default font.

Prototype

```
typedef struct _EFI_HII_SIBT_STRINGS_SCSU_BLOCK {
  EFI_HII_STRING_BLOCK        Header;
  UINT16                      StringCount;
  UINT8                       StringText[];
}   EFI_HII_SIBT_STRINGS_SCSU_BLOCK;
```

Members

Header

Standard header where *Header.BlockType* = *EFI_HII_SIBT_STRINGS_SCSU*

StringCount

Number of strings in *StringText.*

StringText

The strings, where each string is a null-terminated encoded string.

Description

This string block provides the SCSU-encoded text for *StringCount* strings which have the default font and which have sequential string identifiers. The strings are assigned the identifiers, starting with *StringIdCurrent* and continuing through *StringIdCurrent* + *StringCount - 1. StringIdCurrent* is incremented by *StringCount.*

33.3.6.2.10 EFI_HII_SIBT_STRINGS_SCSU_FONT

Summary

Describe strings in the specified font.

Prototype

```
typedef struct _EFI_HII_SIBT_STRINGS_SCSU_FONT_BLOCK {
  EFI_HII_STRING_BLOCK              Header;
  UINT8                             FontIdentifier;
  UINT16                            StringCount;
  UINT8                             StringText[];
} EFI_HII_SIBT_STRINGS_SCSU_FONT_BLOCK;
```

Members

Header
Standard header where *Header.BlockType* = *EFI_HII_SIBT_STRINGS_SCSU_FONT*.

StringCount
Number of strings in *StringText*.

FontIdentifier
The identifier of the font to be used as the starting font for the entire string. The identifier must either be 0 for the default font or an identifier previously specified by an *EFI_HII_SIBT_FONT* block. Any string characters that deviates from this font family, size or style must provide an explicit control character. See *Common Control Codes*.

StringText
The strings, where each string is a null-terminated encoded string.

Description

This string block provides the SCSU-encoded text for *StringCount* strings which have the font specified by *FontIdentifier* and which have sequential string identifiers. The strings are assigned the identifiers, starting with *StringIdCurrent* and continuing through *StringIdCurrent* + *StringCount* - 1. *StringIdCurrent* is incremented by *StringCount*.

33.3.6.2.11 EFI_HII_SIBT_STRING_UCS2

Summary

Describe a string in the default font.

Prototype

```
typedef struct _EFI_HII_SIBT_STRING_UCS2_BLOCK {
  EFI_HII_STRING_BLOCK              Header;
  CHAR16                            StringText[];
}   EFI_HII_SIBT_STRING_UCS2_BLOCK;
```

Members

Header
Standard header where *Header.BlockType* = *EFI_HII_SIBT_STRING_UCS2*.

StringText
The string text is a null-terminated UCS-2 string, which is assigned to the string identifier *StringIdCurren* t.

Description

This string block provides the UCS-2 encoded text for the string in the default font with string identifier *StringIdCurrent* and increments *StringIdCurrent* by one.

33.3.6.2.12 EFI_HII_SIBT_STRING_UCS2_FONT

Summary

Describe a string in the specified font.

Prototype

```
typedef struct _EFI_HII_SIBT_STRING_UCS2_FONT_BLOCK {
  EFI_HII_STRING_BLOCK           Header;
  UINT8                          FontIdentifier;
  CHAR16                         StringText[];
} EFI_HII_SIBT_STRING_UCS2_FONT_BLOCK;
```

Members

Header
Standard header where *Header.BlockType* = *EFI_HII_SIBT_STRING_UCS2_FONT.*

FontIdentifier
The identifier of the font to be used as the starting font for the entire string. The identifier must either be 0 for the default font or an identifier previously specified by an *EFI_HII_SIBT_FONT* block. Any string characters that deviates from this font family, size or style must provide an explicit control character. See *Common Control Codes* .

StringText
The string text is a null-terminated UCS-2 string, which is assigned to the string identifier *StringIdCurrent.*

Description

This string block provides the UCS-2 encoded text for the string in the font specified by *FontIdentifier* with string identifier *StringIdCurrent* and increments *StringIdCurrent* by one.

33.3.6.2.13 EFI_HII_SIBT_STRINGS_UCS2

Summary

Describes strings in the default font.

Prototype

```
typedef struct _EFI_HII_SIBT_STRINGS_UCS2_BLOCK {
  EFI_HII_STRING_BLOCK           Header;
  UINT16                         StringCount;
  CHAR16                         StringText[];
}   EFI_HII_SIBT_STRINGS_UCS2_BLOCK;
```

Members

Header
Standard header where *Header.BlockType* = *EFI_HII_SIBT_STRINGS_UCS2.*

StringCount
Number of strings in *StringText.*

StringText
The string text is a series of null-terminated UCS-2 strings, which are assigned to the string identifiers *StringIdCurren* t.to *StringIdCurrent* + *StringCount - 1.*

Description

This string block provides the UCS-2 encoded text for the strings in the default font with string identifiers *StringIdCurrent* to *StringIdCurrent* + *StringCount* - 1 and increments *StringIdCurrent* by *StringCount.*

33.3.6.2.14 EFI_HII_SIBT_STRINGS_UCS2_FONT

Summary

Describes strings in the specified font.

Prototype

```
typedef struct _EFI_HII_SIBT_STRINGS_UCS2_FONT_BLOCK {
  EFI_HII_STRING_BLOCK           Header;
  UINT8                          FontIdentifier;
  UINT16                         StringCount;
  CHAR16                         StringText[];
}   EFI_HII_SIBT_STRINGS_UCS2_FONT_BLOCK;
```

Members

Header
Standard header where *Header.BlockType* = *EFI_HII_SIBT_STRINGS_UCS2_FONT.*

FontIdentifier
The identifier of the font to be used as the starting font for the entire string. The identifier must either be 0 for the default font or an identifier previously specified by an *EFI_HII_SIBT_FONT* block. Any string characters that deviates from this font family, size or style must provide an explicit control character. See *Common Control Codes* .

StringCount
Number of strings in *StringText.*

StringText
The string text is a series of null-terminated UCS-2 strings, which are assigned to the string identifiers *StringIdCurren* t.through *StringIdCurrent* + *StringCount - 1.*

Description

This string block provides the UCS-2 encoded text for the strings in the font specified by *FontIdentifier* with string identifiers *StringIdCurrent* to *StringIdCurrent* + *StringCount* - 1 and increments *StringIdCurrent* by *StringCount.*

33.3.6.3 String Encoding

Each of the following sections describes part of how string text is encoded.

33.3.6.3.1 Standard Compression Scheme for Unicode (SCSU)

The Unicode consortium provides a standard text compression algorithm, which minimizes the amount of storage required for multiple-language strings. For more information, see "Links to UEFI-Related Documents" (*http://uefi.org/uefi)* under the heading "Unicode Compression Scheme".

This specification extends the technique described in the following ways:

- The strings use the control code 0x7F to introduce the control codes described in *Common Control Codes* . The following byte is the control code. The character value 0x7F will be encoded as 0x01 (SQ0) 0x7F.
- The language information contains default static and dynamic code windows, whereas SCSU provides fixed values for these.
- Characters between 0xF000 and 0xFCFF should be rejected.

33.3.6.3.2 Unicode 2-Byte Encoding (UCS-2)

The Unicode consortium provides a standard encoding algorithm, which takes two bytes per character. For more information see "Links to UEFI-Related Documents" (*http://uefi.org/uefi)* under the heading "Unicode Consortium".

Characters between 0xF000 and 0xFCFF should be rejected.

33.3.7 Image Package

The Image package record describes the mapping between image identifiers and the pixels of the image themselves. The package consists of three parts: a fixed header, image information and the palette information.

33.3.7.1 Fixed Header

Summary

The fixed header consists of a standard record header and the offsets of the image and palette information.

Prototype

```
typedef struct _EFI_HII_IMAGE_PACKAGE_HDR {
  EFI_HII_PACKAGE_HEADER            Header;
  UINT32                            ImageInfoOffset;
  UINT32                            PaletteInfoOffset;
}   EFI_HII_IMAGE_PACKAGE_HDR;
```

Members

Header

Standard package header, where *Header.Type = EFI_HII_PACKAGE_IMAGES.*

ImageInfoOffset

Offset, relative to this header, of the image information. If this is zero, then there are no images in the package.

PaletteInfoOffset

Offset, relative to this header, of the palette information. If this is zero, then there are no palettes in the image package.

33.3.7.2 Image Information

For each image identifier, the image information gives the bitmap and the relevant palette. The image information is encoded as a series of blocks, each with a single byte header. The blocks must be processed in order. Each block begins with a single byte, which contains the block type.

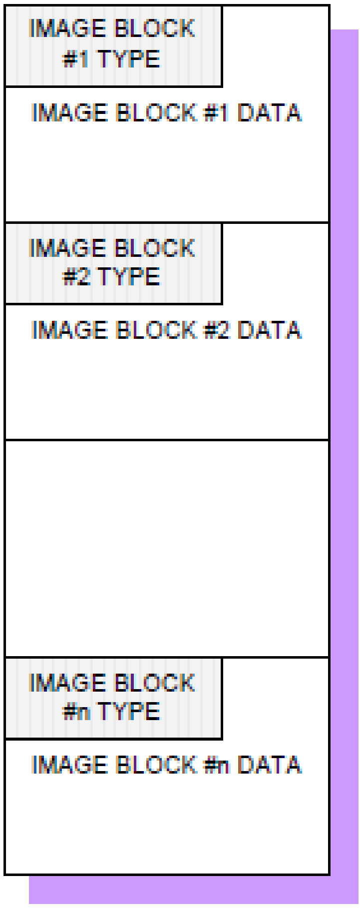

Fig. 33.43: Image Information Encoded in Blocks

Prototype

```
typedef struct _EFI_HII_IMAGE_BLOCK {
  UINT8                    BlockType;
  UINT8                    BlockBody[];
}   EFI_HII_IMAGE_BLOCK;
```

The following table describes the different block types:

Table 33.18: Block Types

Name	Value	Description

continues on next page

Table 33.18 – continued from previous page

EFI_HII_IIBT_END	0x00	The end of the image information.
EFI_HII_IIBT_IMAGE_1BIT	0x10	1-bit w/palette
EFI_HII_IIBT_IMAGE_1BIT_TRANS	0x11	1-bit w/palette & transparency
EFI_HII_IIBT_IMAGE_4BIT	0x12	4-bit w/palette
EFI_HII_IIBT_IMAGE_4BIT_TRANS	0x13	4-bit w/palette & transparency
EFI_HII_IIBT_IMAGE_8BIT	0x14	8-bit w/palette
EFI_HII_IIBT_IMAGE_8BIT_TRANS	0x15	8-bit w/palette & transparency
EFI_HII_IIBT_IMAGE_24BIT	0x16	24-bit RGB
EFI _HII_IIBT_IMAGE_24BIT_TRANS	0x17	24-bit RGB w/transparency
EFI_HII_IIBT_IMAGE_JPEG	0x18	JPEG encoded image
EFI_HII_IIBT_IMAGE_PNG	0x19	PNG encoded image
EFI_HII_IIBT_DUPLICATE	0x20	Duplicate an existing image identifier
EFI_HII_IIBT_SKIP2	0x21	Skip a certain number of image identifiers.
EFI_HII_IIBT_SKIP1	0x22	Skip a certain number of image identifiers.
EFI_HII_IIBT_EXT1	0x30	For future expansion (one byte length field)
EFI_HII_IIBT_EXT2	0x31	For future expansion (two byte length field)
EFI_HII_IIBT_EXT4	0x32	For future expansion (four byte length field)

In order to recreate all images, start at the first block and process them all until an *EFI_HII_IIBT_END_BLOCK* block is found. When processing the image blocks, each block refers to the current image identifier (*ImageIdCurrent*), which is initially set to one (1).

Image blocks of an unknown type should be skipped. If they cannot be skipped, then processing halts.

33.3.7.2.1 EFI_HII_IIBT_END

Summary

Marks the end of the image information.

Prototype

```
# define EFI_HII_IIBT_END 0x00

typedef struct _EFI_HII_IIBT_END_BLOCK {
  EFI_HII_IMAGE_BLOCK            Header;
}   EFI_HII_IIBT_END_BLOCK;
```

Members

Header

Standard image block header, where *Header.BlockType* = *EFI_HII_IIBT_END_BLOCK.*

BlockType2

Indicates the type of extended block. See *String Information* for a list of all block types.

Description

Any images with an image identifier greater than or equal to *ImageIdCurrent* are empty.

33.3.7.2.2 EFI_HII_IIBT_EXT1, EFI_HII_IIBT_EXT2,EFI_HII_IIBT_EXT4

Summary

Generic prefix for image information with a 1-byte length.

Prototype

```
#define EFI_HII_IIBT_EXT1 0x30
typedef struct _EFI_HII_IIBT_EXT1_BLOCK {
EFI_HII_IMAGE_BLOCK           Header;
  UINT8                       BlockType2;
  UINT8                       Length;
}   EFI_HII_IIBT_EXT1_BLOCK;

#define EFI_HII_IIBT_EXT2 0x31

typedef struct _EFI_HII_IIBT_EXT2_BLOCK {
  EFI_HII_IMAGE_BLOCK         Header;
  UINT8                       BlockType2;
  UINT16                      Length;
}   EFI_HII_IIBT_EXT2_BLOCK;

#define EFI_HII_IIBT_EXT4 0x32

typedef struct _EFI_HII_IIBT_EXT4_BLOCK {
  EFI_HII_IMAGE_BLOCK         Header;
  UINT8                       BlockType2;
  UINT32                      Length;
}   EFI_HII_IIBT_EXT4_BLOCK;
```

Members

Header

Standard image block header, where *Header.BlockType* = *EFI_HII_IIBT_EXT1_BLOCK, EFI_HII_IIBT_EXT2_BLOCK* or *EFI_HII_IIBT_EXT4_BLOCK*.

Length

Size of the image block, in bytes, including the image block header.

BlockType2

Indicates the type of extended block. See *Image Information* for a list of all block types.

Description

Future extensions for image records which need a length-byte length use this prefix.

33.3.7.2.3 EFI_HII_IIBT_IMAGE_1BIT

Summary

One bit-per-pixel graphics image with palette information.

Prototype

```
typedef struct _EFI_HII_IIBT_IMAGE_1BIT_BASE {
  UINT16                         Width;
  UINT16                         Height;
  UINT8                          Data[... ];
}   EFI_HII_IIBT_IMAGE_1BIT_BASE;

#define EFI_HII_IIBT_IMAGE_1BIT 0x10

typedef struct _EFI_HII_IIBT_IMAGE_1BIT_BLOCK {
  EFI_HII_IMAGE_BLOCK            Header;
  UINT8                          PaletteIndex;
  EFI_HII_IIBT_IMAGE_1BIT_BASE   Bitmap;
}   EFI_HII_IIBIT_IMAGE_1BIT_BLOCK;
```

Members

Header
Standard image header, where *Header.BlockType* = *EFI_HII_IIBT_IMAGE_1BIT.*

Width
Width of the bitmap in pixels.

Height
Height of the bitmap in pixels.

Bitmap
The bitmap specifies a series of pixels, one bit per pixel, left-to-right, top-to-bottom, and is padded out to the nearest byte. The number of bytes per bitmap can be calculated as: ((*Width* + 7)/8) * *Height.*

PaletteIndex
Index of the palette in the palette information.

Description

This record assigns the 1-bit-per-pixel bitmap data to the *ImageIdCurrent* identifier and increment *ImageIdCurrent* by one. The image's upper left hand corner pixel is the most significant bit of the first bitmap byte. An example of a *EFI_HII_IIBT_IMAGE_1BIT* structure is shown below:

```
0x01 ; Palette Index
0x000B ; Width
0x0013 ; Height
10000000b,00000000b ; Bitmap
11000000b,00000000b
11100000b,00000000b
11110000b,00000000b
11111000b,00000000b
11111100b,00000000b
11111110b,00000000b
11111111b,00000000b
11111111b,10000000b
```

(continues on next page)

(continued from previous page)

```
11111111b,11000000b
11111111b,11100000b
11111110b,00000000b
11101111b,00000000b
11001111b,00000000b
10000111b,10000000b
00000111b,10000000b
00000011b,11000000b
00000011b,11000000b
00000001b,10000000b
```

33.3.7.2.4 EFI_HII_IIBT_IMAGE_1BIT_TRANS

Summary

One bit-per-pixel graphics image with palette information and transparency.

Prototype

```
#define EFI_HII_IIBT_IMAGE_1BIT_TRANS 0x11

typedef struct _EFI_HII_IIBT_IMAGE_1BIT_TRANS_BLOCK {
  EFI_HII_IMAGE_BLOCK               Header;
  UINT8                             PaletteIndex;
  EFI_HII_IIBT_IMAGE_1BIT_BASE      Bitmap;
}   EFI_HII_IIBT_IMAGE_1BIT_TRANS_BLOCK;
```

Members

Header

Standard image header, where *Header.BlockType* = *EFI_HII_IIBT_IMAGE_1BIT_TRANS*.

PaletteIndex

Index of the palette in the palette information.

Bitmap

The bitmap specifies a series of pixels, one bit per pixel, left-to-right, top-to-bottom, and is padded out to the nearest byte. The number of bytes per bitmap can be calculated as: ((*Width* + 7)/8) * *Height*.

Description

This record assigns the 1-bit-per-pixel bitmap data to the *ImageIdCurrent* identifier and increment *ImageIdCurrent* by one. The data in the *EFI_HII_IIBT_IMAGE_1BIT_TRANS* structure is exactly the same as the *EFI_HII_IIBT_IMAGE_1BIT* structure, the difference is how the data is treated.

The bitmap pixel value 0 is the 'transparency' value and will not be written to the screen. The bitmap pixel value 1 will be translated to the color specified by Palette.

33.3.7.2.5 EFI_HII_IIBT_IMAGE_24BIT

Summary

A 24 bit-per-pixel graphics image.

Prototype

```
#define EFI_HII_IIBT_IMAGE_24BIT 0x16

typedef struct _EFI_HII_IIBT_IMAGE_24BIT_BASE
  UINT16                          Width;
  UINT16                          Height;
  EFI_HII_RGB_PIXEL               Bitmap[... ];
}   EFI_HII_IIBT_IMAGE_24BIT_BASE;

typedef struct _EFI_HII_IIBT_IMAGE_24BIT_BLOCK {
  EFI_HII_IMAGE_BLOCK             Header;
  EFI_HII_IIBT_IMAGE_24BIT_BASE   Bitmap;
}   EFI_HII_IIBT_IMAGE_24BIT_BASE;
```

Members

Width
Width of the bitmap in pixels.

Height
Height of the bitmap in pixels.

Header
Standard image header, where *Header.BlockType* = *EFI_HII_IIBT_IMAGE_24BIT*.

Bitmap
The bitmap specifies a series of pixels, 24 bits per pixel, left-to-right, top-to-bottom. The number of bytes per bitmap can be calculated as: (Width * 3) * Height. Type *EFI_HII_RGB_PIXEL* is defined in “Related Definitions” below.

Description

This record assigns the 24-bit-per-pixel bitmap data to the *ImageIdCurrent* identifier and increment *ImageIdCurrent* by one. The image’s upper left hand corner pixel is composed of the first three bitmap bytes. The first byte is the pixel’s blue component value, the next byte is the pixel’s green component value, and the third byte is the pixel’s red component value (B,G,R). Each color component value can vary from 0x00 (color off) to 0xFF (color full on), allowing 16.8 millions colors that can be specified.

Related Definitions

```
typedef struct _EFI_HII_RGB_PIXEL {
  UINT8     b;
  UINT8     g;
  UINT8     r;
}   EFI_HII_RGB_PIXEL;
```

b
The relative intensity of blue in the pixel’s color, from off (0x00) to full-on (0xFF).

g The relative intensity of green in the pixel’s color, from off (0x00) to full-on (0xFF).

r The relative intensity of red in the pixel’s color, from off (0x00) to full-on (0xFF).

33.3.7.2.6 EFI_HII_IIBT_IMAGE_24BIT_TRANS

Summary

A 24 bit-per-pixel graphics image with transparency.

Prototype

```
#define _EFI_HII_IIBT_IMAGE_24BIT_TRANS 0x17

typedef struct EFI_HII_IIBT_IMAGE_24BIT_TRANS_BLOCK {
  EFI_HII_IMAGE_BLOCK                 Header;
  EFI_HII_IIBT_IMAGE_24BIT_BASE       Bitmap;
}   EFI_HII_IIBT_IMAGE_24BIT_TRANS_BLOCK;
```

Members

Header

Standard image header, where *Hea der.BlockType* = *EFI_HII_IIBT_IMAGE_24BIT_TRANS*.

Bitmap

The bitmap specifies a series of pixels, 24 bits per pixel, left-to-right, top-to-bottom. The number of bytes per bitmap can be calculated as: (Width * 3) * Height.

Width

Width of the bitmap in pixels.

Height

Height of the bitmap in pixels.

Description

This record assigns the 24-bit-per-pixel bitmap data to the *ImageIdCurrent* identifier and increment *ImageIdCurrent* by one. The data in the *EFI_HII_IMAGE_24BIT_TRANS* structure is exactly the same as the *EFI_HII_IMAGE_24BIT* structure, the difference is how the data is treated.

The bitmap pixel value 0x00, 0x00, 0x00 is the ‘transparency’ value and will not be written to the screen. All other bitmap pixel values will be written as defined to the screen. Since the ‘transparency’ value replaces true black, for image to display black they should use the color 0x00, 0x00, 0x01 (very dark red)

33.3.7.2.7 EFI_HII_IIBT_IMAGE_4BIT

Summary

Four bits-per-pixel graphics image with palette information.

Prototype

```
typedef struct _EFI_HII_IIBT_IMAGE_4BIT_BASE {
  UINT16                        Width;
  UINT16                        Height;
  UINT8                         Data[...];
}   EFI_HII_IIBT_IMAGE_4BIT_BASE;

#define EFI_HII_IIBT_IMAGE_4BIT 0x12

typedef struct _EFI_HII_IIBT_IMAGE_4BIT_BLOCK {
  EFI_HII_IMAGE_BLOCK           Header;
```

(continues on next page)

Header
Standard image header, where *Header.BlockType* = *EFI_HII_IIBT_IMAGE_4BIT.*

PaletteIndex
Index of the palette in the palette information.

Bitmap
The bitmap specifies a series of pixels, four bits per pixel, left-to-right, top-to-bottom, and is padded out to the nearest byte. The number of bytes per bitmap can be calculated as: ((*Width* + 1)/2) * *Height.*

Description

This record assigns the 4-bit-per-pixel bitmap data to the *ImageIdCurrent* identifier using the specified palette and increment *ImageIdCurrent* by one. The image's upper left hand corner pixel is the most significant nibble of the first bitmap byte.

33.3.7.2.8 EFI_HII_IIBT_IMAGE_4BIT_TRANS

Summary

Four bits-per-pixel graphics image with palette information and transparency.

Prototype

```
#define EFI_HII_IIBT_IMAGE_4BIT_TRANS 0x13

typedef struct _EFI_HII_IIBT_IMAGE_4BIT_TRANS_BLOCK {
  EFI_HII_IMAGE_BLOCK                 Header;
  UINT8                               PaletteIndex;
  EFI_HII_IIBT_IMAGE_4BIT_BASE      Bitmap;
}   EFI_HII_IIBT_IMAGE_4BIT_TRANS_BLOCK;
```

Members

Header
Standard image header, where *Header.BlockType* = *EFI_HII-IIBT_IMAGE_4BIT_TRANS.*

PaletteIndex
Index of the palette in the palette information.

Bitmap
The bitmap specifies a series of pixels, four bits per pixel, left-to-right, top-to-bottom, and is padded out to the nearest byte. The number of bytes per bitmap can be calculated as: ((*Width* + 1)/2) * *Height.*

Description

This record assigns the 4-bit-per-pixel bitmap data to the *ImageIdCurrent* identifier using the specified palette and increment *ImageIdCurrent* by one. The data in the *EFI_HII-IMAGE_4BIT_TRANS* structure is exactly the same as the *EFI_HII-IMAGE_4BIT* structure, the difference is how the data is treated.

The bitmap pixel value 0 is the 'transparency' value and will not be written to the screen. All the other bitmap pixel values will be translated to the color specified by Palette.

33.3.7.2.9 EFI_HII-IIBT_IMAGE_8BIT

Summary

Eight bits-per-pixel graphics image with palette information.

Prototype

```
#define EFI_HII-IIBT_IMAGE_8BIT 0x14

typedef struct _EFI_HII-IIBT_IMAGE_8BIT_BASE {
  UINT16                         Width;
  UINT16                         Height;
  UINT8                          Data[... ];
}   EFI_HII-IIBT_IMAGE_8BIT_BASE;

typedef struct _EFI_HII-IIBT_IMAGE_8BIT_BLOCK {
  EFI_HII-IMAGE_BLOCK            Header;
  UINT8                          PaletteIndex;
  EFI_HII-IIBT_IMAGE_8BIT_BASE   Bitmap;
}   EFI_HII-IIBT_IMAGE_8BIT_BLOCK;
```

Members

Width
Width of the bitmap in pixels.

Height
Height of the bitmap in pixels.

Header
Standard image header, where *Header.BlockType = EFI_HII_IIBT_IMAGE_8BIT.*

PaletteIndex
Index of the palette in the palette information.

Bitmap
The bitmap specifies a series of pixels, eight bits per pixel, left-to-right, top-to-bottom. The number of bytes per bitmap can be calculated as: *Width * Height*.

Description

This record assigns the 8-bit-per-pixel bitmap data to the *ImageIdCurrent* identifier using the specified palette and increment *ImageIdCurrent* by one. The image's upper left hand corner pixel is the first bitmap byte.

33.3.7.2.10 EFI_HII_IIBT_IMAGE_8BIT_TRANS

Summary

Eight bits-per-pixel graphics image with palette information and transparency.

Prototype

```
#define EFI_HII_IIBT_IMAGE_8BIT_TRANS 0x15

typedef struct _EFI_HII_IIBT_IMAGE_8BIT_TRANS_BLOCK {
  EFI_HII_IMAGE_BLOCK               Header;
  UINT8                             PaletteIndex;
  EFI_HII_IIBT_IMAGE_8BIT_BASE      Bitmap;
}   EFI_HII_IIBT_IMAGE_8BIT_TRANS_BLOCK;
```

Members

Standard image header, where *Header.BlockType* = *EFI_HII_IIBT_IMAGE_8BIT_TRANS*.

PaletteIndex
Index of the palette in the palette information.

Bitmap
The bitmap specifies a series of pixels, eight bits per pixel, left-to-right, top-to-bottom. The number of bytes per bitmap can be calculated as: *Width * Height*.

Description

This record assigns the 8-bit-per-pixel bitmap data to the *ImageIdCurrent* identifier using the specified palette and increment *ImageIdCurrent* by one. The data in the *EFI_HII_IMAGE_8BIT_TRANS* structure is exactly the same as the *EFI_HII_IMAGE_8BIT* structure, the difference is how the data is treated.

The bitmap pixel value 0 is the 'transparency' value and will not be written to the screen. All the other bitmap pixel values will be translated to the color specified by Palette.

EFI_HII_IIBT_DUPLICATE %%%%%%%%%%%%%%%%%%%%%%5

Summary

Assigns a new character value to a previously defined image.

Prototype

```
#define EFI_HII_IIBT_DUPLICATE 0x20

typedef struct _EFI_HII_IIBT_DUPLICATE_BLOCK {
EFI_HII_IMAGE_BLOCK           Header;
EFI_IMAGE_ID                  ImageId;
} EFI_HII_IIBT_DUPLICATE_BLOCK;
```

Members

Header
Standard image header, where *Header.BlockType* = *EFI_HII_IIBT_DUPLICATE*.

ImageId
The previously defined image ID with the exact same image.

Description

Indicates that the image with image ID *ImageValueCurrent* has the same image as a previously defined image ID and increments *ImageValueCurrent* by one.

33.3.7.2.11 EFI_HII_IIBT_IMAGE_JPEG

Summary

A true-color bitmap is encoded with JPEG image compression.

Prototype

```
#define EFI_HII_IIBT_IMAGE_JPEG 0x18

typedef struct _EFI_HII_IIBT_JPEG_BLOCK {
EFI_HII_IMAGE_BLOCK           Header;
UINT32                        Size;
UINT8                         Data[... ];
} EFI_HII_IIBT_JPEG;
```

Members

Header
Standard image header, where *Header.BlockType* = *EFI_HII_IIBT_IMAGE_JPEG*.

Size
Specifies the size of the JPEG encoded data.

Data
JPEG encoded data with 'JFIF' signature at offset 6 in the data block. The JPEG encoded data, specifies type of encoding and final size of true-color image.

Description

This record assigns the JPEG image data to the *ImageIdCurrent* identifier and increment *ImageIdCurrent* by one. The JPEG decoder is only required to cover the basic JPEG encoding types, which are produced by standard available paint packages (for example: MSPaint under Windows from Microsoft). This would include JPEG encoding of high (1:1:1) and medium (4:1:1) quality with only three components (R,G,B) - no support for the special gray component encoding.

33.3.7.2.12 EFI_HII_IIBT_SKIP1

Summary

Skips image IDs.

Prototype

```
#define EFI_HII_IIBT_SKIP1 0x22

typedef struct _EFI_HII_IIBT_SKIP1_BLOCK {
  EFI_HII_IMAGE_BLOCK           Header;
  UINT8                         SkipCount;
}   EFI_HII_IIBT_SKIP1_BLOCK;
```

Members

Header

Standard image header, where *Header.BlockType* = *EFI_HII_IIBT_SKIP1*.

SkipCount

The unsigned 8-bit value to add to *ImageIdCurrent*.

Description

Increments the current image ID *ImageIdCurrent* by the number specified.

33.3.7.2.13 EFI_HII_IIBT_SKIP2

Summary

Skips image IDs.

Prototype

```
#define EFI_HII_IIBT_SKIP2 0x21

typedef struct _EFI_HII_IIBT_SKIP2_BLOCK {
  EFI_HII_IMAGE_BLOCK         Header;
  UINT16                      SkipCount;
}   EFI_HII_IIBT_SKIP2_BLOCK;
```

Members

Header

Standard image header, where *Header.BlockType* = *EFI_HII_IIBT_SKIP2*.

SkipCount

The unsigned 16-bit value to add to *ImageIdCurrent*.

Description

Increments the current image ID *ImageIdCurrent* by the number specified.

33.3.7.2.14 EFI_HII_IIBT_PNG_BLOCK

Add a new image block structure for *EFI_HII_IIBT_IMAGE_PNG* . This supports the PNG image format in EFI HII image database.

Related Definitions

```
//**********************************************************
// EFI_HII_IIBT_IMAGE_PNG(0x19)
//**********************************************************
typedef struct _EFI_HII_IIBT_PNG_BLOCK {
  EFI_HII_IMAGE_BLOCK           Header;
  UINT32                        Size;
  UINT8                         Data[1];
}   EFI_IIBT_PNG_BLOCK;
```

Members

Header

Standard image block header, where H *eader.locktype* = *EFI_HII_IIBT_IMAGE_PNG*.

Size
Size of the PNG image.

Data
The raw data of the PNG image file.

33.3.7.3 Palette Information

Summary

This section describes the palette information within an image package.

Prototype

```
typedef struct _EFI_HII_IMAGE_PALETTE_INFO_HEADER {
  UINT16 PaletteCount;
}   EFI_HII_IMAGE_PALETTE_INFO_HEADER;
```

Members

PaletteCount
Number of palettes.

Description

This fixed header is followed by zero or more variable-length palette information records. The structures are assigned a number 1 to n.

33.3.7.3.1 Palette Information Records

Summary

A single palette

Prototype

```
typedef struct _EFI_HII_IMAGE_PALETTE_INFO {
  UINT16                     PaletteSize;
  EFI_HII_RGB_PIXEL          PaletteValue[_];
}   EFI_HII_IMAGE_PALETTE_INFO;
```

Members

PaletteSize
Size of the palette information.

PaletteValue
Array of color values. Type *EFI_HII_RGB_PIXEL* is described in "Related Definitions" in *EFI_HII_IIBT_IMAGE_24BIT*.

Description

Each palette information record is an array of 24-bit color structures. The first entry (*PaletteValue[0]*) corresponds to color 0 in the source image; the second entry (*PaletteValue[1]*) corresponds to color 1, etc. Each palette entry is a three byte entry, with the first byte equal to the blue component of the color, followed by green, and finally red (B,G,R). Each color component value can vary from 0x00 (color off) to 0xFF (color full on), allowing 16.8 millions colors that can be specified.

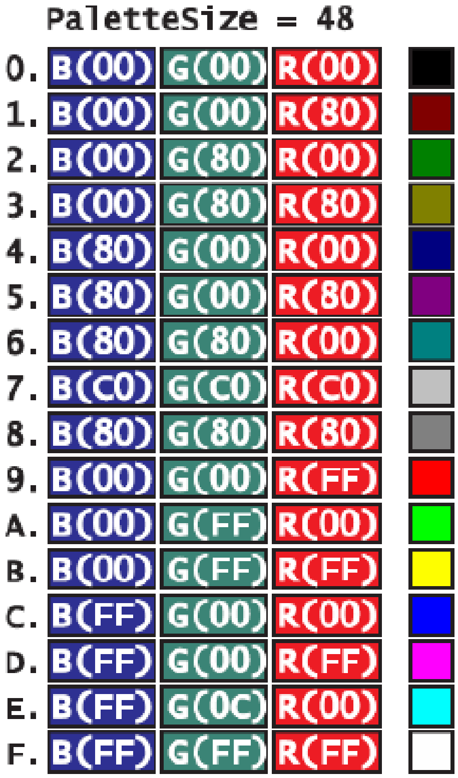
A black & white 1-bit image would have the following palette structure:

PaletteSize = 6

0.	B(00)	G(00)	R(00)	⬛
1.	B(FF)	G(FF)	R(FF)	⬜

Fig. 33.44: Palette Structure of a Black & White, One-BitImage

A 4-bit image would have the following palette structure:



PaletteSize = 48

0.	B(00)	G(00)	R(00)	⬛
1.	B(00)	G(00)	R(80)	🟫
2.	B(00)	G(80)	R(00)	🟩
3.	B(00)	G(80)	R(80)	🟫
4.	B(80)	G(00)	R(00)	🟦
5.	B(80)	G(00)	R(80)	🟪
6.	B(80)	G(80)	R(00)	🟦
7.	B(C0)	G(C0)	R(C0)	⬜
8.	B(80)	G(80)	R(80)	⬛
9.	B(00)	G(00)	R(FF)	🟥
A.	B(00)	G(FF)	R(00)	🟩
B.	B(00)	G(FF)	R(FF)	🟨
C.	B(FF)	G(00)	R(00)	🟦
D.	B(FF)	G(00)	R(FF)	🟪
E.	B(FF)	G(0C)	R(00)	🟦
F.	B(FF)	G(FF)	R(FF)	⬜

Fig. 33.45: Palette Structure of a Four-Bit Image

The image palette must only contain the palette entries specified in the bitmap. The bitmap should allocate each color index starting from 0x00, so the palette information can be as small as possible. The following is an example of a palette structure of a 4-bit image that only uses 6 colors:

Each palette entry specifies each unique color in the image. The above figure would be typical of light blue logo on a black background, with several shades of blue for anti-aliasing the blue logo on the black background.

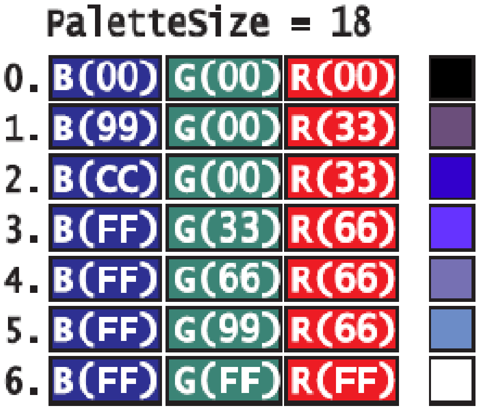


Fig. 33.46: Palette Structure of a Four-Bit, Six-ColorImage

33.3.8 Forms Package

The Forms package is used to carry forms-based encoding data.

Prototype

```
typedef struct _EFI_HII_FORM_PACKAGE_HDR {
  EFI_HII_PACKAGE_HEADER *Header;
//EFI_IFR_OP_HEADER *OpCodeHeader;
//More op-codes follow
}   EFI_HII_FORM_PACKAGE_HDR;
```

Parameters

Header

The standard package header, where Header.Type = EFI_HII_PACKAGE_FORMS.

OpCodeHeader

The header for the first of what will be a series of op-codes associated with the forms data described in this package. The syntax of the forms can be referenced in *Forms* .

Description

This is a package type designed to represent Internal Forms Representation (IFR) objects as a collection of op-codes

33.3.8.1 Binary Encoding

The IFR is a binary encoding for HII-related objects. Every object has (at least) three attributes:

Opcode. The enumeration of all of the different HII-related objects.

Length. The length of the opcode itself (2-127 bytes).

Scope. If set, this opens up a new scope. Certain objects describe attributes or capabilities which only apply to the current scope rather than the entire form. The scope extends up to the special END opcode, which marks the end of the current scope.

The binary objects are encoded as byte stream. Every object begins with a standard header (*EFI_IFR_OP_HEADER*), which describes the opcode type, length and scope.

The simple binary object consists of a standard header, which contains a single 8-bit opcode, a 7-bit length and a 1-bit nesting indicator. The length specifies the number of bytes in the opcode, including the header. The simple binary object may also have zero or more bytes of fixed, object-specific, data.

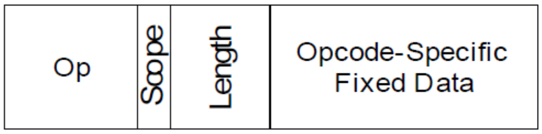

Fig. 33.47: Simple Binary Object

When the *Scope* bit is set, it marks the beginning of a new scope which applies to all subsequent opcodes until the matching *EFI_IFR_END* opcode is found to close the scope. Those opcodes may, in turn, open new scopes as well, creating nested scopes.

33.3.8.2 Standard Headers

33.3.8.2.1 EFI_IFR_OP_HEADER

Summary

Standard opcode header

Prototype

```
typedef struct _EFI_IFR_OP_HEADER {
  UINT8               OpCode;
  UINT8               Length:7;
  UINT8               Scope:1;
}   EFI_IFR_OP_HEADER;
```

Members

OpCode

Defines which type of operation is being described by this header. See *Opcode Reference* for a list of IFR opcodes.

Length

Defines the number of bytes in the opcode, including this header.

Scope

If this bit is set, the opcode begins a new scope, which is ended by an *EFI_IFR_END* opcode.

Description

Forms are represented in a binary format roughly similar to processor instructions.

Each header contains an opcode, a length and a scope indicator.

If *Scope* indicator is set, the scope exists until it reaches a corresponding *EFI_IFR_END* opcode. Scopes may be nested within other scopes.

Related Definitions

33.3.8.2.2 EFI_IFR_QUESTION_HEADER

Summary

Standard question header.

Prototype

```
typedef struct _EFI_IFR_QUESTION_HEADER {
  EFI_IFR_STATEMENT_HEADER          Header;
  EFI_QUESTION_ID                   QuestionId;
  EFI_VARSTORE_ID                   VarStoreId;
  union {
    EFI_STRING_ID                   VarName;
    UINT16                          VarOffset;
  }                                 VarStoreInfo;
  UINT8                             Flags;
}   EFI_IFR_QUESTION_HEADER;
```

Members

Header
The standard statement header.

QuestionId
The unique value that identifies the particular question being defined by the opcode. The value of zero is reserved.

Flags
A bit-mask that determines which unique settings are active for this question. See “Related Definitions” below for the meanings of the individual bits.

VarStoreId
Specifies the identifier of a previously declared variable store to use when storing the question’s value. A value of zero indicates no associated variable store.

VarStoreInfo
If *VarStoreId* refers to Buffer Storage (*EFI_IFR_VARSTORE* or *EFI_IFR_VARSTORE_EFI*), then *VarStoreInfo* contains a 16-bit Buffer Storage offset (*VarOffset*). If *VarStoreId* refers to Name/Value Storage (*EFI_IFR_VARSTORE_NAME_VALUE*), then *VarStoreInfo* contains the String ID of the name (*VarName*) for this name/value pair.

Description

This is the standard header for questions.

Related Definitions

```
//*******************************************************
// Flags values
//*******************************************************
#define EFI_IFR_FLAG_READ_ONLY          0x01
#define EFI_IFR_FLAG_CALLBACK           0x04
#define EFI_IFR_FLAG_RESET_REQUIRED     0x10
```

(continues on next page)

(continued from previous page)

```
#define EFI_IFR_FLAG_REST_STYLE          0x20
#define EFI_IFR_FLAG_RECONNECT_REQUIRED  0x40
#define EFI_IFR_FLAG_OPTIONS_ONLY        0x80
```

EFI_IFR_FLAG_READ_ONLY	The question is read-only
EFI_IFR_FLAG_CALLBACK	Designates if a particular opcode is to be treated as something that will initiate a callback to a registered driver.
EFI_IFR_FLAG_RESET_REQUIRED	If a particular choice is modified, designates that a return flag will be activated upon exiting of the browser, which indicates that the changes that the user requested require a reset to enact.
EFI_IFR_FLAG_REST_STYLE	Designates if a question supports REST architectural style operation. This flag can be omitted if the formset class guid already contains EFI_HII_REST_STYLE_FORMSET_GUID.
EFI_IFR_FLAG_RECONNECT_REQUIRED	If a particular choice is modified, designates that a return flag will be activated upon exiting of the formset or the browser, which indicates that the changes that the user requested require a reconnect to enact.
EFI_IFR_FLAG_OPTIONS_ONLY	For questions with options, this indicates that only the options will be available for user choice.

33.3.8.2.3 EFI_IFR_STATEMENT_HEADER

Summary

Standard statement header.

Prototype

```
typedef struct _EFI_IFR_STATEMENT_HEADER {
  EFI_STRING_ID                       Prompt;
  EFI_STRING_ID                       Help;
}   EFI_IFR_STATEMENT_HEADER;
```

Members

Prompt

The string identifier of the prompt string for this particular statement. The value 0 indicates no prompt string.

Help

The string identifier of the help string for this particular statement. The value 0 indicates no help string.

Description

This is the standard header for statements, including questions.

33.3.8.3 Opcode Reference

This section describes each of the IFR opcode encodings in detail. The table below lists the opcodes in numeric order while the reference section lists them in alphabetic order.

Table 33.20: IFR Opcodes

Opcode	Value	Description
EFI_IFR_FORM_OP	0x01	Form
EFI_IFR_SUBTITLE_OP	0x02	Subtitle statement
EFI_IFR_TEXT_OP	0x03	Static text/image statement
EFI_IFR_IMAGE_OP	0x04	Static image.
EFI_IFR_ONE_OF_OP	0x05	One-of question
EFI_IFR_CHECKBOX_OP	0x06	Boolean question
EFI_IFR_NUMERIC_OP	0x07	Numeric question
EFI_IFR_PASSWORD_OP	0x08	Password string question
EFI_IFR_ONE_OF_OPTION_OP	0x09	Option
EFI_IFR_SUPPRESS_IF_OP	0x0A	Suppress if conditional
EFI_IFR_LOCKED_OP	0x0B	Marks statement/question as locked
EFI_IFR_ACTION_OP	0x0C	Button question
EFI _IFR_RESET_BUTTON_OP	0x0D	Reset button statement
EFI_IFR_FORM_SET_OP	0x0E	Form set
EFI_IFR_REF_OP	0x0F	Cross-reference statement
EFI_IFR_NO_SUBMIT_IF_OP	0x10	Error checking conditional
EFI_IF R_INCONSISTENT_IF_OP	0x11	Error checking conditional
EFI_IFR_EQ_ID_VAL_OP	0x12	Return **TRUE** if question value equals UINT16
EFI_IFR_EQ_ID_ID_OP	0x13	Return **TRUE** if question value equals another question value
EFI_I FR_EQ_ID_VAL_LIST_OP	0x14	Return **TRUE** if question value is found in list of UINT16s
EFI_IFR_AND_OP	0x15	Push **TRUE** if both sub-expressions returns **TRUE**.
EFI_IFR_OR_OP	0x16	Push **TRUE** if either sub-expressions returns **TRUE**.
EFI_IFR_NOT_OP	0x17	Push **FALSE** if sub-expression returns **TRUE**, otherwise return **TRUE**.
EFI_IFR_RULE_OP	0x18	Create rule in current form.
EFI_IFR_GRAY_OUT_IF_OP	0x19	Nested statements, questions or options will not be selectable if expression returns **TRUE**.
EFI_IFR_DATE_OP	0x1A	Date question.
EFI_IFR_TIME_OP	0x1B	Time question.
EFI_IFR_STRING_OP	0x1C	String question
EFI_IFR_REFRESH_OP	0x1D	Interval for refreshing a question
EFI_IFR_DISABLE_IF_OP	0x1E	Nested statements, questions or options will not be processed if expression returns **TRUE**.
EFI_IFR_ANIMATION_OP	0x1F	Animation associated with question statement, form or form set.
EFI_IFR_TO_LOWER_OP	0x20	Convert a string on the expression stack to lower case.
EFI_IFR_TO_UPPER_OP	0x21	Convert a string on the expression stack to upper case.

continues on next page

Table 33.20 – continued from previous page

EFI_IFR_MAP_OP	0x22	Convert one value to another by selecting a match from a list.
EFI _IFR_ORDERED_LIST_OP	0x23	Set question
EFI_IFR_VARSTORE_OP	0x24	Define a buffer-style variable storage.
EFI_IFR_VA RSTORE_NAME_VALUE_OP	0x25	Define a name/value style variable storage.
EFI _IFR_VARSTORE_EFI_OP	0x26	Define a UEFI variable style variable storage.
EFI_IF R_VARSTORE_DEVICE_OP	0x27	Specify the device path to use for variable storage.
EFI_IFR_VERSION_OP	0x28	Push the revision level of the UEFI Specification to which this Forms Processor is compliant.
EFI_IFR_END_OP	0x29	Marks end of scope.
EFI_IFR_MATCH_OP	0x2A	Push **TRUE** if string matches a pattern.
EFI_IFR_GET_OP	0x2B	Return a stored value.
EFI_IFR_SET_OP	0x2C	Change a stored value.
EFI_IFR_READ_OP	0x2D	Provides a value for the current question or default.
EFI_IFR_WRITE	0x2E	Change a value for the current question.
EFI_IFR_EQUAL_OP	0x2F	Push **TRUE** if two expressions are equal.
EFI_IFR_NOT_EQUAL_OP	0x30	Push **TRUE** if two expressions are not equal.
EFI _IFR_GREATER_THAN_OP	0x31	Push **TRUE** if one expression is greater than another expression.
EFI_ IFR_GREATER_EQUAL_OP	0x32	Push **TRUE** if one expression is greater than or equal to another expression.
EFI_IFR_LESS_THAN_OP	0x33	Push **TRUE** if one expression is less than another expression.
EFI_IFR_LESS_EQUAL_OP	0x34	Push **TRUE** if one expression is less than or equal to another expression.
EFI_IFR_BITWISE_AND_OP	0x35	Bitwise-AND two unsigned integers and push the result.
EFI_IFR_BITWISE_OR_OP	0x36	Bitwise-OR two unsigned integers and push the result.
EFI_IFR_BITWISE_NOT_OP	0x37	Bitwise-NOT an unsigned integer and push the result.
EFI_IFR_SHIFT_LEFT_OP	0x38	Shift an unsigned integer left by a number of bits and push the result.
EFI_IFR_SHIFT_RIGHT_OP	0x39	Shift an unsigned integer right by a number of bits and push the result.
EFI_IFR_ADD_OP	0x3A	Add two unsigned integers and push the result.
EFI_IFR_SUBTRACT_OP	0x3B	Subtract two unsigned integers and push the result.
EFI_IFR_MULTIPLY_OP	0x3C	Multiply two unsigned integers and push the result.
EFI_IFR_DIVIDE_OP	0x3D	Divide one unsigned integer by another and push the result.
EFI_IFR_MODULO_OP	0x3E	Divide one unsigned integer by another and push the remainder.
EFI_IFR_RULE_REF_OP	0x3F	Evaluate a rule
EFI_ IFR_QUESTION_REF1_OP	0x40	Push a question's value
EFI_ IFR_QUESTION_REF2_OP	0x41	Push a question's value
EFI_IFR_UINT8_OP	0x42	Push an 8-bit unsigned integer
EFI_IFR_UINT16_OP	0x43	Push a 16-bit unsigned integer.

continues on next page

Table 33.20 – continued from previous page

EFI_IFR_UINT32_OP	0x44	Push a 32-bit unsigned integer
EFI_IFR_UINT64_OP	0x45	Push a 64-bit unsigned integer.
EFI_IFR_TRUE_OP	0x46	Push a boolean **TRUE**.
EFI_IFR_FALSE_OP	0x47	Push a boolean **FALSE**
EFI_IFR_TO_UINT_OP	0x48	Convert expression to an unsigned integer
EFI_IFR_TO_STRING_OP	0x49	Convert expression to a string
EFI_IFR_TO_BOOLEAN_OP	0x4A	Convert expression to a boolean.
EFI_IFR_MID_OP	0x4B	Extract portion of string or buffer
EFI_IFR_FIND_OP	0x4C	Find a string in a string.
EFI_IFR_TOKEN_OP	0x4D	Extract a delimited byte or character string from buffer or string.
EFI_IFR_STRING_REF1_OP	0x4E	Push a string
EFI_IFR_STRING_REF2_OP	0x4F	Push a string
EFI_IFR_CONDITIONAL_OP	0x50	Duplicate one of two expressions depending on result of the first expression.
EFI_IFR_QUESTION_REF3_OP	0x51	Push a question's value from a different form.
EFI_IFR_ZERO_OP	0x52	Push a zero
EFI_IFR_ONE_OP	0x53	Push a one
EFI_IFR_ONES_OP	0x54	Push a 0xFFFFFFFFFFFFFFFF.
EFI_IFR_UNDEFINED_OP	0x55	Push Undefined
EFI_IFR_LENGTH_OP	0x56	Push length of buffer or string.
EFI_IFR_DUP_OP	0x57	Duplicate top of expression stack
EFI_IFR_THIS_OP	0x58	Push the current question's value
EFI_IFR_SPAN_OP	0x59	Return first matching/non-matching character in a string
EFI_IFR_VALUE_OP	0x5A	Provide a value for a question
EFI_IFR_DEFAULT_OP	0x5B	Provide a default value for a question.
EFI_IFR_DEFAULTSTORE_OP	0x5C	Define a Default Type Declaration
EFI_IFR_FORM_MAP_OP	0x5D	Create a standards-map form.
EFI_IFR_CATENATE_OP	0x5E	Push concatenated buffers or strings.
EFI_IFR_GUID_OP	0x5F	An extensible GUIDed op-code
EFI_IFR_SECURITY_OP	0x60	Returns whether current user profile contains specified setup access privileges.
EFI_IFR_MODAL_TAG_OP	0x61	Specify current form is modal
EFI_IFR_REFRESH_ID_OP	0x62	Establish an event group for refreshing a forms-based element.
EFI_IFR_WARNING_IF	0x63	Warning conditional
EFI_IFR_MATCH2_OP	0x64	Push **TRUE** if string matches a Regular Expression pattern.

Code Definitions

Each of the following sections gives a detailed description of the opcodes' behavior.

33.3.8.3.1 EFI_IFR_ACTION

Summary

Create an action button.

Prototype

```
#define EFI_IFR_ACTION_OP 0x0C
typedef struct _EFI_IFR_ACTION {
  EFI_IFR_OP_HEADER              Header;
  EFI_IFR_QUESTION_HEADER        Question;
  EFI_STRING_ID                  QuestionConfig;
}   EFI_IFR_ACTION;

typedef struct _EFI_IFR_ACTION_1 {
  EFI_IFR_OP_HEADER              Header;
  EFI_IFR_QUESTION_HEADER        Question;
} _EFI_IFR_ACTION_1;
```

Members

Header
The standard opcode header, where *Header.OpCode* = *EFI_IFR_ACTION_OP*.

Question
The standard question header. See *EFI_IFR_QUESTION_HEADER* (*EFI_IFR_QUESTION_HEADER*) for more information.

QuestionConfig
The results string which is in <*ConfigResp*> format will be processed when the button is selected by the user.

Description

Creates an action question. When the question is selected, the configuration string specified by *QuestionConfig* will be processed. If *QuestionConfig* is 0 or is not present, then no no configuration string will be processed. This is useful when using an action button only for the callback.

If the question is marked read-only (see *EFI_IFR_QUESTION_HEADER*) then the action question cannot be selected.

33.3.8.3.2 EFI_IFR_ANIMATION

Summary

Creates an image for a statement or question.

Prototype

```
#define EFI_IFR_ANIMATION_OP 0x1F
typedef struct _EFI_IFR_ANIMATION {
  EFI_IFR_OP_HEADER         Header;
  EFI_ANIMATION_ID          Id;
}   EFI_IFR_ANIMATION;
```

Members

Header
Standard opcode header, where *Header.OpCode* is *EFI_IFR_ANIMATION_OP*

Id

Animation identifier in the HII database.

Description

Associates an animation from the HII database with the current question, statement or form. If the specified animation does not exist in the HII database.

33.3.8.3.3 EFI_IFR_ADD

Summary

Pops two unsigned integers, adds them and pushes the result.

Prototype

```
#define EFI_IFR_ADD_OP 0x3a
typedef struct _EFI_IFR_ADD {
  EFI_IFR_OP_HEADER           Header;
}   EFI_IFR_ADD;
```

Members

Header

Standard opcode header, where *Header.OpCode = EFI_IFR_ADD_OP.*

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. Thefirst popped is the *right-hand* value. The secondpopped is the *left-hand* value.
2. If the two values do not evaluate to unsigned integers, push Undefined.
3. Zero-extend the *left-hand* and *right-hand* values to 64-bits.
4. Add the left-hand value to right-hand value.
5. Push the lower 64-bits of the result. Overflow is ignored.

33.3.8.3.4 EFI_IFR_AND

Summary

Pops two booleans, push *TRUE* if both are *TRUE,* otherwise push *FALSE.*

Prototype

```
#define EFI_IFR_AND_OP 0x15
typedef struct _EFI_IFR_AND {
  EFI_IFR_OP_HEADER        Header;
}   EFI_IFR_AND;
```

Members

Header

The standard opcode header, where *Header.OpCode = EFI_IFR_AND_OP.*

Description

This opcode performs the following actions:

1. Pop two expressions from the expressionstack.
2. If the two expressions cannot be evaluated as boolean, push Undefined.
3. If both expressions evaluate to **TRUE,** then push **TRUE.** Otherwise, push **FALSE.**

33.3.8.3.5 EFI_IFR_BITWISE_AND

Summary

Pops two unsigned integers, perform bitwise AND and push the result.

Prototype

```
#define EFI_IFR_BITWISE_AND_OP 0x35
typedef struct _EFI_IFR_BITWISE_AND {
  EFI_IFR_OP_HEADER                Header;
}   EFI_IFR_BITWISE_AND;
```

Members

Header

The standard opcode header, where *Header.OpCode* = *EFI_IFR_BITWISE_AND_OP.*

Description

This opcode performs the following actions:

1. Pop two expressions from the expressionstack.
2. If the two expressions cannot be evaluated as unsigned integers, push Undefined.
3. Otherwise, zero-extend the unsigned integers to 64-bits.
4. Perform a bitwise-AND on the two values.
5. Push the result.

33.3.8.3.6 EFI_IFR_BITWISE_NOT

Summary

Pop an unsigned integer, perform a bitwise NOT and push the result.

Prototype

```
#define EFI_IFR_BITWISE_NOT_OP 0x37
typedef struct _EFI_IFR_BITWISE_NOT {
  EFI_IFR_OP_HEADER                Header;
}   EFI_IFR_BITWISE_NOT;
```

Members

Header

The standard opcode header, where *Header.OpCode* = *EFI_IFR_BITWISE_NOT_OP.*

Description

This opcode performs the following actions:

1. Pop an expression from the expression stack.
2. If the expression cannot be evaluated as an unsigned integer, push Undefined.
3. Otherwise, zero-extend the unsigned integer to 64-bits.
4. Perform a bitwise-NOT on the value.
5. Push the result.

33.3.8.3.7 EFI_IFR_BITWISE_OR

Summary

Pops two unsigned integers, perform bitwise OR and push the result.

Prototype

```
#define EFI_IFR_BITWISE_OR_OP 0x36
typedef struct _EFI_IFR_BITWISE_OR {
  EFI_IFR_OP_HEADER           Header;
}   EFI_IFR_BITWISE_OR;
```

Members

Header
Standard opcode header, where *OpCode* is *EFI_IFR_BITWISE_OR_OP*.

Description

This opcode performs the following actions:

1. Pop two expressions from the expressionstack.
2. If the two expressions cannot be evaluated as unsigned integers, push Undefined.
3. Otherwise, zero-extend the unsigned integers to 64-bits.
4. Perform a bitwise-OR of the two values.
5. Push the result.

33.3.8.3.8 EFI_IFR_CATENATE

Summary

Pops two buffers or strings, concatenates them and pushes the result.

Prototype

```
#define EFI_IFR_CATENATE_OP 0x5e
typedef struct _EFI_IFR_CATENATE {
  EFI_IFR_OP_HEADER           Header;
}   EFI_IFR_CATENATE;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_CATENATE_OP.*

Description

This opcode performs the following actions:

1. Pop two expressions from the expressionstack. The first expression popped is the left valueand the second value popped is the *right* value.
2. If the left or right values cannot be evaluated as a string or a buffer, push Undefined. If the left or right values are of different types, then push Undefined.
3. If the left and right values are strings, push a new string which contains the contents of the left string (without the NULL terminator) followed by the contents of the right string on to the expression stack.
4. If the left and right values are buffers, push a new buffer that contains the contents of the left buffer followed by the contents of the right buffer on to the expression stack.

33.3.8.3.9 EFI_IFR_CHECKBOX

Summary

Creates a boolean checkbox.

Prototype

```
#define EFI_IFR_CHECKBOX_OP 0x06
typedef struct _EFI_IFR_CHECKBOX {
  EFI_IFR_OP_HEADER           Header;
  EFI_IFR_QUESTION_HEADER     Question;
  UINT8                       Flags;
}   EFI_IFR_CHECKBOX;
```

Members

Header

The standard question header, where *Header.OpCode* = *EFI_IFR_CHECKBOX_OP.*

Question

The standard question header. See *EFI_IFR_QUESTION_HEADER* (*EFI_IFR_QUESTION_HEADER*) for more information.

Flags

Flags that describe the behavior of the question. All undefined bits should be zero. See *EFI_IFR_CHECKBOX_x* in “Related Definitions” for more information.

Description

Creates a Boolean checkbox question and adds it to the current form. The checkbox has two values: *FALSE* if the box is not checked and *TRUE* if it is.

There are three ways to specify defaults for this question: the *Flags* field (lowest priority), one or more nested *EFI_IFR_ONE_OF_OPTION,* or nested *EFI_IFR_DEFAULT* (highest priority).

An image may be associated with the question using a nested *EFI_IFR_IMAGE.* An animation may be associated with the option using a nested *EFI_IFR_ANIMATION.*

Related Definitions

```
#define EFI_IFR_CHECKBOX_DEFAULT 0x01
#define EFI_IFR_CHECKBOX_DEFAULT_MFG 0x02
```

33.3.8.3.10 EFI_IFR_CONDITIONAL

Summary

Pops two values and a boolean, pushes one of the values depending on the boolean.

Prototype

```
#define EFI_IFR_CONDITIONAL_OP 0x50
typedef struct _EFI_IFR_CONDITIONAL {
  EFI_IFR_OP_HEADER           Header;
}   EFI_IFR_CONDITIONAL;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_CONDITIONAL_OP.*

Description

This opcode performs the following actions:

Pop three values from the expression stack.The first value popped is the right value. The secondexpression popped is the middle value. The lastexpression popped is the left value.

1. If the left value cannot be evaluated as a boolean, push Undefined.
2. If the left expression evaluates to *TRUE,* push the right value.
3. Otherwise, push the middle value.

33.3.8.3.11 EFI_IFR_DATE

Summary

Create a date question.

Prototype

```
#define EFI_IFR_DATE_OP 0x1A
typedef struct _EFI_IFR_DATE {
  EFI_IFR_OP_HEADER           Header;
  EFI_IFR_QUESTION_HEADER     Question;
  UINT8                       Flags;
}   EFI_IFR_DATE;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_DATE_OP.*

Question

The standard question header. See *EFI_IFR_QUESTION_HEADER* for more information.

Flags

Flags that describe the behavior of the question. All undefined bits should be zero.

```
#define EFI_QF_DATE_YEAR_SUPPRESS    0x01
#define EFI_QF_DATE_MONTH_SUPPRESS   0x02
#define EFI_QF_DATE_DAY_SUPPRESS     0x04
#define EFI_QF_DATE_STORAGE          0x30

For *QF_DATE_STORAGE,* there are currently three valid values:

#define QF_DATE_STORAGE_NORMAL       0x00
#define QF_DATE_STORAGE_TIME         0x10
#define QF_DATE_STORAGE_WAKEUP       0x20
```

Description

Create a Date question (*Date*) and add it to the current form.

There are two ways to specify defaults for this question: one or more nested *EFI_IFR_ONE_OF_OPTION* (lowest priority) or nested *EFI_IFR_DEFAULT* (highest priority). An image may be associated with the option using a nested *EFI_IFR_IMAGE* . An animation may be associated with the question using a nested *EFI_IFR_ANIMATION*.

33.3.8.3.12 EFI_IFR_DEFAULT

Summary

Provides a default value for the current question

Prototype

```
#define EFI_IFR_DEFAULT_OP 0x5b
typedef struct _EFI_IFR_DEFAULT {
  EFI_IFR_OP_HEADER        Header;
  UINT16                   DefaultId;
  UINT8                    Type;
  EFI_IFR_TYPE_VALUE       Value;
}   EFI_IFR_DEFAULT;

typedef struct _EFI_IFR_DEFAULT_2 {
  EFI_IFR_OP_HEADER        Header;
  UINT16                   DefaultId;
  UINT8                    Type;
}   EFI_IFR_DEFAULT_2;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_DEFAULT_OP.*

DefaultId

Identifies the default store for this value. The default store must have previously been created using *EFI_IFR_DEFAULTSTORE.*

Type

The type of data in the Value field. See *EFI_IFR_TYPE_x* in *EFI_IFR_ONE_OF_OPTION.*

Value

The default value. The actual size of this field depends on *Type*. If *Type* is *EFI_IFR_TYPE_OTHER*, then the default value is provided by a nested *EFI_IFR_VALUE*.

Description

This opcode specifies a default value for the current question. There are two forms. The first (*EFI_IFR_DEFAULT*) assumes that the default value is a constant, embedded directly in the Value member. The second (*EFI_IFR_DEFAULT_2*) assumes that the default value is specified using a nested *EFI_IFR_VALUE* opcode.

33.3.8.3.13 EFI_IFR_DEFAULTSTORE

Summary

Provides a declaration for the type of default values that a question can be associated with.

Prototype

```
#define EFI_IFR_DEFAULTSTORE_OP 0x5c
typedef struct _EFI_IFR_DEFAULTSTORE {
  EFI_IFR_OP_HEADER              Header;
  EFI_STRING_ID                  DefaultName;
  UINT16                         DefaultId;
}   EFI_IFR_DEFAULTSTORE;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_DEFAULTSTORE_OP*

DefaultName

A string token reference for the human readable string associated with the type of default being declared.

DefaultId

The default identifier, which is unique within the current form set. The default identifier creates a group of defaults. See Attributes, listed under xxxx *Defaults* for the default identifier ranges.

Description

Declares a class of default which can then have question default values associated with.

An *EFI_IFR_DEFAULTSTORE* with a specified *DefaultId* must appear in the IFR before it can be referenced by an *EFI_IFR_DEFAULT.*

33.3.8.3.14 EFI_IFR_DISABLE_IF

Summary

Disable all nested questions and expressions if the expression evaluates to *TRUE*.

Prototype

```
#define EFI_IFR_DISABLE_IF_OP 0x1e
typedef struct _EFI_IFR_DISABLE_IF {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_DISABLE_IF;
```

Members

Header

The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_DISABLE_IF_OP.*

Description

All nested statements, questions, options or expressions will not be processed if the expression appearing as the first nested object evaluates to **TRUE**. If the expression consists of more than a single opcode, then the first opcode in the expression must have the Scope bit set and the expression must end with *EFI_IFR_END*.

When this opcode appears under a form set, the expression must only rely on constants. When this opcode appears under a form, the expression may rely on question values in the same form which are not inside of an *EFI_DISABLE_IF* expression.

33.3.8.3.15 EFI_IFR_DIVIDE

Summary

Pops two unsigned integers, divide one by the other and pushes the result.

Prototype

```
#define EFI_IFR_DIVIDE_OP 0x3d
typedef struct _EFI_IFR_DIVIDE {
  EFI_IFR_OP_HEADER             Header;
}   EFI_IFR_DIVIDE;
```

Members

Header

Standard opcode header, where OpCode is *EFI_IFR_DIVIDE*.

Description

1. Pop two expressions from the expressionstack. The first popped is the right-hand expression.The second popped is the left-hand expression.**
2. If the two expressions do not evaluate to unsigned integers, push Undefined. If the right-hand expression is equal to zero, push Undefined.
3. Zero-extend the left-hand and right-hand expressions to 64-bits.
4. Divide the left-hand value to right-hand expression.
5. Push the result.

33.3.8.3.16 EFI_IFR_DUP

Summary

Duplicate the top value on the expression stack.

Prototype

```
#define EFI_IFR_DUP_OP 0x57
typedef struct _EFI_IFR_DUP {
```

(continues on next page)

(continued from previous page)

```
  EFI_IFR_OP_HEADER        Header;
}   EFI_IFR_DUP;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_DUP* _OP.

Description

Duplicate the top expression on the expression stack.

NOTE: *This opcode is usually used as an optimization by the tools to help eliminate common sub-expression calculation and make smaller expressions.*

33.3.8.3.17 EFI_IFR_END

Summary

End of the current scope.

Prototype

```
#define EFI_IFR_END_OP 0x29
typedef struct _EFI_IFR_END {
  EFI_IFR_OP_HEADER           Header;
}   EFI_IFR_END;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_END_OP.*

Description

Marks the end of the current scope.

33.3.8.3.18 EFI_IFR_EQUAL

Summary

Pop two values, compare and push *TRUE* if equal, *FALSE* if not.

Prototype

```
#define EFI_IFR_EQUAL_OP 0x2f
typedef struct _EFI_IFR_EQUAL {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_EQUAL;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_EQUAL_OP.*

Description

The opcode performs the following actions:

1. Pop two values from the expression stack.
2. If the two values are not strings, Booleans or unsigned integers, push Undefined.
3. If the two values are of different types, push Undefined.
4. Compare the two values. Strings are compared lexicographically.
5. If the two values are equal then push *TRUE* on the expression stack. If they are not equal, push *FALSE* .

33.3.8.3.19 EFI_IFR_EQ_ID_ID

Summary

Push **TRUE** if the two questions have the same value or **FALSE** if they are not equal.

Prototype

```
#define EFI_IFR_EQ_ID_ID_OP 0x13
typedef struct _EFI_IFR_EQ_ID_ID {
  EFI_IFR_OP_HEADER               Header;
  EFI_QUESTION_ID                 QuestionId1;
  EFI_QUESTION_ID                 QuestionId2;
}   EFI_IFR_EQ_ID_ID;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_EQ_ID_ID_OP.*

QuestionId1,

QuestionId2 Specifies the identifier of the questions whose values will be compared.

Description

Evaluate the values of the specified questions (*QuestionId1, QuestionId2*). If the two values cannot be evaluated or cannot be converted to comparable types, then push Undefined. If they are equal, push **TRUE.** Otherwise push **FALSE.**

33.3.8.3.20 EFI_IFR_EQ_ID_VAL_LIST

Summary

Push *TRUE* if the question's value appears in a list of unsigned integers.

Prototype

```
#define EFI_IFR_EQ_ID_VAL_LIST_OP 0x14
typedef struct _EFI_IFR_EQ_ID_VAL_LIST {
  EFI_IFR_OP_HEADER            Header;
  EFI_QUESTION_ID              QuestionId;
  UINT16                       ListLength;
  UINT16                       ValueList[1];
}   EFI_IFR_EQ_ID_VAL_LIST;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_EQ_ID_VAL_LIST_OP.*

QuestionId

Specifies the identifier of the question whose value will be compared.

ListLength

Number of entries in *ValueList.*

ValueList

Zero or more unsigned integer values to compare against.

Description

Evaluate the value of the specified question (*QuestionId*). If the specified question cannot be evaluated as an unsigned integer, then push Undefined. If the value can be found in *ValueList,* then push **TRUE.** Otherwise push **FALSE.**

33.3.8.3.21 EFI_IFR_EQ_ID_VAL

Summary

Push **TRUE** if a question's value is equal to a 16-bit unsigned integer, otherwise **FALSE**.

Prototype

```
#define EFI_IFR_EQ_ID_VAL_OP 0x12
typedef struct _EFI_IFR_EQ_ID_VAL {
  EFI_IFR_OP_HEADER Header;
  EFI_QUESTION_ID QuestionId;
  UINT16 Value;
}   EFI_IFR_EQ_ID_VAL;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_EQ_ID_VAL_OP.*

QuestionId

Specifies the identifier of the question whose value will be compared.

Value

Unsigned integer value to compare against.

Description

Evaluate the value of the specified question (*QuestionId*). If the specified question cannot be evaluated as an unsigned integer, then push Undefined. If they are equal, push **TRUE.** Otherwise push **FALSE.**

33.3.8.3.22 EFI_IFR_FALSE

Summary

Push a **FALSE** on to the expression stack.

Prototype

```
#define EFI_IFR_FALSE_OP 0x47
typedef struct _EFI_IFR_FALSE {
  EFI_IFR_OP_HEADER           Header;
}   EFI_IFR_FALSE;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_FALSE_OP*

Description

Push a **FALSE** on to the expression stack.

33.3.8.3.23 EFI_IFR_FIND

Summary

Pop two strings and an unsigned integer, find one string in the other and the index where found.

Prototype

```
#define EFI_IFR_FIND_OP 0x4c
typedef struct _EFI_IFR_FIND {
  EFI_IFR_OP_HEADER     Header;
  UINT8                 Format;
}   EFI_IFR_FIND;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_FIND_OP*.

Format

The following flags govern the matching criteria:

Related Definitions

```
#define EFI_IFR_FF_CASE_SENSITIVE      0x00
#define EFI_IFR_FF_CASE_INSENSITIVE    0x01
```

Description

This opcode performs the following actions:

1. Pop three expressions from the expressionstack. The first expression popped is the right-handvalue and the second value popped is the middle valueand the last value popped is the left-hand value.
2. If the left-hand or middle values cannot be evaluated as a string, push Undefined. If the third expression cannot be evaluated as an unsigned integer, push Undefined.
3. The left-hand value is the string to search. The middle value is the string to compare with. The right-hand expression is the zero-based index of the search. |
4. If the string is found, push the zero-based index of the found string.
5. Otherwise, if the string is not found or the right-hand value specifies a value which is greater-than or equal to the length of the left-hand value's string, push 0xFFFFFFFFFFFFFFFF.

33.3.8.3.24 EFI_IFR_FORM

Summary

Creates a form.

Prototype

```
#define EFI_IFR_FORM_OP 0x01
typedef struct _EFI_IFR_FORM {
  EFI_IFR_OP_HEADER        Header;
  EFI_FORM_ID              FormId;
  EFI_STRING_ID            FormTitle;
}   EFI_IFR_FORM;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_FORM_OP.*

FormId

The form identifier, which uniquely identifies the form within the form set. The form identifier, along with the device path and form set GUID, uniquely identifies a form within a system.

FormTitle

The string token reference to the title of this particular form.

Description

A form is the encapsulation of what amounts to a browser page. The header defines a *FormId,* which is referenced by the form set, among others. It also defines a *FormTitle,* which is a string to be used as the title for the form.

33.3.8.3.25 EFI_IFR_FORM_MAP

Summary

Creates a standards map form.

Prototype

```
#define EFI_IFR_FORM_MAP_OP 0x5D
typedef struct _EFI_IFR_FORM_MAP_METHOD {
  EFI_STRING_ID                  MethodTitle;
  EFI_GUID                       MethodIdentifier;
}   EFI_IFR_FORM_MAP_METHOD;

typedef struct _EFI_IFR_FORM_MAP {
  EFI_IFR_OP_HEADER              Header;
  EFI_FORM_ID                    FormId;
  //EFI_IFR_FORM_MAP_METHOD      Methods[];
}   EFI_IFR_FORM_MAP;
```

Parameters

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_FORM_MAP_OP.*

FormId
The unique identifier for this particular form.

Methods
One or more configuration method's name and unique identifier.

MethodTitle
The string identifier which provides the human-readable name of the configuration method for this standards map form.

MethodIdentifier
Identifier which uniquely specifies the configuration methods associated with this standards map form. See "Related Definitions" for current identifiers.

Description

A standards map form describes how the configuration settings are represented for a configuration method identified by *MethodIdentifier.* It also defines a *FormTitle,* which is a string to be used as the title for the form.

Related Definitions

```
#define EFI_HII_STANDARD_FORM_GUID \
    { 0x3bd2f4ec, 0xe524, 0x46e4, \
    { 0xa9, 0xd8, 0x51, 0x01, 0x17, 0x42, 0x55, 0x62 } }
```

An *EFI_IFR_FORM_MAP* where the method identifier is *EFI_HII_STANDARD_FORM_GUID* is semantically identical to a normal *EFI_IFR_FORM.*

33.3.8.3.26 EFI_IFR_FORM_SET

Summary

The form set is a collection of forms that are intended to describe the pages that will be displayed to the user.

Prototype

```
#define EFI_IFR_FORM_SET_OP 0x0E

typedef struct _EFI_IFR_FORM_SET {
  EFI_IFR_OP_HEADER            Header;
  EFI_GUID                     Guid;
  EFI_STRING_ID                FormSetTitle;
  EFI_STRING_ID                Help;
  UINT8                        Flags;
//EFI_GUID                     ClassGuid[_];
}   EFI_IFR_FORM_SET;
```

Members

Header
The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_FORM_SET_OP.*

Guid
The unique GUID value associated with this particular form set. Type *EFI_GUID* is defined in *InstallProtocolInterface()* in this specification.

FormSetTitle
The string token reference to the title of this particular form set.

Help
The string token reference to the help of this particular form set.

Flags
Flags which describe additional features of the form set. Bits 0:1 = number of members in *ClassGuid.* Bits 2:7 = Reserved. Should be set to zero.

ClassGuid
Zero to four class identifiers. The standard class identifiers are described in *EFI_HII_FORM_BROWSER2_PROTOCOL.SendForm().* They do not need to be unique in the form set.

Description

The form set consists of a header and zero or more forms.

33.3.8.3.27 EFI_IFR_GET

Summary

Return a stored value.

Prototype

```
#define EFI_IFR_GET_OP 0x2B
typedef struct _EFI_IFR_GET {
  EFI_IFR_OP_HEADER        Header;
  EFI_VARSTORE_ID          VarStoreId;
  union {
    EFI_STRING_ID          VarName;
    UINT16                 VarOffset;
  }                        VarStoreInfo;
  UINT8                    VarStoreType;
}   EFI_IFR_GET;
```

Parameters

Header
The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_GET_OP.*

VarStoreId
Specifies the identifier of a previously declared variable store to use when retrieving the value.

VarStoreInfo
Depending on the type of variable store selected, this contains either a 16-bit Buffer Storage offset (*VarOffset*) or a Name/Value or EFI Variable name (*VarName*).

VarStoreType
Specifies the type used for storage. The storage types *EFI_IFR_TYPE_x* are defined in *EFI_IFR_ONE_OF_OPTION.*

Description

This operator takes the value from storage and pushes it on to the expression stack. If the value could not be retrieved from storage, then *Undefined* is pushed on to the expression stack.

The type of value retrieved from storage depends on the setting of *VarStoreType,* as described in the following table:

Table 33.21: VarStoreType Descriptions

VarStoreType	**Storage Description**
EFI_IFR_TYPE_NUM_SIZE_8	8-bit unsigned integer
EFI_IFR_TYPE_NUM_SIZE_16	16-bit unsigned integer
EFI_IFR_TYPE_NUM_SIZE_32	32-bit unsigned integer
EFI_IFR_TYPE_NUM_SIZE_64	64-bit unsigned integer
EFI_IFR_TYPE_BOOLEAN	8-bit boolean (0 = **FALSE**, 1 = **TRUE**)
EFI_IFR_TYPE_TIME	*EFI_HII_TIME*
EFI_IFR_TYPE_DATE	*EFI_HII_DATE*
EFI_IFR_TYPE_STRING	Null-terminated string
EFI_IFR_TYPE_OTHER	Invalid
EFI_IFR_TYPE_ACTION	Null-Terminated string
EFI_IFR_TYPE_UNDEFINED	Invalid
EFI_IFR_TYPE_BUFFER	Buffer
EFI_IFR_TYPE_REF	*EFI_HII_REF*

33.3.8.3.28 EFI_IFR_GRAY_OUT_IF

Summary

Creates a group of statements or questions which are conditionally grayed-out.

Prototype

```
#define EFI_IFR_GRAY_OUT_IF_OP 0x19
typedef struct _EFI_IFR_GRAY_OUT_IF {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_GRAY_OUT_IF;
```

Members

Header

The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_GRAY_OUT_IF_OP.*

Description

All nested statements or questions will be grayed out (not selectable and visually distinct) if the expression appearing as the first nested object evaluates to *TRUE.* If the expression consists of more than a single opcode, then the first opcode in the expression must have the Scope bit set and the expression must end with *EFI_IFR_END.*

Different browsers may support this option to varying degrees. For example, HTML has no similar construct so it may not support this facility.

33.3.8.3.29 EFI_IFR_GREATER_EQUAL

Summary

Pop two values, compare, push *TRUE* if first is greater than or equal the second, otherwise push *FALSE.*

Prototype

```
#define EFI_IFR_GREATER_EQUAL_OP 0x32
typedef struct _EFI_IFR_GREATER_EQUAL {
```

(continues on next page)

(continued from previous page)

```
  EFI_IFR_OP_HEADER                  Header;
}   EFI_IFR_GREATER_EQUAL;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_GREATER_EQUAL* _OP.

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. Thefirst value popped is the right-hand value and thesecond value popped is the left-hand value.
2. If the two values do not evaluate to string, boolean or unsigned integer, push Undefined.
3. If the two values do not evaluate to the same type, push Undefined.
4. Compare the two values. Strings are compared lexicographically.
5. If the left-hand value is greater than or equal to the right-hand value, push *TRUE.* Otherwise push *FALSE* .

33.3.8.3.30 EFI_IFR_GREATER_THAN

Summary

Pop two values, compare, push **TRUE** if first is greater than the second, otherwise push **FALSE.**

Prototype

```
#define EFI_IFR_GREATER_THAN_OP 0x31
typedef struct _EFI_IFR_GREATER_THAN {
  EFI_IFR_OP_HEADER *Header;
}   EFI_IFR_GREATER_THAN;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_GREATER_THAN* _OP

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. Thefirst value popped is the right-hand value and thesecond value popped is the left-hand value.
2. If the two values do not evaluate to string, boolean or unsigned integer, push Undefined.
3. If the two values do not evaluate to the same type, push Undefined.
4. Compare the two values. Strings are compared lexicographically.
5. If the left-hand value is greater than the right-hand value, push *TRUE.* Otherwise push *FALSE.*

33.3.8.3.31 EFI_IFR_GUID

Summary

A GUIDed operation. This op-code serves as an extensible op-code which can be defined by the Guid value to have various functionality. It should be noted that IFR browsers or scripts which cannot interpret the meaning of this GUIDed op-code will skip it.

Prototype

```
#define EFI_IFR_GUID_OP 0x5F
typedef struct _EFI_IFR_GUID {
  EFI_IFR_OP_HEADER           Header;
  EFI_GUID                    Guid;
//Optional Data Follows
}   EFI_IFR_GUID;
```

Parameters

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_GUID_OP*

Guid

The GUID value for this op-code. This field is intended to define a particular type of special-purpose function, and the format of the data which immediately follows the Guid field (if any) is defined by that particular GUID.

33.3.8.3.32 EFI_IFR_IMAGE

Summary

Creates an image for a statement or question.

Prototype

```
#define EFI_IFR_IMAGE_OP 0x04
typedef struct _EFI_IFR_IMAGE {
  EFI_IMAGE_ID          Id;
}   EFI_IFR_IMAGE;
```

Members

Id

Image identifier in the HII database.

Description

Specifies the image within the HII database.

33.3.8.3.33 EFI_IFR_INCONSISTENT_IF

Summary

Creates a validation expression and error message for a question.

Prototype

```
#define EFI_IFR_INCONSISTENT_IF_OP 0x011
typedef struct _EFI_IFR_INCONSISTENT_IF {
  EFI_IFR_OP_HEADER                 Header;
  EFI_STRING_ID                     Error;
}   EFI_IFR_INCONSISTENT_IF;
```

Members

Header

The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_INCONSISTENT_IF_OP.*

Error

The string token reference to the string that will be used for the consistency check message.

Description

This tag uses a Boolean expression to allow the IFR creator to check options in a richer manner than provided by the question tags themselves. For example, this tag might be used to validate that two options are not using the same address or that the numbers that were entered align to some pattern (such as leap years and February in a date input field). The tag provides a string to be used in a error display to alert the user to the issue. Inconsistency tags will be evaluated when the user traverses from tag to tag. The user should not be allowed to submit the results of a form inconsistency.

33.3.8.3.34 EFI_IFR_LENGTH

Summary

Pop a string or buffer, push its length.

Prototype

```
#define EFI_IFR_LENGTH_OP 0x56
typedef struct _EFI_IFR_LENGTH {
  EFI_IFR_OP_HEADER               Header;
}   EFI_IFR_LENGTH;
```

Members

Header Standard opcode header, where *OpCode* is *EFI_IFR_LENGTH_OP.*

Description

This opcode performs the following actions:

1. Pop a value from the expression stack.
2. If the value cannot be evaluated as a buffer or string, then push Undefined.
3. If the value can be evaluated as a buffer, push the length of the buffer, in bytes.
4. If the value can be evaluated as a string, push the length of the string, in characters.

33.3.8.3.35 EFI_IFR_LESS_EQUAL

Summary

Pop two values, compare, push *TRUE* if first is less than or equal to the second, otherwise push *FALSE*.

Prototype

```
#define EFI_IFR_LESS_EQUAL_OP 0x34
typedef struct _EFI_IFR_LESS_EQUAL {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_LESS_EQUAL;
```

Members

Header
Standard opcode header, where *OpCode* is *EFI_IFR_LESS_EQUAL* _OP.

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. The first value popped is the right-hand value and the second value popped is the left-hand value.
2. If the two values do not evaluate to string, boolean or unsigned integer, push Undefined.
3. If the two values do not evaluate to the same type, push Undefined.
4. Compare the two values. Strings are compared lexicographically.
5. If the left-hand value is less than or equal to the right-hand value, push **TRUE.** Otherwise push **FALSE.**

33.3.8.3.36 EFI_IFR_LESS_THAN

Summary

Pop two values, compare, push *TRUE* if the first is less than the second, otherwise push *FALSE*.

Prototype

```
#define EFI_IFR_LESS_THAN_OP 0x33
typedef struct _EFI_IFR_LESS_THAN {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_LESS_THAN;
```

Members

Header
Standard opcode header, where *OpCode* is *EFI_IFR_LESS_THAN* _OP.

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. Thefirst value popped is the right-hand value and thesecond value popped is the left-hand value.
2. If the two values do not evaluate to string, boolean or unsigned integer, push Undefined.
3. If the two values do not evaluate to the same type, push Undefined.

4. Compare the two values. Strings are compared lexicographically.
5. If the left-hand value is less than the right-hand value, push **TRUE.** Otherwise push **FALSE.**

33.3.8.3.37 EFI_IFR_LOCKED

Summary

Specifies that the statement or question is locked.

Prototype

```
#define EFI_IFR_LOCKED_OP 0x0B
typedef struct _EFI_IFR_LOCKED {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_LOCKED;
```

Parameters

Header

Standard opcode header, where *Header.Opcode* is *EFI_IFR_LOCKED_OP*.

Members

None

Description

The presence of *EFI_IFR_LOCKED* indicates that the statement or question should not be modified by a Forms Editor.

33.3.8.3.38 EFI_IFR_MAP

Summary

Pops value, compares against an array of comparison values, pushes the corresponding result value.

Prototype

```
#define EFI_IFR_MAP_OP 0x22
typedef struct _EFI_IFR_MAP {
  EFI_IFR_OP_HEADER Header;
}   EFI_IFR_MAP;
```

Parameters

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_MAP_OP*

Description

This operator contains zero or more expression pairs nested within its scope. Each expression pair contains a match expression and a return expression.

This opcode performs the following actions:

1. This operator pops a single value from theexpression stack.
2. Compare this value against the evaluated result of each of the match expressions.

3. If there is a match, then the evaluated result of the corresponding return expression is pushed on to the expression stack.
4. If there is no match, then Undefined is pushed.

33.3.8.3.39 EFI_IFR_MATCH

Summary

Pop a source string and a pattern string, push **TRUE** if the source string matches the pattern specified by the pattern string, otherwise push **FALSE.**

Prototype

```
#define EFI_IFR_MATCH_OP 0x2a
typedef struct _EFI_IFR_MATCH {
  EFI_IFR_OP_HEADER           Header;
}   EFI_IFR_MATCH;
```

Members

Header

Standard opcode header, where *Header.Opcode* is *EFI_IFR_MATCH_OP*.

Description

1. Pop two values from the expression stack. Thefirst value popped is the string and the second valuepopped is the pattern.
2. If the string or the pattern cannot be evaluated as a string, then push Undefined.
3. Process the string and pattern using the *MetaiMatch* function of the *EFI_UNICODE_COLLATION2_PROTOCOL.*
4. If the result is **TRUE,** then push **TRUE.**
5. If the result is **FALSE,** then push **FALSE.**

33.3.8.3.40 EFI_IFR_MID

Summary

Pop a string or buffer and two unsigned integers, push an extracted portion of the string or buffer.

Prototype

```
#define EFI_IFR_MID_OP 0x4b
typedef struct _EFI_IFR_MID {
  EFI_IFR_OP_HEADER           Header;
}   EFI_IFR_MID;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_MID_OP*.

Description

1. Pop three values from the expression stack.The first value popped is the right value and thesecond value popped is the middle value and the lastexpression popped is the left value.**

2. If the left value cannot be evaluated as a string or a buffer, push Undefined. If the middle or right value cannot be evaluated as unsigned integers, push Undefined.
3. If the left value is a string, then the middle value is the 0-based index of the first character in the string to extract and the right value is the length of the string to extract. If the right value is zero or the middle value is greater than or equal the string's length, then push an Empty string. Push the extracted string on the expression stack. If the right value would cause extraction to extend beyond the end of the string, then only the characters up to and include the last character of the string are in the pushed result.
4. If the left value is a buffer, then the middle value is the 0-based index of the first byte in the buffer to extract and the right value is the length of the buffer to extract. If the right value is zero or the middle value is greater than the buffer's length, then push an empty buffer. Push the extracted buffer on the expression stack. If the right value would cause extraction to extend beyond the end of the buffer, then only the bytes up to and include the last byte of the buffer are in the pushed result.

33.3.8.3.41 EFI_IFR_MODAL_TAG

Summary

Specify that the current form is a modal form.

Prototype

```
#define EFI_IFR_MODAL_TAG_OP 0x61
typedef struct _EFI_IFR_MODAL_TAG {
  EFI_IFR_OP_HEADER *Header;
}   EFI_IFR_MODAL_TAG;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_MODAL_TAG* _OP.

Description

When this opcode is present within the scope of a form, the form is modal; if the opcode is not present, the form is not modal.

A "modal" form is one that requires specific user interaction before it is deactivated. Examples of modal forms include error messages or confirmation dialogs.

When a modal form is activated, it is also selected. A modal form is deactivated only when one of the following occurs:

- The user chooses a "Navigate To Form" behavior (defined in *Selected Form* , "Selected Form"). Note that this is distinct from the "Navigate Forms" behavior.
- A question in the form requires callback, and the callback returns one of the following ActionRequest values (defined in *EFI_HII_CONFIG_ACCESS_PROTOCOL.CallBack()*):

  - *EFI_BROWSER_ACTION_REQUEST_RESET*
  - *EFI_BROWSER_ACTION_REQUEST_SUBMIT*
  - *EFI_BROWSER_ACTION_REQUEST_EXIT*
  - *EFI_BROWSER_ACTION_REQUEST_FORM_SUBMIT_EXIT*
  - *EFI_BROWSER_ACTION_REQUEST_FORM_DISCARD_EXIT*

A modal form cannot be deactivated using other navigation behaviors, including:

- Navigate Forms
- Exit Browser/Discard All (except when initiated by a callback as indicated above)
- Exit Browser/Submit All (except when initiated by a callback as indicated above)
- Exit Browser/Discard All/Reset Platform (except when initiated by a callback as indicated above)

33.3.8.3.42 EFI_IFR_MODULO

Summary

Pop two unsigned integers, divide one by the other and push the remainder.

Prototype

```
#define EFI_IFR_MODULO_OP 0x3e
typedef struct _EFI_IFR_MODULO {
  EFI_IFR_OP_HEADER *Header;
}   EFI_IFR_MODULO;
```

Members

Header
Standard opcode header, where *OpCode* is *EFI_IFR_MODULO* _OP.

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. Thefirst value popped is the right-hand value and thesecond value popped is the left-hand value.
2. If the two values do not evaluate to unsigned integers, push Undefined. If the right-hand value to 0, push Undefined.
3. Zero-extend the values to 64-bits. Then, divide the left-hand value by the right-hand value.
4. Push the difference between the left-hand value and the product of the right-hand value and the calculated quotient.

33.3.8.3.43 EFI_IFR_MULTIPLY

Summary

Multiply one unsigned integer by another and push the result.

Prototype

```
#define EFI_IFR_MULTIPLY_OP 0x3c
typedef struct _EFI_IFR_MULTIPLY {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_MULTPLY;
```

Members

Header
Standard opcode header, where *OpCode* is *EFI_IFR_MULTIPLY_OP.*

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. Thefirst value popped is the right-hand expression andthe second value popped is the left-hand expression.
2. If the two values do not evaluate to unsigned integers, push Undefined.
3. Zero-extend the values to 64-bits. Then, multiply the right-hand value by the left-hand value. Push the lower 64-bits of the result.

33.3.8.3.44 EFI_IFR_NOT

Summary

Pop a boolean and, if **TRUE,** push **FALSE.** If **FALSE,** push **TRUE.**

Prototype

```
#define EFI_IFR_NOT_OP 0x17
typedef struct _EFI_IFR_NOT {
  EFI_IFR_OP_HEADER           Header;
}   EFI_IFR_NOT;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_NOT_OP.*

Description

This opcode performs the following actions:

1. Pop one value from the expression stack.
2. If the value cannot be evaluated as a Boolean, push Undefined.
3. If the value evaluates to **TRUE,** then push **FALSE.** Otherwise, push **TRUE.**

33.3.8.3.45 EFI_IFR_NOT_EQUAL

Summary

Pop two values, compare and push **TRUE** if not equal, otherwise push **FALSE.**

Prototype

```
#define EFI_IFR_NOT_EQUAL_OP 0x30
typedef struct _EFI_IFR_NOT_EQUAL {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_NOT_EQUAL;
```

Members

Header* Standard opcode header, where *OpCode* is *EFI_IFR_NOT_EQUAL_OP.*

Description

This opcode performs the following actions:

1. Pop two values from the expression stack.
2. If the two values are not strings, Booleans or unsigned integers, push Undefined.
3. If the two values are of different types, push Undefined.
4. Compare the two values. Strings are compared lexicographically.
5. If the two values are not equal then push **TRUE** on the expression stack. If they are equal, push **FALSE**.

33.3.8.3.46 EFI_IFR_NO_SUBMIT_IF

Summary

Creates a validation expression and error message for a question.

Prototype

```
#define EFI_IFR_NO_SUBMIT_IF_OP 0x10
typedef struct _EFI_IFR_NO_SUBMIT_IF {
  EFI_IFR_OP_HEADER                 Header;
  EFI_STRING_ID                     Error;
}   EFI_IFR_NO_SUBMIT_IF;
```

Members

Header

The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_NO_SUBMIT_IF_OP.*

Error

The string token reference to the string that will be used for the consistency check message.

Description

Creates a conditional expression which will be evaluated when the form is submitted. If the conditional evaluates to **TRUE**, then the error message Error will be displayed to the user and the user will be prevented from submitting the form.

33.3.8.3.47 EFI_IFR_NUMERIC

Summary

Creates a number question.

Prototype

```
#define EFI_IFR_NUMERIC_OP 0x07
typedef struct _EFI_IFR_NUMERIC {
  EFI_IFR_OP_HEADER               Header;

}   EFI_IFR_NUMERIC;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_NUMERIC_OP.*

Question

The standard question header. xxxx See *EFI_IFR_QUESTION_HEADER* for more information.

Flags

Specifies flags related to the numeric question. See "Related Definitions"

MinValue

The minimum value to be accepted by the browser for this opcode. The size of the data field may vary from 8 to 64 bits.

MaxValue

The maximum value to be accepted by the browser for this opcode. The size of the data field may vary from 8 to 64 bits.

Step

Defines the amount to increment or decrement the value each time a user requests a value change. If the step value is 0, then the input mechanism for the numeric value is to be free-form and require the user to type in the actual value. The size of the data field may vary from 8 to 64 bits.

Description

Creates a number question on the current form, with built-in error checking and default information. The storage size depends on the *EFI_IFR_NUMERIC_SIZE* portion of the *Flags* field.

There are two ways to specify defaults for this question: one or more nested *EFI_IFR_ONE_OF_OPTION* (lowest priority) or nested *EFI_IFR_DEFAULT* (highest priority). An image may be associated with the option using a nested *EFI_IFR_IMAGE* . An animation may be associated with the question using a nested *EFI_IFR_ANIMATION.*

#define EFI_IFR_NUMERIC_SIZE_2      0x01
#define EFI_IFR_NUMERIC_SIZE_4      0x02
#define EFI_IFR_NUMERIC_SIZE_8      0x03

#define EFI_IFR_DISPLAY             0x30
#define EFI_IFR_DISPLAY_INT_DEC     0x00
#define EFI_IFR_DISPLAY_UINT_DEC    0x10
#define EFI_IFR_DISPLAY_UINT_HEX    0x20
```

EFI_IFR_NUMERIC_SIZE — Specifies the size of the numeric value, the storage required and the size of the *MinValue, MaxValue* and *Step* values in the opcode header.

EFI_IFR_DISPLAY — The value will be displayed in signed decimal, unsigned decimal or unsigned hexadecimal. Input is still allowed in any form.

NOTE: *IFR expressions do not support signed types (Data Types* Data Types). *The value of a numeric question is treated during expression evaluation as an unsigned integer even if* EFI_IFR_DISPLAY_INT_DEC *flag is specified. However, the* EFI_IFR_DISPLAY_INT_DEC *flag is taken into consideration while validating question's current or default value against* MinValue *and* MaxValue. *When* EFI_IFR_DISPLAY_INT_DEC *flag is specified, forms processor must treat* MinValue, MaxValue, *current question value, and default question value as signed integers*.

33.3.8.3.48 EFI_IFR_ONE

Summary

Push a one on to the expression stack.

Prototype

```
#define EFI_IFR_ONE_OP 0x53
typedef struct _EFI_IFR_ONE {
  EFI_IFR_OP_HEADER           Header;
}   EFI_IFR_ONE;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_ONE_OP*

Description

Push a one on to the expression stack.

33.3.8.3.49 EFI_IFR_ONES

Summary

Push 0xFFFFFFFFFFFFFFFF on to the expression stack.

Prototype

```
#define EFI_IFR_ONES_OP 0x54
typedef struct _EFI_IFR_ONES {
```

(continues on next page)

(continued from previous page)

```
  EFI_IFR_OP_HEADER            Header;
}   EFI_IFR_ONES;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_ONES_OP*

Description

Push 0xFFFFFFFFFFFFFFFF on to the expression stack.

33.3.8.3.50 EFI_IFR_ONE_OF

Summary

Creates a select-one-of question.

Prototype

```
#define EFI_IFR_ONE_OF_OP 0x05

typedef struct _EFI_IFR_ONE_OF {
  EFI_IFR_OP_HEADER Header;
  EFI_IFR_QUESTION_HEADER *Question;
  UINT8 Flags;

  union {
  struct {
    UINT8            MinValue;
    UINT8            MaxValue;
    UINT8            Step;
  } u8;
  struct {
    UINT16            MinValue;
    UINT16            MaxValue;
    UINT16            Step;
  } u16;
  struct {
    UINT32            MinValue;
    UINT32            MaxValue;
    UINT32            Step;
  } u32;
  struct {
    UINT64            MinValue;
    UINT64            MaxValue;
    UINT64            Step;
  }   u64;
  }   data;
}   EFI_IFR_ONE_OF;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_ONE_OF_OP.*

Question

The standard question header. xxxx See *EFI_IFR_QUESTION_HEADER* for more information.

Flags

Specifies flags related to the numeric question. See "Related Definitions" in *EFI_IFR_NUMERIC.*

MinValue

The minimum value to be accepted by the browser for this opcode. The size of the data field may vary from 8 to 64 bits, depending on the size specified in *Flags*

MaxValue

The maximum value to be accepted by the browser for this opcode. The size of the data field may vary from 8 to 64 bits, depending on the size specified in *Flags*

Step

Defines the amount to increment or decrement the value each time a user requests a value change. If the step value is 0, then the input mechanism for the numeric value is to be free-form and require the user to type in the actual value. The size of the data field may vary from 8 to 64 bits, depending on the size specified in *Flags*

Description

This opcode creates a select-on-of object, where the user must select from one of the nested options. This is identical to *EFI_IFR_NUMERIC.*

There are two ways to specify defaults for this question: one or more nested *EFI_IFR_ONE_OF_OPTION* (lowest priority) or nested *EFI_IFR_DEFAULT* (highest priority). An image may be associated with the option using a nested *EFI_IFR_IMAGE* . An animation may be associated with the question using a nested *EFI_IFR_ANIMATION.*

33.3.8.3.51 EFI_IFR_ONE_OF_OPTION

Summary

Creates a pre-defined option for a question.

Prototype

```
#define EFI_IFR_ONE_OF_OPTION_OP 0x09
typedef struct _EFI_IFR_ONE_OF_OPTION {
  EFI_IFR_OP_HEADER                Header;
  EFI_STRING_ID                    Option;
  UINT8                            Flags;
  UINT8                            Type;
  EFI_IFR_TYPE_VALUE Value;
}   EFI_IFR_ONE_OF_OPTION;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_ONE_OF_OPTION_OP.*

Option

The string token reference to the option description string for this particular opcode.

Flags

Specifies the flags associated with the current option. See *EFI_IFR_OPTION_x.*

Type

Specifies the type of the option's value. See *EFI_IFR_TYPE*.

Value

The union of all of the different possible values. The actual contents (and size) of the field depends on *Type*.

Related Definitions

```

(continues on next page)

(continued from previous page)

```

#define EFI_IFR_OPTION_DEFAULT      0x10
#define EFI_IFR_OPTION_DEFAULT_MFG  0x20
```

Description

Create a selection for use in any of the questions.

The value is encoded within the opcode itself, unless *EFI_IFR_TYPE_OTHER* is specified, in which case the value is determined by a nested *EFI_IFR_VALUE.*

An image may be associated with the option using a nested *EFI_IFR_IMAGE.* An animation may be associated with the question using a nested *EFI_IFR_ANIMATION.*

33.3.8.3.52 EFI_IFR_OR

Summary

Pop two Booleans, push **TRUE** if either is **TRUE.** Otherwise push **FALSE.**

Prototype

```
#define EFI_IFR_OR_OP 0x16
typedef struct _EFI_IFR_OR {
  EFI_IFR_OP_HEADER                  Header;
}   EFI_IFR_OR;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode* = *EFI_IFR_OR* _OP.

Description

This opcode performs the following actions:

1. Pop two values from the expression stack.
2. If either value does not evaluate as a Boolean, then push Undefined.
3. If either value evaluates to **TRUE,** then push **TRUE**. Otherwise, push **FALSE.**

33.3.8.3.53 EFI_IFR_ORDERED_LIST

Summary

Creates a set question using an ordered list.

Prototype

```
#define EFI_IFR_ORDERED_LIST_OP 0x23

typedef struct _EFI_IFR_ORDERED_LIST {
  EFI_IFR_OP_HEADER                 Header;
  EFI_IFR_QUESTION_HEADER           Question;
```

(continues on next page)

(continued from previous page)

```
  UINT8                             MaxContainers;
  UINT8                             Flags;
}   EFI_IFR_ORDERED_LIST;
```

Members

Header
The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_ORDERED_LIST_OP.*

Question
The standard question header. See *EFI_IFR_QUESTION_HEADER* for more information.

MaxContainers
The maximum number of entries for which this tag will maintain an order. This value also identifies the size of the storage associated with this tag's ordering array.

Flags
A bit-mask that determines which unique settings are active for this opcode.

Description

Create an ordered list question in the current form. One thing to note is that valid values for the options in ordered lists should never be a 0. The value of 0 is used to determine if a particular "slot" in the array is empty. Therefore, if in the previous example 3 was followed by a 4 and then followed by a 0, the valid options to be displayed would be 3 and 4 only.

An image may be associated with the option using a nested *EFI_IFR_IMAGE*. An animation may be associated with the question using a nested *EFI_IFR_ANIMATION*.

Related Definitions

```
#define EFI_IFR_UNIQUE_SET 0x01
#define EFI_IFR_NO_EMPTY_SET 0x02
```

These flags determine whether all entries in the list must be unique (*EFI_IFR_UNIQUE_SET*) and whether there can be any empty items in the ordered list (*EFI_IFR_NO_EMPTY_SET*).

33.3.8.3.54 EFI_IFR_PASSWORD

Summary

Creates a password question

Prototype

```
#define EFI_IFR_PASSWORD_OP 0x08
typedef struct _EFI_IFR_PASSWORD {
  EFI_IFR_OP_HEADER               Header;
  EFI_IFR_QUESTION_HEADER         Question;
  UINT16                          MinSize;
  UINT16                          MaxSize;
}   EFI_IFR_PASSWORD;
```

Members

Header
The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_PASSWORD_OP.*

Question
The standard question header. xxxx See *EFI_IFR_QUESTION_HEADER* for more information.

MinSize
The minimum number of characters that can be accepted for this opcode.

MaxSize
The maximum number of characters that can be accepted for this opcode.

Description

Creates a password question in the current form.

An image may be associated with the option using a nested *EFI_IFR_IMAGE*. An animation may be associated with the question using a nested *EFI_IFR_ANIMATION.*The password question has two modes of operation. The first is when the Header.Flags has the *EFI_IFR_FLAG_CALLBACK* bit not set. If the bit isn't set, the browser will handle all password operations itself, including string comparisons as needed. If the password question has the *EFI_IFR_FLAG_CALLBACK* bit set, then there will be a formal handshake initiated between the browser and the registered driver that would accept the callback. See the flowchart represented in the Figures, below, for details.

(This flowchart is provided in two parts because of page formatting but should be viewed as a single continuous chart.)

33.3.8.3.55 EFI_IFR_QUESTION_REF1

Summary

Push a question's value on the expression stack.

Prototype

```
#define EFI_IFR_QUESTION_REF1_OP 0x40
typedef struct _EFI_IFR_QUESTION_REF1 {
  EFI_IFR_OP_HEADER               Header;
  EFI_QUESTION_ID                 QuestionId;
}   EFI_IFR_QUESTION_REF1;
```

Members

Header
The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_QUESTION_REF1_OP.*

QuestionId
The question's identifier, which must be unique within the form set.

Description

Push the value of the question specified by *QuestionId* on to the expression stack. If the question's value cannot be determined or the question does not exist, then push Undefined.

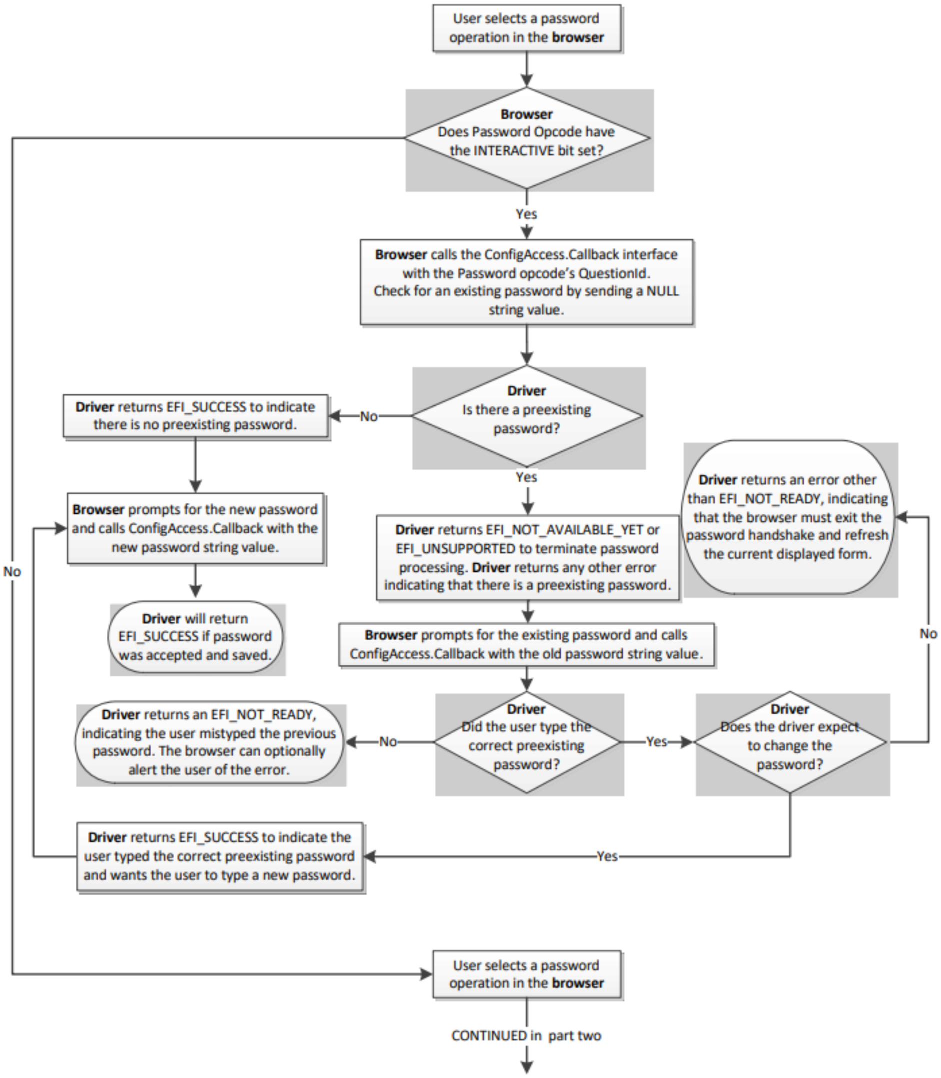

Fig. 33.48: Password Flowchart (part one)

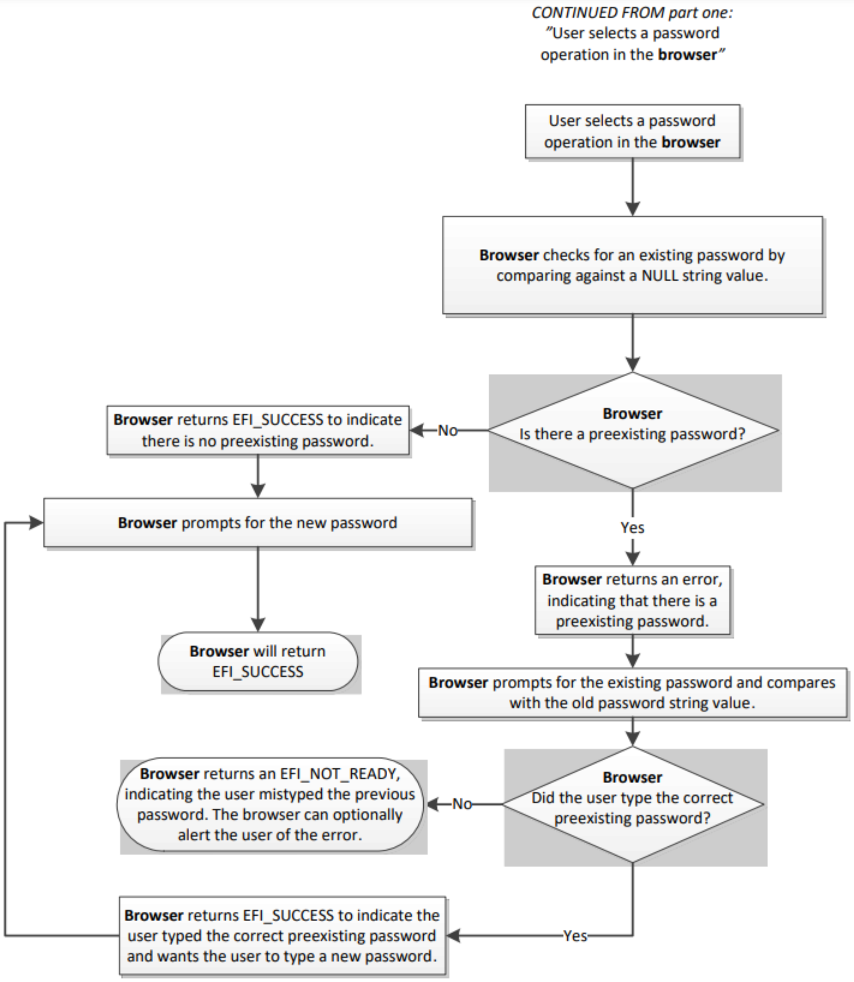

Fig. 33.49: Password Flowchart (part two)

33.3.8.3.56 EFI_IFR_QUESTION_REF2

Summary

Pop an integer from the expression stack, convert it to a question id, and push the question value associated with that question id onto the expression stack.

Prototype

```
#define EFI_IFR_QUESTION_REF2_OP 0x41
typedef struct _EFI_IFR_QUESTION_REF2 {
  EFI_IFR_OP_HEADER                Header;
}   EFI_IFR_QUESTION_REF2;
```

Members

Header

The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_QUESTION_REF2_OP.*

Description

This opcode performs the following actions:

1. Pop an integer from the expression stack
2. Convert it to a question id
3. Push the question value associated with that question id onto the expression stack.

If the popped expression cannot be evaluated as an unsigned integer or the value of the unsigned integer is greater than 0xFFFF, then push Undefined onto the expression stack in step 3. If the value of the question specified by the unsigned integer, after converted to a question id, cannot be determined or the question does not exist, also push Undefined onto the expression stack in step 3.

33.3.8.3.57 EFI_IFR_QUESTION_REF3

Summary

Pop an integer from the expression stack, convert it to a question id, and push the question value associated with that question id onto the expression stack.

Prototype

```
#define EFI_IFR_QUESTION_REF3_OP 0x51
typedef struct _EFI_IFR_QUESTION_REF3 {
  EFI_IFR_OP_HEADER                  Header;
}   EFI_IFR_QUESTION_REF3;

typedef struct _EFI_IFR_QUESTION_REF3_2 {
  EFI_IFR_OP_HEADER                  Header;
  EFI_STRING_ID                      DevicePath;
}   EFI_IFR_QUESTION_REF3_2;

typedef struct _EFI_IFR_QUESTION_REF3_3 {
  EFI_IFR_OP_HEADER                  Header;
  EFI_STRING_ID                      DevicePath;
```

(continues on next page)

(continued from previous page)

```
  EFI_GUID                              Guid;
}   EFI_IFR_QUESTION_REF3_3;
```

Members

Header

The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_QUESTION_REF3_OP.*

DevicePath

Specifies the text representation of the device path containing the form set where the question is defined. If this is not present or the value is 0 then the device path installed on the *EFI_HANDLE* which was registered with the form set containing the current question is used.

Guid

Specifies the GUID of the form set where the question is defined. If the value is Nil or this field is not present, then the current form set is used (if *DevicePath* is 0) or the only form set attached to the device path specified by *DevicePath* is used. If the value is Nil and there is more than one form set on the specified device path, then the value Undefined will be pushed.

Description

This opcode performs the following actions:

1. Pop an integer from the expression stack
2. Convert it to a question id
3. Push the question value associated with that question id onto the expression stack.

If the popped expression cannot be evaluated as an unsigned integer or the value of the unsigned integer is greater than 0xFFFF, then push Undefined onto the expression stack in step 3. If the value of the question specified by the unsigned integer, after converted to a question id, cannot be determined or the question does not exist, also push Undefined onto the expression stack in step 3.

This version allows question values from other forms to be referenced in expressions.

33.3.8.3.58 EFI_IFR_READ

Summary

Provides a value for the current question or default.

Prototype

```
#define EFI_IFR_READ_OP 0x2D
typedef struct _EFI_IFR_READ {
  EFI_IFR_OP_HEADER                Header;
}   EFI_IFR_READ;
```

Parameters

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_READ_OP*

Description

After reading the value for the current question (if any storage was specified) and setting the *this* constant (see *EFI_IFR_THIS*), this expression will be evaluated (if present) to return the value. If the *FormId* and *QuestionId* are either both not present, or are both set to zero, then the link does nothing.

33.3.8.3.59 EFI_IFR_REF

Summary

Creates a cross-reference statement.

Prototype

```
#define EFI_IFR_REF_OP 0x0F
typedef struct _EFI_IFR_REF {
  EFI_IFR_OP_HEADER           Header;
  EFI_IFR_QUESTION_HEADER     Question;
  EFI_FORM_ID                 FormId;
}   EFI_IFR_REF;

typedef struct _EFI_IFR_REF2 {
  EFI_IFR_OP_HEADER           Header;
  EFI_IFR_QUESTION_HEADER     Question;
  EFI_FORM_ID                 FormId;
  EFI_QUESTION_ID             QuestionId;
}   EFI_IFR_REF2;

typedef struct _EFI_IFR_REF3 {
  EFI_IFR_OP_HEADER           Header;
  EFI_IFR_QUESTION_HEADER     Question;
  EFI_FORM_ID                 FormId;
  EFI_QUESTION_ID             QuestionId;
  EFI_GUID FormSetId;
}   EFI_IFR_REF3;

typedef struct _EFI_IFR_REF4 {
  EFI_IFR_OP_HEADER           Header;
  EFI_IFR_QUESTION_HEADER     Question;
  EFI_FORM_ID                 FormId;
  EFI_QUESTION_ID             QuestionId;
  EFI_GUID                    FormSetId;
  EFI_STRING_ID               DevicePath;
}   EFI_IFR_REF4;

typedef struct _EFI_IFR_REF5 {
  EFI_IFR_OP_HEADER           Header;
  EFI_IFR_QUESTION_HEADER     Question;
}   EFI_IFR_REF5;
```

Members

Header

The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_REF_OP.*

Question
Standard question header. xxxx See *EFI_IFR_QUESTION_HEADER*

FormId
The form to which this link is referring. If this is zero, then the link is on the current form. If this is missing, then the link is determined by the nested *EFI_IFR_VALUE*.

QuestionId
The question on the form to which this link is referring. If this field is not present (determined by the length of the opcode) or the value is zero, then the link refers to the top of the form.

FormSetId
The form set to which this link is referring. If it is all zeroes or not present, and *DevicePath* is not present, then the link is to the current form set. If it is all zeroes (or not present) and the *DevicePath* is present, then the link is to the first form set associated with the *DevicePath*.

DevicePath
The string identifier that specifies the string containing the text representation of the device path to which the form set containing the form specified by *FormId* . If this field is not present (determined by the opcode's length) or the value is zero, then the link refers to the current page. The format of the device path string that this field references is compatible with the Text format that is specified in the Text Device Node Reference (*Text Device Node Reference*)

Description

Creates a user-selectable link to a form or a question on a form. There are several forms of this opcode which are distinguished by the length of the opcode.

33.3.8.3.60 EFI_IFR_REFRESH

Summary

Mark a question for periodic refresh.

Prototype

```
#define EFI_IFR_REFRESH_OP 0x1d
typedef struct _EFI_IFR_REFRESH {
  EFI_IFR_OP_HEADER           Header;
  UINT8                       RefreshInterval;
}   EFI_IFR_REFRESH;
```

Members

Header
The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_REFRESH_OP*.

RefreshInterval
Minimum number of seconds before the question value should be refreshed. A value of zero indicates the question should not be refreshed automatically.

Description

When placed within the scope of a question, it will force the question's value to be refreshed at least every *RefreshInterval* seconds. The value may be refreshed less often, depending on browser policy or capabilities.

33.3.8.3.61 EFI_IFR_REFRESH_ID

Summary

Mark an Question for an asynchronous refresh.

Prototype

```
#define EFI_IFR_REFRESH_ID_OP 0x62
typedef struct _EFI_IFR_REFRESH_ID {
  EFI_IFR_OP_HEADER              Header;
  EFI_GUID                       RefreshEventGroupId;
}   EFI_IFR_REFRESH_ID;
```

Members

Header
The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_REFRESH_ID_OP.*

RefreshEventGroupId
The GUID associated with the event group which will be used to initiate a re-evaluation of an element in a set of forms.

Description

This tag op-code must be placed within the scope of a question or a form. If within the scope of a question and the event is signaled which belongs to the *RefreshEventGroupId,* the question will be refreshed. More than one question may share the same Event Group.

If the tag op-code is placed within the scope of an *EFI_IFR_FORM* op-code and the event is signaled which belongs to the *RefreshEventGroupId,* the entire form's contents will be refreshed.

- If the contents within a form had an *EFI_IFR_REFRESH_ID* tag op-code placed within the scope of the form, and an event is signalled, all questions associated with the *RefreshEventGroupId* are marked for refresh. The Forms Browser will update the question value from storage, reparse the forms from the HII database and, at some time later, reflect that change if the question is displayed.

When interpreting this op-code, a browser must do the following actions:

- The browser will create an event group via CreateEventEx() based on the specified *RefreshEventGroupId* when the form set which contains the op-code is opened by the browser.
- When an event is signaled, all questions associated with the *RefreshEventGroupId* are marked for refresh. The Forms Browser will update the question value from storage and, at some time later, update the question's display.
- The browser will close the event group which was previously created when the form set which contains the op-code is closed by the browser.

33.3.8.3.62 EFI_IFR_RESET_BUTTON

Summary

Create a reset or submit button on the current form.

Prototype

```
#define EFI_IFR_RESET_BUTTON_OP 0x0d
typedef struct _EFI_IFR_RESET_BUTTON {
  EFI_IFR_OP_HEADER                 Header;
  EFI_IFR_STATEMENT_HEADER          Statement;
  EFI_DEFAULT_ID                    DefaultId;
}   EFI_IFR_RESET_BUTTON;

typedef UINT16 EFI_DEFAULT_ID;
```

Members

Header
The standard header, where *Header.OpCode = EFI_IFR_RESET_BUTTON_OP.*

Statement
Standard statement header, including the prompt and help text.

DefaultId
Specifies the set of default store to use when restoring the defaults to the questions on this form. xxxx See *EFI_IFR_DEFAULTSTORE* for more information.

Description

This opcode creates a user-selectable button that resets the question values for all questions on the current form to the default values specified by *DefaultId.* If *EFI_IFR_FLAGS_CALLBACK* is set in the question header, then the callback associated with the form set will be called. An image may be associated with the statement using a nested *EFI_IFR_IMAGE.* An animation may be associated with the statement using a nested *EFI_IFR_ANIMATION.*

33.3.8.3.63 EFI_IFR_RULE

Summary

Create a rule for use in a form and associate it with an identifier.

Prototype

```
#define EFI_IFR_RULE_OP 0x18
typedef struct _EFI_IFR_RULE {
  EFI_IFR_OP_HEADER           Header;
  UINT8                       RuleId;
}   EFI_IFR_RULE;
```

Members

Header
The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_RULE_OP.*

RuleId
Unique identifier for the rule. There can only one rule within a form with the specified *RuleId.* If another already exists, then the form is marked as invalid.

Description

Create a rule, which associates an expression with an identifier and attaches it to the currently opened form. These rules allow common sub-expressions to be re-used within a form.

33.3.8.3.64 EFI_IFR_RULE_REF

Summary

Evaluate a form rule and push its result on the expression stack.

Prototype

```
#define EFI_IFR_RULE_REF_OP 0x3f
typedef struct _EFI_IFR_RULE_REF {
  EFI_IFR_OP_HEADER              Header;
  UINT8                          RuleId;
}   EFI_IFR_RULE_REF;
```

Members

Header

The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_RULE_REF_OP.*

RuleId

The rule's identifier, which must be unique within the form.

Description

Look up the rule specified by *RuleId* and push the evaluated result on the expression stack. If the specified rule does not exist, then push Undefined.

33.3.8.3.65 EFI_IFR_SECURITY

Summary

Push **TRUE** if the current user profile contains the specified setup access permissions.

Prototype

```
#define EFI_IFR_SECURITY_OP       0x60
typedef struct _EFI_IFR_SECURITY {
  EFI_IFR_OP_HEADER              Header;
  EFI_GUID                       Permissions;
}   EFI_IFR_SECURITY;
```

Members

Header

Standard opcode header, where *Header.Op = EFI_IFR_SECURITY_OP.*

Permissions

Security permission level.

Description

This opcode pushes whether or not the current user profile contains the specified setup access permissions. This opcode can be used in expressions to disable, suppress or gray-out forms, statements and questions. It can also be used in checking question values to disallow or allow certain values.

This opcode performs the following actions:

1. If the current user profile contains thespecified setup access permissions, then push *TRUE.*Otherwise, push **FALSE.**

33.3.8.3.66 EFI_IFR_SET

Summary

Change a stored value.

Prototype

```
#define EFI_IFR_SET_OP 0x2C
typedef struct _EFI_IFR_SET {
  EFI_IFR_OP_HEADER           Header;
  EFI_VARSTORE_ID             VarStoreId;
  union {
  EFI_STRING_ID               VarName;
  UINT16                      VarOffset;
  }                           VarStoreInfo;
  UINT8                       VarStoreType;
} EFI_IFR_SET;
```

Parameters

Header
The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_SET_OP.*

VarStoreId
Specifies the identifier of a previously declared variable store to use when storing the question's value.

VarStoreInfo
Depending on the type of variable store selected, this contains either a 16-bit Buffer Storage offset (*VarOffset*) or a Name/Value or EFI Variable name (*VarName*).

VarStoreType
Specifies the type used for storage. The storage types *EFI_IFR_TYPE_x* are defined in *EFI_IFR_ONE_OF_OPTION.*

Description

This operator pops an expression from the expression stack. The expression popped is the value.

The value is stored into the variable store identified by *VarStoreId* and *VarStoreInfo.*

If the value could be stored successfully, then **TRUE** is pushed on to the expression stack. Otherwise, **FALSE** is pushed on the expression stack.

33.3.8.3.67 EFI_IFR_SHIFT_LEFT

Summary

Pop two unsigned integers, shift one left by the number of bits specified by the other and push the result.

Prototype

```
#define EFI_IFR_SHIFT_LEFT_OP 0x38
typedef struct _EFI_IFR_SHIFT_LEFT {
  EFI_IFR_OP_HEADER                 Header;
}   EFI_IFR_SHIFT_LEFT;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_SHIFT_LEFT* _OP.

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. The first value popped is the right-hand value and the second value popped is the left-hand value.
2. If the two values do not evaluate to unsigned integers, push Undefined.
3. Shift the left-hand value left by the number of bits specified by the right-hand value and push the result.

33.3.8.3.68 EFI_IFR_SHIFT_RIGHT

Summary

Pop two unsigned integers, shift one right by the number of bits specified by the other and push the result.

Prototype

```
#define EFI_IFR_SHIFT_RIGHT_OP 0x39
typedef struct _EFI_IFR_SHIFT_RIGHT {
  EFI_IFR_OP_HEADER                    Header;
}   EFI_IFR_SHIFT_RIGHT;
```

Members

Header

Standard opcode header, where *OpCode* is *EFI_IFR_SHIFT_RIGHT* _OP.

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. The first value popped is the right-hand value and the second value popped is the left-hand value.
2. If the two values do not evaluate to unsigned integers, push Undefined.
3. Shift the left-hand value right by the number of bits specified by the right-hand value and push the result.

33.3.8.3.69 EFI_IFR_SPAN

Summary

Pop two strings and an unsigned integer, find the first character from one string that contains characters found in another and push its index.

Prototype

```
#define EFI_IFR_SPAN_OP 0x59
typedef struct _EFI_IFR_SPAN {
  EFI_IFR_OP_HEADER            Header;
  UINT8                        Flags;
}   EFI_IFR_SPAN;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_SPAN_OP*.

Flags

Specifies whether to find the first matching string (*EFI_IFR_FLAGS_FIRST_MATCHING*) or the first non-matching string (*EFI_IFR_FLAGS_FIRST_NON_MATCHING*).

Description

This opcode performs the following actions:

1. Pop three values from the expression stack.The first value popped is the right value and thesecond value popped is the middle value and the lastvalue popped is the left expression.
2. If the left or middle values cannot be evaluated as a string, push Undefined. If the right value cannot be evaluated as an unsigned integer, push Undefined.
3. The left string is the string to scan. The middle string consists of character pairs representing the low-end of a range and the high-end of a range of characters. The right unsigned integer represents the starting location for the scan.
4. The operation will push the zero-based index of the first character after the right value which falls within any one of the ranges (*EFI_IFR_FLAGS_FIRST_MATCHING*) or falls within none of the ranges (*EFI_IFR_FLAGS_FIRST_NON_MATCHING*).

Related Definitions

```
#define EFI_IFR_FLAGS_FIRST_MATCHING      0x00

#define EFI_IFR_FLAGS_FIRST_NON_MATCHING  0x01
```

33.3.8.3.70 EFI_IFR_STRING

Summary

Defines the string question.

Prototype

```
#define EFI_IFR_STRING_OP 0x1C
typedef struct _EFI_IFR_STRING {
  EFI_IFR_OP_HEADER              Header;
  EFI_IFR_QUESTION_HEADER        Question;
  UINT8                          MinSize;
  UINT8                          MaxSize;
  UINT8                          Flags;
}   EFI_IFR_STRING;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_STRING_OP*.

Question

The standard question header. xxxx See *EFI_IFR_QUESTION_HEADER* for more information.

MinSize
The minimum number of characters that can be accepted for this opcode.

MaxSize
The maximum number of characters that can be accepted for this opcode.

Flags
Flags which control the string editing behavior. See “Related Definitions” below.

Description

This creates a string question. The minimum length is *MinSize* and the maximum length is *MaxSize* characters.

An image may be associated with the question using a nested *EFI_IFR_IMAGE*. An animation may be associated with the question using a nested *EFI_IFR_ANIMATION*.

There are two ways to specify defaults for this question: one or more nested *EFI_IFR_ONE_OF_OPTION* (lowest priority) or nested *EFI_IFR_DEFAULT* (highest priority).

If *EFI_IFR_STRING_MULTI_LINE* is set, it is a hint to the Forms Browser that multi-line text can be allowed. If it is clear, then multi-line editing should not be allowed.

Related Definitions

```
#define EFI_IFR_STRING_MULTI_LINE 0x01
```

33.3.8.3.71 EFI_IFR_STRING_REF1

Summary

Push a string on the expression stack.

Prototype

```
#define EFI_IFR_STRING_REF1_OP 0x4e
typedef struct _EFI_IFR_STRING_REF1 {
  EFI_IFR_OP_HEADER                Header;
  EFI_STRING_ID                    StringId;
}   EFI_IFR_STRING_REF1;
```

Members

Header
The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_STRING_REF1_OP.*

StringId
The string’s identifier, which must be unique within the package list.

Description

Push the string specified by *StringId* on to the expression stack. If the string does not exist, then push an empty string.

33.3.8.3.72 EFI_IFR_STRING_REF2

Summary

Pop a string identifier, push the associated string.

Prototype

```
#define EFI_IFR_STRING_REF2_OP 0x4f
typedef struct _EFI_IFR_STRING_REF2 {
  EFI_IFR_OP_HEADER                 Header;
}   EFI_IFR_STRING_REF2;
```

Members

Header
The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_STRING_REF2_OP.*

Description

This opcode performs the following actions:

1. Pop a value from the expression stack.
2. If the value cannot be evaluated as an unsigned integer or the value of the unsigned integer is greater than 0xFFFF, push Undefined.
3. If the string specified by the value (converted to a string identifier) cannot be determined or the string does not exist, push an empty string.
4. Otherwise, push the string on to the expression stack.

33.3.8.3.73 EFI_IFR_SUBTITLE

Summary

Creates a sub-title in the current form.

Prototype

```
#define EFI_IFR_SUBTITLE_OP 0x02
typedef struct _EFI_IFR_SUBTITLE {
  EFI_IFR_OP_HEADER              Header;
  EFI_IFR_STATEMENT_HEADER       Statement;
  UINT8                          Flags;
}   EFI_IFR_SUBTITLE;
```

Members

Header
The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_SUBTITLE_OP.*

Flags
Identifies specific behavior for the sub-title.

Description

Subtitle strings are intended to be used by authors to separate sections of questions into semantic groups. If *Header.Scope* is set, then the Forms Browser may further distinguish the end of the semantic group as including only those statements and questions which are nested.

If *EFI_IFR_FLAGS_HORIZONTAL* is set, then this provides a hint that the nested statements or questions should be horizontally arranged. Otherwise, they are assumed to be vertically arranged.

An image may be associated with the statement using a nested *EFI_IFR_IMAGE*. An animation may be associated with the statement using a nested *EFI_IFR_ANIMATION*.

Related Definitions

```
#define EFI_IFR_FLAGS_HORIZONTAL 0x01
```

33.3.8.3.74 EFI_IFR_SUBTRACT

Summary

Pop two unsigned integers, subtract one from the other, push the result.

Prototype

```
#define EFI_IFR_SUBTRACT_OP 0x3b
typedef struct _EFI_IFR_SUBTRACT {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_SUBTRACT;
```

Members

Header

Standard opcode header, where *Header.OpCode* is *EFI_IFR_SUBTRACT* _OP.

Description

This opcode performs the following operations:

1. Pop two values from the expression stack. Thefirst value popped is the right-hand value and thesecond value popped is the left-hand value.
2. If the two values do not evaluate to unsigned integers, push Undefined.
3. Zero-extend the values to 64-bits.
4. Subtract the right-hand value from the left-hand value.
5. Push the lower 64-bits of the result.

33.3.8.3.75 EFI_IFR_SUPPRESS_IF

Summary

Creates a group of statements or questions which are conditionally invisible.

Prototype

```
#define EFI_IFR_SUPPRESS_IF_OP 0x0a
typedef struct _EFI_IFR_SUPPRESS_IF {
  EFI_IFR_OP_HEADER                 Header;
}   EFI_IFR_SUPPRESS_IF;
```

Members

Header

The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_SUPPRESS_IF_OP*.

Description

The suppress tag causes the nested objects to be hidden from the user if the expression appearing as the first nested object evaluates to **TRUE**. If the expression consists of more than a single opcode, then the first opcode in the expression must have the Scope bit set and the expression must end with *EFI_IFR_END*.

This display form is maintained until the scope for this opcode is closed.

33.3.8.3.76 EFI_IFR_TEXT

Summary

Creates a static text and image.

Prototype

```
#define EFI_IFR_TEXT_OP 0x03
typedef struct _EFI_IFR_TEXT {
  EFI_IFR_OP_HEADER               Header;
  EFI_IFR_STATEMENT_HEADER        Statement;
  EFI_STRING_ID                   TextTwo;
}   EFI_IFR_TEXT;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_TEXT_OP*.

Statement

Standard statement header.

TextTwo

The string token reference to the secondary string for this opcode.

Description

This is a static text/image statement.

An image may be associated with the statement using a nested *EFI_IFR_IMAGE*. An animation may be associated with the question using a nested *EFI_IFR_ANIMATION*.

33.3.8.3.77 EFI_IFR_THIS

Summary

Push current question’s value.

Prototype

```
#define EFI_IFR_THIS_OP 0x58
typedef struct _EFI_IFR_THIS {
  EFI_IFR_OP_HEADER           Header;
}   EFI_IFR_THIS;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_THIS_OP.*

Description

Push the current question's value.

33.3.8.3.78 EFI_IFR_TIME

Summary

Create a Time question.

Prototype

```
#define EFI_IFR_TIME_OP 0x1b
typedef struct _EFI_IFR_TIME {
  EFI_IFR_OP_HEADER              Header;
  EFI_IFR_QUESTION_HEADER        Question;
  UINT8                          Flags;
}   EFI_IFR_TIME;
```

Members

Header

Basic question information. *Header.Opcode = EFI_IFR_TIME_OP.*

Question

The standard question header. xxxx See *EFI_IFR_QUESTION_HEADER* for more information.

Flags

A bit-mask that determines which unique settings are active for this opcode.

QF_TIME_HOUR_SUPPRESS 0x01
QF_TIME_MINUTE_SUPPRESS 0x02
QF_TIME_SECOND_SUPPRESS 0x04
QF_TIME_STORAGE 0x30

For *QF_TIME_STORAGE,* there are currently three valid values:

QF_TIME_STORAGE_NORMAL 0x00
QF_TIME_STORAGE_TIME 0x10
QF_TIME_STORAGE_WAKEUP 0x20

Description

Create a Time question xxxx (*Time*) and add it to the current form.

An image may be associated with the question using a nested *EFI_IFR_IMAGE*. An animation may be associated with the question using a nested *EFI_IFR_ANIMATION*.

33.3.8.3.79 EFI_IFR_TOKEN

Summary

Pop two strings and an unsigned integer, then push the nth section of the first string using delimiters from the second string.

Prototype

```
#define EFI_IFR_TOKEN_OP 0x4d
typedef struct _EFI_IFR_TOKEN {
  EFI_IFR_OP_HEADER                 Header;
}   EFI_IFR_TOKEN;
```

Members

Header
Standard opcode header, where *OpCode* is *EFI_IFR_TOKEN_OP*.

Description

This opcode performs the following actions:

1. Pop three values from the expression stack. The first value popped is the right value and the second value popped is the middle value and the last value popped is the left value.
2. If the left or middle values cannot be evaluated as a string, push Undefined. If the right value cannot be evaluated as an unsigned integer, push Undefined.
3. The first value is the string. The second value is a string, where each character is a valid delimiter. The third value is the zero-based index.
4. Push the nth delimited sub-string on to the expression stack (0 = left of the first delimiter). The end of the string always acts a the final delimiter.
5. The no such string exists, an empty string is pushed.

33.3.8.3.80 EFI_IFR_TO_BOOLEAN

Summary

Pop a value, convert to Boolean and push the result.

Prototype

```
#define EFI_IFR_TO_BOOLEAN_OP 0x4A
typedef struct _EFI_IFR_TO_BOOLEAN{
  EFI_IFR_OP_HEADER                 Header;
}   EFI_IFR_TO_BOOLEAN;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_TO_BOOLEAN_OP*

Description

This opcode performs the following actions:

1. Pop a value from the expression stack. If thevalue is Undefined or cannot be evaluated as aBoolean, push Undefined. Otherwise push the Boolean onthe expression stack.
2. When converting from an unsigned integer, zero will be converted to **FALSE** and any other value will be converted to **TRUE.**
3. When converting from a string, if case-insensitive compare with "true" is *True,* then push **TRUE.** If a case-insensitive compare with "false" is **TRUE,** then push **False.** Otherwise, push Undefined.
4. When converting from a buffer, if the buffer is all zeroes, then push **FALSE.* Otherwise push **TRUE.**

33.3.8.3.81 EFI_IFR_TO_LOWER

Summary

Convert a string on the expression stack to lower case.

Prototype

```
#define EFI_IFR_TO_LOWER_OP 0x20
typedef struct _EFI_IFR_TO_LOWER {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_TO_LOWER;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_TO_LOWER_OP*

Description

Pop an expression from the expression stack. If the expression is Undefined or cannot be evaluated as a string, push Undefined. Otherwise, convert the string to all lower case using the *StrLwr* function of the *EFI_UNICODE_COLLATION2_PROTOCOL* and push the string on the expression stack.

33.3.8.3.82 EFI_IFR_TO_STRING

Summary

Pop a value, convert to a string, push the result.

Prototype

```
#define EFI_IFR_TO_STRING_OP 0x49
typedef struct _EFI_IFR_TO_STRING{
  EFI_IFR_OP_HEADER                    Header;
  UINT8                                Format;
}   EFI_IFR_TO_STRING;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_TO_STRING_OP*

Format

When converting from unsigned integers, these flags control the format:

0 = unsigned decimal
1 = signed decimal
2 = hexadecimal (lower-case alpha)
3 = hexadecimal (upper-case alpha)

When converting from a buffer, these flags control the format:

0 = ASCII
8 = UCS-2

Description

This opcode performs the following actions:

1. Pop a value from the expression stack.**

#. If the value is Undefined or cannot be evaluated as a string, push Undefined.

1. Convert the value to a string. When converting from an unsigned integer, the number will be converted to a unsigned decimal string (Format = 0), signed decimal string (Format = 1) or a hexadecimal string (Format = 2 or 3).

When converting from a boolean, the boolean will be converted to “True” (True) or “False” (False). When converting from a buffer, each 8-bit (Format = 0) or 16-bit (Format = 8) value will be converted into a character and appended to the string, up until the end of the buffer or a NULL character. 4. Push the result.

33.3.8.3.83 EFI_IFR_TO_UINT

Summary

Pop a value, convert to an unsigned integer, push the result.

Prototype

```
#define EFI_IFR_TO_UINT_OP 0x48
typedef struct _EFI_IFR_TO_UINT {
  EFI_IFR_OP_HEADER                 Header;
}   EFI_IFR_TO_UINT;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_TO_UINT_OP*

Description

1. Pop a value from the expression stack.
2. If the value is Undefined or cannot be evaluated as an unsigned integer, push Undefined.
3. Convert the value to an unsigned integer. When converting from a boolean, if **TRUE**, push 1 and if **FALSE**, push 0. When converting from a string, whitespace is skipped. The prefix '0x' or '0X' indicates to convert from a hexadecimal string while the prefix '-' indicates conversion from a signed integer string. When converting from a buffer, if the buffer is greater than 8 bytes in length, push Undefined. Otherwise, zero-extend the contents of the buffer to 64-bits.
4. Push the result.

33.3.8.3.84 EFI_IFR_TO_UPPER

Summary

Convert a string on the expression stack to upper case.

Prototype

```
#define EFI_IFR_TO_UPPER_OP 0x21
typedef struct _EFI_IFR_TO_UPPER {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_TO_UPPER;
```

Members

Header
The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_TO_UPPER_OP*

Description

Pop an expression from the expression stack. If the expression is Undefined or cannot be evaluated as a string, push Undefined. Otherwise, convert the string to all upper case using the *StrUpr* function of the *EFI_UNICODE_COLLATION2_PROTOCOL* and push the string on the expression stack.

33.3.8.3.85 EFI_IFR_TRUE

Summary

Push a TRUE on to the expression stack.

Prototype

```
#define EFI_IFR_TRUE_OP 0x46
typedef struct _EFI_IFR_TRUE {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_TRUE;
```

Members

Header
The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_TRUE_OP*

Description

Push a **TRUE** on to the expression stack.

33.3.8.3.86 EFI_IFR_UINT8, EFI_IFR_UINT16,EFI_IFR_UINT32, EFI_IFR_UINT64

Summary

Push an unsigned integer on to the expression stack.

Prototype

```
#define EFI_IFR_UINT8_OP 0x42
typedef struct _EFI_IFR_UINT8 {
  EFI_IFR_OP_HEADER           Header;
  UINT8                       Value;
}   EFI_IFR_UINT8;

#define EFI_IFR_UINT16_OP 0x43
typedef struct _EFI_IFR_UINT16 {
  EFI_IFR_OP_HEADER           Header;
  UINT16                      Value;
}   EFI_IFR_UINT16;

#define EFI_IFR_UINT32_OP 0x44
typedef struct _EFI_IFR_UINT32 {
  EFI_IFR_OP_HEADER           Header;
  UINT32                      Value;
}   EFI_IFR_UINT32;

#define EFI_IFR_UINT64_OP 0x45
typedef struct _EFI_IFR_UINT64 {
  EFI_IFR_OP_HEADER           Header;
  UINT64                      Value;
}   EFI_IFR_UINT64;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_UINT8_OP, EFI_IFR_UINT16_OP, EFI_IFR_UINT32_OP* or *EFI_IFR_UINT64_OP.*

Value

The unsigned integer.

Description

Push the specified unsigned integer, zero-extended to 64-bits, on to the expression stack.

33.3.8.3.87 EFI_IFR_UNDEFINED

Summary

Push an Undefined to the expression stack.

Prototype

```
#define EFI_IFR_UNDEFINED_OP 0x55
typedef struct _EFI_IFR_UNDEFINED {
 EFI_IFR_OP_HEADER                Header;
}   EFI_IFR_UNDEFINED;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_UNDEFINED_OP*

Description

Push Undefined on to the expression stack.

33.3.8.3.88 EFI_IFR_VALUE

Summary

Provides a value for the current question or default.

Prototype

```
#define EFI_IFR_VALUE_OP 0x5a
typedef struct _EFI_IFR_VALUE {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_VALUE;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_VALUE_OP*

Description

Creates a value for the current question or default with no storage. The value is the result of the expression nested in the scope.

If used for a question, then the question will be read-only.

33.3.8.3.89 EFI_IFR_VARSTORE

Summary

Creates a variable storage short-cut for linear buffer storage.

Prototype

```
#define EFI_IFR_VARSTORE_OP 0x24
typedef struct {
  EFI_IFR_OP_HEADER        Header;
  EFI_GUID                 Guid;
  EFI_VARSTORE_ID          VarStoreId;
  UINT16                   Size;
  //UINT8                  Name[];
}   EFI_IFR_VARSTORE;
```

Members

Header
The byte sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode* = *EFI_IFR_VARSTORE_OP*.

Guid
The variable's GUID definition. This field comprises one half of the variable name, with the other half being the human-readable aspect of the name, which is represented by the string immediately following the Size field. Type *EFI_GUID* is defined in *InstallProtocolInterface()* in this specification.

VarStoreId
The variable store identifier, which is unique within the current form set. This field is the value that uniquely identify this instance from others. Question headers refer to this value to designate which is the active variable that is being used. A value of zero is invalid.

Size
The size of the variable store.

Name
A null-terminated ASCII string that specifies the name associated with the variable store. The field is not actually included in the structure but is included here to help illustrate the encoding of the opcode. The size of the string, including the null termination, is included in the opcode's header size.

Description

This opcode describes a Buffer Storage Variable Store within a form set. A question can select this variable store by setting the *VarStoreId* field in its opcode header.

An *EFI_IFR_VARSTORE* with a specified *VarStoreId* must appear in the IFR before it can be referenced by a question.

33.3.8.3.90 EFI_IFR_VARSTORE_NAME_VALUE

Summary

Creates a variable storage short-cut for name/value storage.

Prototype

```
#define EFI_IFR_VARSTORE_NAME_VALUE_OP 0x25
typedef struct _EFI_IFR_VARSTORE_NAME_VALUE {
```

(continues on next page)

(continued from previous page)

```
  EFI_IFR_OP_HEADER               Header;
  EFI_VARSTORE_ID                 VarStoreId;
  EFI_GUID                        Guid;
}   EFI_IFR_VARSTORE_NAME_VALUE;
```

Members

Header

The byte sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_VARSTORE_NAME_VALUE_OP*.

Guid

The variable's GUID definition. This field comprises one half of the variable name, with the other half being the human-readable aspect of the name, which is specified in the *VariableName* field in the question's header (see *EFI_IFR_QUESTION_HEADER*). Type *EFI_GUID* is defined in *InstallProtocolInterface()* in the UEFI Specification.

VarStoreId

The variable store identifier, which is unique within the current form set. This field is the value that uniquely identifies this variable store definition instance from others. Question headers refer to this value to designate which is the active variable that is being used. A value of zero is invalid.

Description

This opcode describes a Name/Value Variable Store within a form set. A question can select this variable store by setting the *VarStoreId* field in its question header.

An *EFI_IFR_VARSTORE_NAME_VALUE* with a specified *VarStoreId* must appear in the IFR before it can be referenced by a question.

33.3.8.3.91 EFI_IFR_VARSTORE_EFI

Summary

Creates a variable storage short-cut for EFI variable storage.

Prototype

```
#define EFI_IFR_VARSTORE_EFI_OP 0x26
typedef struct _EFI_IFR_VARSTORE_EFI {
  EFI_IFR_OP_HEADER               Header;
  EFI_VARSTORE_ID                 VarStoreId;
  EFI_GUID                        Guid;
  UINT32                          Attributes
  UINT16                          Size;
  //UINT8                         Name[];
}   EFI_IFR_VARSTORE_EFI;
```

Members

Header

The byte sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_VARSTORE_EFI_OP*.

VarStoreId

The variable store identifier, which is unique within the current form set. This field is the value that uniquely identifies this variable store definition instance from others. Question headers refer to this value to designate which is the active variable that is being used. A value of zero is invalid.

Guid

The EFI variable's GUID definition. This field comprises one half of the EFI variable name, with the other half being the human-readable aspect of the name, which is specified in the *Name* field below. Type *EFI_GUID* is defined in *InstallProtocolInterface()* in this specification.

Attributes

Specifies the flags to use for the variable.

Size

The size of the variable store.

Name

A null-terminated ASCII string that specifies one half of the EFI name for this variable store. The other half is specified in the *Guid* field (above). The *Name* field is not actually included in the structure but is included here to help illustrate the encoding of the opcode. The size of the string, including the null termination, is included in the opcode's header size.

Description

This opcode describes an EFI Variable Variable Store within a form set. The Guid and Name specified here will be used with *GetVariable()* and *SetVariable()*.

- A question can select this variable store by setting the *VarStoreId* field in its question header.
- A question can refer to a specific offset within the EFI Variable using the *VarOffset* field in its question header.
- *Name* must be converted to a CHAR16 string before it is passed to *GetVariable()* or *SetVariable()*. An *EFI_IFR_VARSTORE_EFI* with a specified *VarStoreId* must appear in the IFR before it can be referenced by a question.

33.3.8.3.92 EFI_IFR_VARSTORE_DEVICE

Summary

Select the device which contains the variable store.

Prototype

```
#define EFI_IFR_VARSTORE_DEVICE_OP 0x27
typedef struct _EFI_IFR_VARSTORE_DEVICE {
  EFI_IFR_OP_HEADER                 Header;
  EFI_STRING_ID                     DevicePath;
}   EFI_IFR_VARSTORE_DEVICE;
```

Members

Header

The byte sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_VARSTORE_DEVICE_OP*.

DevicePath

Specifies the string which contains the device path of the device where the variable store resides.

Description

This opcode describes the device path where a variable store resides. Normally, the Forms Processor finds the variable store on the handle specified when the HII database function *NewPackageList()* was called. However, if this opcode is found in the scope of a question, the handle specified by the text device path *DevicePath* is used instead.

33.3.8.3.93 EFI_IFR_VERSION

Summary

Push the version of the UEFI specification to which the Forms Processor conforms.

Prototype

```
#define EFI_IFR_VERSION_OP 0x28
typedef struct _EFI_IFR_VERSION {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_VERSION;
```

Members

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_VERSION_OP.*

Description

Returns the revision level of the UEFI specification with which the Forms Processor is compliant as a 16-bit unsigned integer, with the form:

[15:8] Major revision
[7:4] Tens digit of the minor revision
[3:0] Ones digit of the minor revision

The fields of the version have the following correlation with the revision of the UEFI system table.

Major revision: EFI_SYSTEM_TABLE_REVISION >> 16
Tens digit of the minor revision: (EFI_SYSTEM_TABLE_REVISION & 0xFFFF)/10
Ones digit of the minor revision: (EFI_SYSTEM_TABLE_REVISION & 0xFFFF)%10

33.3.8.3.94 EFI_IFR_WRITE

Summary

Change a value for the current question.

Prototype

```
#define EFI_IFR_WRITE_OP 0x2E
typedef struct _EFI_IFR_WRITE {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_WRITE;
```

Parameters

Header

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_WRITE_OP*

Description

Before writing the value of the current question to storage (if any storage was specified), the *this* constant is set (see *EFI_IFR_THIS*) and then this expression is evaluated.

33.3.8.3.95 EFI_IFR_ZERO

Summary

Push a zero on to the expression stack.

Prototype

```
#define EFI_IFR_ZERO_OP 0x52
typedef struct _EFI_IFR_ZERO {
  EFI_IFR_OP_HEADER              Header;
}   EFI_IFR_ZERO;
```

Members

Header
The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, *Header.OpCode = EFI_IFR_ZERO_OP*

Description

Push a zero on to the expression stack.

33.3.8.3.96 EFI_IFR_WARNING_IF

Summary

Creates a validation expression and warning message for a question.

Prototype

```
#define EFI_IFR_WARNING_IF_OP 0x063
typedef struct _EFI_IFR_WARNING_IF {
  EFI_IFR_OP_HEADER              Header;
  EFI_STRING_ID                  Warning;
  UINT8                          TimeOut;
}   EFI_IFR_WARNING_IF;
```

Members

Header
The byte sequence that defines the type of opcode as well as the length of the opcode being defined. *Header.OpCode = EFI_IFR_WARNING_IF_OP.*

Warning
The string token reference to the string that will be used for the warning check message.

TimeOut
The number of seconds for the warning message to be displayed before it is timed out or acknowledged by the user. A value of zero indicates that the message is displayed indefinitely until the user acknowledges it.

Description

This tag uses a Boolean expression to allow the IFR creator to check options in a question, and provide a warning message if the expression is **TRUE**. For example, this tag might be used to give a warning if the user attempts to disable a security setting, or change the value of a sensitive question. The tag provides a string to be used in a warning display to alert the user of the consequences of changing the question value. Warning tags will be evaluated when the user traverses from tag to tag. The browser must display the warning text message and not allow the form to be submitted until either the user acknowledges the message (with some key press for instance) or the number of seconds in TimeOut elapses. Unlike inconsistency tags, the user should still be allowed to submit the results of a form even if the warning expression evaluates to **TRUE**.

33.3.8.3.97 EFI_IFR_MATCH2

Summary

Pop a source string and a pattern string, push **TRUE** if the source string matches the Regular Expression pattern specified by the pattern string, otherwise push **FALSE**.

Prototype

```
#define EFI_IFR_MATCH2_OP 0x64
typedef struct _EFI_IFR_MATCH2 {
  EFI_IFR_OP_HEADER           Header;
  EFI_GUID                    SyntaxType;
}   EFI_IFR_MATCH2;
```

Members

Header
Standard opcode header, where *Header.Opcode* is *EFI_IFR_MATCH2_OP.*

SyntaxType
A GUID that identifies the regular expression syntax type to use for the *pattern* string. See *EFI_REGULAR_EXPRESSION_PROTOCOL* for current syntax definitions.

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. Thefirst value popped is the *string* and the secondvalue popped is the *pattern.*
2. If the *string* or the *pattern* cannot be evaluated as a string, then push Undefined.
3. Call *GetInfo* function of each instance of *EFI_REGULAR_EXPRESSION_PROTOCOL,* looking for a *SyntaxType* that is listed in the set of supported regular expression syntax types returned by *RegExSyntaxTypeList.* If the type specified by *SyntaxType* is not supported in any of the *EFI_REGULAR_EXPRESSION_PROTOCOL* instances, or no *EFI_REGULAR_EXPRESSION_PROTOCOL* instance was found, push Undefined.
4. Process the *string* and *pattern* using the *MatchString* function of the *EFI_REGULAR_EXPRESSION_PROTOCOL* instance that supports the *SyntaxType,* where *SyntaxType* is the *SyntaxType* input to *MatchString.*
5. If the returned regular expression *Result* is **TRUE** , then push **TRUE.**
6. If the return regular expression *Result* is **FALSE,** then push **FALSE.**

NOTE: *To ensure interoperability, drivers that publish HII IFR Forms packages should check the system capabilities by calling the* GetInfo *function of each* EFI_REGULAR_EXPRESSION_PROTCOL *instance during initialization. If the required regular expression syntax type is not supported, the driver may install its own instance of* EFI_REGULAR_EXPRESSION_PROTCOL *to add the support. The driver may also choose to fall back to other methods of validation, such as using* EFI_IFR_MATCH *or callbacks.*

33.3.9 Keyboard Package

```
//*******************************************
// EFI_HII_KEYBOARD_PACKAGE_HDR
//*******************************************
typedef struct {
  EFI_HII_PACKAGE_HDR          Header;
  UINT16                       LayoutCount;
//EFI_HII_KEYBOARD_LAYOUT      Layout[];
}   EFI_HII_KEYBOARD_PACKAGE_HDR;
```

Header
The general pack header which defines both the type of pack and the length of the entire pack.

LayoutCount
The number of keyboard layouts contained in the entire keyboard pack.

Layout
An array of *LayoutCount* number of keyboard layouts.

33.3.10 Animations Package

The Animation package record describes how, when, and which EFI images to display. The package consists of two parts: a fixed header and the animation information.

33.3.10.1 Animated Images Package

Summary

The fixed header consists of a standard record header and the

Prototype

```
typedef struct _EFI_HII_ANIMATION_PACKAGE_HDR {
EFI_HII_ANIMATION_PACKAGE          Header;
UINT32                             AnimationInfoOffset;
} EFI_HII_ANIMATION_PACKAGE_HDR;
```

Members

Header
Standard image header, where Header.BlockType = EFI_HII_PACKAGE_ANIMATIONS.

AnimationInfoOffset
Offset, relative to this header, of the animation information. If this is zero, then there are no animation sequences in the package.

33.3.10.2 Animation Information

For each animated image identifier, the animation information gives a sequence of EFI images to display and how and when to transition to the next image. The animation information is encoded as a series of blocks, with each block prefixed by a single byte header (*EFI_HII_ANIMATION_BLOCK*) or one of the extension headers (*EFI_HII_AIBT_EXTx_BLOCK*). The blocks must be processed in order.

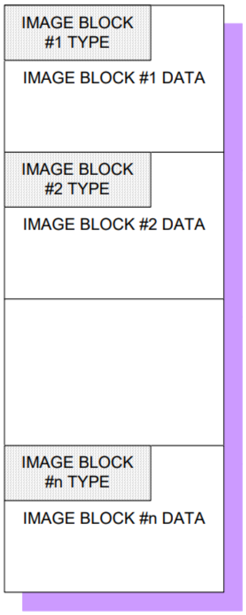

Fig. 33.50: Animation Information Encoded in Blocks

Prototype

```
typedef struct _EFI_HII_ANIMATION_BLOCK {
  UINT8                 BlockType;
//UINT8                 BlockBody[];
}   EFI_HII_ANIMATION_BLOCK;
```

The following table describes the different block types:

Table 33.22: Animation Block Types

Name	Value	Description
EFI_HII_AIBT_END	0x00	The end of the animation information.
EFI_HII_AIBT_OVERLAY_IMAGES	0x10	Animate sequence once by displaying the next image in the logical window.
EFI_HII_AIBT_CLEAR_IMAGES	0x11	Animate sequence once by clearing the logical window before displaying the next image.
EFI_HII_AIBT_RESTORE_SCRN	0x12	Animate sequence once by clearing the restoring the logical window before displaying the next image.
EFI_HII_AIBT_OVERLAY_IMAGES_LOOP	0x18	Animate repeating sequence by displaying the next image in the logical window.

continues on next page

Table 33.22 – continued from previous page

EFI_HII_AIBT_CLEAR_IMAGES_LOOP	0x19	Animate repeating sequence by clearing the logical window before displaying the next image.
EFI_HII_AIBT_RESTORE_SCRN_LOOP	0x1A	Animate repeating sequence by clearing the restoring the logical window before displaying the next image.
EFI_HII_AIBT_DUPLICATE	0x20	Duplicate an existing animation identifier
EFI_HII_AIBT_SKIP2	0x21	Skip a certain number of animation identifiers.
EFI_HII_AIBT_SKIP1	0x22	Skip a certain number of animation identifiers.
EFI_HII_AIBT_EXT1	0x30	For future expansion (one byte length field)
EFI_HII_AIBT_EXT2	0x31	For future expansion (two byte length field)
EFI_HII_AIBT_EXT4	0x32	For future expansion (four byte length field)

In order to recreate all animation sequences, start at the first block and process them all until either an EFI_HII_AIBT_END block is found. When processing the animation blocks, each block refers to the current animation identifier (*AnimationIdCurrent*), which is initially set to one (1).

Animation blocks of an unknown type should be skipped. If they cannot be skipped, then processing halts.

33.3.10.2.1 EFI_HII_AIBT_END

Summary

Marks the end of the animation information.

Prototype

```
None
```

Members

Header

Standard animation header, where *Header.BlockType* = *EFI_HII_AIBT_END*.

Discussion

Any animation sequences with an animation identifier greater than or equal to *AnimationIdCurrent* are empty. There is no additional data.

33.3.10.2.2 EFI_HII_AIBT_EXT1, EFI_HII_AIBT_EXT2,EFI_HII_AIBT_EXT4

Summary

Generic prefix for animation information with a 1-byte,2-byte or 4-byte length.

Prototype

```
typedef struct _EFI_HII_AIBT_EXT1_BLOCK {
  EFI_HII_ANIMATION_BLOCK     Header;
  UINT8                       BlockType2;
  UINT8                       Length;
}  EFI_HII_AIBT_EXT1_BLOCK;
```

(continues on next page)

(continued from previous page)

```
typedef struct _EFI_HII_AIBT_EXT2_BLOCK {
  EFI_HII_ANIMATION_BLOCK     Header;
  UINT8                       BlockType2;
  UINT16                      Length;
}   EFI_HII_AIBT_EXT2_BLOCK;

typedef struct _EFI_HII_AIBT_EXT4_BLOCK {
  EFI_HII_ANIMATION_BLOCK     Header;
  UINT8                       BlockType2;
  UINT32                      Length;
}   EFI_HII_AIBT_EXT4_BLOCK;
```

Members

Header

Standard animation header, where *Header.BlockType = EFI_HII_AIBT_EXT1, EFI_HII_AIBT_EXT2,* or *EFI_HII_AIBT_EXT4.*

Length

Size of the animation block, in bytes, including the animation block header.

BlockType2

The block type, as described in *Table 33-9 :ref: `TODO LINK 81028 in HII.rst*

Discussion

These records are used for variable sized animation records which need an explicit length.

33.3.10.2.3 EFI_HII_AIBT_OVERLAY_IMAGES

Summary

An animation block to describe an animation sequence that does not cycle, and where one image is simply displayed over the previous image.

Prototype

```
typedef struct _EFI_HII_AIBT_OVERLAY_IMAGES_BLOCK {
  EFI_IMAGE_ID             DftImageId;
  UINT16                   Width;
  UINT16                   Height;
  UINT16                   CellCount;
  EFI_HII_ANIMATION_CELL   AnimationCell[];
}   EFI_HII_AIBT_OVERLAY_IMAGES_BLOCK;
```

Members

DftImageId

This is image that is to be reference by the image protocols, if the animation function is not supported or disabled. This image can be one particular image from the animation sequence (if any one of the animation frames has a complete image) or an alternate image that can be displayed alone. If the value is zero, no image is displayed.

Width

The overall width of the set of images (logical window width).

Height
The overall height of the set of images (logical window height).

CellCount
The number of *EFI_HII_ANIMATION_CELL* contained in the animation sequence.

AnimationCell
An array of *CellCount* animation cells. The type *EFI_HII_ANIMATION_CELL* is defined in "Related Definitions" below.

Description

This record assigns the animation sequence data to the *AnimationIdCurrent* identifier and increment *AnimationIdCurrent* by one. This animation sequence is meant to be displayed only once (it is not a repeating sequence). Each image in the sequence will remain on the screen for the specified delay before the next image in the sequence is displayed.

The header type (either *BlockType* in *EFI_HII_ANIMATION_BLOCK* or *BlockType2* in *EFI_HII_AIBT_EXTx_BLOCK*) will be set to *EFI_HII_AIBT_OVERLAY_IMAGES.*

Related Definition

```
typedef struct _EFI_HII_ANIMATION_CELL {
  UINT16                OffsetX;
  UINT16                OffsetY;
  EFI_IMAGE_ID          ImageId;
  UINT16                Delay;
}   EFI_HII_ANIMATION_CELL;
```

OffsetX
The X offset from the upper left hand corner of the logical window to position the indexed image.

OffsetY
The Y offset from the upper left hand corner of the logical window to position the indexed image.

ImageId
The image to display at the specified offset from the upper left hand corner of the logical window.

Delay
The number of milliseconds to delay after displaying the indexed image and before continuing on to the next linked image. If value is zero, no delay.

Related Description

The logical window definition allows the animation to be centered, even though the first image might be way off center (bounds the sequence of images). All images will be clipped to the defined logical window, since the logical window is suppose to bound all images, normally there is nothing to clip. The *DftImageId* definition allows an alternate image to be displayed if animation is currently not supported. The *DftImageId* image is to be centered in the defined logical window.

33.3.10.2.4 EFI_HII_AIBT_CLEAR_IMAGES

Summary

An animation block to describe an animation sequence that does not cycle, and where the logical window is cleared to the specified color before the next image is displayed.

Prototype

```
typedef struct _EFI_HII_AIBT_CLEAR_IMAGES_BLOCK {

EFI_IMAGE_ID DftImageId;

UINT16 Width;

UINT16 Height;

UINT16 CellCount;

EFI_HII_RGB_PIXEL BackgndColor;

EFI_HII_ANIMATION_CELL AnimationCell[];

} EFI_HII_AIBT_CLEAR_IMAGES_BLOCK;
```

Members

DftImageId
This is image that is to be reference by the image protocols, if the animation function is not supported or disabled. This image can be one particular image from the animation sequence (if any one of the animation frames has a complete image) or an alternate image that can be displayed alone. If the value is zero, no image is displayed.

Width
The overall width of the set of images (logical window width).

Height
The overall height of the set of images (logical window height).

CellCount
The number of *EFI_HII_ANIMATION_CELL* contained in the animation sequence.

BackgndColor
The color to clear the logical window to before displaying the indexed image.

AnimationCell
An array of *CellCount* animation cells. The type *EFI_HII_ANIMATION_CELL* is defined in "Related Definitions" in *EFI_HII_AIBT_OVERLAY_IMAGES*.

Description

This record assigns the animation sequence data to the *AnimationIdCurrent* identifier and increment AnimationIdCurrent by one. This animation sequence is meant to be displayed only once (it is not a repeating sequence). Each image in the sequence will remain on the screen for the specified delay before the logical window is cleared to the specified color (BackgndColor) and the next image is displayed. The logical window is also cleared to the specified color before displaying the *DftImageId* image.

The header type (either BlockType in EFI_HII_ANIMATION_BLOCK or BlockType2 in EFI_HII_AIBT_EXTx_BLOCK) will be set to EFI_HII_AIBT_CLEAR_IMAGES.

33.3.10.2.5 EFI_HII_AIBT_RESTORE_SCRN

Summary

An animation block to describe an animation sequence that does not cycle, and where the screen is restored to the original state before the next image is displayed.

Prototype

```
typedef struct _EFI_HII_AIBT_RESTORE_SCRN_BLOCK {
  EFI_IMAGE_ID                DftImageId;
  UINT16                      Width;
  UINT16                      Height;
  UINT16                      CellCount;
  EFI_HII_ANIMATION_CELL      AnimationCell[];
}   EFI_HII_AIBT_RESTORE_SCRN_BLOCK;
```

Members

The overall width of the set of images (logical window width).

Height
The overall height of the set of images (logical window height).

CellCount
The number of EFI_HII_ANIMATION_CELL contained in the animation sequence.

AnimationCell
An array of *CellCount* animation cells. The type *EFI_HII_ANIMATION_CELL* is defined in “Related Definitions” in *EFI_HII_AIBT_OVERLAY_IMAGES*.

Description

This record assigns the animation sequence data to the *AnimationIdCurrent* identifier and increment *AnimationIdCurrent* by one. This animation sequence is meant to be displayed only once (it is not a repeating sequence). Before the first image is displayed, the entire defined logical window is saved to a buffer. Then each image in the sequence will remain on the screen for the specified delay before the logical window is restored to the original state and the next image is displayed.

If memory buffers are not available to save the logical window, this structure is treated as *EFI_HII_AIBT_CLEAR_IMAGES* structure, with the *BackgndColor* value set to black.

The header type (either *BlockType* in *EFI_HII_ANIMATION_BLOCK* or *BlockType2* in *EFI_HII_AIBT_EXTx_BLOCK*) will be set to *EFI_HII_AIBT_RESTORE_SCRN*.

33.3.10.2.6 EFI_HII_AIBT_OVERLAY_IMAGES_LOOP

Summary

An animation block to describe an animation sequence that continuously cycles, and where one image is simply displayed over the previous image.

Prototype

```
typedef EFI_HII_AIBT_OVERLAY_IMAGES_BLOCK
EFI_HII_AIBT_OVERLAY_IMAGES_LOOP_BLOCK {
  EFI_IMAGE_ID                DftImageId;
  UINT16                      Width;
  UINT16                      Height;
  UINT16                      CellCount;
  EFI_HII_ANIMATION_CELL      AnimationCell[];
}   EFI_HII_AIBT_OVERLAY_IMAGES_LOOP_BLOCK;
```

Members

DftImageId
This is image that is to be reference by the image protocols, if the animation function is not supported or disabled. This image can be one particular image from the animation sequence (if any one of the animation frames has a complete image) or an alternate image that can be displayed alone. If the value is zero, no image is displayed.

Width
The overall width of the set of images (logical window width).

Height
The overall height of the set of images (logical window height).

CellCount
The number of EFI_HII_ANIMATION_CELL contained in the animation sequence.

AnimationCell
An array of *CellCount* animation cells. The type *EFI_HII_ANIMATION_CELL* is defined in "Related Definitions" in *EFI_HII_AIBT_OVERLAY_IMAGES*

Description

This record assigns the animation sequence data to the *AnimationIdCurrent* identifier and increment *AnimationIdCurrent* by one. This animation sequence is meant to continuously cycle until stopped or paused. Each image in the sequence will remain on the screen for the specified delay before the next image in the sequence is displayed.

The header type (either *BlockType* in *EFI_HII_ANIMATION_BLOCK* or *BlockType2* in *EFI_HII_AIBT_EXTx_BLOCK*) will be set to *EFI_HII_AIBT_OVERLAY_IMAGES_LOOP.*

33.3.10.2.7 EFI_HII_AIBT_CLEAR_IMAGES_LOOP

Summary

An animation block to describe an animation sequence that continuously cycles, and where the logical window is cleared to the specified color before the next image is displayed.

Prototype

```
typedef EFI_HII_AIBT_CLEAR_IMAGES_BLOCK    EFI_HII_AIBT_CLEAR_IMAGES_LOOP_BLOCK {
  EFI_IMAGE_ID               DftImageId;
```

(continues on next page)

(continued from previous page)

```
  UINT16                      Width;
  UINT16                      Height;
  UINT16                      CellCount;
  EFI_HII_RGB_PIXEL           BackgndColor;
  EFI_HII_ANIMATION_CELL      AnimationCell[];
}   EFI_HII_AIBT_CLEAR_IMAGES_LOOP_BLOCK;
```

Members

DftImageId
This is image that is to be reference by the image protocols, if the animation function is not supported or disabled. This image can be one particular image from the animation sequence (if any one of the animation frames has a complete image) or an alternate image that can be displayed alone. If the value is zero, no image is displayed.

Width
The overall width of the set of images (logical window width).

Height
The overall height of the set of images (logical window height).

CellCount
The number of *EFI_HII_ANIMATION_CELL* contained in the animation sequence.

BackgndColor
The color to clear the logical window to before displaying the indexed image.

AnimationCell
An array of *CellCount* animation cells. The type *EFI_HII_ANIMATION_CELL* is defined in "Related Definitions" in *EFI_HII_AIBT_OVERLAY_IMAGES*

Description

This record assigns the animation sequence data to the *AnimationIdCurrent* identifier and increment *AnimationIdCurrent* by one. This animation sequence is meant to continuously cycle until stopped or paused. Each image in the sequence will remain on the screen for the specified delay before the logical window is cleared to the specified color (BackgndColor) and the next image is displayed. The logical window is also cleared to the specified color before displaying the *DftImageId* image.

The header type (either *BlockType* in *EFI_HII_ANIMATION_BLOCK* or *BlockType2* in *EFI_HII_AIBT_EXTx_BLOCK*) will be set to *EFI_HII_AIBT_CLEAR_IMAGES_LOOP*.

33.3.10.2.8 EFI_AIBT_RESTORE_SCRN_LOOP

Summary

An animation block to describe an animation sequence that continuously cycles, and where the screen is restored to the original state before the next image is displayed.

Prototype

```
typedef EFI_HII_AIBT_RESTORE_SCRN_LOOP_BLOCK
EFI_HII_AIBT_RESTORE_SCRN_LOOP_BLOCK {
  EFI_IMAGE_ID                DftImageId;
  UINT16                      Width;
  UINT16                      Height;
  UINT16                      CellCount;
```

(continues on next page)

(continued from previous page)

```
  EFI_HII_ANIMATION_CELL      AnimationCell[];
}   EFI_HII_AIBT_RESTORE_SCRN_LOOP_BLOCK;
```

Members

Header
Standard image header, where *Header.BlockType* = *EFI_HII_AIBT_RESTORE_SCRN_LOOP*.

DftImageId
This is image that is to be reference by the image protocols, if the animation function is not supported or disabled. This image can be one particular image from the animation sequence (if any one of the animation frames has a complete image) or an alternate image that can be displayed alone. If the value is zero, no image is displayed.

Length
Size of the animation block, in bytes, including the animation block header.

Width
The overall width of the set of images (logical window width).

Height
The overall height of the set of images (logical window height).

CellCount
The number of *EFI_HII_ANIMATION_CELL* contained in the animation sequence.

AnimationCell
An array of *CellCount* animation cells. The type *EFI_HII_ANIMATION_CELL* is defined in "Related Definitions" in *EFI_HII_AIBT_OVERLAY_IMAGES*

Description

This record assigns the animation sequence data to the *AnimationIdCurrent* identifier and increment *AnimationIdCurrent* by one. This animation sequence is meant to continuously cycle until stopped or paused. Before the first image is displayed, the entire defined logical window is saved to a buffer. Then each image in the sequence will remain on the screen for the specified delay before the logical window is restored to the original state and the next image is displayed.

If memory buffers are not available to save the logical window, this structure is treated as *EFI_HII_AIBT_CLEAR_IMAGES_LOOP* structure, with the BackgndColor value set to black.

The header type (either *BlockType* in *EFI_HII_ANIMATION_BLOCK* or *BlockType2* in *EFI_HII_AIBT_EXTx_BLOCK*) will be set to *EFI_HII_AIBT_RESTORE_SCRN_LOOP*.

33.3.10.2.9 EFI_HII_AIBT_DUPLICATE

Summary

Assigns a new character value to a previously defined animation sequence.

Prototype

```
typedef struct _EFI_HII_AIBT_DUPLICATE_BLOCK {
  EFI_ANIMATION_ID                  AnimationId;
}   EFI_HII_AIBT_DUPLICATE_BLOCK;
```

Members

AnimationId
The previously defined animation ID with the exact same animation information.

Discussion

Indicates that the animation sequence with animation ID *AnimationIdCurrent* has the same animation information as a previously defined animation ID and increments *AnimationIdCurrent* by one.

The header type (either *BlockType* in *EFI_HII_ANIMATION_BLOCK* or *BlockType2* in *EFI_HII_AIBT_EXTx_BLOCK*) will be set to *EFI_HII_AIBT_DUPLICATE.*

33.3.10.2.10 EFI_HII_AIBT_SKIP1

Summary

Skips animation IDs.

Prototype

```
typedef struct _EFI_HII_AIBT_SKIP1_BLOCK {
  UINT8                 SkipCount;
}   EFI_HII_AIBT_SKIP1_BLOCK;
```

Members

SkipCount
The unsigned 8-bit value to add to *AnimationIdCurrent.*

Discussion

Increments the current animation ID *AnimationIdCurrent* by the number specified. The header type (either *BlockType* in *EFI_HII_ANIMATION_BLOCK* or *BlockType2* in *EFI_HII_AIBT_EXTx_BLOCK*) will be set to *EFI_HII_AIBT_SKIP1.*

33.3.10.2.11 EFI_HII_AIBT_SKIP2

Summary

Skips animation IDs.

Prototype

```
typedef struct _EFI_HII_AIBT_SKIP2_BLOCK {
  UINT16                   SkipCount;
}   EFI_HII_AIBT_SKIP2_BLOCK;
```

Members

SkipCount
The unsigned 16-bit value to add to AnimationIdCurrent.

Discussion

Increments the current animation ID *AnimationIdCurrent* by the number specified.

The header type (either *BlockType* in *EFI_HII_ANIMATION_BLOCK* or *BlockType2* in *EFI_HII_AIBT_EXTx_BLOCK*) will be set to *EFI_HII_AIBT_SKIP2.*

CHAPTER

THIRTYFOUR

HII PROTOCOLS

This section provides code definitions for the HII-related protocols, functions, and type definitions, which are the required architectural mechanisms by which UEFI-compliant systems manage user input. The major areas described include the following:

- Font management.
- String management.
- Image management.
- Database management.

34.1 Font Protocol

34.1.1 EFI_HII_FONT_PROTOCOL

Summary

Interfaces which retrieve font information.

GUID

```
#define EFI_HII_FONT_PROTOCOL_GUID \
  { 0xe9ca4775, 0x8657, 0x47fc, \
    {0x97, 0xe7, 0x7e, 0xd6, 0x5a, 0x8, 0x43, 0x24 }}
```

Protocol

```
typedef struct _EFI_HII_FONT_PROTOCOL {
  EFI_HII_STRING_TO_IMAGE          StringToImage;
  EFI_HII_STRING_ID_TO_IMAGE       StringIdToImage;
  EFI_HII_GET_GLYPH                GetGlyph;
  EFI_HII_GET_FONT_INFO            GetFontInfo;
}   EFI_HII_FONT_PROTOCOL;
```

Members

StringToImage, StringIdToImage
Render a string to a bitmap or to the display.

GetGlyph
Return a specific glyph in a specific font.

GetFontInfo
Return font information for a specific font.

34.1.2 EFI_HII_FONT_PROTOCOL.StringToImage()

Summary

Renders a string to a bitmap or to the display.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_STRING_TO_IMAGE) (
  IN CONST EFI_HII_FONT_PROTOCOL       *This,
  IN EFI_HII_OUT_FLAGS                 Flags,
  IN CONST EFI_STRING                  String,
  IN CONST EFI_FONT_DISPLAY_INFO       *StringInfo OPTIONAL,
  IN OUT EFI_IMAGE_OUTPUT              **Blt,
  IN UINTN                             BltX,
  IN UINTN                             BltY,
  OUT EFI_HII_ROW_INFO                 **RowInfoArray OPTIONAL,
  OUT UINTN                            *RowInfoArraySize OPTIONAL,
  OUT UINTN                            *ColumnInfoArray OPTIONAL
);
```

Parameters

This
A pointer to the *EFI_HII_FONT_PROTOCOL* instance.

Flags
Describes how the string is to be drawn. *EFI_HII_OUT_FLAGS* is defined in Related Definitions, below.

String
Points to the null-terminated string to be displayed.

StringInfo
Points to the string output information, including the color and font. If NULL, then the string will be output in the default system font and color.

Blt
If this points to a non-NULL on entry, this points to the image, which is *Blt.Width* pixels wide and *Blt.Height* pixels high. The string will be drawn onto this image and *EFI_HII_OUT_FLAG_CLIP* is implied. If this points to a NULL on entry, then a buffer will be allocated to hold the generated image and the pointer updated on exit. It is the caller's responsibility to free this buffer.

BltX, BltY
Specifies the offset from the left and top edge of the image of the first character cell in the image.

RowInfoArray
If this is non-NULL on entry, then on exit, this will point to an allocated buffer containing row information and *RowInfoArraySize* will be updated to contain the number of elements. This array describes the characters which were at least partially drawn and the heights of the rows. It is the caller's responsibility to free this buffer.

RowInfoArraySize
If this is non-NULL on entry, then on exit it contains the number of elements in *RowInfoArray*.

ColumnInfoArray

If this is non-NULL, then on return it will be filled with the horizontal offset for each character in the string on the row where it is displayed. Non-printing characters will have the offset ~0. The caller is responsible to allocate a buffer large enough so that there is one entry for each character in the string, not including the null-terminator. It is possible when character display is normalized that some character cells overlap.

Description

This function renders a string to a bitmap or the screen using the specified font, color and options. It either draws the string and glyphs on an existing bitmap, allocates a new bitmap or uses the screen. The strings can be clipped or wrapped. Optionally, the function also returns the information about each row and the character position on that row.

If *EFI_HII_OUT_FLAG_CLIP* is set, then text will be formatted only based on explicit line breaks and all pixels which would lie outside the bounding box specified by *Blt.Width* and *Blt.Height* are ignored. The information in the *RowInfoArray* only describes characters which are at least partially displayed. For the final row, the *RowInfoArray.LineHeight* and *RowInfoArray.BaseLine* may describe pixels which are outside the limit specified by *Blt. Height* (unless *EFI_HII_OUT_FLAG_CLIP_CLEAN_Y* is specified) even though those pixels were not drawn. The *LineWidth* may describe pixels which are outside the limit specified by *Blt.Width* (unless *EFI_HII_OUT_FLAG_CLIP_CLEAN_X* is specified) even though those pixels were not drawn.

If *EFI_HII_OUT_FLAG_CLIP_CLEAN_X* is set, then it modifies the behavior of *EFI_HII_OUT_FLAG_CLIP* so that if a character's right-most on pixel cannot fit, then it will not be drawn at all. This flag requires that *EFI_HII_OUT_FLAG_CLIP* be set.

If *EFI_HII_OUT_FLAG_CLIP_CLEAN_Y* is set, then it modifies the behavior of *EFI_HII_OUT_FLAG_CLIP* so that if a row's bottom-most pixel cannot fit, then it will not be drawn at all. This flag requires that *EFI_HII_OUT_FLAG_CLIP* be set.

If *EFI_HII_OUT_FLAG_WRAP* is set, then text will be wrapped at the right-most line-break opportunity prior to a character whose right-most extent would exceed *Blt.Width.* If no line-break opportunity can be found, then the text will behave as if *EFI_HII_OUT_FLAG_CLIP_CLEAN_X* is set. This flag cannot be used with *EFI_HII_OUT_FLAG_CLIP_CLEAN_X.*

If *EFI_HII_OUT_FLAG_TRANSPARENT* is set, then *StringInfo.BackgroundColor* is ignored and all "off" pixels in the character's drawn will use the pixel value from *Blt.* This flag cannot be used if *Blt* is NULL upon entry.

If *EFI_HII_IGNORE_IF_NO_GLYPH* is set, then characters which have no glyphs are not drawn. Otherwise, they are replaced with Unicode character code 0xFFFD (REPLACEMENT CHARACTER).

If *EFI_HII_IGNORE_LINE_BREAK* is set, then explicit line break characters will be ignored.

If *EFI_HII_DIRECT_TO_SCREEN* is set, then the string will be written directly to the output device specified by *Screen.* Otherwise the string will be rendered to the bitmap specified by *Bitmap*.

Related Definitions

```
typedef UINT32 EFI_HII_OUT_FLAGS;

#define EFI_HII_OUT_FLAG_CLIP               0x00000001
#define EFI_HII_OUT_FLAG_WRAP               0x00000002
#define EFI_HII_OUT_FLAG_CLIP_CLEAN_Y       0x00000004
#define EFI_HII_OUT_FLAG_CLIP_CLEAN_X       0x00000008

typedef CHAR16 *EFI_STRING;
```

(continues on next page)

(continued from previous page)

```
typedef struct _EFI_HII_ROW_INFO {
  UINTN                                    StartIndex;
  UINTN                                    EndIndex;
  UINTN                                    LineHeight;
  UINTN                                    LineWidth;
  UINTN                                    BaselineOffset;
}   EFI_HII_ROW_INFO;
```

StartIndex
The index of the first character in the string which is displayed on the line.

EndIndex
The index of the last character in the string which is displayed on the line.

LineHeight
The height of the line, in pixels.

LineWidth
The width of the text on the line, in pixels.

BaselineOffset
The font baseline offset in pixels from the bottom of the row, or 0 if none.

Status Codes Returned

EFI_SUCCESS	The string was successfully updated.
EFI_OUT_OF_RESOURCES	Unable to allocate an output buffer for *RowInfoArray* or *Blt*.
EFI_INVALID_PARAMETER	The *String* or *Blt* was NULL.
EFI_INVALID_PARAMETER	Flags were invalid combination

34.1.3 EFI_HII_FONT_PROTOCOL.StringIdToImage()

Summary

Render a string to a bitmap or the screen containing the contents of the specified string.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_STRING_ID_TO_IMAGE) (
  IN   CONST EFI_HII_FONT_PROTOCOL         *This,
  IN   EFI_HII_OUT_FLAGS                   Flags,
  IN   EFI_HII_HANDLE                      PackageList,
  IN   EFI_STRING_ID                       StringId,
  IN   CONST CHAR8*                        Language,
  IN   CONST EFI_FONT_DISPLAY_INFO         *StringInfo OPTIONAL,
  IN  OUT EFI_IMAGE_OUTPUT                 **Blt,
  IN   UINTN                               BltX,
  IN   UINTN                               BltY,
  OUT   EFI_HII_ROW_INFO                   **RowInfoArray OPTIONAL,
  OUT   UINTN                              *RowInfoArraySize OPTIONAL,
  OUT   UINTN                              *ColumnInfoArray OPTIONAL
  );
```

Parameters

This

A pointer to the *EFI_HII_FONT_PROTOCOL* instance.

Flags

Describes how the string is to be drawn. *EFI_HII_OUT_FLAGS* is defined in Related Definitions, below.

PackageList

The package list in the HII database to search for the specified string.

StringId

The string's id, which is unique within *PackageList.*

Language

Points to the language for the retrieved string. If NULL, then the current system language is used.

StringInfo

Points to the string output information, including the color and font. If NULL, then the string will be output in the default system font and color.

Blt

If this points to a non-NULL on entry, this points to the image, which is *Blt.Width* pixels wide and *Height* pixels high. The string will be drawn onto this image and *EFI_HII_OUT_FLAG_CLIP* is implied. If this points to a NULL on entry, then a buffer will be allocated to hold the generated image and the pointer updated on exit. It is the caller's responsibility to free this buffer.

BltX, BltY

Specifies the offset from the left and top edge of the output image of the first character cell in the image.

RowInfoArray

If this is non-NULL on entry, then on exit, this will point to an allocated buffer containing row information and *RowInfoArraySize* will be updated to contain the number of elements. This array describes the characters which were at least partially drawn and the heights of the rows. It is the caller's responsibility to free this buffer.

RowInfoArraySize

If this is non-NULL on entry, then on exit it contains the number of elements in *RowInfoArray.*

ColumnInfoArray

If non-NULL, on return it is filled with the horizontal offset for each character in the string on the row where it is displayed. Non-printing characters will have the offset ~0. The caller is responsible to allocate a buffer large enough so that there is one entry for each character in the string, not including the null-terminator. It is possible when character display is normalized that some character cells overlap.

Description

This function renders a string as a bitmap or to the screen and can clip or wrap the string. The bitmap is either supplied by the caller or else is allocated by the function. The strings are drawn with the font, size and style specified and can be drawn transparently or opaquely. The function can also return information about each row and each character's position on the row.

If *EFI_HII_OUT_FLAG_CLIP* is set, then text will be formatted only based on explicit line breaks and all pixels which would lie outside the bounding box specified by *Width* and *Height* are ignored. The information in the *RowInfoArray* only describes characters which are at least partially displayed. For the final row, the LineHeight and BaseLine may describe pixels which are outside the limit specified by *Height* (unless *EFI_HII_OUT_FLAG_CLIP_CLEAN_Y* is specified) even though those pixels were not drawn.

If *EFI_HII_OUT_FLAG_CLIP_CLEAN_X* is set, then it modifies the behavior of *EFI_HII_OUT_FLAG_CLIP* so that if a character's right-most on pixel cannot fit, then it will not be drawn at all. This flag requires that *EFI_HII_OUT_FLAG_CLIP* be set. If *EFI_HII_OUT_FLAG_CLIP_CLEAN_Y* is set, then it modifies the behavior of

EFI_HII_OUT_FLAG_CLIP so that if a row's bottom most pixel cannot fit, then it will not be drawn at all. This flag requires that *EFI_HII_OUT_FLAG_CLIP* be set.

If *EFI_HII_OUT_FLAG_WRAP* is set, then text will be wrapped at the right-most line-break opportunity prior to a character whose right-most extent would exceed *Width*. If no line-break opportunity can be found, then the text will behave as if *EFI_HII_OUT_FLAG_CLIP_CLEAN_X* is set. This flag cannot be used with *EFI_HII_OUT_FLAG_CLIP_CLEAN_X*.

If *EFI_HII_OUT_FLAG_TRANSPARENT* is set, then *BackgroundColor* is ignored and all "off" pixels in the character's glyph will use the pixel value from *Blt*. This flag cannot be used if *Blt* is NULL upon entry.

If *EFI_HII_IGNORE_IF_NO_GLYPH* is set, then characters which have no glyphs are not drawn. Otherwise, they are replaced with Unicode character code 0xFFFD (REPLACEMENT CHARACTER).

If *EFI_HII_IGNORE_LINE_BREAK* is set, then explicit line break characters will be ignored.

If *EFI_HII_DIRECT_TO_SCREEN* is set, then the string will be written directly to the output device specified by *Screen*. Otherwise the string will be rendered to the bitmap specified by *Bitmap*.

Status Codes Returned

EFI_SUCCESS	The string was successfully updated.
EFI_OUT_OF_RESOURCES	Unable to allocate an output buffer for *RowInfoArray* or *Blt*.
EFI_INVALID_PARAMETER	The *StringId* or *PackageList* was *NULL*.
EFI_INVALID_PARAMETER	*Flags* were invalid combination.
EFI_NOT_FOUND	The *StringId* is not in the specified *PackageList*. The specified *PackageList* is not in the Database.

34.1.4 EFI_HII_FONT_PROTOCOL.GetGlyph()

Summary

Return image and information about a single glyph.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GET_GLYPH) (
  IN CONST EFI_HII_FONT_PROTOCOL       *This,
  IN CHAR16                            Char,
  IN CONST EFI_FONT_DISPLAY_INFO       *StringInfo,
  OUT EFI_IMAGE_OUTPUT                 **Blt;
  OUT UINTN                            *Baseline OPTIONAL;
  );
```

Parameters

This

A pointer to the *EFI_HII_FONT_PROTOCOL* instance.

Char

Character to retrieve.

StringInfo

Points to the string font and color information or NULL if the string should use the default system font and color.

Blt

Thus must point to a NULL on entry. A buffer will be allocated to hold the output and the pointer updated on exit. It is the caller's responsibility to free this buffer.On return, only *Blt.Width, Blt.Height,* and *Blt.Image.Bitmap* are valid.

Baseline

Number of pixels from the bottom of the bitmap to the baseline.

Description

Convert the glyph for a single character into a bitmap.

Status Codes Returned

EFI_SUCCESS	Glyph bitmap created.
EFI_OUT_OF_RESOURCES	Unable to allocate the output buffer *Blt.*
EFI_WARN_UNKNOWN_GLYPH	The glyph was unknown and was replaced with the glyph for Unicode character code 0xFFFD.
EFI_INVALID_PARAMETER	*Blt* is NULL or * *Blt* is !Null

34.1.5 EFI_HII_FONT_PROTOCOL.GetFontInfo()

Summary

Return information about a particular font.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GET_FONT_INFO) (
  IN    CONST EFI_HII_FONT_PROTOCOL          *This,
  IN  OUT EFI_FONT_HANDLE                    *FontHandle,
  IN    CONST EFI_FONT_DISPLAY_INFO          *StringInfoIn,OPTIONAL
  OUT   EFI_FONT_DISPLAY_INFO                **StringInfoOut,
  IN    CONST EFI_STRING                     String OPTIONAL
  );

typedef VOID                                 *EFI_FONT_HANDLE;
```

Parameters

This

A pointer to the *EFI_HII_FONT_PROTOCOL* instance.

FontHandle

On entry, points to the font handle returned by a previous call to *GetFontInfo()* or points to NULL to start with the first font. On return, points to the returned font handle or points to NULL if there are no more matching fonts.

StringInfoIn

Upon entry, points to the font to return information about. If NULL, then the information about the system default font will be returned.

StringInfoOut

Upon return, contains the matching font's information. If NULL, then no information is returned. This buffer is allocated with a call to the *Boot Service AllocatePool().* It is the caller's responsibility to call the *Boot Service FreePool()* when the caller no longer requires the contents of *StringInfoOut.*

String

Points to the string which will be tested to determine if all characters are available. If **NULL**, then any font is acceptable.

Description

This function iterates through fonts which match the specified font, using the specified criteria. If *String* is non-NULL, then all of the characters in the string must exist in order for a candidate font to be returned.

Status Codes Returned

EFI_SUCCESS	Matching font returned successfully.
EFI_NOT_FOUND	No matching font was found.
EFI_OUT_OF_RESOURCES	There were insufficient resources to complete the request.

34.2 EFI HII Font Ex Protocol

The EFI HII Font Ex protocol defines an extension to the EFI HII Font protocol which enables various new capabilities described in this section.

34.2.1 EFI_HII_FONT_EX_PROTOCOL

Summary

Interfaces which retrieve the font information.

GUID

```
#define EFI_HII_FONT_EX_PROTOCOL_GUID \
  { 0x849e6875, 0xdb35, 0x4df8, 0xb4, \
    {0x1e, 0xc8, 0xf3, 0x37, 0x18, 0x7, 0x3f }}
```

Protocol

```
typedef struct _EFI_HII_FONT_EX_PROTOCOL {
  EFI_HII_STRING_TO_IMAGE_EX          StringToImageEx;
  EFI_HII_STRING_ID_TO_IMAGE_EX       StringIdToImageEx;
  EFI_HII_GET_GLYPH_EX                GetGlyphEx;
  EFI_HII_GET_FONT_INFO_EX            GetFontInfoEx;
  EFI_HII_GET_GLYPH_INFO              GetGlyphInfo;
}   EFI_HII_FONT_EX_PROTOCOL;
```

Members

StringToImageEx, StringIdToImageEx

Render a string to a bitmap or to the display. This function will try to use the external font glyph generator for generating the glyph if it can't find the glyph in the font database.

GetGlphyEx

Return a specific glyph in a specific font. This function will try to use the external font glyph generator for generating the glyph if it can't find the glyph in the font database.

GetFontInfoEx

Return the font information for a specific font, this protocol invokes original *EFI_HII_FONT_PROTOCOL.GetFontInfo()* implicitly.

GetGlphyInfoEx
Return the glyph information for the single glyph.

34.2.2 EFI_HII_FONT_EX_PROTOCOL.StringToImageEx()

Summary

Render a string to a bitmap or to the display. The prototype of this extension function is the same with *EFI_HII_FONT_PROTOCOL.StringToImage()*.

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_STRING_TO_IMAGE_EX)(
  IN CONST EFI_HII_FONT_EX_PROTOCOL       *This,
  IN EFI_HII_OUT_FLAGS                    Flags,
  IN CONST EFI_STRING                     String,
  IN CONST EFI_FONT_DISPLAY_INFO          *StringInfo OPTIONAL,
  IN OUT EFI_IMAGE_OUTPUT                 **Blt,
  IN UINTN                                BltX,
  IN UINTN                                BltY,
  OUT EFI_HII_ROW_INFO                    **RowInfoArray OPTIONAL,
  OUT UINTN                               *RowInfoArraySize OPTIONAL,
  OUT UINTN                               *ColumnInfoArray OPTIONAL
  );
```

Parameters

Same with *EFI_HII_FONT_PROTOCOL.STRINGTOIMAGE()* .

Description

This function is similar to *EFI_HII_FONT_PROTOCOL.StringToImage()*. The difference is that this function will locate all *EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL* instances that are installed in the system when the glyph in the string with the given font information is not found in the current HII glyph database. The function will attempt to generate the glyph information and the bitmap using the first *EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL* instance that supports the requested font information in the *EFI_FONT_DISPLAY_INFO*.

Status Codes Returned — Same with *EFI_HII_FONT_PROTOCOL.STRINGTOIMAGE()* .

34.2.3 EFI_HII_FONT_EX_PROTOCOL.StringIdToImageEx()

Summary

Render a string to a bitmap or the screen containing the contents of the specified string. The prototype of this extension function is the same with *EFI_HII_FONT_PROTOCOL.STRINGTOIMAGE()* .

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_STRING_ID_TO_IMAGE_EX)(
  IN CONST EFI_HII_FONT_EX_PROTOCOL          *This,
  IN EFI_HII_OUT_FLAGS                       Flags,
  IN EFI_HII_HANDLE                          PackageList,
```

(continues on next page)

(continued from previous page)

```
  IN EFI_STRING_ID                           StringId,
  IN CONST CHAR8                             *Language,
  IN CONST EFI_FONT_DISPLAY_INFO             *StringInfo OPTIONAL,
  IN OUT EFI_IMAGE_OUTPUT                    **Blt,
  IN UINTN                                   BltX,
  IN UINTN                                   BltY,
  OUT EFI_HII_ROW_INFO                       **RowInfoArray OPTIONAL,
  OUT UINTN                                  *RowInfoArraySize OPTIONAL,
  OUT UINTN                                  *ColumnInfoArray OPTIONAL
  );
```

Parameters

Same with *EFI_HII_FONT_PROTOCOL.STRINGTOIMAGE()* .

Description

This function is similar to *EFI_HII_FONT_PROTOCOL.StringIdToImage().*The difference is that this function will locate all *EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL* instances that are installed in the system when the glyph in the string with the given font information is not found in the current HII glyph database. The function will attempt to generate the glyph information and the bitmap using the first *EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL* instance that supports the requested font information in the *EFI_FONT_DISPLAY_INFO* .

Status Codes Returned — Same with *EFI_HII_FONT_PROTOCOL.STRINGTOIMAGE()* .

34.2.4 EFI_HII_FONT_EX_PROTOCOL.GetGlyphEx()

Summary

Return image and baseline about a single glyph. The prototype of this extension function is the same with *EFI_HII_FONT_PROTOCOL.GETGLYPH()* .

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GET_GLYPH_EX)(
  IN CONST EFI_HII_FONT_EX_PROTOCOL     *This,
  IN CHAR16                             Char,
  IN CONST EFI_FONT_DISPLAY_INFO        *StringInfo,
  IN OUT EFI_IMAGE_OUTPUT               **Blt,
  IN UINTN                              Baseline OPTIONAL
  );
```

Parameters — Same with *EFI_HII_FONT_PROTOCOL.GETGLYPH()* .

Description

The difference is that this function will locate all *EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL* instances that are installed in the system when the glyph in the string with the given font information is not found in the current HII glyph database. The function will attempt to generate the glyph information and the bitmap using the first *EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL* instance that supports the requested font information in the *EFI_FONT_DISPLAY_INFO.*

Status Codes Returned — Same as *EFI_HII_FONT_PROTOCOL.GETGLYPH()* .

34.2.5 EFI_HII_FONT_EX_PROTOCOL.GetFontInfoEx()

Summary

Return information about a particular font. The prototype of this extension function is the same with

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GET_FONT_INFO_EX)(
  IN CONST EFI_HII_FONT_EX_PROTOCOL             *This,
  IN OUT EFI_FONT_HANDLE                        *FontHandle,
  IN CONST EFI_FONT_DISPLAY_INFO                *StringInfoIn, OPTIONAL
  OUT EFI_FONT_DISPLAY_INFO                     **StringInfoOut,
  IN CONST EFI_STRING                           String OPTIONAL
  );
```

Parameters — Same with *EFI_HII_FONT_PROTOCOL.GETFONTINFO()* .

Description

Same with *EFI_HII_FONT_PROTOCOL.GETFONTINFO()* . This protocol invokes *EFI_HII_FONT_PROTOCOL.GETFONTINFO()* . implicitly.

Status Codes Returned — Same as *EFI_HII_FONT_PROTOCOL.GETFONTINFO()* .

34.2.6 EFI_HII_FONT_EX_PROTOCOL.GetGlyphInfo()

Summary

The function returns the information of the single glyph.

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GET_GLYPH_INFO)(
  IN CONST EFI_HII_FONT_EX_PROTOCOL          *This,
  IN CHAR16                                  Char,
  IN CONST EFI_FONT_DISPLAY_INFO             *FontDisplayInfo,
  OUT EFI_HII_GLYPH_INFO *                   GlyphInfo
  );
```

Parameters

This
EFI_HII_FONT_EX_PROTOCOL instance.

Char
Information of Character to retrieve.

FontDisplayInfo
Font display information of this character.

GlyphInfo
Pointer to retrieve the glyph information.

Description

This function returns the glyph information of character in the specific font family. This function will locate all *EFI_HII_FONT_GLYPH_GENERATOR* protocol instances that are installed in the system, and attempt to use them if it can't find the glyph information in the font database. It returns *EFI_UNSUPPORTED* if neither the font database nor any instances of the *EFI_HII_FONT_GLYPH_GENRATOR* protocols support the font glyph in the specific font family. Otherwise, the *EFI_HII_GLYPH_INFO* is returned in *GlyphInfo*. This function only returns the glyph geometry information instead of allocating the buffer for *EFI_IMAGE_OUTPUT* and drawing the glyph in the buffer.

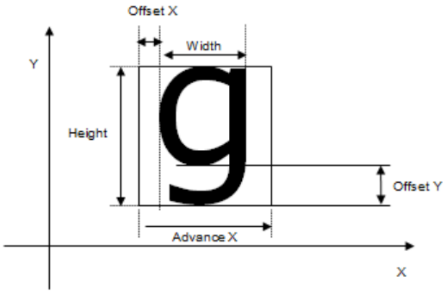

Fig. 34.1: **Glyph Example**

Status Codes Returned

EFI_SUCCESS	The glyph information was returned to *GlyphInfo*.
EFI_OUT_OF_RESOURCES	Memory allocation failed in this function.
EFI_NOT_FOUND	The input character was not found in the database.
EFI_UNSUPPORTED	The font is not supported.
EFI_INVALID_PARAMETER	The *GlyphInfo* or *FontDisplayInfo* was NULL.

34.2.7 Code Definitions

34.2.7.1 EFI_FONT_DISPLAY_INFO

Summary

Describes font output-related information.

Prototype

```
typedef struct _EFI_FONT_DISPLAY_INFO {
  EFI_GRAPHICS_OUTPUT_BLT_PIXEL              ForegroundColor;
  EFI_GRAPHICS_OUTPUT_BLT_PIXEL              BackgroundColor;
  EFI_FONT_INFO_MASK                         FontInfoMask;
  EFI_FONT_INFO                              FontInfo
}  EFI_FONT_DISPLAY_INFO;
```

Members

FontInfo
The font information. Type *EFI_FONT_INFO* is defined in *EFI_HII_STRING_PROTOCOL.NewString()*.

ForegroundColor
The color of the "on" pixels in the glyph in the bitmap.

BackgroundColor

The color of the "off" pixels in the glyph in the bitmap.

FontInfoMask

The font information mask determines which portion of the font information will be used and what to do if the specific font is not available.

Description

This structure is used for describing the way in which a string should be rendered in a particular font. *FontInfo* specifies the basic font information and *ForegroundColor* and *BackgroundColor* specify the color in which they should be displayed. The flags in *FontInfoMask* describe where the system default should be supplied instead of the specified information. The flags also describe what options can be used to make a match between the font requested and the font available.

If *EFI_FONT_INFO_SYS_FONT* is specified, then the font name in *FontInfo* is ignored and the system font name is used. This flag cannot be used with *EFI_FONT_INFO_ANY_FONT.*

If *EFI_FONT_INFO_SYS_SIZE* is specified, then the font height specified in *FontInfo* is ignored and the system font height is used instead. This flag cannot be used with *EFI_FONT_INFO_ANY_SIZE.*

If *EFI_FONT_INFO_SYS_STYLE* is specified, then the font style in *FontInfo* is ignored and the system font style is used. This flag cannot be used with *EFI_FONT_INFO_ANY_STYLE.*

If *EFI_FONT_INFO_SYS_FORE_COLOR* is specified, then *ForegroundColor* is ignored and the system foreground color is used.

If *EFI_FONT_INFO_SYS_BACK_COLOR* is specified, then *BackgroundColor* is ignored and the system background color is used.

If *EFI_FONT_INFO_RESIZE* is specified, then the system may attempt to stretch or shrink a font to meet the size requested. This flag cannot be used with *EFI_FONT_INFO_ANY_SIZE.*

If *EFI_FONT_INFO_RESTYLE* is specified, then the system may attempt to remove some of the specified styles in order to meet the style requested. This flag cannot be used with *EFI_FONT_INFO_ANY_STYLE.*

If *EFI_FONT_INFO_ANY_FONT* is specified, then the system may attempt to match with any font. This flag cannot be used with *EFI_FONT_INFO_SYS_FONT.*

If *EFI_FONT_INFO_ANY_SIZE* is specified, then the system may attempt to match with any font size. This flag cannot be used with *EFI_FONT_INFO_SYS_SIZE* or *EFI_FONT_INFO_RESIZE* .

If *EFI_FONT_INFO_ANY_STYLE* is specified, then the system may attempt to match with any font style. This flag cannot be used with *EFI_FONT_INFO_SYS_STYLE* or *EFI_FONT_INFO_RESTYLE.*

Related Definitions

```
typedef UINT32 EFI_FONT_INFO_MASK;

#define EFI_FONT_INFO_ANY_SIZE         0x00020000
#define EFI_FONT_INFO_ANY_STYLE        0x00040000
```

34.2.7.2 EFI_IMAGE_OUTPUT

Summary

Describes information about either a bitmap or a graphical output device.

Prototype

```
typedef struct _EFI_IMAGE_OUTPUT {
  UINT16                              Width;
  UINT16                              Height;
  union {
    EFI_GRAPHICS_OUTPUT_BLT_PIXEL      *Bitmap;
    EFI_GRAPHICS_OUTPUT_PROTOCOL       *Screen;
  } Image;
}  EFI_IMAGE_OUTPUT;
```

Members

Width
Width of the output image.

Height
Height of the output image.

Bitmap
Points to the output bitmap.

Screen
Points to the *EFI_GRAPHICS_OUTPUT_PROTOCOL* which describes the screen on which to draw the specified string.

34.3 String Protocol

34.3.1 EFI_HII_STRING_PROTOCOL

Summary

Interfaces which manipulate string data.

GUID

```
#define EFI_HII_STRING_PROTOCOL_GUID \
  { 0xfd96974, 0x23aa, 0x4cdc,\
    { 0xb9, 0xcb, 0x98, 0xd1, 0x77, 0x50, 0x32, 0x2a }}
```

Protocol

```
typedef struct _EFI_HII_STRING_PROTOCOL {
  EFI_HII_NEW_STRING                      NewString;
  EFI_HII_GET_STRING                      GetString;
  EFI_HII_SET_STRING                      SetString;
  EFI_HII_GET_LANGUAGES                   GetLanguages;
  EFI_HII_GET_2ND_LANGUAGES               GetSecondaryLanguages;
}   EFI_HII_STRING_PROTOCOL;
```

Members

NewString
Add a new string.

GetString
Retrieve a string and related string information.

SetString
Change a string.

GetLanguages
List the languages for a particular package list.

GetSecondaryLanguages
List supported secondary languages for a particular primary language.

34.3.2 EFI_HII_STRING_PROTOCOL.NewString()

Summary

Creates a new string in a specific language and add it to strings from a specific package list.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_NEW_STRING) (
  IN CONST EFI_HII_STRING_PROTOCOL          *This,
  IN EFI_HII_HANDLE                         PackageList,
  OUT EFI_STRING_ID                         *StringId
  IN CONST CHAR8                            *Language,
  IN CONST CHAR16                           *LanguageName OPTIONAL,
  IN CONST EFI_STRING                       String,
  IN CONST EFI_FONT_INFO                    *StringFontInfo
  );
```

Parameters

This
A pointer to the *EFI_HII_STRING_PROTOCOL* instance.

PackageList
Handle of the package list where this string will be added.

Language
Points to the language for the new string. The language information is in the format described by *Appendix M — Formats — Language Codes and Language Code Arrays* of the UEFI Specification.

LanguageName
Points to the printable language name to associate with the passed in *Language* field. This is analogous to passing in "zh-Hans" in the *Language* field and *LanguageName* might contain "Simplified Chinese" as the printable language.

String
Points to the new null-terminated string.

StringFontInfo
Points to the new string's font information or NULL if the string should have the default system font, size and style.

StringId

On return, contains the new strings id, which is unique within *PackageList.* Type *EFI_STRING_ID* is defined in *EFI_IFR_OP_HEADER* .

Description

This function adds the string *String* to the group of strings owned by *PackageList,* with the specified font information *StringFontInfo* and returns a new string id. The new string identifier is guaranteed to be unique within the package list. That new string identifier is reserved for all languages in the package list.

Related Definitions

```
typedef struct {
  EFI_HII_FONT_STYLE       FontStyle;
  UINT16                   FontSize;
  CHAR16                   FontName[...];
}   EFI_FONT_INFO;
```

FontStyle

The design style of the font. Type *EFI_HII_FONT_STYLE* is defined in *Fixed Header*.

FontSize

The character cell height, in pixels.

FontName

The null-terminated font family name.

Status Codes Returns

EFI_SUCCESS	The new string was added successfully
EFI_OUT_OF_RESOURCES	Could not add the string.
EFI_INVALID_PARAMETER	*String* is **NULL** or *StringId* is **NULL** or *Language* is **NULL**.
EFI_NOT_FOUND	The input package list could not be found in the current database.

34.3.3 EFI_HII_STRING_PROTOCOL.GetString()

Summary

Returns information about a string in a specific language, associated with a package list.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GET_STRING) (
  IN   CONST EFI_HII_STRING_PROTOCOL      *This,
  IN   CONST CHAR8                        *Language,
  IN   EFI_HII_HANDLE                     PackageList,
  IN   EFI_STRING_ID                      StringId,
  OUT  EFI_STRING                         String,
  IN  OUT UINTN                           *StringSize,
  OUT  EFI_FONT_INFO                      **StringFontInfo OPTIONAL
  );
```

Parameters

This
A pointer to the *EFI_HII_STRING_PROTOCOL* instance.

PackageList
The package list in the HII database to search for the specified string.

Language
Points to the language for the retrieved string. Callers of interfaces that require RFC 4646 language codes to retrieve a Unicode string must use the RFC 4647 algorithm to lookup the Unicode string with the closest matching RFC 4646 language code.

StringId
The string's id, which is unique within *PackageList.*

String
Points to the new null-terminated string.

StringSize
On entry, points to the size of the buffer pointed to by *String,* in bytes. On return, points to the length of the string, in bytes.

StringFontInfo
Points to a buffer that will be callee allocated and will have the string's font information into this buffer. The caller is responsible for freeing this buffer. If the parameter is NULL a buffer will not be allocated and the string font information will not be returned.

Description

This function retrieves the string specified by *StringId* which is associated with the specified *PackageList* in the language *Language* and copies it into the buffer specified by *String.*

If the string specified by *StringId* is not present in the specified *PackageList,* then *EFI_NOT_FOUND* is returned. If the string specified by *StringId* is present, but not in the specified language then *EFI_INVALID_LANGUAGE* is returned.

If the buffer specified by *StringSize* is too small to hold the string, then *EFI_BUFFER_TOO_SMALL* will be returned. *StringSize* will be updated to the size of buffer actually required to hold the string.

Status Codes Returned

EFI_SUCCESS	The string was returned successfully.
EFI_NOT_FOUND	The string specified by *StringId* is not available. The specified *PackageList* is not in the Database.
EFI_INVALID_LANGUAGE	The string specified by *StringId* is available but not in the specified language.
EFI_BUFFER_TOO_SMALL	The buffer specified by *StringLength* is too small to hold the string.
EFI_INVALID_PARAMETER	The *Language* or *StringSize* was **NULL**.
EFI_INVALID_PARAMETER	The value referenced by *StringLength* was not zero and *String* was **NULL**.
EFI_OUT_OF_RESOURCES	There were insufficient resources to complete the request.

34.3.4 EFI_HII_STRING_PROTOCOL.SetString()

Summary

Change information about the string.

Prototype

```
typedef
EFI_STATUS
```

(continues on next page)

(continued from previous page)

```
(EFIAPI *EFI_HII_SET_STRING) (
  IN CONST EFI_HII_STRING_PROTOCOL        *This,
  IN EFI_HII_HANDLE                       PackageList,
  IN EFI_STRING_ID                        StringId,
  IN CONST CHAR8                          *Language,
  IN CONST EFI_STRING                     String,
  IN CONST EFI_FONT_INFO                  *StringFontInfo OPTIONAL

  );
```

Parameters

This
A pointer to the *EFI_HII_STRING_PROTOCOL* instance.

PackageList
The package list containing the strings.

Language
Points to the language for the updated string.

StringId
The string id, which is unique within *PackageList*.

String
Points to the new null-terminated string.

StringFontInfo
Points to the string's font information or **NULL** if the string font information is not changed.

Description

This function updates the string specified by *StringId* in the specified *PackageList* to the text specified by *String* and, optionally, the font information specified by *StringFontInfo* . There is no way to change the font information without changing the string text.

Status Codes Returned

EFI_SUCCESS	The string was successfully updated.
EFI_NOT_FOUND	The string specified by *StringId* is not in the database. The specified *PackageList* is not in the Database.
EFI_INVALID_PARAMETER	The *String* or *Language* was **NULL**.
EFI_OUT_OF_RESOURCES	The system is out of resources to accomplish the task.

34.3.5 EFI_HII_STRING_PROTOCOL.GetLanguages()

Summary

Returns a list of the languages present in strings in a package list.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GET_LANGUAGES) (
  IN   CONST EFI_HII_STRING_PROTOCOL      *This,
```

(continues on next page)

(continued from previous page)

```
  IN   EFI_HII_HANDLE                        PackageList,
  IN OUT CHAR8                               *Languages,
  IN OUT UINTN                               *LanguagesSize
  );
```

Parameters

This

A pointer to the *EFI_HII_STRING_PROTOCOL* instance.

PackageList

The package list to examine.

Languages

Points to the buffer to hold the returned null-terminated ASCII string.

LanguageSize

On entry, points to the size of the buffer pointed to by *Languages,* in bytes. On return, points to the length of *Languages,* in bytes.

Description

This function returns the list of supported languages, in the format specified in *Appendix M — Formats — Language Codes and Language Code Arrays* .

Status Codes Returned

EFI_SUCCESS	The languages were returned successfully.
EFI_BUFFER_TOO_SMALL	The *LanguagesSize* is too small to hold the list of supported languages. *LanguageSize* is updated to contain the required size.
EFI_NOT_FOUND	The specified *PackageList* is not in the Database.
EFI_INVALID_PARAMETER	*LanguagesSize* is **NULL**.
EFI_INVALID_PARAMETER	The value referenced by *LanguagesSize* is not zero and *Languages* is **NULL**.

34.3.6 EFI_HII_STRING_PROTOCOL.GetSecondaryLanguages()

Summary

Given a primary language, returns the secondary languages supported in a package list.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GET_2ND_LANGUAGES) (
  IN   CONST EFI_HII_STRING_PROTOCOL        *This,
  IN   EFI_HII_HANDLE                       PackageList,
  IN   CONST CHAR8*                         PrimaryLanguage;
  IN OUT CHAR8                              *SecondaryLanguages,
  IN OUT UINTN                              *SecondaryLanguagesSize
  );
```

Parameters

This

A pointer to the *EFI_HII_STRING_PROTOCOL* instance.

PackageList
The package list to examine.

Primary Language
Points to the null-terminated ASCII string that specifies the primary language. Languages are specified in the format specified in *Appendix M — Formats — Language Codes and Language Code Arrays* of the UEFI Specification.

SecondaryLanguages
Points to the buffer to hold the returned null-terminated ASCII string that describes the list of secondary languages for the specified *PrimaryLanguage*. If there are no secondary languages, the function returns successfully, but this is set to **NULL**.

SecondaryLanguagesSize
On entry, points to the size of the buffer pointed to by *SecondaryLanguages,* in bytes. On return, points to the length of *SecondaryLanguages* in bytes.

Description

Each string package has associated with it a single primary language and zero or more secondary languages. This routine returns the secondary languages associated with a package list.

Status Codes Returned

EFI_SUCCESS	Secondary languages correctly returned
EFI_BUFFER_TOO_SMALL	The buffer specified by *SecondaryLanguagesSize* is too small to hold the returned information. *SecondaryLanguageSize* is updated to hold the size of the buffer required.
EFI_INVALID_LANGUAGE	The language specified by *FirstLanguage* is not present in the specified package list.
EFI_NOT_FOUND	The specified *PackageList* is not in the Database.
EFI_INVALID_PARAMETER	*PrimaryLanguage* or SecondaryLanguagesSize is **NULL**.
EFI_INVALID_PARAMETER	The value referenced by *SecondaryLanguagesSize* is not zero and *SecondaryLanguages* is **NULL**.

34.4 Image Protocol

34.4.1 EFI_HII_IMAGE_PROTOCOL

Summary

Protocol which allow access to images in the images database.

GUID

```
#define EFI_HII_IMAGE_PROTOCOL_GUID \
  { 0x31a6406a, 0x6bdf, 0x4e46,\
    { 0xb2, 0xa2, 0xeb, 0xaa, 0x89, 0xc4, 0x9, 0x20 }}
```

Protocol

```
typedef struct _EFI_HII_IMAGE_PROTOCOL {
  EFI_HII_NEW_IMAGE           NewImage;
  EFI_HII_GET_IMAGE           GetImage;
  EFI_HII_SET_IMAGE           SetImage;
```

(continues on next page)

(continued from previous page)

```
  EFI_HII_DRAW_IMAGE          DrawImage;
  EFI_HII_DRAW_IMAGE_ID       DrawImageId;
} EFI_HII_IMAGE_PROTOCOL;
```

Members

NewImage
Add a new image.

GetImage
Retrieve an image and related font information.

SetImage
Change an image.

34.4.2 EFI_HII_IMAGE_PROTOCOL.NewImage()

Summary

Creates a new image and add it to images from a specific package list.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_NEW_IMAGE) (
  IN CONST EFI_HII_IMAGE_PROTOCO     *This,
  IN EFI_HII_HANDLE                  PackageList,
  OUT EFI_IMAGE_ID                   *ImageId
  IN CONST EFI_IMAGE_INPUT           *Image
  );
```

Parameters

This
A pointer to the *EFI_HII_IMAGE_PROTOCOL* instance.

PackageList
Handle of the package list where this image will be added.

ImageId
On return, contains the new image id, which is unique within *PackageList.*

Image
Points to the image.

Description

This function adds the image *Image* to the group of images owned by *PackageList,* and returns a new image identifier (*ImageId*).

Related Definitions

```
typedef UINT16 EFI_IMAGE_ID;

typedef struct {
  UINT32                         Flags;
```

(continues on next page)

(continued from previous page)

```
  UINT16                          Width;
  UINT16                          Height;
  EFI_GRAPHICS_OUTPUT_BLT_PIXEL  *Bitmap;
}   EFI_IMAGE_INPUT;
```

Flags

Describe image characteristics. If EFI_IMAGE_TRANSPARENT is set, then the image was designed for transparent display. *#define EFI_IMAGE_TRANSPARENT 0x00000001*

Width

Image width, in pixels.

Height

Image height, in pixels.

Bitmap

A pointer to the actual bitmap, organized left-to-right, top-to-bottom. The size of the bitmap is Width * Height * size of (EFI_GRAPHICS_OUTPUT_BLT_PIXEL).

Status Codes Returned

EFI_SUCCESS	The new image was added successfully
EFI_OUT_OF_RESOURCES	Could not add the image.
EFI_INVALID_PARAMETER	*Image* is **NULL** or *ImageId* is **NULL**.
EFI_NOT_FOUND	The *PackageList* could not be found.

34.4.3 EFI_HII_IMAGE_PROTOCOL.GetImage()

Summary

Returns information about an image, associated with a package list.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GET_IMAGE) (
  IN CONST EFI_HII_IMAGE_PROTOCOL    *This,
  IN EFI_HII_HANDLE                  PackageList,
  IN EFI_IMAGE_ID                    ImageId,
  OUT EFI_IMAGE_INPUT                *Image
  );
```

Parameters

This

A pointer to the *EFI_HII_IMAGE_PROTOCOL* instance.

PackageList

The package list in the HII database to search for the specified image.

ImageId

The image’s id, which is unique within *PackageList*.

Image

Points to the new image.

Description

This function retrieves the image specified by *ImageId* which is associated with the specified *PackageList* and copies it into the buffer specified by *Image.*

If the image specified by *ImageId* is not present in the specified *PackageList,* then *EFI_NOT_FOUND* is returned.

The actual bitmap (I *mage->Bitmap*) should not be freed by the caller and should not be modified directly.

Status Codes Returned

EFI_SUCCESS	The image was returned successfully.
EFI_NOT_FOUND	The image specified by *ImageId* is not available. The specified *PackageList* is not in the Database.
EFI_INVALID_PARAMETER	*Image* was NULL.
EFI_OUT_OF_RESOURCES	The bitmap could not be retrieved because there was not enough memory.

34.4.4 EFI_HII_IMAGE_PROTOCOL.SetImage()

Summary

Change information about the image.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_SET_IMAGE) (
  IN CONST EFI_HII_IMAGE_PROTOCOL    *This,
  IN EFI_HII_HANDLE                  PackageList,
  IN EFI_IMAGE_ID                    ImageId,
  IN CONST EFI_IMAGE_INPUT           *Image,
  );
```

Parameters

This
A pointer to the *EFI_HII_IMAGE_PROTOCOL* instance.

PackageList
The package list containing the images.

ImageId
The image id, which is unique within *PackageList.*

Image
Points to the image.

Description

This function updates the image specified by *ImageId* in the specified *PackageListHandle* to the image specified by *Image* .

Status Codes Returned

EFI_SUCCESS	The image was successfully updated.
EFI_NOT_FOUND	The image specified by *ImageId* is not in the database. The specified *PackageList* is not in the Database.

continues on next page

Table 34.13 – continued from previous page

EFI_INVALID_PARAMETER	The *Image* was **NULL**.

34.4.5 EFI_HII_IMAGE_PROTOCOL.DrawImage()

Summary

Renders an image to a bitmap or to the display.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DRAW_IMAGE) (
  IN CONST EFI_HII_IMAGE_PROTOCOL    *This,
  IN EFI_HII_DRAW_FLAGS              Flags,
  IN CONST EFI_IMAGE_INPUT           *Image,
  IN OUT EFI_IMAGE_OUTPUT            **Blt,
  IN UINTN                           BltX,
  IN UINTN                           BltY,
  );
```

Parameters

This

A pointer to the *EFI_HII_IMAGE_PROTOCOL* instance.

Flags

Describes how the image is to be drawn. *EFI_HII_DRAW_FLAGS* is defined in Related Definitions, below.

Image

Points to the image to be displayed.

Blt

If this points to a non-NULL on entry, this points to the image, which is *Width* pixels wide and *Height* pixels high. The image will be drawn onto this image and *EFI_HII_DRAW_FLAG_CLIP* is implied. If this points to a NULL on entry, then a buffer will be allocated to hold the generated image and the pointer updated on exit. It is the caller's responsibility to free this buffer.

BltX, BltY

Specifies the offset from the left and top edge of the image of the first pixel in the image.

Description

This function renders an image to a bitmap or the screen using the specified color and options. It draws the image on an existing bitmap, allocates a new bitmap or uses the screen. The images can be clipped.

If *EFI_HII_DRAW_FLAG_CLIP* is set, then all pixels drawn outside the bounding box specified by *Width* and *Height* are ignored.

The *EFI_HII_DRAW_FLAG_TRANSPARENT* flag determines whether the image will be drawn transparent or opaque. If *EFI_HII_DRAW_FLAG_FORCE_TRANS* is set then the image's pixels will be drawn so that all "off" pixels in the image will be drawn using the pixel value from *BLT* and all other pixels will be copied. If *EFI_HII_DRAW_FLAG_FORCE_OPAQUE* is set, then the image's pixels will be copied directly to the destination. If *EFI_HII_DRAW_FLAG_DEFAULT* is set, then the image will be drawn transparently or opaque, depending on the image's transparency setting (see EFI_IMAGE_TRANSPARENT). Images cannot be drawn transparently if *Blt* is NULL.

If *EFI_HII_DIRECT_TO_SCREEN* is set, then the image will be written directly to the output device specified by *Screen*. Otherwise the image will be rendered to the bitmap specified by *Bitmap*.

Status Codes Returned

EFI_SUCCESS	The image was successfully updated.
EFI_OUT_OF_RESOURCES	Unable to allocate an output buffer for *Blt*.
EFI_INVALID_PARAMETER	The *Image* or *Blt* was **NULL**.

34.4.6 EFI_HII_IMAGE_PROTOCOL.DrawImageId()

Summary

Render an image to a bitmap or the screen containing the contents of the specified image.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DRAW_IMAGE_ID) (
  IN CONST EFI_HII_IMAGE_PROTOCOL      *This,
  IN EFI_HII_DRAW_FLAGS                Flags,
  IN EFI_HII_HANDLE                    PackageList,
  IN EFI_IMAGE_ID                      ImageId,
  IN OUT EFI_IMAGE_OUTPUT              **Blt,
  IN UINTN                             BltX,
  IN UINTN                             BltY,
  );
```

Parameters

This

A pointer to the *EFI_HII_IMAGE_PROTOCOL* instance.

Flags

Describes how the image is to be drawn. *EFI_HII_DRAW_FLAGS* is defined in Related Definitions, below.

PackageList

The package list in the HII database to search for the specified image.

ImageId

The image's id, which is unique within *PackageList*.

Blt

If this points to a non-NULL on entry, this points to the image, which is *Width* pixels wide and *Height* pixels high. The image will be drawn onto this image and *EFI_HII_DRAW_FLAG_CLIP* is implied. If this points to a NULL on entry, then a buffer will be allocated to hold the generated image and the pointer updated on exit. It is the caller's responsibility to free this buffer.

BltX, BltY

Specifies the offset from the left and top edge of the output image of the first pixel in the image.

Description

This function renders an image to a bitmap or the screen using the specified color and options. It draws the image on an existing bitmap, allocates a new bitmap or uses the screen. The images can be clipped.

If EFI_HII_DRAW_FLAG_CLIP is set, then all pixels drawn outside the bounding box specified by *Width* and *Height* are ignored.

The EFI_HII_DRAW_FLAG_TRANSPARENT flag determines whether the image will be drawn transparent or opaque. If EFI_HII_DRAW_FLAG_FORCE_TRANS is set, then the image will be drawn so that all "off" pixels in the image will be drawn using the pixel value from Blt and all other pixels will be copied. If EFI_HII_DRAW_FLAG_FORCE_OPAQUE is set, then the image's pixels will be copied directly to the destination. If EFI_HII_DRAW_FLAG_DEFAULT is set, then the image will be drawn transparently or opaque, depending on the image's transparency setting (EFI_IMAGE_TRANSPARENT). Images cannot be drawn transparently if Blt is NULL.

If EFI_HII_DIRECT_TO_SCREEN is set, then the image will be written directly to the output device specified by *Screen*. Otherwise the image will be rendered to the bitmap specified by *Bitmap*.

Related Definitions

```
typedef UINT32 EFI_HII_DRAW_FLAGS;
#define EFI_HII_DRAW_FLAG_CLIP           0x00000001
#define EFI_HII_DRAW_FLAG_TRANSPARENT    0x00000030
#define EFI_HII_DRAW_FLAG_DEFAULT        0x00000000
#define EFI_HII_DRAW_FLAG_FORCE_TRANS    0x00000010
#define EFI_HII_DRAW_FLAG_FORCE_OPAQUE   0x00000020
#define EFI_HII_DIRECT_TO_SCREEN         0x00000080
```

Status Codes Returned

EFI_SUCCESS	The image was successfully updated.
EFI_OUT_OF_RESOURCES	Unable to allocate an output buffer for *RowInfoArray* or *Blt*.
EFI_NOT_FOUND	The image specified by *ImageId* is not in the database. The specified *PackageList* is not in the Database
EFI_INVALID_PARAMETER	The *Image* or *Blt* was **NULL**.

34.5 EFI HII Image Ex Protocol

The EFI HII Image Ex protocol defines an extension to the EFI HII Image protocol which enables various new capabilities described in this section.

34.5.1 EFI_HII_IMAGE_EX_PROTOCOL

Summary

Protocol which allows access to the images in the images database

GUID

```
#define EFI_HII_IMAGE_EX_PROTOCOL_GUID \
  {0x1a1241e6, 0x8f19, 0x41a9, 0xbc, \
    {0xe, 0xe8, 0xef,0x39, 0xe0, 0x65, 0x46}}
```

Protocol

```
typedef struct _EFI_HII_IMAGE_EX_PROTOCOL {
  EFI_HII_NEW_IMAGE_EX               NewImageEx;
  EFI_HII_GET_IMAGE_EX               GetImageEx;
```

(continues on next page)

(continued from previous page)

```
  EFI_HII_SET_IMAGE_EX                   SetImageEx;
  EFI_HII_DRAW_IMAGE_EX                  DrawImageEx;
  EFI_HII_DRAW_IMAGE_ID_EX               DrawImageIdEx;
  EFI_HII_GET_IMAGE_INFO                 GetImageInfo;
}   EFI_HII_IMAGE_EX_PROTOCOL;
```

Members

NewImageEx
Add a new image. This protocol invokes the original *EFI_HII_IMAGE_PROTOCOL.NewImage()* implicitly.

GetImageEx
Retrieve an image and the related image information. This function will try to locate the *EFI_HII_IMAGE_DECODER_PROTOCOL* if the image decoder for the image is not supported by the EFI HII image EX protocol.

SetImageEx
Change information about the image, this protocol invokes original *EFI_HII_IMAGE_PROTOCOL.SetImage()* implicitly.

DrawImageEx
Renders an image to a bitmap or the display, this protocol invokes original *EFI_HII_IMAGE_PROTOCOL.DrawImage()* implicitly.

DrawImageIdEx
Renders an image to a bitmap or the screen containing the contents of the specified image, this protocol invokes original *EFI_HII_IMAGE_PROTOCOL.DrawImageId()* implicitly.

GetImageInfo
This function retrieves the image information specified by the image ID which is associated with the specified HII package list. This function only returns the geometry of the image instead of allocating the memory buffer and decoding the image to the buffer.

34.5.2 EFI_HII_IMAGE_EX_PROTOCOL.NewImageEx()

Summary

The prototype of this extension function is the same with *EFI_HII_IMAGE_PROTOCOL.NEWIMAGE()* .

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_NEW_IMAGE_EX)(
  IN CONST EFI_HII_IMAGE_EX_PROTOCOL     *This,
  IN EFI_HII_HANDLE                      PackageList,
  OUT EFI_IMAGE_ID                       *ImageId
  IN OUT EFI_IMAGE_INPUT                 *Image
);
```

Parameters

Same with *EFI_HII_IMAGE_PROTOCOL.NEWIMAGE()* .

Description

Same with *EFI_HII_IMAGE_PROTOCOL.NEWIMAGE()* . This protocol invokes *EFI_HII_IMAGE_PROTOCOL.NEWIMAGE()* implicitly.

Status Codes Returned — Same as *EFI_HII_IMAGE_PROTOCOL.NEWIMAGE()*

34.5.3 EFI_HII_IMAGE_EX_PROTOCOL.GetImageEx()

Summary

Return the information about the image, associated with the package list. The prototype of this extension function is the same with *EFI_HII_IMAGE_PROTOCOL.GETIMAGE()*

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GET_IMAGE_EX)(
  IN CONST EFI_HII_IMAGE_EX_PROTOCOL   *This,
  IN EFI_HII_HANDLE                    PackageList,
  IN EFI_IMAGE_ID                      ImageId,
  OUT EFI_IMAGE_INPUT                  *Image
);
```

Parameters — Same with *EFI_HII_IMAGE_PROTOCOL.GETIMAGE()* .

Description

This function is similar to *EFI_HII_IMAGE_PROTOCOL.GETIMAGE()* . The difference is that this function will locate all *EFI_HII_IMAGE_DECODER_PROTOCOL* instances installed in the system if the decoder of the certain image type is not supported by the *EFI_HII_IMAGE_EX_PROTOCOL*. The function will attempt to decode the image to the *EFI_IMAGE_INPUT* using the first *EFI_HII_IMAGE_DECODER_PROTOCOL* instance that supports the requested image type.

Status Codes Returned — Same as *EFI_HII_IMAGE_PROTOCOL.GETIMAGE()* .

34.5.4 EFI_HII_IMAGE_EX_PROTOCOL.SetImageEx()

Summary

Change the information about the image. The prototype of this extension function is the same with *EFI_HII_IMAGE_PROTOCOL.SetImage()* .

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_SET_IMAGE_EX)(
  IN CONST EFI_HII_IMAGE_EX_PROTOCOL      *This,
  IN EFI_HII_HANDLE                       PackageList,
  IN EFI_IMAGE_ID                         ImageId,
  IN CONST EFI_IMAGE_INPUT                *Image
);
```

Parameters — Same with`EFI_HII_IMAGE_PROTOCOL.SetImage()`_ .

Description

Same with *EFI_HII_IMAGE_PROTOCOL.SetImage()* , this protocol invokes *EFI_HII_IMAGE_PROTOCOL.SetImage()* implicitly.

Status Codes Returned — Same as *EFI_HII_IMAGE_PROTOCOL.SetImage()* .

34.5.5 EFI_HII_IMAGE_EX_PROTOCOL.DrawImageEx()

Summary

Renders an image to a bitmap or to the display. The prototype of this extension function is the same with *EFI_HII_IMAGE_PROTOCOL.DrawImageId()* .

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DRAW_IMAGE_EX)(
  IN CONST EFI_HII_IMAGE_EX_PROTOCOL       *This,
  IN EFI_HII_DRAW_FLAGS                    Flags,
  IN CONST EFI_IMAGE_INPUT                 *Image,
  IN OUT EFI_IMAGE_OUTPUT                  **Blt,
  IN UINTN                                 BltX,
  IN UINTN                                 BltY
);
```

Parameters

Same with *EFI_HII_IMAGE_PROTOCOL.DrawImageId()* .

Description

Same with *EFI_HII_IMAGE_PROTOCOL.DrawImage()* ` this protocol invokes *EFI_HII_IMAGE_PROTOCOL.DrawImage()* implicitly.

Status Codes Returned — Same as *EFI_HII_IMAGE_PROTOCOL.DrawImage()*

34.5.6 EFI_HII_IMAGE_EX_PROTOCOL.DrawImageIdEx()

Summary

Renders an image to a bitmap or the screen containing the contents of the specified image. The prototype of this extension function is the same with *EFI_HII_IMAGE_PROTOCOL.DrawImageID()*

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DRAW_IMAGE_ID_EX)(
  IN CONST EFI_HII_IMAGE_EX_PROTOCOL     *This,
  IN EFI_HII_DRAW_FLAGS                  Flags,
  IN EFI_HII_HANDLE                      PackageList,
  IN EFI_IMAGE_ID                        ImageId,
  IN OUT EFI_IMAGE_OUTPUT                **Blt,
  IN UINTN                               BltX,
  IN UINTN                               BltY
);
```

Parameters — Same with *EFI_HII_IMAGE_PROTOCOL.DrawImageID()* .

Description

This function is similar to *EFI_HII_IMAGE_PROTOCOL.DrawImageID()* . The difference is that this function will locate all *EFI_HII_IMAGE_DECODER_PROTOCOL* instances installed in the system if the decoder of the certain image type is not supported by the *EFI_HII_IMAGE_EX_PROTOCOL*. The function will attempt to decode the image to the *EFI_IMAGE_INPUT* using the first *EFI_HII_IMAGE_DECODER_PROTOCOL* instance that supports the requested image type.

Status Codes Returned — Same as *EFI_HII_IMAGE_PROTOCOL.DrawImageID()* .

34.5.7 EFI_HII_IMAGE_EX_PROTOCOL.GetImageInfo()

Summary

The function returns the information of the image. This function is differ from the *EFI_HII_IMAGE_EX_PROTOCOL.GetImageEx()* . This function only returns the geometry of the image instead of decoding the image to the buffer.

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GET_IMAGE_INFO)(
  IN CONST EFI_HII_IMAGE_EX_PROTOCOL       *This,
  IN EFI_HII_HANDLE                        PackageList,
  IN EFI_IMAGE_ID                          ImageId,
  OUT EFI_IMAGE_OUTPUT                     *Image
);
```

Parameters

This
EFI_HII_IMAGE_EX_PROTOCOL instance.

PackageList
The HII package list.

ImageId
The HII image ID.

Image
EFI_IMAGE_OUTPUT to retrieve the image information. Only *Image.Width* and Image.Height will be updated by this function. *Image.Bitmap* is always set to **NULL.**

Description

This function returns the image information to EFI_IMAGE_OUTPUT. Only the width and height are returned to the *EFI_IMAGE_OUTPUT* instead of decoding the image to the buffer. This function is used to get the geometry of the image. *This function will try to locate all of the EFI_HII_IMAGE_DECODER_PROTOCOL installed on the system if the decoder of image type is not supported by the EFI_HII_IMAGE_EX_PROTOCOL* .

Status Codes Returned

EFI_SUCCESS	The image information was returned to Image.
EFI_OUT_OF_RESOURCES	Memory allocation failed in this function.
EFI_UNSUPPORTED	The format of image is not supported.
EFI_NOT_FOUND	The image was not found in the database.
EFI_INVALID_PARAMETER	The Image was NULL or ImageId was 0.

34.6 EFI HII Image Decoder Protocol

For those HII image block types which don't have the corresponding image decoder supported in EFI HII image EX protocol, *EFI_HII_IMAGE_DECODER_PROTOCOL* can be used to provide the proper image decoder. There may be more than one *EFI_HII_IMAGE_DECODER_PROTOCOL* instance installed in the system. Each image decoder can decode more than on HII image block types. Whether or not the HII image block type of image is supported by the certain image decoder is reported through the *EFI_HII_IMAGE_DECODER_PROTOCOL. GetImageDecoderName()* . Caller can invoke this function to verify the image is supported by the image decoder before sending the image raw data to the image decoder. There are two image decoder names defined in this specification: *EFI_HII_IMAGE_DECODER_NAME_JPEG* and *EFI_HII_IMAGE_DECODER_NAME_PNG*.

The image decoder protocol can publish the support for additional image decoder names other than the ones defined in this specification. This allows the image decoder to support additional image formats that are not defined by the HII image block types. In that case, callers can send the image raw data to the image decoder protocol instance to retrieve the image information or decode the image. Since the HII image block type of such images is not defined, the image may or may not be decoded by that decoder. The decoder can use the signature or data structures in the image raw data is check the format before it processes the image.

The *EFI_HII_IMAGE_EX_PROTOCOL* uses *EFI_HII_IMAGE_DECODER_PROTOCOL* as follows:

34.6.1 EFI_HII_IMAGE_DECODER_PROTOCOL.DecodeImage()

Summary

Provides the image decr for specific image file formats.

GUID

```
#define EFI_HII_IMAGE_DECODER_PROTOCOL_GUID \
  {0x9E66F251, 0x727C, 0x418C, \
  {0xBF, 0xD6, 0xC2, 0xB4, 0x25, 0x28, 0x18, 0xEA}}
```

Protocol

```
typedef struct _EFI_HII_IMAGE_DECODER_PROTOCOL {
  EFI_HII_IMAGE_DECODER_GET_NAME            GetImageDecoderName;
  EFI_HII_IMAGE_DECODER_GET_IMAGE_INFO      GetImageInfo;
  EFI_HII_IMAGE_DECODER_DECODE              DecodeImage;
}  EFI_HII_IMAGE_DECODER_PROTOCOL;
```

Members

GetImageDecodeName
The function returns the decoder name.

GetImageInfo
The function returns the image information

DecodeImage
The function decodes the image to the *EFI_IMAGE_INPUT*

Status Codes Returned

EFI_SUCCESS	The image information was returned to *Bitmap*.
EFI_UNSUPPORTED	The image decoder can't decode this image.

continues on next page

Table 34.17 – continued from previous page

EFI_OUT_OF_RESOURCE	Not enough memory to decode this image.
EFI_INVALID_PARAMETER	The *Image* was **NULL** or *ImageRawDataSize* was 0.

34.6.2 EFI_HII_IMAGE_DECODER_PROTOCOL.GetImageDecoderName()

Summary

This function returns the decoder name.

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_IMAGE_DECODER_GET_NAME)(
  IN CONST EFI_HII_IMAGE_DECODER_PROTOCOL      *This,
  IN OUT EFI_GUID                              **DecoderName,
  OUT UINT16                                   *NumberOfDecoderName
);
```

Parameters

This

EFI_HII_IMAGE_DECODER_PROTOCOL instance.

DecoderName

Pointer to a dimension to retrieve the decoder names in *EFI_GUID* format. The number of the decoder names is returned in *NumberOfDecoderName*.

NumberOfDecoderName

Pointer to retrieve the number of decoders which supported by this decoder driver.

Description

There could be more than one *EFI_HII_IMAGE_DECODER_PROTOCOL* instances installed in the system for different image formats. This function returns the decoder name which callers can use to find the proper image decoder for the image. It is possible to support multiple image formats in one *EFI_HII_IMAGE_DECODER_PROTOCOL*. The capability of the supported image formats is returned in *DecoderName* and *NumberOfDecoderName*.

```

Status Codes Returned

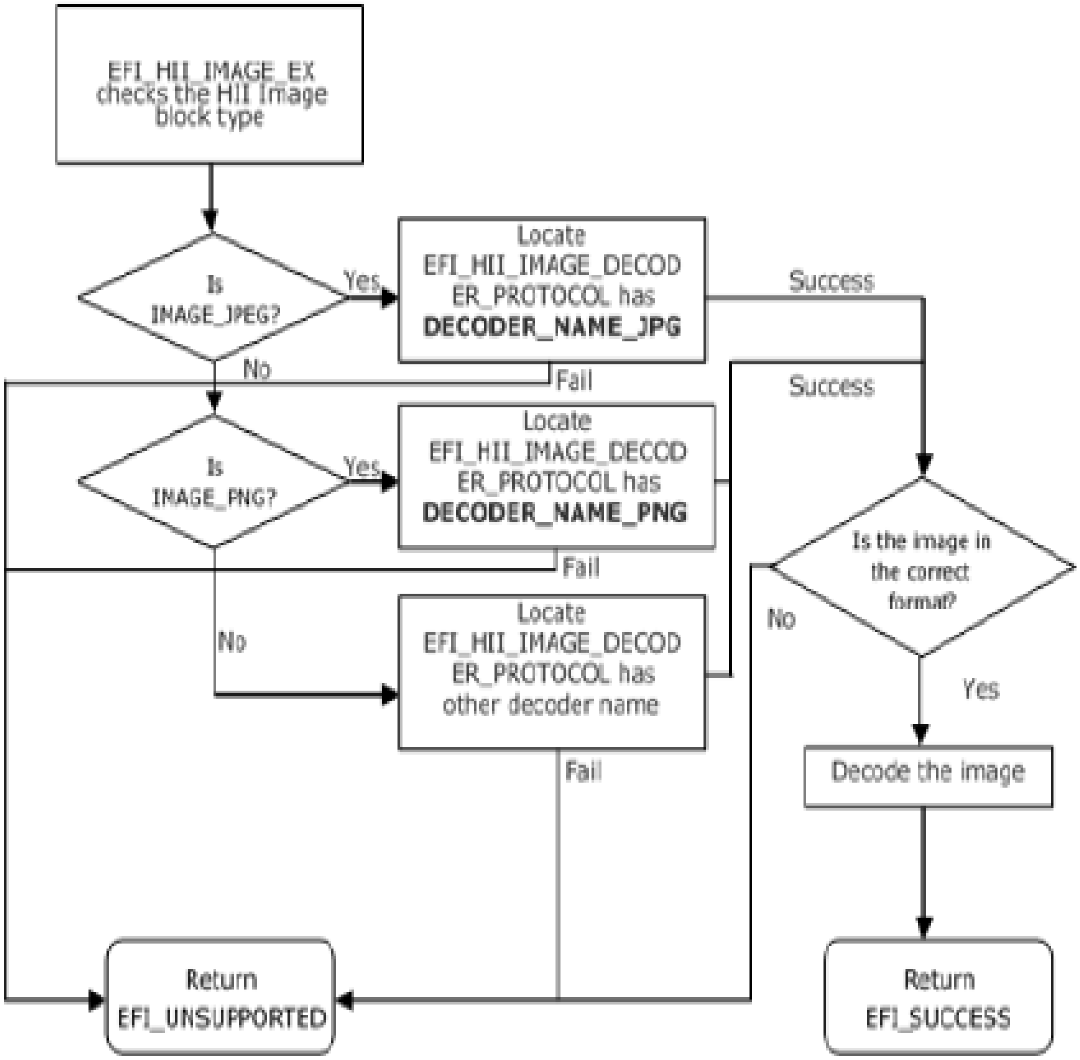

Fig. 34.2: How EFI_HII_IMAGE_EX_PROTOCOL uses EFI_HII_IMAGE_DECODER_PROTOCOL

EFI_SUCCESS	The image decoder names were returned in DecoderName.
EFI_UNSUPPORTED	No image decoders found in this EFI_HII_IMAGE_DECODER instance.

34.6.3 EFI_HII_IMAGE_DECODER_PROTOCOL.GetImageInfo()

Summary

The function returns the *EFI_HII_IMAGE_DECODER_IMAGE_INFO* to the caller.

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_IMAGE_DECODER_GET_IMAGE_INFO)(
  IN CONST EFI_HII_IMAGE_DECODER_PROTOCOL    *This,
  IN VOID                                    *Image,
  IN UINTN                                   SizeOfImage,
  IN OUT EFI_HII_IMAGE_DECODER_IMAGE_INFO    **ImageInfo
);
```

Parameters

This
EFI_HII_IMAGE_DECODER_PROTOCOL instance.

Image
Pointer to the image raw data

SizeOfImage
Size of the entire image raw data

ImageInfo
Pointer to receive the *EFI_HII_IMAGE_DECODER_IMAGE_INFO*

Description

This function returns the image information of the given image raw data. This function first checks whether the image raw data is supported by this decoder or not. This function may go through the first few bytes in the image raw data for the specific data structure or the image signature. If the image is not supported by this image decoder, this function returns *EFI_UNSUPPORTED* to the caller. Otherwise, this function returns the proper image information to the caller. It is the caller's responsibility to free then*ImageInfo*.

Status Codes Returned

EFI_SUCCESS	The image information was returned to ImageInfo.
EFI_UNSUPPORTED	No image decoder for the given Image or the image decoder can't decode this image.
EFI_OUT_OF_RESOURCE	Not enough memory to decode this image for getting the image information.
EFI_INVALID_PARAMETER	The Image was NULL, SizeOfImage was 0 or the image is corrupted.

  //
  // Variable length of image file extension name.
  //
}   EFI_HII_IMAGE_DECODER_OTHER_INFO;
```

Header
EFI_HII_IMAGE_DECODER_IMAGE_INFO_HEADER

ImageExtenion
The string of the image file extension. For example, “GIF”, “TIFF” or others.

34.6.4 EFI_HII_IMAGE_DECODER_PROTOCOL.Decode()

Summary

The function decodes the image

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_IMAGE_DECODER_DECODE)(
  IN CONST EFI_HII_IMAGE_DECODER_PROTOCOL    *This,
  IN VOID                                    *Image,
  IN UINTN                                   ImageRawDataSize,
  IN OUT EFI_IMAGE_OUTPUT                    **Bitmap,
```

(continues on next page)

(continued from previous page)

```
  IN BOOLEAN                                    Transparent
);
```

Parameters

This
EFI_HII_IMAGE_DECODER_PROTOCOL instance.

Image
Pointer to the image raw data

ImageRawDataSize
Size of the entire image raw data

Bitmap
EFI_IMAGE_OUTPUT to receive the image or overlap the image on the original buffer.

Transparent
BOOLEAN value indicates whether the image decoder has to handle the transparent image or not.

Description

This function decodes the image which the image type of this image is supported by this *EFI_HII_IMAGE_DECODER_PROTOCOL*. If *Bitmap* is not **NULL**, the caller intends to put the image in the given image buffer. That allows the caller to put an image overlap on the original image. The transparency is handled by the image decoder because the transparency capability depends on the image format. Callers can set *Transparent* to **FALSE** to force disabling the transparency process on the image. Forcing *Transparent* to **FALSE** may also improve the performance of the image decoding because the image decoder can skip the transparency processing.

If *Bitmap* is **NULL**, the image decoder allocates the memory buffer for the *EFI_IMAGE_OUTPUT* and decodes the image to the image buffer. It is the caller's responsibility to free the memory for *EFI_IMAGE_OUTPUT*. Image decoder doesn't have to handle the transparency in this case because there is no background image given by the caller. The background color in this case is all black (#00000000).

34.7 Font Glyph Generator Protocol

The EFI HII Font glyph generator protocol generates font glyphs of the requested characters according to the given font information. This protocol is utilized by the *EFI_HII_FONT_EX_PROTOCOL* when the character can't be found in the existing glyph database. That is when glyph is not found in any HII font package, *EFI_HII_FONT_EX_PROTOCOL* locates *EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL* to generate glyph block and insert glyph block into HII font package. The HII font package can be an existing HII font package or a new HII font package. This protocol can be provided by any driver that knows how to generate the glyph for a specific font family. For example, EFI application or driver may provide "Times new roman" font glyph generator driver. With this driver, platform can have "Times new roman" font supported on system.*

34.7.1 EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL

Summary

EFI HII Font glyph generator protocol generates the glyph of the character according to the given font information.

GUID

```
#define EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL_GUID \
  { 0xf7102853, 0x7787, 0x4dc2, 0xa8, \
    {0xa8, 0x21, 0xb5, 0xdd, 0x5, 0xc8, 0x9b }}
```

Protocol

```
typedef struct _EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL {
  EFI_GENERATE_GLYPH                GenerateGlyph;
  EFI_GENERATE_IMAGE                GenerateGlyphImage;
}  EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL;
```

Members

GenerateGlyph
The function generates the glyph information according to the given font information.

GenerateGlyphImage
The function generates the glyph image according to the given font information.

34.7.2 EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL.GenerateGlyph()

Summary

The function generates the glyph information according to the given font information. This function returns the glyph block in *EFI_HII_GIBT_GLYPH_VARIABILITY* type.

Protocol

```
typedef
  EFI_STATUS
  (EFIAPI *EFI_HII_GENERATE_GLYPH)(
  IN CONST EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL   *This,
  IN CHAR16                                        Char,
  IN CONST EFI_FONT_DISPLAY_INFO                   *FontInfo,
  OUT EFI_HII_GIBT_VARIABILITY_BLOCK               *GlyphBlock
);
```

Parameters

This
EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL instance.

Char
Character to retrieve.

FontInfo
Font display information of this character.

GlyphBlock
Pointer to retrieve the *EFI_HII_GIBT_VARIABILITY_BLOCK*

Description

This function generates the glyph information of the character in the specific font family. *EFI_HII_GIBT_VARIABILITY_BLOCK* is returned to *GlyphBlock* if *GlyphBlock* is not **NULL**. *GlyphBlock* can be called by *EFI_HII_FONT_EX_PROTOCOL* to retrieve the glyph information which are provided by the font family specific driver, or can be used to build up the HII font package if the HII font package with the specific font family does not exist in the HII database.

Status Codes Returned

EFI_SUCCESS	The glyph information was returned to *GlyphBlock*.
EFI_INVALID_PARAMETER	The FontInfo or *GlyphBloc* was **NULL**,
EFI_OUT_OF_RESOURCE	Not enough memory to generate the glyph information.
EFI_UNSUPPORTED	The font glyph generator can't generate the glyph for the given *Char*. This may caused by the unsupported character, font name font style or font size.

34.7.3 EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL.GenerateGlyphImage()

Summary

The function generates the glyph image according to the given font information. This function returns *EFI_GRAPHICS_OUTPUT_BLT_PIXEL* points to the *EFI_IMAGE_OUTPUT* buffer. This function is used for glyphs which are reported in the font database as *EFI_HII_GIBT_GLYPH_VARIABILITY* glyph blocks.

Protocol

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GENERATE_GLYPH_IMAGE)(
  IN CONST EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL   *This,
  IN CONST EFI_HII_GLYPH_INFO                      *Cell,
  IN UINT8                                         *GlyphBuffer,
  IN CONST EFI_FONT_DISPLAY_INFO                   *FontInfo,
  IN OUT EFI_IMAGE_OUTPUT                          *Image,
  IN INT32                                         *BltX,
  IN INT32                                         *BltY,
  IN BOOLEAN                                       Transparent
);
```

Parameters

This
EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL instance.

Cell
Pointer to *EFI_HII_GLYPH_INFO*

GlyphBuffer
The buffer points to the bitmap of glyph. This pointer points to GlyphBlock.BitmapData which returned from GenerateGlyph()function

FontInfo
Font display information of this glyph.

Image
Image output buffer to retrieve the glyph image.

BltX

Together with BltY, specifies the offset from the left and top edge of the image of the first character cell in the * *Image*.

BltY

Together with BltX, specifies the offset from the left and top edge of the image of the first character cell in the * *Image*.

Transparent

If **TRUE**, the Background color is ignored and all"off" pixels in the character's drawn will use the pixel value from * *Image*.

Description

This function generates the glyph image of the character in the specific font family on the given *EFI_IMAGE_OUTPUT*

Status Codes Returned

EFI_SUCCESS	The glyph image was generated in Image.
EFI_OUT_OF_RESOURCE	Not enough memory to generate image of the given glyph.
EFI_UNSUPPORTED	The font glyph generator can't generate the glyph for the given FontInfo. This may caused by the unsupported font name, font style or font size.
EFI_INVALID_PARAMETER	One or more parameters of Cell, GlyphBuffe, FontInfo, Image, BltX or BltY was **NULL**.

34.8 Database Protocol

34.8.1 EFI_HII_DATABASE_PROTOCOL

Summary

Database manager for HII-related data structures.

GUID

```
#define EFI_HII_DATABASE_PROTOCOL_GUID \
  { 0xef9fc172, 0xa1b2, 0x4693,\
    { 0xb3, 0x27, 0x6d, 0x32, 0xfc, 0x41, 0x60, 0x42 }}
```

Protocol

```
typedef struct _EFI_HII_DATABASE_PROTOCOL {
  EFI_HII_DATABASE_NEW_PACK            NewPackageList;
  EFI_HII_DATABASE_REMOVE_PACK         RemovePackageList;
  EFI_HII_DATABASE_UPDATE_PACK         UpdatePackageList;
  EFI_HII_DATABASE_LIST_PACKS          ListPackageLists;
  EFI_HII_DATABASE_EXPORT_PACKS        ExportPackageLists;
  EFI_HII_DATABASE_REGISTER_NOTIFY     RegisterPackageNotify;
  EFI_HII_DATABASE_UNREGISTER_NOTIFY   UnregisterPackageNotify;
  EFI_HII_FIND_KEYBOARD_LAYOUTS        FindKeyboardLayouts;
  EFI_HII_GET_KEYBOARD_LAYOUT          GetKeyboardLayout;
  EFI_HII_SET_KEYBOARD_LAYOUT          SetKeyboardLayout;
  EFI_HII_DATABASE_GET_PACK_HANDLE     GetPackageListHandle;
}   EFI_HII_DATABASE_PROTOCOL;
```

Members

NewPackageList
Add a new package list to the HII database.

RemovePackageList
Remove a package list from the HII database.

UpdatePackageList
Update a package list in the HII database.

ListPackageLists
List the handles of the package lists within the HII database.

ExportPackageLists
Export package lists from the HII database.

RegisterPackageNotify
Register notification when packages of a certain type are installed.

UnregisterPackageNotify
Unregister notification of packages.

FindKeyboardLayouts
Retrieves a list of the keyboard layouts in the system.

GetKeyboardLayout
Allows a program to extract the current keyboard layout. See the GetKeyboardLayout() function description.

SetKeyboardLayout
Changes the current keyboard layout. See the SetKeyboardLayout() function description.

GetPackageListHandle
Return the EFI handle associated with a given package list.

34.8.2 EFI_HII_DATABASE_PROTOCOL.NewPackageList()

Summary

Adds the packages in the package list to the HII database.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DATABASE_NEW_PACK) (
  IN CONST EFI_HII_DATABASE_PROTOCOL        *This,
  IN CONST EFI_HII_PACKAGE_LIST_HEADER      *PackageList,
  IN CONST EFI_HANDLE                       DriverHandle, OPTIONAL
  OUT EFI_HII_HANDLE                        *Handle
  );
```

Parameters

This
A pointer to the *EFI_HII_DATABASE_PROTOCOL* instance.

PackageList
A pointer to an *EFI_HII_PACKAGE_LIST_HEADER* structure.

DriverHandle
Associate the package list with this EFI handle

Handle
A pointer to the *EFI_HII_HANDLE* instance. Type *EFI_HII_HANDLE* is defined in "Related Definitions" below.

Description

This function adds the packages in the package list to the database and returns a handle. If there is a *EFI_DEVICE_PATH_PROTOCOL* associated with the *DriverHandle,* then this function will create a package of type *EFI_PACKAGE_TYPE_DEVICE_PATH* and add it to the package list.

For each package in the package list, registered functions with the notification type *NEW_PACK* and having the same package type will be called.

For each call to *NewPackageList(),* there should be a corresponding call to *EFI_HII_DATABASE_PROTOCOL.RemovePackageList()* .

Related Definitions

```
typedef void *EFI_HII_HANDLE:
```

Status Codes Returns

EFI_SUCCESS	The package list associated with the *Handle* was added to the HII database.
EFI_OUT_OF_RESOURCES	Unable to allocate necessary resources for the new database contents.
EFI_INVALID_PARAMETER	*PackageList* is **NULL** or *Handle* is **NULL**.

34.8.3 EFI_HII_DATABASE_PROTOCOL.RemovePackageList()

Summary

Removes a package list from the HII database.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DATABASE_REMOVE_PACK) (
  IN CONST EFI_HII_DATABASE_PROTOCOL         *This,
  IN EFI_HII_HANDLE                          Handle
  );
```

Parameters

This
A pointer to the *EFI_HII_DATABASE_PROTOCOL* instance.

Handle
The handle that was registered to the data that is requested for removal. Type *EFI_HII_HANDLE* is defined in *EFI_HII_DATABASE_PROTOCOL.NewPackageList()* in the Packages section.

Description

This function removes the package list that is associated with a handle *Handle* from the HII database. Before removing the package, any registered functions with the notification type *REMOVE_PACK* and the same package type will be called.

For each call to *EFI_HII_DATABASE_PROTOCOL.NewPackageList()* , there should be a corresponding call to RemovePackageList.

Status Codes Returned

EFI_SUCCESS	The data associated with the *Handle* was removed from the HII database.
EFI_NOT_FOUND	The specified *Handle* is not in the Database.

34.8.4 EFI_HII_DATABASE_PROTOCOL.UpdatePackageList()

Summary

Update a package list in the HII database.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DATABASE_UPDATE_PACK) (
  IN CONST EFI_HII_DATABASE_PROTOCOL          *This,
  IN EFI_HII_HANDLE                           Handle,
  IN CONST EFI_HII_PACKAGE_LIST_HEADER        *PackageList,
  );
```

Parameters

This
A pointer to the *EFI_HII_DATABASE_PROTOCOL* instance.

Handle
The handle that was registered to the data that is requested to be updated. Type *EFI_HII_HANDLE* is defined in *EFI_HII_DATABASE_PROTOCOL.NewPackageList()* in the Packages section.

PackageList
A pointer to an instance of EFI_HII_PACKAGE_LIST_HEADER.

Description

This function updates the existing package list (which has the specified *Handle*) in the HII databases, using the new package list specified by *PackageList.* The update process has the following steps:

Collect all the package types in the package list specified by *PackageList.* A package type consists of the *Type* field of *EFI_HII_PACKAGE_HEADER* and, if the *Type* is *EFI_HII_PACKAGE_TYPE_GUID,* the *Guid* field, as defined in *EFI_HII_GUID_PACKAGE_HDR.*

Iterate through the packages within the existing package list in the HII database specified by *Handle.* If a package's type matches one of the types collected in step 1, then perform the following steps:

- Call any functions registered with the notification type *REMOVE_PACK.*
- Remove the package from the package list and the HII database.

Add all of the packages within the new package list specified by *PackageList,* using the following steps:

- Add the package to the package list and the HII database.
- Call any functions registered with the notification type *ADD_PACK.*

Status Codes Returned

EFI_SUCCESS	The HII database was successfully updated.
EFI_OUT_OF_RESOURCES	Unable to allocate enough memory for the updated database.
EFI_INVALID_PARAMETER	*PackageList* was *NULL.*
EFI_NOT_FOUND	The specified *Handle* is not in the Database.

34.8.5 EFI_HII_DATABASE_PROTOCOL.ListPackageLists()

Summary

Determines the handles that are currently active in the database.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DATABASE_LIST_PACKS) (
  IN CONST EFI_HII_DATABASE_PROTOCOL      *This,
  IN UINT8                                PackageType,
  IN CONST EFI_GUID                       *PackageGuid,
  IN OUT UINTN                            *HandleBufferLength,
  OUT EFI_HII_HANDLE                      *Handle
  );
```

Parameters

This

A pointer to the *EFI_HII_DATABASE_PROTOCOL* instance.

PackageType

Specifies the package type of the packages to list or *EFI_HII_PACKAGE_TYPE_ALL* for all packages to be listed.

PackageGuid

If *PackageType* is *EFI_HII_PACKAGE_TYPE_GUID,* then this is the pointer to the GUID which must match the *Guid* field of *EFI_HII_GUID_PACKAGE_HDR.* Otherwise, it must be **NULL**.

HandleBufferLength

On input, a pointer to the length of the handle buffer. On output, the length of the handle buffer that is required for the handles found.

Handle

An array of *EFI_HII_HANDLE* instances returned. Type *EFI_HII_HANDLE* is defined in *EFI_HII_DATABASE_PROTOCOL.NewPackageList()* in the Packages section.

Description

This function returns a list of the package handles of the specified type that are currently active in the database. The pseudo-type *EFI_HII_PACKAGE_TYPE_ALL* will cause all package handles to be listed.

Status Codes Returned

EFI_SUCCESS	A list of Packages was placed in *Handle* successfully. *HandleBufferLength* is updated with the actual length.
EFI_BUFFER_TOO_SMALL	The *HandleBufferLength* parameter indicates that *Handle* is too small to support the number of handles. *HandleBufferLength* is updated with a value that will enable the data to fit.
EFI_INVALID_PARAMETER	*HandleBufferLength* was **NULL.**

continues on next page

Table 34.25 – continued from previous page

EFI_INVALID_PARAMETER	The value referenced by *HandleBufferLength* was not zero and *Handle* was NULL.
EFI_INVALID_PARAMETER	*PackageType* is a *EFI_HII_PACKAGE_TYPE_GUID* but *PackageGuid* is not **NULL.**
EFI_INVALID_PARAMETER	*PackageType* is a *EFI_HII_PACKAGE_TYPE_GUID* but *PackageGuid* is **NULL.**
EFI_NOT_FOUND	No matching handles were found

34.8.6 EFI_HII_DATABASE_PROTOCOL.ExportPackageLists()

Summary

Exports the contents of one or all package lists in the HII database into a buffer.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DATABASE_EXPORT_PACKS) (
  IN CONST EFI_HII_DATABASE_PROTOCOL      *This,
  IN EFI_HII_HANDLE                       Handle,
  IN OUT UINTN                            *BufferSize,
  OUT EFI_HII_PACKAGE_LIST_HEADER         *Buffer
  );
```

Parameters

This

A pointer to the *EFI_HII_DATABASE_PROTOCOL* instance.

Handle

An *EFI_HII_HANDLE* that corresponds to the desired package list in the HII database to export or NULL to indicate all package lists should be exported.

BufferSize

On input, a pointer to the length of the buffer. On output, the length of the buffer that is required for the exported data.

Buffer

A pointer to a buffer that will contain the results of the export function.

Description

This function will export one or all package lists in the database to a buffer. For each package list exported, this function will call functions registered with *EXPORT_PACK* and then copy the package list to the buffer. The registered functions may call *EFI_HII_DATABASE_PROTOCOL.UpdatePackageList()* to modify the package list before it is copied to the buffer.

If the specified *BufferSize* is too small, then the status *EFI_BUFFER_TOO_SMALL* will be returned and the actual package size will be returned in *BufferSize.*

Status Codes Returned

EFI_SUCCESS	Package exported.
EFI_BUFFER_TOO_SMALL	*BufferSize* is too small to hold the package.

continues on next page

Table 34.26 – continued from previous page

EFI_INVALID_PARAMETER	*BufferSize* was NULL
EFI_INVALID_PARAMETER	The value referenced by *BufferSize* was not zero and *Buffer* was **NULL**.
EFI_NOT_FOUND	The specified *Handle* could not be found in the current database.

34.8.7 EFI_HII_DATABASE_PROTOCOL.RegisterPackageNotify()

Summary

Registers a notification function for HII database-related events.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DATABASE_REGISTER_NOTIFY) (
  IN CONST EFI_HII_DATABASE_PROTOCOL         *This,
  IN UINT8                                   PackageType,
  IN CONST EFI_GUID                          *PackageGuid,
  IN CONST EFI_HII_DATABASE_NOTIFY           PackageNotifyFn,
  IN EFI_HII_DATABASE_NOTIFY_TYPE            NotifyType,
  OUT EFI_HANDLE                             *NotifyHandle
  );
```

Parameters

This

A pointer to the *EFI_HII_DATABASE_PROTOCOL* instance.

PackageType

The package type. See EFI_HII_PACKAGE_TYPE_x in *EFI_HII_PACKAGE_HEADER*.

PackageGuid

If *PackageType* is *EFI_HII_PACKAGE_TYPE_GUID*, then this is the pointer to the GUID which must match the *Guid* field of *EFI_HII_GUID_PACKAGE_HDR*. Otherwise, it must be **NULL**.

PackageNotifyFn

Points to the function to be called when the event specified by *NotificationType* occurs. See ` .

NotifyType

Describes the types of notification which this function will be receiving. See *EFI_HII_DATABASE_NOTIFY* for more a list of types.

NotifyHandle

Points to the unique handle assigned to the registered notification. Can be used in *EFI_HII_DATABASE_PROTOCOL.UnregisterPackageNotify()* to stop notifications.

Description

This function registers a function which will be called when specified actions related to packages of the specified type occur in the HII database. By registering a function, other HII-related drivers are notified when specific package types are added, removed or updated in the HII database.

Each driver or application which registers a notification should use *EFI_HII_DATABASE_PROTOCOL.UnregisterPackageNotify()* before exiting.

If a driver registers a **NULL** *PackageGuid* when *PackageType* is *EFI_HII_PACKAGE_TYPE_GUID*, a notification will occur for every package of type *EFI_HII_PACKAGE_TYPE_GUID* that is registered.

Related Definitions

EFI_HII_PACKAGE_HEADER is defined in *EFI_HII_PACKAGE_HEADER* .

EFI_HII_DATABASE_NOTIFY is defined in *EFI_HII_DATABASE_NOTIFY* .

EIF_HII_DATABASE_NOTIFY_TYPE is defined in *EFI_HII_DATABASE_NOTIFY_TYPE* .

Returned Status Codes

EFI_SUCCESS	Notification registered successfully.
EFI_OUT_OF_RESOURCES	Unable to allocate necessary data structures.
EFI_INVALID_PARAMETER	*NotifyHandle* is **NULL.**
EFI_INVALID_PARAMETER	*PackageType* is not an *EFI_HII_PACKAGE_TYPE_GUID* but *PackageGuid* is not **NULL**.
EFI_INVALID_PARAMETER	*PackageType* is a *EFI_HII_PACKAGE_TYPE_GUID* but *PackageGuid* is NULL

34.8.8 EFI_HII_DATABASE_PROTOCOL.UnregisterPackageNotify()

Summary

Removes the specified HII database package-related notification.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DATABASE_UNREGISTER_NOTIFY) (
  IN CONST EFI_HII_DATABASE_PROTOCOL         *This,
  IN EFI_HANDLE                              NotificationHandle
  );
```

Parameters

This
A pointer to the *EFI_HII_DATABASE_PROTOCOL* instance.

NotificationHandle
The handle of the notification function being unregistered.

Returned Status Codes

EFI_SUCCESS	Invalidated
EFI_NOT_FOUND	The *NotificationHandle* could not be found in the database.

34.8.9 EFI_HII_DATABASE_PROTOCOL.FindKeyboardLayouts()

Summary

Retrieves a list of the keyboard layouts in the system.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_FIND_KEYBOARD_LAYOUTS) (
  IN CONST EFI_HII_DATABASE_PROTOCOL      *This,
  IN OUT UINT16                           *KeyGuidBufferLength,
  OUT EFI_GUID                            *KeyGuidBuffer
  );
```

Parameters

This

A pointer to the *EFI_HII_DATABASE_PROTOCOL* instance.

KeyGuidBufferLength

On input, a pointer to the length of the keyboard *GUID* buffer. On output, the length of the handle buffer that is required for the handles found.

KeyGuidBuffer

An array of keyboard layout *GUID* instances returned.

Description

This routine retrieves an array of GUID values for each keyboard layout that was previously registered in the system.

Status Codes Returned

EFI_SUCCESS	*KeyGuidBuffer* was updated successfully.
EFI_BUFFER_TOO_SMALL	The *KeyGuidBufferLength* parameter indicates that *KeyGuidBuffer* is too small to support the number of GUIDs. *KeyGuidBufferLength* is updated with a value that will enable the data to fit.
EFI_INVALID_PARAMETER	*KeyGuidBufferLength* is **NULL.**
EFI_INVALID_PARAMETER	The value referenced by *KeyGuidBufferLength* is not zero and *KeyGuidBuffer* is **NULL**.

34.8.10 EFI_HII_DATABASE_PROTOCOL.GetKeyboardLayout()

Summary

Retrieves the requested keyboard layout.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_GET_KEYBOARD_LAYOUT) (
  IN CONST EFI_HII_DATABASE_PROTOCOL   *This,
  IN EFI_GUID                          *KeyGuid,
  IN OUT UINIT16                       *KeyboardLayoutLength,
  OUT EFI_HII_KEYBOARD_LAYOUT          *KeyboardLayout
  );
```

Parameters

This

A pointer to the *EFI_HII_DATABASE_PROTOCOL* instance.

KeyGuid
A pointer to the unique ID associated with a given keyboard layout. If *KeyGuid* is NULL then the current layout will be retrieved.

KeyboardLayout
A pointer to a buffer containing the retrieved keyboard layout. below.

KeyboardLayoutLength
On input, a pointer to the length of the KeyboardLayout buffer. On output, the length of the data placed into KeyboardLayout.

Description

This routine retrieves the requested keyboard layout. The layout is a physical description of the keys on a keyboard and the character(s) that are associated with a particular set of key strokes.

Related Definitions

```
//************************************************
// EFI_HII_KEYBOARD_LAYOUT
//************************************************
typedef struct {
  UINT16                  LayoutLength;
  EFI_GUID                Guid;
  UINT32                  LayoutDescriptorStringOffset;
  UINT8                   DescriptorCount;
  EFI_KEY_DESCRIPTOR      Descriptors[];
}   EFI_HII_KEYBOARD_LAYOUT;
```

LayoutLength
The length of the current keyboard layout.

Guid
The unique ID associated with this keyboard layout.

LayoutDescriptorStringOffset
An offset location (0 is the beginning of the *EFI_KEYBOARD_LAYOUT* instance) of the string which describes this keyboard layout. The data that is being referenced is in *EFI_DESCRIPTION_STRING_BUNDLE* format.

DescriptorCount
The number of Descriptor entries in this layout.

Descriptors
An array of key descriptors.

```
//*****************************************************
// EFI_DESCRIPTION_STRING - byte packed data
//*****************************************************
CHAR16         Language[];
CHAR16         Space;
//CHAR16       DescriptionString[];
```

Language
The language in RFC 4646 format to associate with *DescriptionString*.

Space
A space (U-0x0020) character to force as a separator between the *Language* field and the formal description string.

DescriptionString

A null-terminated description string.

```
//******************************************************
// EFI_DESCRIPTION_STRING_BUNDLE - byte packed data
//
// Example: 2en-US English Keyboard<null>es-ES Keyboard en    ingles<null>
// <null> = U-0000
//******************************************************
UINT16                        DescriptionCount;
EFI_DESCRIPTION_STRING        DescriptionString[];
```

DescriptionCount

The number of description strings.

DescriptionString

An array of language-specific description strings.

```
//******************************************************
// EFI_KEY_DESCRIPTOR
//******************************************************
typedef struct {
  EFI_KEY                Key;
  CHAR16                 Unicode;
  CHAR16                 ShiftedUnicode;
  CHAR16                 AltGrUnicode;
  CHAR16                 ShiftedAltGrUnicode;
  UINT16                 Modifier;
  UINT16                 AffectedAttribute;
}   EFI_KEY_DESCRIPTOR;

// A key which is affected by all the standard shift    modifiers.
// Most keys would be expected to have this bit active.
#define EFI_AFFECTED_BY_STANDARD_SHIFT    0x0001

// This key is affected by the caps lock so that if a keyboard
// driver would need to disambiguate between a key which had a
// "1" defined versus a "a" character. Having this bit turned on
// would tell the keyboard driver to use the appropriate    shifted // state or not.
#define EFI_AFFECTED_BY_CAPS_LOCK         0x0002

// Similar to the case of CAPS lock, if this bit is active, the
// key is affected by the num lock being turned on.
#define EFI_AFFECTED_BY_NUM_LOCK 0x0004
```

Key

Used to describe a physical key on a keyboard. Type *EFI_KEY* is defined below.

Unicode

Unicode character code for the *Key*.

ShiftedUnicode

Unicode character code for the key with the shift key being held down.

AltGrUnicode

Unicode character code for the key with the Alt-GR being held down.

ShiftedAltGrUnicode

Unicode character code for the key with the Alt-GR and shift keys being held down.

Modifier

Modifier keys are defined to allow for special functionality that is not necessarily accomplished by a printable character. Many of these modifier keys are flags to toggle certain state bits on and off inside of a keyboard driver. Values for *Modifier* are defined below.

```
//*****************************************************
// EFI_KEY
//*****************************************************
typedef enum {
  EfiKeyLCtrl, EfiKeyA0, EfiKeyLAlt, EfiKeySpaceBar, EfiKeyA2,
  EfiKeyA3, EfiKeyA4, EfiKeyRCtrl, EfiKeyLeftArrow,
  EfiKeyDownArrow, EfiKeyRightArrow, EfiKeyZero, EfiKeyPeriod,
  EfiKeyEnter, EfiKeyLShift, EfiKeyB0, EfiKeyB1, EfiKeyB2,
  EfiKeyB3, EfiKeyB4, EfiKeyB5, EfiKeyB6, EfiKeyB7, EfiKeyB8,
  EfiKeyB9, EfiKeyB10, EfiKeyRShift, EfiKeyUpArrow, EfiKeyOne,
  EfiKeyTwo, EfiKeyThree, EfiKeyCapsLock, EfiKeyC1, EfiKeyC2,
  EfiKeyC3, EfiKeyC4, EfiKeyC5, EfiKeyC6, EfiKeyC7, EfiKeyC8,
  EfiKeyC9, EfiKeyC10, EfiKeyC11, EfiKeyC12, EfiKeyFour,
  EfiKeyFive, EfiKeySix, EfiKeyPlus, EfiKeyTab, EfiKeyD1,
  EfiKeyD2, EfiKeyD3, EfiKeyD4, EfiKeyD5, EfiKeyD6, EfiKeyD7,
  EfiKeyD8, EfiKeyD9, EfiKeyD10, EfiKeyD11, EfiKeyD12, EfiKeyD13,
  EfiKeyDel, EfiKeyEnd, EfiKeyPgDn, EfiKeySeven, EfiKeyEight,
  EfiKeyNine, EfiKeyE0, EfiKeyE1, EfiKeyE2, EfiKeyE3, EfiKeyE4,
  EfiKeyE5, EfiKeyE6, EfiKeyE7, EfiKeyE8, EfiKeyE9, EfiKeyE10,
  EfiKeyE11, EfiKeyE12, EfiKeyBackSpace, EfiKeyIns, EfiKeyHome,
  EfiKeyPgUp, EfiKeyNLck, EfiKeySlash, EfiKeyAsterisk,
  EfiKeyMinus, EfiKeyEsc, EfiKeyF1, EfiKeyF2, EfiKeyF3, EfiKeyF4,
  EfiKeyF5, EfiKeyF6, EfiKeyF7, EfiKeyF8, EfiKeyF9, EfiKeyF10,
  EfiKeyF11, EfiKeyF12, EfiKeyPrint, EfiKeySLck, EfiKeyPause,
  EfiKeyIntl0, EfiKeyIntl1, EfiKeyIntl2, EfiKeyIntl3,
  EfiKeyIntl4, EfiKeyIntl5, EfiKeyIntl6, EfiKeyIntl7,
  EfiKeyIntl8, EfiKeyIntl9
} EFI_KEY;
```

See the figure below for which key corresponds to the values in the enumeration above. For example, *EfiKeyLCtrl* corresponds to the left control key in the lower-left corner of the keyboard, *EfiKeyFour* corresponds to the 4 key on the numeric keypad, and *EfiKeySLck* corresponds to the Scroll Lock key in the upper-right corner of the keyboard.

#define EFI_MENU_MODIFIER                 0x0029
```

Status Codes Returned

EFI_SUCCESS	The keyboard layout was retrieved successfully.
EFI_NOT_FOUND	The requested keyboard layout was not found.
EFI_BUFFER_TOO_SMALL	The *KeyboardLayoutLength* parameter indicates the *KeyboardLayout* is too small to hold the keyboard layout.
EFI_INVALID_PARAMETER	*KeyboardLayoutLength* is *NULL*
EFI_INVALID_PARAMETER	The value referenced by *KeyboardLayoutLength* is not zero and *KeyboardLayout* is NULL.

34.8.11 EFI_HII_DATABASE_PROTOCOL.SetKeyboardLayout()

Summary

Sets the currently active keyboard layout.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_SET_KEYBOARD_LAYOUT) (
  IN CONST EFI_HII_DATABASE_PROTOCOL      *This,
  IN EFI_GUID                             *KeyGuid
  );
```

Parameters

This
A pointer to the *EFI_HII_DATABASE_PROTOCOL* instance.

KeyGuid
A pointer to the unique ID associated with a given keyboard layout.

Description

This routine sets the default keyboard layout to the one referenced by *KeyGuid*. When this routine is called, an event will be signaled of the *EFI_HII_SET_KEYBOARD_LAYOUT_EVENT_GUID* group type. This is so that agents which are sensitive to the current keyboard layout being changed can be notified of this change.

Related Definitions

GUID

```
#define EFI_HII_SET_KEYBOARD_LAYOUT_EVENT_GUID \
  { 0x14982a4f, 0xb0ed, 0x45b8, \
    { 0xa8, 0x11, 0x5a, 0x7a, 0x9b, 0xc2, 0x32, 0xdf }}
```

Status Codes Returned

EFI_SUCCESS	The current keyboard layout was successfully set.
EFI_NOT_FOUND	The referenced keyboard layout was not found, so action was taken.
EFI_INVALID_PARAMETER	*KeyGuid* is **NULL**.

34.8.12 EFI_HII_DATABASE_PROTOCOL.GetPackageListHandle()

Summary

Return the EFI handle associated with a package list.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DATABASE_GET_PACK_HANDLE) (
  IN CONST EFI_HII_DATABASE_PROTOCOL      *This,
  IN EFI_HII_HANDLE                       PackageListHandle,
  OUT EFI_HANDLE                          *DriverHandle
  );
```

Parameters

This

A pointer to the *EFI_HII_DATABASE_PROTOCOL* instance.

PackageListHandle

An *EFI_HII_HANDLE* that corresponds to the desired package list in the HIIdatabase.

DriverHandle

On return, contains the *EFI_HANDLE* which was registered with the package list in *NewPackageList()*.

Status Codes Returned

EFI_SUCCESS	The *DriverHandle* was returned successfully.
EFI_INVALID_PARAMETER	The *PackageListHandle* was not valid.
EFI_INVALID_PARAMETER	The *DriverHandle* must not be **NULL**.

34.8.13 Database Structures

34.8.13.1 EFI_HII_DATABASE_NOTIFY

Summary

Handle a registered notification for a package change to the database.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DATABASE_NOTIFY) (
  IN UINT8                          PackageType,
  IN CONST EFI_GUID                 *PackageGuid,
  IN CONST EFI_HII_PACKAGE_HEADER   *Package,
  IN EFI_HII_HANDLE                 Handle,
  IN EFI_HII_DATABASE_NOTIFY_TYPE   NotifyType
  );
```

Parameters

PackageType

Package type of the notification.

PackageGuid

If *PackageType* is *EFI_HII_PACKAGE_TYPE_GUID,* then this is the pointer to the GUID from the *Guid* field of *EFI_HII_GUID_PACKAGE_HDR.* Otherwise, it must be **NULL**.

Package

Points to the package referred to by the notification

Handle

The handle of the package list which contains the specified package.

NotifyType

The type of change concerning the database. See *EFI_HII_DATABASE_NOTIFY_TYPE* .

Description

Functions which are registered to receive notification of database events have this prototype. The actual event is encoded in *NotifyType.* The following table describes how *PackageType, PackageGuid, Handle,* and *Package* are used for each of the notification types.

Notification Type	**Parameter Description**
NEW_PACK	*PackageType* and *PackageGuid* are the type of the new package. *Package* points to the new package. *Handle* is the handle of the package list which is being added to the database.
REMOVE_PACK	*PackageType* and *PackageGuid* are the type of the package which is being removed. *Package* points to the package being removed. *Handle* is the package list from which the package is being removed.
EXPORT_PACK	*PackageType* and *PackageGuid* are the type of the package being exported. *Package* points to the existing package in the database. *Handle* is the package list being exported.
ADD_PACK	*PackageType* and *PackageGuid* are the type of the package being added. *Package* points to the package being added. *Handle* is the package list to which the package is being added.

34.8.14 EFI_HII_DATABASE_NOTIFY_TYPE

```
typedef UINTN EFI_HII_DATABASE_NOTIFY_TYPE;

#define EFI_HII_DATABASE_NOTIFY_NEW_PACK      0x00000001
#define EFI_HII_DATABASE_NOTIFY_REMOVE_PACK   0x00000002
#define EFI_HII_DATABASE_NOTIFY_EXPORT_PACK   0x00000004
#define EFI_HII_DATABASE_NOTIFY_ADD_PACK      0x00000008
```

CHAPTER

THIRTYFIVE

HII CONFIGURATION PROCESSING AND BROWSER PROTOCOL

35.1 Introduction

This section describes the data and APIs used to manage the system's configuration: the actual data that describes the knobs and settings.

35.1.1 Common Configuration Data Format

The configuration data is stored as name / value string pairs. As in e.g. HTML, the name and value are separated by '=' and the pairs are separated one from the next by '&'. The configuration data structures are thus variable length UNICODE (UCS-2) strings.

Certain names and values have limitations on their syntax to manage routing and to enable extended support for common storage mechanisms.

35.1.2 Data Flow

There is a two-way flow through the hierarchy of drivers and protocols that parallels the flow in other parts of HII. Initially, the flow is from the drivers up to the HII database and on to configuration applications. When changes to configuration are accepted, the flow reverses itself, going from the configuration applications through the HII database protocols back to the drivers through separate protocols.

The flow from driver up consists of the current and alternative (default) configurations. The flow down from the configuration applications consists of changed configurations.

The protocol managed by the HII Database is known as the EFI HII Configuration Routing Protocol, while the one presented by the drivers themselves is known as the EFI HII Configuration Access Protocol. The HII Configuration Routing Protocol is the only one that outside callers should invoke.

35.2 Configuration Strings

The configuration strings follow the same general format as HTTP argument strings, which is to say '&' separated name / value pairs. The name and value are separated by '='. The strings are a subset of full HTML argument strings and do not require quoting, the '%' character sequences used to insert spaces, ampersands, equal signs, and the like into HTTP argument strings.

35.2.1 String Syntax

Assumptions are typical for BNF with the following extensions

Characters in single quotes, e.g. ‘a’, indicate terminals.

Square brackets immediately followed by a number n indicate that the contents are to be repeated n times, so [‘a’]4 would be “aaaa”.

An italicized non-terminal, e. g. <All Printable ASCII Characters> is used to indicate a set of terminals whose definition is outside the scope of this document.

The syntax for configuration strings is as follows.

35.2.1.1 Basic forms

```
<Dec19> ::= ‘1’ | ‘2’ |... | ‘9’
<DecCh> ::= ‘0’ | <Dec19>
<HexAf> ::= ‘a’ | ‘b’ | ‘c’ | ‘d’ | ‘e’ | ‘f’
<Hex1f> ::= <Dec19> | <HexAf>
<HexCh> ::= <DecCh> | <HexAf>
<Number> ::= <HexCh>+
<Alpha> ::= ‘a’ |... | ‘z’ | ‘A’ |... | ‘Z’
```

35.2.1.2 Types

```
<Guid> ::= <HexCh>32
<LabelStart> ::= <Alpha> | "_"
<LabelBody> ::= <LabelStart> | <DecCh>
<Label> ::= <LabelStart> [<LabelBody>]*
<Char> ::= <HexCh>4
<String> ::= [<Char>]+
<AltCfgId> ::= <HexCh>4
```

35.2.1.3 Routing elements

```
<GuidHdr> ::= ‘GUID=’<Guid>
<NameHdr> ::= ‘NAME=’<String>
<PathHdr> ::= ‘PATH=’<UEFI binary Device Path represented as
hex number>
<DescHdr> ::= ‘ALTCFG=’<AltCfgId>
<ConfigHdr> ::= <GuidHdr>’&’<NameHdr>’&’<PathHdr>
<AltConfigHdr> ::= <ConfigHdr> ‘&’<DescHdr>
```

35.2.1.4 Body elements

```
<ConfigBody> ::= <ConfigElement>*
<ConfigElement> ::= ‘&’<BlockConfig> | ‘&’<NvConfig>
<BlockName> ::= ‘OFFSET=’<Number>’&WIDTH=’<Number>
<BlockConfig> ::= <BlockName>’&VALUE=’<Number>
<RequestElement> ::= ‘&’<BlockName> | ‘&’<Label>
<NvConfig> ::= <Label>’=’<String> | <Label>’=’<Number>
```

35.2.1.5 Configuration strings

```
<ConfigRequest> ::= <ConfigHdr><RequestElement>*
<MultiConfigRequest> ::= <ConfigRequest>[‘&’ <ConfigRequest>]*
<ConfigResp> ::= <ConfigHdr><ConfigBody>
<AltResp> ::= <AltConfigHdr><ConfigBody>
<ConfigAltResp> ::= <ConfigResp> [‘&’ <AltResp>]*
<MultiConfigAltResp> ::= <ConfigAltResp> [‘&’ <ConfigAltResp>]*
<MultiConfigResp> ::= <ConfigResp> [‘&’<ConfigResp>]*
```

Notes:

The <*Number*> represents a data buffer and is encoded as a sequence of bytes in the format %02x in the same order as the buffer bytes reside in memory.

The <*Guid*> represents a hex encoding of GUID and is encoded as a sequence of bytes in the format %02x in the same order as the GUID bytes reside in memory.

The syntax for a <*Label*> is the C label (e.g. Variable) syntax.

The <*ConfigHdr*> provides routing information. The name field is required even if non-block storage is targeted. In these cases, it may be used as a way to distinguish like storages from one another when a driver is being used

The <*BlockName*> provides addressing information for managing block (e.g. UEFI Variable) storage. The first number provides the byte offset into the block while the second provides the length of bytes.

The <*PathHdr*> presents a hex encoding of a UEFI device path. This is not the printable path since the printable path is optional in UEFI and to enable simpler comparisons. The data is encoded as strings with the format %02x bytes in the same order as the device path resides in RAM memory.

The <*ConfigRequest*> provides a mechanism to request the current configuration for one or more elements.

The <*AltCfgId*> is the identifier of a configuration declared in the corresponding IFR.

The name ‘GUID’ is also used to separate <*String*> or <*ConfigRequest*> elements in the equivalent *Multi* version. That is:

```
*GUID=...&NAME=...&...&fred=12&GUID=...&NAME=...&...&goyle=11*
```

Indicates two <*String*>, with one ending with *fred=12*.

The following are reserved <*name*> s and cannot be used as names in a <*ConfigElement*> :

```
GUID
NAME
PATH
ALTCFG
OFFSET
```

(continues on next page)

(continued from previous page)

```
WIDTH
VALUE
```

35.2.1.6 Keyword strings

```
<NameSpaceId>        ::=‘NAMESPACE=’<String>’&’
<Keyword>            ::=‘KEYWORD=’<String>[‘:’<DecCh>(1/4)]
<DataFilter>         ::=‘Buffer’|‘Numeric’[‘:1’|‘:2’|‘:4’|‘:8’]
                         |‘String’|‘Boolean’|‘Date’|’Time’
<UsageFilter>        ::=‘ReadOnly’|‘ReadWrite’
<Filter>             ::=<UsageFilter>|<DataFilter>|<UsageFilter>
                        ’&’<DataFilter>
<ValueRange>         ::=‘&MAX=’<Number>‘&MIN=’<Number>[’&STEP=’<Number>]
<ValueOption>        ::=‘&OPTIONVALUE=’<Number>’&OPTIONSTRING=’<String>
                         [‘&VALUETYPE=‘Numeric’[':1’|‘:2’|‘:4’|‘:8’]]
<ValueAttribute>      ::=[<ValueRange>][<ValueOption>*]
<Default>             ::=[‘&STANDARDDEFAULT=’<Number>]
                         [‘&MFGDEFAULT=’<Number>]
                         [‘&SAFEDEFAULT=’<Number>]
<Display>             ::=’&DISPLAYNAME=’<String>
<DataType>            ::=‘&DATATYPE=’<DataFilter>
<KeywordInfoFilter>   ::=‘All’|[‘DataType’][‘ValueAttribute’][‘Default’]
                         [’DisplayName’]
<Boolean>             ::=’True’|’False’
<KeywordInfoRequest>  ::=’KEYWORDINFO=’<KeywordInfoFilter>
<KeywordInfoResp>     ::=[<DataType>][<ValueAttribute>][<Default>][<Display>]
<KeywordRequest>      ::=[<PathHdr>’&’]<Keyword>
                         [’&’<KeywordInfoRequest>][’&’<Filter>]
<KeywordResp>         ::=<NameSpaceId><PathHdr>’&’<Keyword>’&VALUE=’<Number>
                         [‘&READONLY’][<KeywordInfoResp>]
<MultiKeywordRequest> ::=<KeywordRequest>[‘&’<KeywordRequest>] *
<MultiKeywordResp>    ::=<KeywordResp>[‘&’<KeywordResp>] *
```

NOTE: *For Keyword definitions, see the UEFI Configuration Namespace Registry document on* http://uefi.org/uefi.

HII Question Type	**HII Keyword Data Type**	**Data information in <ValueAttribute>**
Numeric	Numeric	ValueRanges
One-Of	Numeric	ValueOptions
Checkbox	Boolean	
String	String	ValueRanges
Ordered-List	Buffer	ValueOptions
Date	Date	
Time	Time	

The <*NameSpaceId*> element is equivalent to the platform configuration language being used for the keyword definition*.

The <*Keyword*> element uses the ‘KEYWORD=’ name to designate that immediately following the reserved name is a string value associated with a configuration namespace keyword as defined in the Configuration NameSpace Registry document (*http://uefi.org/uefi*).

Typically, when a Keyword is defined, the value is a solitary string such as "BIOSVendor". However, when certain Keywords are intended to represent a setting that may have multiple instances (e.g. ChipsetSATAPortEnable), that is when a ":<DecCh>(1/4)" suffix will be appended to the keyword definition. In that case, we might see something like: "ChipsetSATAPortEnable:5" if a particular platform had at least five SATA ports and one of the questions was represented by the aforementioned string. It would also be reasonable to expect that there might also be a "ChipsetSATAPortEnable:1" and a ":2", ":3" etc.

If the <*PathHdr*> element within <*KeywordRequest*> is omitted, then all instances are returned.

If the Keyboard Handler protocol knows or detects that a particular Keyword is read-only, then the <*KeywordResp*> must include the "&READONLY" tag.

The <*DataFilter*> element specifies the optional filter based on data type to use when a request is made. If no filtering is desired, then this element must be omitted from the <*KeywordRequest*>. Filtering is not guaranteed to work on any platform configuration language that isn't defined in the UEFI Configuration Namespace Document.

DataFilter.Buffer

HII questions with *EFI_IFR_TYPE_BUFFER* type are treated as this type. This is most commonly represented in 'C' as a VOID type, or as a more complex type. Other than the *EFI_IFR_TYPE_BOOLEAN* and *EFI_IFR_TYPE_NUM_x* data types, all of the HII configuration data types are treated as a sequence of data.

DataFilter.Numeric

A sequence of data that must be interpreted as a one, two, four, or eight-byte wide numeric value. For instance, a definition of "Numeric:2" would indicate that the keyword is a two-byte numeric value. If no byte-size designation is specified, then the value may vary in size.

DataFilter.String

HII questions with EFI_IFR_TYPE_STRING type are treated as this type.

DataFilter.Boolean

HII questions with EFI_IFR_TYPE_BOOLEAN type are treated as this type.

DataFilter.Date

HII questions with EFI_IFR_TYPE_DATE type are treated as this type.

DataFilter.Time

HII questions with EFI_IFR_TYPE_TIME type are treated as this type.

The <*UsageFilter*> element defines the optional filter to use based on usage type when a request is made. If no filtering is desired, then this element must be omitted from the <*KeywordRequest*>.

UsageType.ReadOnly

The data for the keyword cannot be changed. It is intended solely for informational purposes, and can be used to read a setting that may be static or dynamic (e.g. CPU temperature).

UsageType.ReadWrite

The data for the keyword can be changed.

The <*KeywordInfoRequest*> element allows the callers to request some additional information of the keyword to be returned. <*KeywordInfoRequest*> element is used when user doesn't know the information about the keyword and wants to get more information about this keyword. When <KeywordInfoRequest> element is specified with <*KeywordRequest*>*,* the <*KeywordInfoResp*> element will be specified with <*KeywordResp*> to return the info requested by <*KeywordInfoRequest*>.

The <*KeywordInfoFilter*> element is used to specify the additional information that caller wants to know about the keyword. Caller can specify any type of additional information he/she wants to know. When 'All' is specified, means all the supported information need to be returned.

The <*DataType*> element specifies the data type of a keyword, can refer to <DataFilter> for the detailed info the data types.

The <*ValueAttribute*> element specifies the value attribute of a keyword. Such as the value range of a keyword or the selectable values for a keyword.

<*ValueRange*> element specifies the variation range of a keyword value. Such as it can be specified for a keyword used in *EFI_IFR_NUMERIC_OP, EFI_IFR_STRING_OP* opcode. For *EFI_IFR_NUMERIC_OP* opcode, it specifies the maximum value, minimum value and increment or decrement step. For *EFI_IFR_STRING_OP* opcode, it specifies the maximum length and minimum length of the string can be input.

<*ValueOption*> element specifies all the (selectable) values and related string representation of these values for a keyword. Such as it can be specified for keyword used in *EFI_IFR_ONE_OF_OP, EFI_IFR_ORDERED_LIST_OP* opcode. For *EFI_IFR_ONE_OF_OP,* it specifies the all selectable values and the string representation of the values. The keyword value can be one of them.

For *EFI_IFR_ORDERED_LIST_OP,* it specifies all values and the string representation of the values. The keyword value can be the permutation and combination of these values. And for *EFI_IFR_ORDERED_LIST_OP,* its data type is Buffer, so can return the value type in a <ValueOption> to indicate the data stored in the Buffer is numeric as a one, two, four, or eight-byte wide.

The <*Default*> element specifies the default value of a keyword. Only the three standard defaults stores are supported including the standard defaults, the manufacturing defaults and the Safe defaults. If the keyword doesn't have any type of defaults, then there is no default info returned. And if the keyword only has the standard default, then only the standard default information will be returned.

The <*Display*> element specifies the displayed prompt string of this keyword in the UI page.

35.2.1.6.1 An example of some basic keyword-related strings:

<*KeywordRequest*> to retrieve the current BIOS Vendor name:

```
KEYWORD=BIOSVendor
```

35.2.1.6.2 A possible response might look like:

```
x-UEFI-ns&KEYWORD=BIOSVendor&VALUE=AcmeBIOSCompany
```

If a request was made to retrieve all of the settings for a platform, a user would initiate a call to KeywordHandleràGetData() with the KeywordString and NamespaceId being **NULL**.

35.2.1.6.3 A possible response might look like:

```
x-UEFI-ns&KEYWORD=BIOSVendor&VALUE=AcmeBIOSCompany&x-UEFI-extension
-ACME&KEYWORD=SpecialSettingX&VALUE=3
```

In this case, the string returned tells us that there was one discovered keyword called "BIOSVendor" under the standard UEFI namespace and its value was "AcmeBIOS". There was also an ACME branded namespace element which was discovered that had a keyword called "SpecialSettingX" whose value was 3.

35.2.1.6.4 An example to get more information of a keyword:

```
KEYWORD=BIOSVendor&KEYWORDINFO=All
```

A possible response might look like:

```
x-UEFI-ns&KEYWORD=BIOSVendor&VALUE=AcmeBIOSCompany&DataType=String&MAX=30&MIN
=6&STANDARDDEFAULT=AcmeBIOSCompany&MFGDEFAULT=AcmeBIOSCompany
```

35.2.2 String Types

There are six string types. As can be seen from the BNF, the syntax of all is quite similar. The first three are used in communications between drivers and HII. The last three are used for analogous communication between external applications and HII.

<*ConfigRequest*> : This string is used by HII to request the current and any alternative configurations from a driver. It consists of routing information and only ampersand separated names.

<*ConfigAltResp*> : A string in this format is returned by the driver in response to a request to fill in a <*ConfigRequest*> string. The string consists of the current configuration followed by possibly several alternative configurations. The alternative configurations have the *ALTCFG* name / value pair in addition to the usual *GUID, NAME,* and *PATH* entries in the routing prefix. The *ALTCFG* value is a Default ID which is used to describe the alternative default configuration.

<*ConfigResp*> : A sting in this format is handed by the HII to the driver to cause the driver to change its configuration. It consists of routing information and name / value pairs which correspond to the questions in the driver's IFR. Only <*ConfigResp*> strings which refer to a driver in question may be handed to that driver. The driver shall reject all others.

<*MultiConfigRequest*> : A string in this format is handed to HII by an external application in order to request the current an alternate configurations of the system's drivers. The format of this string is a series of <*ConfigRequest*> strings separated by ampersands. The HII's job is to separate the requests and hand them off to the appropriate drivers (as indicated by the routing headers).

<*MultiConfigAltResp*> : A string in this format is handed back to an external application which has requested the current and alternate configurations of the system's drivers. The format of this string is a series of <*ConfigAltResp*> strings separated by ampersands. The HII creates this string by concatenating the current and alternate configuration strings provided by each driver.

<*MultiConfigResp*> : A string in this format is handed to the HII in order to update the system's configuration. Analogous to the other "Multi" string formats, its syntax is a series of ampersand separated <*ConfigResp*> strings. Upon receipt, the HII routes the <*ConfigResp*> strings to the corresponding drivers.

35.3 EFI Configuration Keyword Handler Protocol

This section provides a detailed description of the EFI Configuration Keyword Handler Protocol.

35.3.1 EFI_CONFIG_KEYWORD_HANDLER_PROTOCOL

Summary

The *EFI_CONFIG_KEYWORD_HANDLER_PROTOCOL* provides the mechanism to set and get the values associated with a keyword exposed through a x-UEFI- prefixed configuration language namespace.

GUID

```
#define EFI_CONFIG_KEYWORD_HANDLER_PROTOCOL_GUID \
{ 0x0a8badd5, 0x03b8, 0x4d19,\
  {0xb1, 0x28, 0x7b, 0x8f, 0x0e, 0xda, 0xa5, 0x96 }}
```

Protocol Interface Structure

```
typedef struct _EFI_CONFIG_KEYWORD_HANDLER_PROTOCOL {
  EFI_CONFIG_KEYWORD_HANDLER_SET_DATA        SetData;
  EFI_CONFIG_KEYWORD_HANDLER_GET_DATA        GetData;
}   EFI_CONFIG_KEYWORD_HANDLER_PROTOCOL;
```

Parameters

SetData
Set the data associated with a particular configuration namespace keyword.

GetData
Get the data associated with a particular configuration namespace keyword.

Description

The *EFI_CONFIG_KEYWORD_HANDLER_PROTOCOL* allows other components in the platform (e.g. Browser, Manageability Software, etc.) to retrieve and set configuration settings within the system.

Keywords are text elements which are associated with a particular configuration option within the platform. These keywords are intended to add semantic meaning to the configuration option they are attached to. The text associated for the keyword would be encoded in a UEFI configuration language. These languages are like French or German or Japanese, but are not designed for display purposes for an end-user. Instead each language serves as a namespace for the purposes of grouping and manipulating groups of platform configurations options. See *Working with a UEFI Configuration Language* for more information.

NOTE: *Not all configuration options will be associated with a keyword. Associating a keyword with a configuration option is at the discretion of the platform and/or the hardware vendor. For more information about keyword definitions associated with a UEFI namespace, see the UEFI Keyword Namespace Registry link in the UEFI Link Document.*

35.3.2 EFI_KEYWORD_HANDLER _PROTOCOL.SetData()

Summary

Set the data associated with a particular configuration namespace keyword.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_KEYWORD_HANDLER _SET_DATA) (
  IN EFI_KEYWORD_HANDLER_PROTOCOL   *This,
  IN CONST EFI_STRING               KeywordString,
  OUT EFI_STRING                    *Progress,
```

(continues on next page)

(continued from previous page)

```
OUT UINT32                          *ProgressErr
);
```

Parameters

This

Pointer to the *EFI_KEYWORD_HANDLER _PROTOCOL* instance.

KeywordString

A null-terminated string in <*MultiKeywordResp*> format.

Progress

On return, points to a character in the *KeywordString*. Points to the string's NULL terminator if the request was successful. Points to the most recent '&' before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) if the request was not successful.

ProgressErr

If during the processing of the *KeywordString* there was a failure, this parameter gives additional information about the possible source of the problem. The various errors are defined in "Related Definitions" below.

Description

This function accepts a <*MultiKeywordResp*> formatted string, finds the associated keyword owners, creates a <*MultiConfigResp*> string from it and forwards it to the *EFI_HII_ROUTING_PROTOCOL.RouteConfig* function.

If there is an issue in resolving the contents of the *KeywordString,* then the function returns an error and also sets the *Progress* and *ProgressErr* with the appropriate information about where the issue occurred and additional data about the nature of the issue.

In the case when *KeywordString* containing multiple keywords, when an *EFI_NOT_FOUND* error is generated during processing the second or later keyword element, the system storage associated with earlier keywords is not modified. All elements of the *KeywordString* must successfully pass all tests for format and access prior to making any modifications to storage.

In the case when *EFI_DEVICE_ERROR* is returned from the processing of a *KeywordString* containing multiple keywords, the state of storage associated with earlier keywords is undefined.

Related Definitions

```
//****************************************************************
// Progress Errors
//****************************************************************
#define KEYWORD_HANDLER_NO_ERROR                      0x00000000
#define KEYWORD_HANDLER_NAMESPACE_ID_NOT_FOUND        0x00000001
#define KEYWORD_HANDLER_MALFORMED_STRING              0x00000002
#define KEYWORD_HANDLER_KEYWORD_NOT_FOUND             0x00000004
#define KEYWORD_HANDLER_INCOMPATIBLE_VALUE_DETECTED   0x00000008
#define KEYWORD_HANDLER_ACCESS_NOT_PERMITTED          0x00000010
#define KEYWORD_HANDLER_UNDEFINED_PROCESSING_ERROR    0x80000000
```

The *KEYWORD_HANDLER_x* values describe the error values returned in the *ProgressErr* field.

If no errors were encountered, then *KEYWORD_HANDLER_NO_ERROR* is returned with no bits are set.

If the <*NameSpaceId*> specified by the KeywordString was not found in any of the registered configuration data, the *KEYWORD_HANDLER_NAMESPACE_ID_NOT_FOUND* bit is set.

If there was an error in the parsing of the KeywordString, the *KEYWORD_HANDLER_MALFORMED_STRING* bit is set.

If there was a keyword specified in the KeywordString which was not found in any of the registered configuration data, *KEYWORD_HANDLER_KEYWORD_NOT_FOUND* bit is set.

If the value either passed into *KeywordString* (during a SetData operation) or the value discovered for the Keyword (during a GetData operation) did not match what was known to be valid for the defined keyword, the *KEYWORD_HANDLER_INCOMPATIBLE_VALUE_DETECTED* bit is set.

If there was an error as a result of a violation of system policy. For example trying to write a read-only element, the *KEYWORD_HANDLER_ACCESS_NOT_PERMITTED* bit is set.

If there was an undefined type of error in processing the passed in data, the *KEYWORD_HANDLER_UNDEFINED_PROCESSING_ERROR* bit is set.

Status Codes Returned

EFI_SUCCESS	The specified action was completed successfully.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE**: *KeywordString* is **NULL**. Parsing of the *KeywordString* resulted in an error. See *Progress* and *ProgressErr* for more data.
EFI_NOT_FOUND	An element of the *KeywordString* was not found. See *ProgressErr* for more data.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated. See *ProgressErr* for more data.
EFI_ACCESS_DENIED	The action violated system policy. See *ProgressErr* for more data.
EFI_DEVICE_ERROR	An unexpected system error occurred. See *ProgressErr* for more data.

35.3.3 EFI_KEYWORD_HANDLER _PROTOCOL.GetData()

Summary

Get the data associated with a particular configuration namespace keyword.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_KEYWORD_HANDLER _GET_DATA) (
  IN EFI_KEYWORD_HANDLER_PROTOCOL        *This,
  IN CONST EFI_STRING                    NameSpaceId, OPTIONAL
  IN CONST EFI_STRING                    KeywordString, OPTIONAL
  OUT EFI_STRING                         *Progress,
  OUT UINT32                             *ProgressErr,
  OUT EFI_STRING                         *Results
  );
```

Parameters

This

Pointer to the *EFI_KEYWORD_HANDLER _PROTOCOL* instance.

NamespaceId

A null-terminated string containing the platform configuration language to search through in the system. If a NULL is passed in, then it is assumed that any platform configuration language with the prefix of “x-UEFI-” are searched.

KeywordString

A null-terminated string in <*MultiKeywordRequest*> format. If a NULL is passed in the *KeywordString* field, all of the known keywords in the system for the *NameSpaceId* specified are returned in the Results field.

Progress

On return, points to a character in the *KeywordString*. Points to the string's NULL terminator if the request was successful. Points to the most recent '&' before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) if the request was not successful.

ProgressErr

If during the processing of the *KeywordString* there was a failure, this parameter gives additional information about the possible source of the problem. See the definitions in *SetData()* for valid value definitions.

Results

A null-terminated string in <*MultiKeywordResp*> format is returned which has all the values filled in for the keywords in the *KeywordString*. This is a callee-allocated field, and must be freed by the caller after being used.

Description

This function accepts a <*MultiKeywordRequest*> formatted string, finds the underlying keyword owners, creates a <*MultiConfigRequest*> string from it and forwards it to the *EFI_HII_ROUTING_PROTOCOL.ExtractConfig* function.

If there is an issue in resolving the contents of the *KeywordString,* then the function returns an *EFI_INVALID_PARAMETER* and also set the *Progress* and *ProgressErr* with the appropriate information about where the issue occurred and additional data about the nature of the issue.

In the case when *KeywordString* is **NULL**, or contains multiple keywords, or when *EFI_NOT_FOUND* is generated while processing the keyword elements, the *Results* string contains values returned for all keywords processed prior to the keyword generating the error but no values for the keyword with error or any following keywords.

Status Codes Returned

EFI_SUCCESS	The specified action was completed successfully.
EFI_INVALID_PARAMETER	One or more of the following are **TRUE**: *Progress, ProgressErr,* or *Results* is **NULL**. Parsing of the KeywordString resulted in an error. See *Progress* and *ProgressErr* for more data.
EFI_NOT_FOUND	An element of the *KeywordString* was not found. See *ProgressErr* for more data.
EFI_NOT_FOUND	The *NamespaceId* specified was not found. See *ProgressErr* for more data.
EFI_OUT_OF_RESOURCES	Required system resources could not be allocated. See *ProgressErr* for more data.
EFI_ACCESS_DENIED	The action violated system policy. See *ProgressErr* for more data.
EFI_DEVICE_ERROR	An unexpected system error occurred. See *ProgressErr* for more data.

35.4 EFI HII Configuration Routing Protocol

35.4.1 EFI_HII_CONFIG_ROUTING_PROTOCOL

Summary

The EFI HII Configuration Routing Protocol manages the movement of configuration data from drivers to configuration applications. It then serves as the single point to receive configuration information from configuration applications, routing the results to the appropriate drivers.

GUID

```
#define EFI_HII_CONFIG_ROUTING_PROTOCOL_GUID \
  { 0x587e72d7, 0xcc50, 0x4f79,\
  { 0x82, 0x09, 0xca, 0x29, 0x1f, 0xc1, 0xa1, 0x0f }}
```

Protocol Interface Structure

```
typedef struct {
  EFI_HII_EXTRACT_CONFIG          ExtractConfig;
  EFI_HII_EXPORT_CONFIG           ExportConfig
  EFI_HII_ROUTE_CONFIG            RouteConfig;
  EFI_HII_BLOCK_TO_CONFIG         BlockToConfig;
  EFI_HII_CONFIG_TO_BLOCK         ConfigToBlock;
  EFI_HII_GET_ALT_CFG             GetAltConfig;
}   EFI_HII_CONFIG_ROUTING_PROTOCOL;
```

Related Definitions

None

Parameters

Description

This protocol defines the configuration routing interfaces between external applications and the HII.

There may only be one instance of this protocol in the system.

35.4.2 EFI_HII_CONFIG_ROUTING_PROTOCOL.ExtractConfig()

Summary

This function allows a caller to extract the current configuration for one or more named elements from one or more drivers.

Prototype

```
typedef
EFI_STATUS
  (EFIAPI * EFI_HII_EXTRACT_CONFIG ) (
    IN CONST EFI_HII_CONFIG_ROUTING_PROTOCOL    *This,
    IN CONST EFI_STRING                         Request,
    OUT EFI_STRING                              *Progress,
    OUT EFI_STRING                              *Results
    );
```

Parameters

This

Points to the *EFI_HII_CONFIG_ROUTING_PROTOCOL* instance.

Request

A null-terminated string in <*MultiConfigRequest*> format.

Progress

On return, points to a character in the Request string. Points to the string's null terminator if request was successful. Points to the most recent '&' before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) if the request was not successful

Results

A null-terminated string in <*MultiConfigAltResp*> format which has all values filled in for the names in the *Request* string.

Description

This function allows the caller to request the current configuration for one or more named elements from one or more drivers. The resulting string is in the standard HII configuration string format. If Successful *Results* contains an equivalent string with "=" and the values associated with all names added in.

The expected implementation is for each <*ConfigRequest*> substring in the Request, call the HII Configuration Access Protocol *ExtractConfig* function for the driver corresponding to the <*ConfigHdr*> at the start of the <*ConfigRequest*> substring. The request fails if no driver matches the <*ConfigRequest*> substring.

NOTE: *Alternative configuration strings may also be appended to the end of the current configuration string. If they are, they must appear after the current configuration. They must contain the same routing (GUID, NAME, PATH) as the current configuration string. They must have an additional description indicating the type of alternative configuration the string represents*, "ALTCFG=<AltCfgId>". *The* <AltCfgId> *is a reference to a Default ID which stipulates the type of Default being referenced such as* EFI_HII_DEFAULT_CLASS_STANDARD.

As an example, assume that the Request string is:

```
GUID=...&PATH=...&Fred&George&Ron&Neville
```

A result might be:

```
GUID=...&PATH=...&Fred=16&George=16&Ron=12&Neville=11&
GUID=...&PATH=...&ALTCFG=0037&Fred=12&Neville=7
```

NOTE: *For the output Results, the value filled in the names in the Request string with* <MultiConfigAltResp> *format may change when called multiple times due to some data being of a dynamic nature*.

Status Codes Returned

EFI_SUCCESS	The *Results* string is filled with the values corresponding to all requested names.
EFI_OUT_OF_RESOURCES	Not enough memory to store the parts of the results that must be stored awaiting possible future protocols.
EFI_NOT_FOUND	Routing data doesn't match any known driver. Progress set to the "G" in "GUID" of the routing header that doesn't match. Note: There is no requirement that all routing data be validated before any configuration extraction.
EFI_INVALID_PARAMETER	Illegal syntax. Progress set to most recent "&" before the error or the beginning of the string.
EFI_INVALID_PARAMETER	The ExtractConfig function of the underlying HII Configuration Access Protocol returned EFI_INVALID_PARAMETER. Progress set to most recent "&" before the error or the beginning of the string.
EFI_ACCESS_DENIED	The action violated a system policy.

35.4.3 EFI_HII_CONFIG_ROUTING_PROTOCOL.ExportConfig()

Summary

This function allows the caller to request the current configuration for the entirety of the current HII database and returns the data in a null-terminated string.

Prototype

```
typedef
EFI_STATUS
  (EFIAPI * EFI_HII_EXPORT_CONFIG ) (
    IN CONST EFI_HII_CONFIG_ROUTING_PROTOCOL    *This,
    OUT EFI_STRING                              *Results
    );
```

Parameters

This

Points to the *EFI_HII_CONFIG_ROUTING_PROTOCOL* instance.

Results

A null-terminated string in <*MultiConfigAltResp*> format which has all values filled in for the entirety of the current HII database.

Description

This function allows the caller to request the current configuration for all of the current HII database. The results include both the current and alternate configurations as described in *ExtractConfig()* above.

EFI_HII_CONFIG_ACCESS_PROTOCOL.ExtractConfig() interfaces below.

Status Codes Returned

EFI_SUCCESS	The *Results* string is filled with the values corresponding to all requested names.
EFI_OUT_OF_RESOURCES	Not enough memory to store the parts of the results that must be stored awaiting possible future protocols.
EFI_INVALID_PARAMETER	For example, passing in a NULL for the *Results* parameter would result in this type of error.

35.4.4 EFI_HII_CONFIG_ROUTING_PROTOCOL.RouteConfig()

Summary

This function processes the results of processing forms and routes it to the appropriate handlers or storage.

Prototype

```
typedef
EFI_STATUS
  (EFIAPI * EFI_HII_ROUTE_CONFIG ) (
    IN CONST EFI_HII_CONFIG_ROUTING_PROTOCOL   *This,
    IN CONST EFI_STRING                        Configuration,
    OUT EFI_STRING                             *Progress
    );
```

Parameters

This

Points to the *EFI_HII_CONFIG_ROUTING_PROTOCOL* instance.

Configuration

A null-terminated string in <*MultiConfigResp*> format.

Progress

A pointer to a string filled in with the offset of the most recent '&' before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) or the terminating NULL if all was successful.

Description

This function routes the results of processing forms to the appropriate targets. It scans for <*ConfigHdr*> within the string and passes the header and subsequent body to the driver whose location is described in the <*ConfigHdr*>. Many <*ConfigHdr*> s may appear as a single request.

The expected implementation is to hand off the various <*ConfigResp*> substrings to the Configuration Access Protocol *RouteConfig* routine corresponding to the driver whose routing information is defined by the <*ConfigHdr*> in turn.

Status Codes Returned

EFI_SUCCESS	The results have been distributed or are awaiting distribution.
EFI_OUT_OF_RESOURCES	Not enough memory to store the parts of the results that must be stored awaiting possible future protocols.
EFI_INVALID_PARAMETERS	Passing in a **NULL** for the *Configuration* parameter would result in this type of error.
EFI_NOT_FOUND	Target for the specified routing data was not found
EFI_ACCESS_DENIED	The action violated a system policy.

35.4.5 EFI_HII_CONFIG_ROUTING_PROTOCOL.BlockToConfig()

Summary

This helper function is to be called by drivers to map configuration data stored in byte array ("block") formats such as UEFI Variables into current configuration strings.

Prototype

```
typedef
EFI_STATUS
  (EFIAPI  * EFI_HII_BLOCK_TO_CONFIG ) (
    IN CONST EFI_HII_CONFIG_ROUTING_PROTOCOL    *This,
    IN CONST EFI_STRING                         ConfigRequest,
    IN CONST UINT8                              *Block,
    IN CONST UINTN                              BlockSize,
    OUT EFI_STRING                              *Config,
    OUT EFI_STRING                              *Progress
    );
```

Parameters

This

Points to the *EFI_HII_CONFIG_ROUTING_PROTOCOL* instance.

ConfigRequest

A null-terminated string in <*ConfigRequest*> format.

Block

Array of bytes defining the block's configuration.

BlockSize

Length in bytes of *Block*.

Config

Filled-in configuration string. String allocated by the function. Returned only if call is successful. The null-terminated string will be in <*ConfigResp*> format

Progress

A pointer to a string filled in with the offset of the most recent '&' before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) or the terminating NULL if all was successful.

Description

This function extracts the current configuration from a block of bytes. To do so, it requires that the *ConfigRequest* string consists of a list of <*BlockName*> formatted names. It uses the offset in the name to determine the index into the Block to start the extraction and the width of each name to determine the number of bytes to extract. These are mapped to a string using the equivalent of the C "%x" format (with optional leading spaces).

The call fails if, for any (offset, width) pair in *ConfigRequest,* offset+value >= *BlockSize*.

Status Codes Returned

EFI_SUCCESS	The request succeeded. Progress points to the null terminator at the end of the *ConfigRequest* string.
EFI_OUT_OF_RESOURCES	Not enough memory to allocate *Config*. Progress points to the first character of *ConfigRequest*.
EFI_INVALID_PARAMETERS	Passing in a NULL for the *ConfigRequest* or *Block* parameter would result in this type of error. Progress points to the first character of *ConfigRequest*.
EFI_NOT_FOUND	Target for the specified routing data was not found. *Progress* points to the "G" in "GUID" of the errant routing data.
EFI_DEVICE_ERROR	Block not large enough. *Progress* undefined.
EFI_INVALID_PARAMETER	Encountered non <BlockName> formatted string. Block is left updated and Progress points at the '&' preceding the first non-<BlockName>.

35.4.6 EFI_HII_CONFIG_ROUTING_PROTOCOL.ConfigToBlock()

Summary

This helper function is to be called by drivers to map configuration strings to configurations stored in byte array ("block") formats such as UEFI Variables.

Prototype

```
typedef
EFI_STATUS
  (EFIAPI * EFI_HII_CONFIG_TO_BLOCK ) (
  IN   CONST EFI_HII_CONFIG_ROUTING_PROTOCOL    *This,
  IN   CONST EFI_STRING                         *ConfigResp,
  IN OUT CONST UINT8                            *Block,
  IN OUT UINTN                                  *BlockSize,
  OUT   EFI_STRING                              *Progress
  );
```

Parameters

This

Points to the *EFI_HII_CONFIG_ROUTING_PROTOCOL* instance.

ConfigResp

A null-terminated string in <*ConfigResp*> format.

Block

A possibly null array of bytes representing the current block. Only bytes referenced in the *ConfigResp* string in the block are modified. If this parameter is null or if the * *BlockSize* parameter is (on input) shorter than required by the *Configuration* string, only the *BlockSize* parameter is updated and an appropriate status (see below) is returned.

BlockSize

The length of the *Block* in units of UINT8. On input, this is the size of the *Block*. On output, if successful, contains the largest index of the modified byte in the *Block*, or the required buffer size if the *Block* is not large enough.

Progress

On return, points to an element of the *ConfigResp* string filled in with the offset of the most recent '&' before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) or the terminating NULL if all was successful.

Description

This function maps a configuration containing a series of <*BlockConfig*> formatted name value pairs in *ConfigResp* into a *Block* so it may be stored in a linear mapped storage such as a UEFI Variable. If present, the function skips *GUID, NAME,* and *PATH* in < *ConfigResp*>. It stops when it finds a non- <*BlockConfig*> name / value pair (after skipping the routing header) or when it reaches the end of the string.

Example

Assume an existing block containing:

```
00 01 02 03 04 05
```

And the *ConfigResp* string is:

```
OFFSET=3WIDTH=1&VALUE=7&OFFSET=0&WIDTH=2&VALUE=AA55
```

The results are

```
55 AA 02 07 04 05
```

Status Codes Returned

EFI_SUCCESS	The request succeeded. Progress points to the null terminator at the end of the *ConfigResp* string.
EFI_OUT_OF_RESOURCES	Not enough memory to allocate *Config*. Progress points to the first character of *ConfigResp*.
EFI_INVALID_PARAMETER	Passing in a NULL for the *ConfigResp* or *Block* parameter would result in this type of error. Progress points to the first character of *ConfigResp*.
EFI_NOT_FOUND	Target for the specified routing data was not found. *Progress* points to the "G" in "GUID" of the errant routing data.
EFI_BUFFER_TOO_SMALL	Block not large enough. *Progress* undefined. *BlockSize* is updated with the required buffer size.

continues on next page

Table 35.7 – continued from previous page

EFI_INVALID_PARAMETER	Encountered non <BlockName> formatted name / value pair. *Block* is left updated and *Progress* points at the '&' preceding the first non-<BlockName>.

35.4.7 EFI_HII_CONFIG_ROUTING_PROTOCOL.GetAltCfg()

Summary

This helper function is to be called by drivers to extract portions of a larger configuration string.

Prototype

```
typedef
EFI_STATUS
  (EFIAPI * EFI_HII_GET_ALT_CFG ) (
  IN   CONST EFI_HII_CONFIG_ROUTING_PROTOCOL      *This,
  IN   CONST EFI_STRING                           ConfigResp,
  IN   CONST EFI_GUID                             *Guid,
  IN   CONST EFI_STRING                           Name,
  IN   CONST EFI_DEVICE_PATH_PROTOCOL             *DevicePath,
  IN   CONST EFI_STRING                           AltCfgId,
  OUT  EFI_STRING                                 *AltCfgResp
  );
```

Parameters

This
Points to the *EFI_HII_CONFIG_ROUTING_PROTOCOL* instance.

ConfigResp
A null-terminated string in <*ConfigAltResp*> format.

Guid
A pointer to the GUID value to search for in the routing portion of the *ConfigResp* string when retrieving the requested data. If Guid is NULL, then all GUID values will be searched for.

Name
A pointer to the NAME value to search for in the routing portion of the *ConfigResp* string when retrieving the requested data. If *Name* is NULL, then all *Name* values will be searched for.

DevicePath
A pointer to the PATH value to search for in the routing portion of the *ConfigResp* string when retrieving the requested data. If *DevicePath* is **NULL**, then all *DevicePath* values will be searched for.

AltCfgId
A pointer to the ALTCFG value to search for in the routing portion of the *ConfigResp* string when retrieving the requested data. If this parameter is **NULL**, then the current setting will be retrieved.

AltCfgResp
A pointer to a buffer which will be allocated by the function which contains the retrieved string as requested. This buffer is only allocated if the call was successful. The null-terminated string will be in <*ConfigResp*> format.

Description

This function retrieves the requested portion of the configuration string from a larger configuration string. This function will use the *Guid, Name,* and *DevicePath* parameters to find the appropriate section of the *ConfigResp* string. Upon finding this portion of the string, it will use the *AltCfgId* parameter to find the appropriate instance of data in the

ConfigResp string. Once found, the found data will be copied to a buffer which is allocated by the function so that it can be returned to the caller. The caller is responsible for freeing this allocated buffer.

Status Codes Returned

EFI_SUCCESS	The request succeeded. The requested data was extracted and placed in the newly allocated *AltCfgResp* buffer.
EFI_OUT_OF_RESOURCES	Not enough memory to allocate *AltCfgResp*.
EFI_INVALID_PARAMETER	Passing in a NULL for the *ConfigResp* or *AltCfgResp* would result in this type of error.

35.5 EFI HII Configuration Access Protocol

35.5.1 EFI_HII_CONFIG_ACCESS_PROTOCOL

Summary

The EFI HII configuration routing protocol invokes this type of protocol when it needs to forward requests to a driver's configuration handler. This protocol is published by drivers providing and receiving configuration data from HII. The *ExtractConfig()* and *RouteConfig()* functions are typically invoked by the driver which implements the HII Configuration Routing Protocol. The *Callback()* function is typically invoked by the Forms Browser.

If the protocol functions modify active form set, they must not change layout and size of the existing variable stores. The forms browser processes updated IFR package in accordance with the following rules:

1. If active form set no longer exists, the behavior is browser specific. The browser identifies form set using a combination of the form set GUID and device path associated with the package list containing the form set.
2. If form set update has been initiated by the *Callback()* function, the browser executes action requested by the function. See *EFI_HII_CONFIG_ACCESS_PROTOCOL.CallBack()* section for additional details regarding browser action requests.

NOTE: *If browser action implies saving of the modified questions values, the browser will use uncommitted data associated with the old form set instance. The HII Configuration Access implementation is responsible for properly handling such requests.*

3. The browser performs standard processing steps that are performed on a form set prior to displaying it (including reading question values and generating *EFI_BROWSER_ACTION_FORM_OPEN* and *EFI_BROWSER_ACTION_FORM_RETRIEVE* callbacks).
4. If there is an uncommitted browser data associated with an active form set, the browser applies it, matching variable stores by their identifiers. If variable store no longer exists, the uncommitted data for this store is discarded.

NOTE: *Changing layout or size of the existing variable stores during form set update is not allowed and can lead to unpredictable results.*

5. The browser applies prior browsing history, matching forms by their identifiers. If a form saved in the browsing history no longer exists, the behavior is browser-specific.
6. If all forms in the browsing history have been matched, the browser sets selection on a question that was active prior to the form set update, matching question by its identifier. If question does not exist, the first question on the form is selected.

GUID

```
#define EFI_HII_CONFIG_ACCESS_PROTOCOL_GUID \
{ 0x330d4706, 0xf2a0, 0x4e4f,\
{0xa3,0x69, 0xb6, 0x6f,0xa8, 0xd5, 0x43, 0x85}}
```

Protocol Interface Structure

```
typedef struct {
  EFI_HII_ACCESS_EXTRACT_CONFIG       ExtractConfig;
  EFI_HII_ACCESS_ROUTE_CONFIG         RouteConfig;
  EFI_HII_ACCESS_FORM_CALLBACK        Callback;
}   EFI_HII_CONFIG_ACCESS_PROTOCOL;
```

Related Definitions

None

Parameters

ExtractConfig
This function breaks apart the request strings routing them to the appropriate drivers. This function is analogous to the similarly named function in the HII Routing Protocol.

RouteConfig
This function breaks apart the results strings and returns configuration information as specified by the request.

Callback
This function is called from the configuration browser to communicate certain activities that were initiated by a user.

Description

This protocol provides a callable interface between the HII and drivers. Only drivers which provide IFR data to HII are required to publish this protocol.

35.5.2 EFI_HII_CONFIG_ACCESS_PROTOCOL.ExtractConfig()

Summary

This function allows a caller to extract the current configuration for one or more named elements from the target driver.

Prototype

```
typedef
EFI_STATUS
  (EFIAPI * EFI_HII_ACCESS_EXTRACT_CONFIG ) (
  IN CONST EFI_HII_CONFIG_ACCESS_PROTOCOL    *This,
  IN CONST EFI_STRING                        Request,
  OUT EFI_STRING                             *Progress,
  OUT EFI_STRING                             *Results
  );
```

Parameters

This
Points to the *EFI_HII_CONFIG_ACCESS_PROTOCOL*.

Request
A null-terminated string in <*ConfigRequest*> format. Note that this includes the routing information as well as the configurable name / value pairs. It is invalid for this string to be in <*MultiConfigRequest*> format.

If a **NULL** is passed in for the *Request* field, all of the settings being abstracted by this function will be returned in the *Results* field. In addition, if a *ConfigHdr* is passed in with no request elements, all of the settings being abstracted for that particular *ConfigHdr* reference will be returned in the *Results* Field.

Progress

On return, points to a character in the *Request* string. Points to the string's null terminator if request was successful. Points to the most recent '&' before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) if the request was not successful

Results

A null-terminated string in <*MultiConfigAltResp*> format which has all values filled in for the names in the *Request* string. String to be allocated by the called function.

Description

This function allows the caller to request the current configuration for one or more named elements. The resulting string is in <*ConfigAltResp*> format.

In order to support forms processors other than a Forms Browser, the configuration returned by this function must not depend on context in which the function is used. In particular, it must not depend on the current state of the Forms Browser (including any uncommitted state information) and actions performed by the driver callbacks invoked prior to the ExtractConfig call. See:numref:*Connected-forms-browser-processor* for more details.

Any and all alternative configuration strings shall also be appended to the end of the current configuration string. If they are, they must appear after the current configuration. They must contain the same routing (GUID, NAME, PATH) as the current configuration string. They must have an additional description indicating the type of alternative configuration the string represents, ” *ALTCFG=<AltCfgId>* “. The <*AltCfgId*> is a reference to a Default ID which stipulates the type of Default being referenced such as *EFI_HII_DEFAULT_CLASS_STANDARD*.

As an example, assume that the Request string is:

```
GUID=...&PATH=...&Fred&George&Ron&Neville
```

A result might be:

```
GUID=...&PATH=...&Fred=16&George=16&Ron=12&Neville=11&GUID=...&PATH=...&ALTCFG=0037&
Fred=12&Neville=7
```

This function allows the caller to request the current configuration for one or more named elements. The resulting string is in <*ConfigAltResp*> format.

Any and all alternative configuration strings shall also be appended to the end of the current configuration string. If they are, they must appear after the current configuration. They must contain the same routing (GUID, NAME, PATH) as the current configuration string. They must have an additional description indicating the type of alternative configuration the string represents, ” *ALTCFG=<AltCfgId>* “. The <*AltCfgId*> is a reference to a Default ID which stipulates the type of Default being referenced such as *EFI_HII_DEFAULT_CLASS_STANDARD*.

As an example, assume that the *Request* string is:

```
GUID=...&PATH=...&Fred&George&Ron&Neville
```

A result might be:

```
GUID=...&PATH=...&Fred=16&George=16&Ron=12&Neville=11&
GUID=...&PATH=...&ALTCFG=0037&Fred=12&Neville=7
```

NOTE: *For the output Results, the value filled in the names in the Request string with* <ConfigAltResp> *format may change when called multiple times due to some data being of a dynamic nature.*

Status Codes Returned

EFI_SUCCESS	The *Results* string is filled with the values corresponding to all requested names.
EFI_OUT_OF_RESOURCES	Not enough memory to store the parts of the results that must be stored awaiting possible future protocols.
EFI_NOT_FOUND	A configuration element matching the routing data is not found. Progress set to the first character in the routing header.
EFI_INVALID_PARAMETER	Illegal syntax. Progress set to most recent "&" before the error or the beginning of the string.
EFI_INVALID_PARAMETER	Unknown name. *Progress* points to the "&" before the name in question.
EFI_INVALID_PARAMETER	If Results or Progress is **NULL**.
EFI_ACCESS_DENIED	The action violated a system policy.
EFI_DEVICE_ERROR	Failed to extract the current configuration for one or more named elements.

35.5.3 EFI_HII_CONFIG_ACCESS_PROTOCOL.RouteConfig()

Summary

This function processes the results of changes in configuration for the driver that published this protocol.

Prototype

```
typedef
EFI_STATUS
(EFIAPI * EFI_HII_ACCESS_ROUTE_CONFIG ) (
  IN CONST EFI_HII_CONFIG_ACCESS_PROTOCOL       *This,
  IN CONST EFI_STRING                           Configuration,
  OUT EFI_STRING                                *Progress
  );
```

Parameters

This

Points to the *EFI_HII_CONFIG_ACCESS_PROTOCOL*.

Configuration

A null-terminated string in <*ConfigResp*> format.

Progress

A pointer to a string filled in with the offset of the most recent '&' before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) or the terminating NULL if all was successful.

Description

This function applies changes in a driver's configuration. Input is a *Configuration,* which has the routing data for this driver followed by name / value configuration pairs. The driver must apply those pairs to its configurable storage.

In order to support forms processors other than a Forms Browser, the way in which configuration data is applied must not depend on context in which the function is used. In particular, it must not depend on the current state of the Forms Browser (including any uncommitted state information) and actions performed by the driver callbacks invoked prior to the *RouteConfig* call. *Connected Forms Browser/Processor* provides additional details regarding forms browser/processor.

If the driver's configuration is stored in a linear block of data and the driver's name / value pairs are in <*BlockConfig*> format, it may use the *ConfigToBlock* helper function (above) to simplify the job.

Status Codes Returned

EFI_SUCCESS	The results have been distributed or are awaiting distribution.
EFI_OUT_OF_RESOURCES	Not enough memory to store the parts of the results that must be stored awaiting possible future protocols.
EFI_INVALID_PARAMETER	If Configuration or Progress is NULL.
EFI_NOT_FOUND	Target for the specified routing data was not found
EFI_ACCESS_DENIED	The action violated a system policy.

35.5.4 EFI_HII_CONFIG_ACCESS_PROTOCOL.CallBack()

Summary

This function is called to provide results data to the driver.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_HII_ACCESS_FORM_CALLBACK) (
  IN   CONST EFI_HII_CONFIG_ACCESS_PROTOCOL     *This,
  IN   EFI_BROWSER_ACTION                       Action,
  IN   EFI_QUESTION_ID                          QuestionId,
  IN   UINT8                                    Type
  IN OUT EFI_IFR_TYPE_VALUE                     *Value,
  OUT  EFI_BROWSER_ACTION_REQUEST               *ActionRequest,
  );
```

Parameters

This

Points to the *EFI_HII_CONFIG_ACCESS_PROTOCOL*.

Action

Specifies the type of action taken by the browser. See *EFI_BROWSER_ACTION_x* in “Related Definitions” below.

QuestionId

A unique value which is sent to the original exporting driver so that it can identify the type of data to expect. The format of the data tends to vary based on the opcode that generated the callback.

Type

The type of value for the question. See *EFI_IFR_TYPE_x* in *EFI_IFR_ONE_OF_OPTION*.

Value

A pointer to the data being sent to the original exporting driver. The type is specified by *Type*. Type *EFI_IFR_TYPE_VALUE* is defined in *EFI_IFR_ONE_OF_OPTION.*

ActionRequest

On return, points to the action requested by the callback function. Type *EFI_BROWSER_ACTION_REQUEST* is specified in *SendForm()* in the Form Browser Protocol.

Description

This function is called by the forms browser in response to a user action on a question which has the *EFI_IFR_FLAG_CALLBACK* bit set in the *EFI_IFR_QUESTION_HEADER*. The user action is specified by *Action*. Depending on the action, the browser may also pass the question value using *Type* and *Value*. Upon return, the callback function may specify the desired browser action.

The browser maintains uncommitted browser data (modified and unsaved question values) across Callback function boundaries. Callback function may change unsaved question values using one of the following methods:

- Current question's value may be changed by updating the *Value* parameter.
- Values of other questions from the active formset can be changed using *EFI_FORM_BROWSER2_PROTOCOL.BrowserCallback()* interface.

NOTE: *Modification of the question values by the Callback function without notifying the browser using one of the above mentioned methods can lead to unpredictable browser behavior.*

Callback function may request configuration update from the browser by returning an appropriate *ActionRequest*.

In order to save uncommitted data, driver should return one of the *_SUBMIT* actions or *_APPLY* action. The browser will then write all modified question values (in case of the *_SUBMIT* actions) or modified question values from an active form (in case of the *_APPLY* action) to storage using *RouteConfig()* function. This will include questions modified prior to an invocation of the *Callback()* function as well as questions modified by the *Callback()* function.

The behavior of the *ExtractConfig* and *RouteConfig* functions must not depend on the actions performed by this function.

Callback functions should return *EFI_UNSUPPORTED* for all values of *Action* that they do not support.

Related Definitions

```
typedef UINTN EFI_BROWSER_ACTION;

#define EFI_BROWSER_ACTION_CHANGING              0
#define EFI_BROWSER_ACTION_CHANGED               1
#define EFI_BROWSER_ACTION_RETRIEVE              2

#define EFI_BROWSER_ACTION_SUBMITTED             5
#define EFI_BROWSER_ACTION_DEFAULT_STANDARD      0x1000
#define EFI_BROWSER_ACTION_DEFAULT_MANUFACTURING 0x1001
#define EFI_BROWSER_ACTION_DEFAULT_SAFE          0x1002
#define EFI_BROWSER_ACTION_DEFAULT_PLATFORM      0x2000
#define EFI_BROWSER_ACTION_DEFAULT_HARDWARE      0x3000
#define EFI_BROWSER_ACTION_DEFAULT_FIRMWARE      0x4000
```

The following table describes the behavior of the callback for each question type.

Table 35.11: Callback Behavior

Question Type	**Type**	**Action**
Action Button	*EFI_IFR_TYPE_ACTION*	No special behavior. If the short form of the opcode is used, then the value will be a string identifier of zero.
Checkbox	*EFI_IFR_TYPE_BOOLEAN*	No special behavior
Cross-Reference	*EFI_IFR_TYPE_REF* *EF I_IFR_TYPE_UNDEFINED*	CHANGING: If EFI_UNSUPPORTED or EFI_SUCCESS, the updated cross-reference is taken. Any other error the cross-reference will not be taken. CHANGED: Never called. RETRIEVE: Called before displaying the cross-reference. Error codes ignored. The Ref field of the Value parameter is initialized with the REF question's value prior to CHANGING and RETRIEVE.

continues on next page

Table 35.11 – continued from previous page

Date	*EFI_IFR_TYPE_DATE*	No special behavior
Numeric, One-Of	*EFI _IFR_TYPE_NUM_SIZE_8*, *EFI_ IFR_TYPE_NUM_SIZE_16*, *EFI_ IFR_TYPE_NUM_SIZE_32*, *EFI_ IFR_TYPE_NUM_SIZE_64*	No special behavior.
Ordered-List	*EFI_IFR_TYPE_BUFFER*	No special behavior
String, Password	*EFI_IFR_TYPE_STRING*	No special behavior.
Time	*EFI_IFR_TYPE_DATE*	No special behavior.

The value *EFI_BROWSER_ACTION_CHANGING* is called before the browser changes the value in the display (for questions which have a value) or takes an action (in the case of an action button or cross-reference). If the callback returns *EFI_UNSUPPORTED,* then the browser will use the value passed to *Callback()* and ignore the value returned by *Callback()*. If the callback returns *EFI_SUCCESS,* then the browser will use the value returned by *Callback()*. If any other error is returned, then the browser will not update the current question value. *ActionRequest* is used. The *Value* represents the updated value. The changes here should not be finalized until the user submits the results.

The value *EFI_BROWSER_ACTION_CHANGED* is called after the browser has changed its internal copy of the question value and displayed it (if appropriate). For action buttons, this is called after the value has been processed. For cross-references, this is never called. Errors returned are ignored. *ActionRequest* is used. The changes here should not be finalized until the user submits the results.

The value *EFI_BROWSER_ACTION_RETRIEVE* is called after the browser has read the current question value, but before it has been displayed. If the callback returns *EFI_UNSUPPORTED* or any other error then the original value is used. If *EFI_SUCCESS* is returned, then the updated value is used.

The value *EFI_BROWSER_ACTION_FORM_OPEN* is called for each question on a form prior to its value being retrieved or displayed. If a question appears on more than one form, and the Forms Browser supports more than one form being active simultaneously, this may be called more than once, even prior to any *EFI_BROWSER_ACTION_FORM_CLOSE* callback.

NOTE: EFI_FORM_BROWSER2_PROTOCOL.BrowserCallback() *cannot be used with this browser action because question values have not been retrieved yet*.

The value *EFI_BROWSER_ACTION_FORM_CLOSE* is called for each question on a form after the processing of any submit actions for that form. If a question appears on more than one form, and the Forms Processor supports more than one form being active simultaneously, this will be called more than once.

The value *EFI_BROWSER_ACTION_SUBMITTED* is called after Browser submits the modified question value. *ActionRequest* is ignored.

When *Action* specifies one of the "default" actions, such as *EFI_BROWSER_ACTION_DEFAULT_STANDARD,* etc. it indicates that the Forms Processor is attempting to retrieve the default value for the specified question. The proposed default value is passed in using *Type* and *Value* and reflects the value which the Forms Processor was able to select based on the lower-priority defaulting methods (see *Defaults*). If the function returns *EFI_SUCCESS,* then the updated value will be used. If the function does not have an updated default value for the specified question or specified default store, or does not provide any support for the actions, it should return *EFI_UNSUPPORTED,* and the returned value will be ignored.

The *DEFAULT_PLATFORM, DEFAULT_HARDWARE* and *DEFAULT_FIRMWARE* represent ranges of 4096 (0x1000) possible default store identifiers. The *DEFAULT_STANDARD* represents the range of 4096 possible action values reserved for UEFI-defined default store identifiers. See *Defaults* for more information on defaults.

```
typedef UINTN EFI_BROWSER_ACTION_REQUEST;

#define EFI_BROWSER_ACTION_REQUEST_NONE               0
#define EFI_BROWSER_ACTION_REQUEST_RESET              1
#define EFI_BROWSER_ACTION_REQUEST_SUBMIT             2
#define EFI_BROWSER_ACTION_REQUEST_EXIT               3
#define EFI_BROWSER_ACTION_REQUEST_FORM_SUBMIT_EXIT   4
#define EFI_BROWSER_ACTION_REQUEST_FORM_DISCARD_EXIT  5
#define EFI_BROWSER_ACTION_REQUEST_FORM_APPLY         6
#define EFI_BROWSER_ACTION_REQUEST_FORM_DISCARD       7
#define EFI_BROWSER_ACTION_REQUEST_RECONNECT          8
#define EFI_BROWSER_ACTION_REQUEST_QUESTION_APPLY     9
```

If the callback function returns with the *ActionRequest* set to _NONE, then the Forms Browser will take no special behavior.

If the callback function returns with the *ActionRequest* set to _RESET, then the Forms Browser will exit and request the platform to reset.

If the callback function returns with the *ActionRequest* set to _SUBMIT, then the Forms Browser will save all modified question values to storage and exit.

If the callback function returns with the *ActionRequest* et to _EXIT, then the Forms Browser will discard all modified question values and exit.

If the callback function returns with the *ActionRequest* set to _FORM_SUBMIT_EXIT, then the Forms Browser will write all modified question values on the selected form to storage and then exit the selected form.

If the callback function returns with the *ActionRequest* set to _FORM_DISCARD_EXIT, then the Forms Browser will discard the modified question values on the selected form and then exit the selected form.

If the callback function returns with the *ActionRequest* set to _FORM_APPLY, then the Forms Browser will write all modified current question values on the selected form to storage.

If the callback function returns with the *ActionRequest* set to _FORM_DISCARD, then the Forms Browser will discard the current question values on the selected form and replace them with the original question values.

If the callback function returns with the *ActionRequest* set to _RECONNECT, a hardware and/or software configuration change was performed by the user, and the controller needs to be reconnected for the driver to recognize the change. Upon the user exiting the formset or the browser, the Forms Browser is required to call the EFI Boot Service *DisconnectController()* followed by the EFI Boot Service *ConnectController()* to reconnect the controller. The controller handle passed to *DisconnectController()* and *ConnectController()* is the handle on which this *EFI_HII_CONFIG_ACCESS_PROTOCOL* is installed.

If the callback function returns with the *ActionRequest* set to _QUESTION_APPLY, then the Forms Browser will write the current modified question value on the selected form to storage.

Status Codes Returned

EFI_SUCCESS	The callback successfully handled the action.
EFI_OUT_OF_RESOURCES	Not enough storage is available to hold the variable and its data.
EFI_DEVICE_ERROR	The variable could not be saved.
EFI_UNSUPPORTED	The specified Action is not supported by the callback.

35.6 Form Browser Protocol

The *EFI_FORM_BROWSER2_PROTOCOL* is the interface to call for drivers to leverage the EFI configuration driver interface.

35.6.1 EFI_FORM_BROWSER2_PROTOCOL

Summary

The *EFI_FORM_BROWSER2_PROTOCOL* is the interface to the UEFI configuration driver. This interface will allow the caller to direct the configuration driver to use either the HII database or use the passed-in packet of data.

GUID

```
#define EFI_FORM_BROWSER2_PROTOCOL_GUID \
  { 0xb9d4c360, 0xbcfb, 0x4f9b, \
  { 0x92, 0x98, 0x53, 0xc1, 0x36, 0x98, 0x22, 0x58 } }
```

Protocol Interface Structure

```
typedef struct _EFI_FORM_BROWSER2_PROTOCOL {
  EFI_SEND_FORM2                     SendForm;
  EFI_BROWSER_CALLBACK2              BrowserCallback;
}   EFI_FORM_BROWSER2_PROTOCOL;
```

Parameters

SendForm
Browse the specified configuration forms. See the *SendForm()* function description.

BrowserCallback
Routine used to expose internal configuration state of the browser. This is primarily used by callback handler routines which were called by the browser and in-turn need to get additional information from the browser itself. See the *BrowserCallback()* function description.

Description

This protocol is the interface to call for drivers to leverage the EFI configuration driver interface.

35.6.2 EFI_FORM_BROWSER2_PROTOCOL.SendForm()

Summary

Initialize the browser to display the specified configuration forms.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SEND_FORM2) (
  IN CONST EFI_FORM_BROWSER2_PROTOCOL        *This,
  IN EFI_HII_HANDLE                          *Handles,
```

(continues on next page)

(continued from previous page)

```
IN UINTN                                  HandleCount,
IN CONST EFI_GUID                         *FormsetGuid, OPTIONAL
IN EFI_FORM_ID                            FormId, OPTIONAL
IN CONST EFI_SCREEN_DESCRIPTOR            *ScreenDimensions, OPTIONAL
OUT EFI_BROWSER_ACTION_REQUEST            *ActionRequest OPTIONAL
);
```

Parameters

This

A pointer to the *EFI_FORM_BROWSER2_PROTOCOL* instance.

Handles

A pointer to an array of HII handles to display. This value should correspond to the value of the HII form package that is required to be displayed. Type *EFI_HII_HANDLE* is defined in *EFI_HII_DATABASE_PROTOCOL.NewPackageList()* in *Package Lists and Package Headers*.

HandleCount

The number of handles in the array specified by *Handle*.

FormsetGuid

This field points to the *EFI_GUID* which must match the *Guid* field or one of the elements of the ClassId field in the *EFI_IFR_FORM_SET* op-code. If *FormsetGuid* is *NULL,* then this function will display the form set class *EFI_HII_PLATFORM_SETUP_FORMSET_GUID*.

FormId

This field specifies the identifier of the form within the form set to render as the first displayable page. If this field has a value of 0x0000, then the Forms Browser will render the first enabled form in the form set.

ScreenDimensions

Points to recommended form dimensions, including any non-content area, in characters. Type *EFI_SCREEN_DESCRIPTOR* is defined in "Related Definitions" below.

ActionRequested

Points to the action recommended by the form.

Description

This function is the primary interface to the Forms Browser. The Forms Browser displays the forms specified by *FormsetGuid* and *FormId* from all of HII handles specified by *Handles*. If more than one form can be displayed, the Forms Browser will provide some means for the user to navigate between the forms in addition to that provided by cross-references in the forms themselves.

If ScreenDimensions is non-NULL, then it points to a recommended display size for the form. If browsing in text mode, then these are recommended character positions. If browsing in graphics mode, then these values are converted to pixel locations using the standard font size (8 pixels per horizontal character cell and 19 pixels per vertical character cell). If ScreenDimensions is NULL the browser may choose the size based on platform policy. The browser may choose to ignore the size based on platform policy.

If ActionRequested is non-NULL, then upon return, it points to an enumerated value (see EFI_BROWSER_ACTION_x in "Related Definitions" below) which describes the action requested by the user. If set to EFI_BROWSER_ACTION_NONE, then no specific action was requested by the form. If set to EFI_BROWSER_ACTION_RESET, then the form requested that the platform be reset. The browser may, based on platform policy, ignore such action requests.

If *FormsetGuid* is set to *EFI_HII_PLATFORM_SETUP_FORMSET_GUID,* it indicates that the form set contains forms designed to be used for platform configuration. If *FormsetGuid* is set to *EFI_HII_DRIVER_HEALTH_FORMSET_GUID,* it indicates that the form set contains forms designed to be used for support of the Driver Health Protocol (*EFI Driver Health Protocol*). If FormsetGuid is set to

EFI_HII_USER_CREDENTIAL_FORMSET_GUID, it indicates that the form set contains forms designed to be used for support of the User Credential Protocol (*Credential Provider Protocols*) If *FormsetGuid* is set to *EFI_HII_REST_STYLE_FORMSET_GUID,* it indicates that the form set contains forms designed to be used for support configuration of REST architectural style (see Section 29.7). Other values may be used for other applications.

Related Definitions

```
//*******************************************
// EFI_SCREEN_DESCRIPTOR
//*******************************************
typedef struct {
  UINTN          LeftColumn;
  UINTN          RightColumn;
  UINTN          TopRow;
  UINTN          BottomRow;
}  EFI_SCREEN_DESCRIPTOR;
```

LeftColumn
Value that designates the text column where the browser window will begin from the left-hand side of the screen

RightColumn
Value that designates the text column where the browser window will end on the right-hand side of the screen.

TopRow
Value that designates the text row from the top of the screen where the browser window will start.

BottomRow
Value that designates the text row from the bottom of the screen where the browser window will end.

```
typedef UINTN EFI_BROWSER_ACTION_REQUEST;

#define EFI_BROWSER_ACTION_REQUEST_NONE      0
#define EFI_BROWSER_ACTION_REQUEST_RESET     1
#define EFI_BROWSER_ACTION_REQUEST_SUBMIT    2
#define EFI_BROWSER_ACTION_REQUEST_EXIT      3
```

The value *EFI_BROWSER_ACTION* _REQUEST *_NONE* indicates that no specific caller action is required. The value *EFI_BROWSER_ACTION* _REQUEST *_RESET* indicates that the caller requested a platform reset. The value *EFI_BROWSER_ACTION* _REQUEST *_SUBMIT* indicates that a callback requested that the browser submit all values and exit. The value *EFI_BROWSER_ACTION* _REQUEST *_EXIT* indicates that a callback requested that the browser exit without saving all values.

```
#define EFI_HII_PLATFORM_SETUP_FORMSET_GUID \

{ 0x91, 0x70, 0x5f, 0xf7, 0x11, 0x31, 0x8b, 0x27 } }
```

Status Codes Returned

EFI_SUCCESS	The function completed successfully
EFI_NOT_FOUND	No valid forms could be found to display.
EFI_INVALID_PARAMETER	One of the parameters has an invalid value.

35.6.3 EFI_FORM_BROWSER2_PROTOCOL.BrowserCallback()

Summary

This function is called by a callback handler to retrieve uncommitted state data from the browser.

Prototype

```
EFI_STATUS
  (EFIAPI *EFI_BROWSER_CALLBACK2 ) (
  IN    CONST EFI_FORM_BROWSER2_PROTOCOL     *This,
  IN  OUT UINTN                              *ResultsDataSize,
  IN  OUT EFI_STRING                         ResultsData,
  IN    BOOLEAN                              RetrieveData,
  IN    CONST EFI_GUID                       *VariableGuid, OPTIONAL
  IN    CONST CHAR16                         *VariableName OPTIONAL
  );
```

Parameters

This
A pointer to the *EFI_FORM_BROWSER2_PROTOCOL* instance.

ResultsDataSize
A pointer to the size of the buffer associated with ResultsData. On input, the size in bytes of *ResultsData*. On output, the size of data returned in *ResultsData*.

ResultsData
A string returned from an IFR browser or equivalent. The results string will have no routing information in them.

RetrieveData
A BOOLEAN field which allows an agent to retrieve (if RetrieveData = **TRUE**) data from the uncommitted browser state information or set (if RetrieveData = **FALSE**) data in the uncommitted browser state information.

VariableGuid
An optional field to indicate the target variable GUID name to use.

VariableName
An optional field to indicate the target human-readable variable name.

Description

This service is typically called by a driver's callback routine which was in turn called by the browser. The routine called this service in the browser to retrieve or set certain uncommitted state information that resides in the open formsets.

Status Codes Returned

EFI_SUCCESS	The results have been distributed or are awaiting distribution.
EFI_BUFFER_TOO_SMALL	The *ResultsDataSize* specified was too small to contain the results data.
EFI_UNSUPPORTED	Uncommitted browser state is not available at the current stage of execution.

35.7 HII Popup Protocol

35.7.1 EFI_HII_POPUP_PROTOCOL

Summary

This protocol provides services to display a popup window.

The protocol is typically produced by the forms browser and consumed by a driver's callback handler.

GUID

```
#define EFI_HII_POPUP_PROTOCOL_GUID \\
{ 0x4311edc0, 0x6054, 0x46d4, { 0x9e, 0x40, 0x89, 0x3e, 0xa9, 0x52, 0xfc, 0xcc
} }
```

Protocol Interface Structure

```
typedef struct {
        UINT64                 Revision;
EFI_HII_CREATE_POPUP           CreatePopup;
} EFI_HII_POPUP_PROTOCOL;
```

Parameters

Revision
Protocol revision

CreatePopup
Displays a popup window

Related Definitions

```
#define *EFI_HII_POPUP_PROTOCOL_REVISION* 1
```

35.7.2 EFI_HII_POPUP_PROTOCOL.CreatePopup()

Summary

Displays a popup window.

Prototype

```
typedef
EFI_STATUS
(EFIAPI * EFI_HII_CREATE_POPUP) (
IN EFI_HII_POPUP_PROTOCOL             *This,
IN EFI_HII_POPUP_STYLE                PopupStyle,
IN EFI_HII_POPUP_TYPE                 PopupType,
```

(continues on next page)

(continued from previous page)

```
EFI_HII_HANDLE                      HiiHandle
IN EFI_STRING_ID                    Message,
OUT EFI_HII_POPUP_SELECTION         *UserSelection OPTIONAL,
);
```

Parameters

This
A pointer to the *EFI_HII_POPUP_PROTOCOL* instance.

PopupStyle
Popup style to use. *EFI_HII_POPUP_STYLE* is defined in the "Related Definitions" below.

PopupType
Type of the popup to display. *EFI_HII_POPUP_TYPE* is defined in the "Related Definitions" below.

HiiHandle
HII handle of the string pack containing *Message*

Message
A message to display in the popup box.

UserSelection
User selection. *EFI_HII_POPUP_SELECTION* is defined in the "Related Definitions" below.

Description

The *CreatePopup()* function displays a modal message box that contains string specified by *Message*. Explicit line break characters can be used to specify a multi-line message (*Common Control Codes*). A popup window may contain user selectable options. The option selected by a user is returned via an optional *UserSelection* parameter.

A list of options presented to a user is defined by the *PopupType*.

The *PopupStyle* provides a hint to protocol implementation regarding nature of the message being displayed. The function may optionally use *PopupStyle* to customize visual appearance of the message box.

EfiHiiPopupTypeOk is a simple popup window with a single user selectable option that can be used to acknowledge the message. If *UserSelection* is specified, it is set to EfiHiiPopupSelectionOk.

EfiHiiPopupTypeOkCancel is a popup window with two user selectable options: OK and Cancel.

EfiHiiPopupTypeYesNo is a popup window with two user selectable options: Yes and No.

EfiHiiPopupTypeYesNoCancel is a popup window with three user selectable options: Yes, No, and Cancel.

Related Definitions

```
typedef enum {
  EfiHiiPopupStyleInfo,
  EfiHiiPopupStyleWarning,
  EfiHiiPopupStyleError
}   EFI_HII_POPUP_STYLE;
typedef enum {
  EfiHiiPopupTypeOk,
  EfiHiiPopupTypeOkCancel,
  EfiHiiPopupTypeYesNo,
EfiHiiPopupTypeYesNoCancel
}   EFI_HII_POPUP_TYPE;
typedef enum {
  EfiHiiPopupSelectionOk,
```

(continues on next page)

(continued from previous page)

```
  EfiHiiPopupSelectionCancel,
  EfiHiiPopupSelectionYes,
  EfiHiiPopupSelectionNo
}   EFI_HII_POPUP_SELECTION;
```

Status Codes Returned

EFI_SUCCESS	The popup box was successfully displayed
EFI_INVALID_PARAMETER	HiiHandle and Message do not define is a valid HII string.
EFI_INVALID_PARAMETER	PopupType is not one of the values defined by this specification.
EFI_OUT_OF_RESOURCES	There are not enough resources available to display the popup box.

CHAPTER

THIRTYSIX

USER IDENTIFICATION

36.1 User Identification Overview

This section describes services which describe the current user of the platform. A user is the entity which is controlling the behavior of the machine. The user may be an individual, a class or group of individuals or another machine.

Each user has a user profile. There is always at least one user profile for a machine. This profile governs the behavior of the user identification process until a another user has been selected. The nature and definition of these privileges are beyond the scope of this section. One user profile is always active and describes the platform's *current user*.

New user profiles are introduced into the system through enrollment. During enrollment, information about a new user is gathered. Some of this information identifies the user for specific purposes, such as a user's name or a user's network domain. Other information is gathered in the form of credentials, which is information which can be used at a later time to verify the identity of a user. Credentials are generally divided into three categories: something you know (password), something you have (smart card, smart token, RFID), something you are (fingerprint). The means by which a platform determines the user's identity based on credentials is user *identification*.

In the simplest case, a single set of credentials are required to establish a user's identity. This is called single-factor authentication. In more rigorous cases, multiple credentials might be required to establish a user's identity or different privilege levels given if only a single factor is available. This is called *multi-factor* authentication.

If the credentials are checked only once, this is called static authentication. For example, a sign-on box where the user enters a password and provides a fingerprint would be examples of static authentication. However, if credentials (and thus the user's identity) can be changed during system execution, this is called *dynamic* authentication. For example, a smart token which can be hot-removed from the system or an RFID tag which is moved in and out of range would be examples of dynamic authentication.

The user *identity manager* is the optional UEFI driver which manages the process of determining the user's identity and storing information about the user.

The user *enrollment manager* is the optional application which adds or enrolls new users, gathering the necessary information to ascertain their identity in the future.

The *credential provider* driver manages a single class of credentials. Examples include a USB fingerprint sensor, a smart card or a password. The means by which these drivers are selected and invoked is beyond the scope of this specification.

36.1.1 User Identify

The process of identifying the user occurs after platform initialization has made the services described in the EFI System Table available. Before the Boot Manager behavior described in chapter 3, a user profile must be established. The user profile established might be:

- A default user profile, giving a standard set of privileges. This is similar to a "guest" login.
- A default user profile, based on a User Credential Provider where Default() returns AutoLogon = **TRUE**.
- A specific user profile, established using the Identify() function of the User Manager.

Every time the user profile is modified, the User Identity Manager will signal the EFI_EVENT_GROUP_USER_PROFILE_CHANGED event. The current user profile can only be changed by calling the User Identity Manager's Identify() function or as the result of a credential provider calling the Notify() function (when dynamic authentication is supported). The Identify() function changes the current user profile after examining the credentials provided by the various credential providers and comparing these against those found in the user profile database.

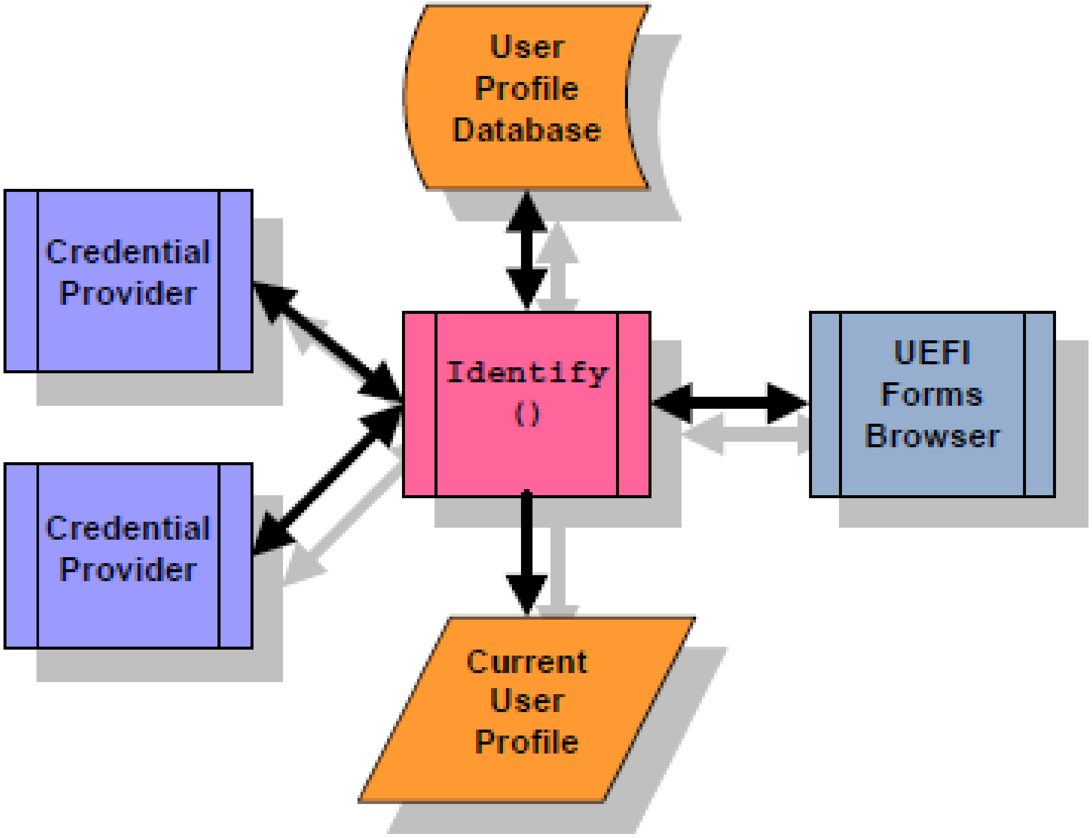

Fig. 36.1: User Identity

When the UEFI Boot Manager signals the EFI_EVENT_GROUP_READY_TO_BOOT event group, the User Identity Manager publishes the current user profile information in the EFI System Configuration Table.

Depending on the security considerations in the implementation (see *Security Considerations*), user identification can continue into different phases of execution.

1. Boot Manager, Once. In this scenario, identification is permitted until the EFI_EVENT_GROUP_READY_TO_BOOT is signaled by the Boot Manager. After this time, user identification is not allowed again. This is the simplest, since the user profile database can be locked at this time using a simple one-time lock.
2. Boot Manager, Multiple. In this scenario, identification is permitted until the EFI_EVENT_GROUP_READY_TO_BOOT is signaled by the Boot Manager. After this time, if the boot option returns back into the Boot Manager, identification is allowed again. This scenario requires that the user profile database only be updatable while in the Boot Manager.
3. Until ExitBootServices. In this scenario, identification is permitted until the EFI_EVENT_GROUP_EXIT_BOOT_SERVICES is signaled by the Boot Manager. This scenario requires that the user profile database cannot be updated by unauthorized executables.

36.1.2 User Profiles

The user profiles are collections of information about users. There is always a current user (and thus, a currently selected user profile). The user profiles are stored in a user profile database.

Each user profile has the following attributes:

§ User Identifier

User identifiers are unique to a particular user profile. The uniqueness of the user profile identifier must persist across reboots. Credentials return this identifier during the identification process.

§ User Identification Policy

The user identification policy determines which credentials must be presented in order to establish the user's identity and set the user profile as the current user profile. The policy consists of a boolean expression consisting of credential handles and the operators AND, OR and NOT. This allows the user profile to be selected, for example, depending on a password credential OR a fingerprint credential. Or the profile might be selected depending on a password credential AND a fingerprint credential.

§ User Privileges

The user privileges control what the user can and cannot do. For example, can the user enroll other users, boot off of a selected device, etc.

§ User Information

User information consists of typed data records attached to the user profile handle. Some of this information is non-volatile. Some of this information may be provided by a specific credential driver. User information is classified as public, private or protected:

- Public user information is available at any time.
- Private user information is only available while it is part of the current user profile.
- Protected user information is only available once user has been authenticated by a credential provider.

Drivers and applications can be notified when the current user profile is changed, by using the UEFI Boot Service CreateEventEx() and the EFI_EVENT_GROUP_USER_PROFILE_CHANGED

User profiles are available while the User Identity Manager is running, but only the current user profile is available after the UEFI Boot Manager has started execution.

36.1.2.1 User Profile Database

The user profile database is a repository of all users known to the user identity manager. The user profile database should be maintained in non-volatile memory and this memory must be protected against corruption and erasure.

The user profile database is considered "open" if the user profile database can still be updated and the current profile can still be changed using the EFI User Manager Protocol. The user profile database is considered "closed" if the user profile database cannot be updated nor the current user profile changes using the EFI User Manager Protocol.

36.1.2.2 User Identification Policy

The user identification policy is a boolean expression which determines which class of credential or which credential providers must assert the user's identity in order to a user profile to be eligible for selection as the current user profile.

For example, assume that you want a password:

```
CredentialClass(Password)
```

This expression would assert **TRUE** if any credential provider asserts that a user has successfully entered a password.

```
CredentialClass(Password) && CredentialClass(Fingerprint)
```

This expression would require the user to present both a fingerprint AND a password in order to select this user profile.

```
CredentialClass(Password) || CredentialClass(Fingerprint)
```

This expression, on the other hand, allows the user to present a fingerprint OR a password in order to select this user profile.

Let's say you only want the Phoenix password provider:

```
CredentialClass(Password) && CredentialProvider(Phoenix)
```

In all of these cases, the class of credential and the provider of the credential are actually GUIDs. The standard credential class GUIDs are assigned by this specification. The credential provider identifiers are generated by the companies creating the credential providers.

36.1.3 Credential Providers

The User Credential Provider drivers follow the UEFI driver model. During initialization, they install an instance of the EFI Driver Binding Protocol. For hardware devices, the User Credential Provider may consume the bus I/O protocol and produce the User Credential Protocol. For software-based User Credential Providers, the User Credential Protocol could be installed on the image handler. The exact implementation depends on the number of separate credential types that the User Identity Manager will display.

When *Start()* is called, they:

1. Install one instance of the *EFI_USER_CREDENTIAL2_PROTOCOL* for each simultaneous user which might be authenticated. For example, if more than one smart token were inserted, then one instance might be created for each token. However, for a fingerprint sensor, one instance might be created for all fingerprint sensors managed by the same driver.
2. Install the user-interface forms used for interacting with the user using the HII Database Protocol. The form must be encoded using the GUID *EFI_USER_CREDENTIAL2_PROTOCOL_GUID*.

3. Install the EFI HII Configuration Access Protocol to handle interaction with the UEFI forms browser. This protocol is called to retrieve the current information from the credential provider. It is also called when the user presses OK to save the current form values. It also provides the callback functionality which allows real-time processing of the form values.

User Credential Providers are responsible to creating a one-to-one mapping between a device, fingerprint or password and a user identifier.

This specification does not explicitly support passing of user credential information related to operating system logon to an OS-present environment. For example, User Credential Providers may encrypt the user credential information and pass it, either as a part of the User Information Table or the EFI System Configuration Table, to an OS-present driver or application.

This specification does not explicitly support OS-present update of user credential information or user identification policy. Such support may be implemented in many ways, including the usage of write-authenticated EFI variables (see *SetVariable()*) or capsules (see *UpdateCapsule()*).

36.1.4 Security Considerations

Since the current profile details a number of security-related privileges, it is important that the User Identity Manager and User Credential Providers and the environment in which they execute are trusted.

This includes:

- Protecting the storage area where these drivers are stored
- Protecting the means by which these drivers are selected.
- Protecting the execution environment of these drivers from unverified drivers.
- The data structures used by these drivers should not be corrupted by unauthorized drivers while they are still being used.

In many cases, the User Identity Manager, the User Credential drivers and the on-board drivers are located in a protected location (e.g. a write-protected flash device) and the platform policy for these locations allows them to be trusted.

However, other drivers may be loaded from unprotected location or may be loaded from devices (such as PCI cards) or a hard drive which are easily replaced. Therefore, all drivers loaded prior to the User Identity Manager should be verified. No unverified drivers or applications should be allowed to execute while decisions based on the current user policy are still being made.

For example, either the default platform policy must successfully be able to verify drivers listed in the *Driver####* load options, or else the user must be identified prior to processing these drivers. Otherwise, the drivers' execution should be deferred. If the user profile is changed through a subsequent call to *Identify()* or through dynamic authentication, the *Driver####* options may not be processed again.

In systems where the user profile database and current user profile can be protected from corruption, the user profile database is closed when the system signals the event *EFI EXIT_BOOT_SERVICES_EVENT_GUID*. In systems where the user profile database and current user profile cannot be protected from corruption, the user profile database is closed when the system signals the event *EFI_READY_TO_BOOT_EVENT_GUID*.

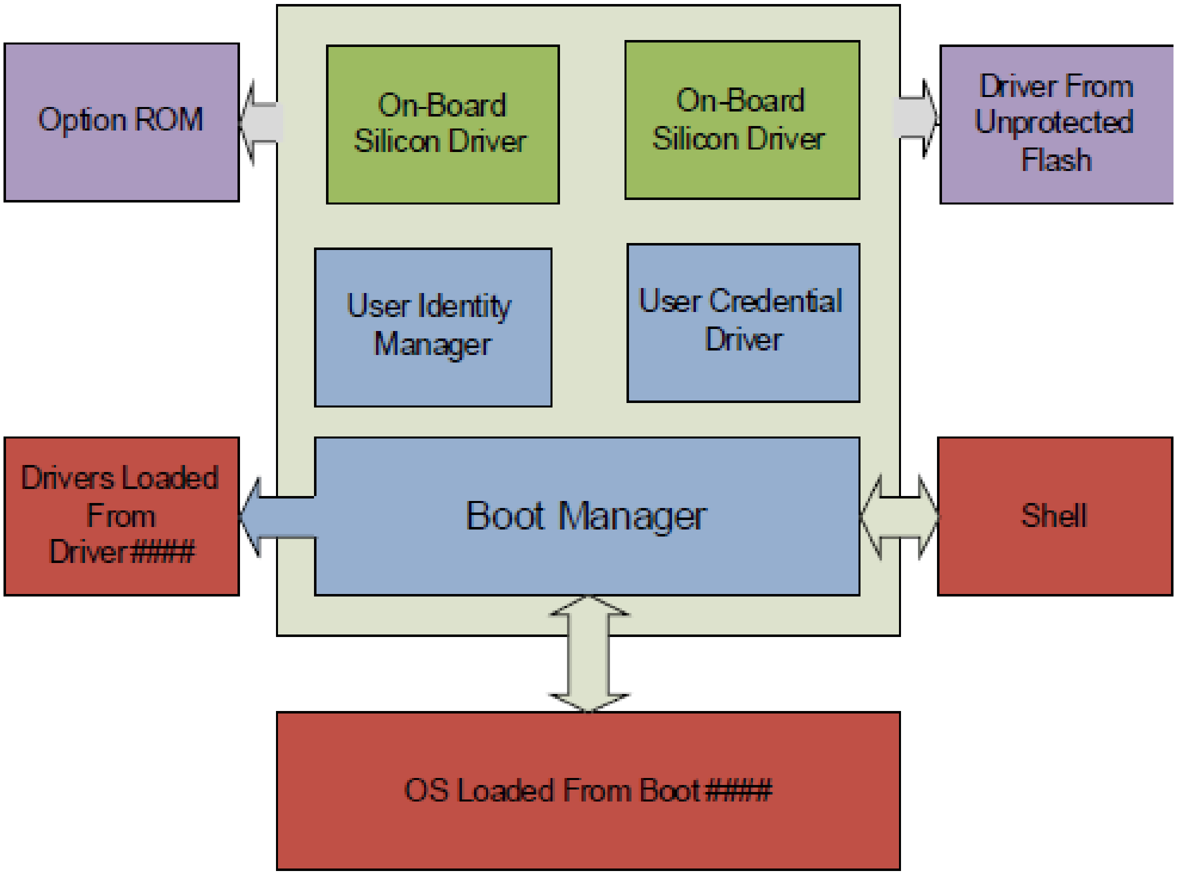

Fig. 36.2: User Identity Manager

36.1.5 Deferred Execution

The platform may need to defer the execution of an image because of security considerations. For example, see LoadImage(). Information about the images which are not executed because of security considerations may be recorded and then reported by installing an instance of the EFI_DEFERRED_IMAGE_LOAD_PROTOCOL (see *Deferred Image Load Protocol*). There may be more than one producer of the protocol.

The firmware's boot manager may use the instances of this protocol in order to automatically load drivers whose execution was deferred because of inadequate privileges once the current user profile contains adequate security privileges.

This boot manager can reevaluate the deferred images each time that the event EFI_EVENT_GROUP_USER_IDENTITY_CHANGED is signaled

Images which have been loaded may not be unloaded when the current user profile is changed, even if the new user profile would have prevented that driver from being loaded.

36.2 User Identification Process

This section describes the typical initialization steps required for the user identification process.

36.2.1 User Identification Process

1. The User Identity Manager is launched. This driver reads all of the user profiles from the user profile database, sets the default user profile as the current profile, and installs an instance of the EFI_USER_MANAGER_PROTOCOL.
2. Each credential provider driver registers their user-interface related forms and installs an instance of the EFI_USER_CREDENTIAL2_PROTOCOL.
3. The User Identity Manager's Identify() function is called to select the current user.
4. The User Identity Manager enumerates all of the User Credential Providers required by the User Identification Policy.

    a. Select the User Credential Provider which returns Default = **TRUE** from the Default() function. If more than one return **TRUE** or none return **TRUE**, choose a default based on implementation-specific criteria (last-logged-on, etc.)

    b. If that credential provider also returns AutoLogon = **TRUE** from the Default() function, then call User(). If no error was returned and a user profile with the specified user identifier exists, select the specified user profile as the current user profile and jump to step 9.

5. The User Identity Manager enumerates all of the User Credential Providers required by the User Identification Policy:

    a. Call the *Title()* and (optionally) the *Tile()* function to retrieve the text and image indicated for each User Credential Provider.

    b. Call the *Form()* function to retrieve the form indicated for each User Credential Provider.

   c. Create the user interface to allow the user to select between the different User Credential Providers.

   d. Highlight the default User Credential Provider, as specified in step 4.a.

6. If the user selects one of the User Credential Providers, call Select(). If AutoLogon = **TRUE** on return, then call User(). If no error was returned and a user profile with the specified user identifier exists, select the specified user profile as the current user profile and jump to step 9.
7. Interact with the user. Regular interaction can occur using the Callback() functions. If another User Credential Provider is selected then Deselect() is called for the current User Credential Provider and Select() is called for the newly selected User Credential Provider.
8. If the user presses OK then the User Manager will saved settings using the EFI Configuration Access protocol. Then it will call the User() function of each credential provider. If it returns successfully and one of the user policies evaluates to **TRUE**, then select the specified user profile as the current user profile and go to step 9. Otherwise display an error and go back.
9. Go through all of the credential providers using *GetNextInfo()* and *GetInfo()* and add the information to the current user profile.
10. Exit

36.2.2 Changing The Current User Profile

This section describes the typical actions taken when the current user profile is changed.

1. If there was already a valid current user profile, then all records marked as private in that profile are no longer available.
2. All records marked as private in the new user profile will be available.
3. The handle of the current user profile is changed.
4. An event with the *GUID EFI_EVENT_GROUP_USER_IDENTITY_CHANGED* is signaled to indicate that the current user profile has been changed.

36.2.3 Ready To Boot

Before the boot manager is read to pass control to the boot option and signals the *EFI_EVENT_GROUP_READY_TO_BOOT* event group, the User Identity Manager will publish the current user profile into the EFI System Configuration Table with the *EFI_USER_MANAGER_PROTOCOL_GUID*. The format is described in the *User Information Table* (*User Information Table*). It will also save all non-volatile profile information.

User Credential drivers with non-volatile storage should also store non-volatile credential information which has changed.

36.3 Code Definitions

36.3.1 User Manager Protocol

36.3.1.1 EFI_USER_MANAGER_PROTOCOL

Summary

Reports information about a user.

GUID

```
#define EFI_USER_MANAGER_PROTOCOL_GUID \
  { 0x6fd5b00c, 0xd426, 0x4283, \
  { 0x98, 0x87, 0x6c, 0xf5, 0xcf, 0x1c, 0xb1, 0xfe } };
```

Protocol Interface Structure

```
typedef struct _EFI_USER_MANAGER_PROTOCOL {
  EFI_USER_PROFILE_CREATE           Create;
  EFI_USER_PROFILE_DELETE           Delete;
  EFI_USER_PROFILE_GET_NEXT         GetNext;
  EFI_USER_PROFILE_CURRENT          Current;
  EFI_USER_PROFILE_IDENTIFY         Identify;
  EFI_USER_PROFILE_FIND             Find;
  EFI_USER_PROFILE_NOTIFY           Notify;
  EFI_USER_PROFILE_GET_INFO         GetInfo;
  EFI_USER_PROFILE_SET_INFO         SetInfo;
  EFI_USER_PROFILE_DELETE_INFO      DeleteInfo;
  EFI_USER_PROFILE_GET_NEXT_INFO    GetNextInfo;
}   EFI_USER_MANAGER_PROTOCOL;
```

Parameters

Create
Create a new user profile.

Delete
Delete an existing user profile.

GetNext
Cycle through all user profiles.

Current
Return the current user profile.

Identify
Identify a user and set the current user profile using credentials.

Find
Find a user by a piece of user information.

Notify
Notify the user manager driver that credential information has changed.

GetInfo
Return information from a user profile.

SetInfo
Change information in a user profile.

DeleteInfo
Delete information from a user profile.

GetNextInfo
Cycle through all information from a user profile.

Description

This protocol manages user profiles.

36.3.1.2 EFI_USER_MANAGER_PROTOCOL.Create()

Summary

Create a new user profile.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_USER_PROFILE_CREATE) (
  IN CONST EFI_USER_MANAGER_PROTOCOL        *This,
  OUT EFI_USER_PROFILE_HANDLE               *User
  );
```

Parameters

This
Points to this instance of the *EFI_USER_MANAGER_PROTOCOL*.

User
On return, points to the new user profile handle. The user profile handle is unique only during this boot.

Description

This function creates a new user profile with only a new user identifier attached and returns its handle. The user profile is non-volatile, but the handle *User* can change across reboots.

If the current user profile does not permit creation of new user profiles then *EFI_ACCESS_DENIED* will be returned. If creation of new user profiles is not supported, then *EFI_UNSUPPORTED* is returned.

Related Definitions

```
typedef VOID *EFI_USER_PROFILE_HANDLE;
```

Status Codes Returned

EFI_SUCCESS	User profile was successfully created.
EFI_ACCESS_DENIED	Current user does not have sufficient permissions to create a user profile.
EFI_UNSUPPORTED	Creation of new user profiles is not supported.
EFI_INVALID_PARAMETER	*User* is **NULL**.

36.3.1.3 EFI_USER_MANAGER_PROTOCOL.Delete()

Summary

Delete an existing user profile.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_USER_PROFILE_DELETE) (
  IN CONST EFI_USER_MANAGER_PROTOCOL     *This,
  IN EFI_USER_PROFILE_HANDLE             User
  );
```

Parameters

This
Points to this instance of the *EFI_USER_MANAGER_PROTOCOL*.

User
User profile handle. Type *EFI_USER_PROFILE_HANDLE* is defined in *Create()*.

Description

Delete an existing user profile. If the current user profile does not permit deletion of user profiles then *EFI_ACCESS_DENIED* will be returned. If there is only a single user profile then *EFI_ACCESS_DENIED* will be returned. If deletion of user profiles is not supported, then *EFI_UNSUPPORTED* will be returned.

Status Codes Returned

EFI_SUCCESS	User profile was successfully deleted.
EFI_ACCESS_DENIED	Current user does not have sufficient permissions to delete a user profile or there is only one user profile.
EFI_UNSUPPORTED	Deletion of new user profiles is not supported.
EFI_INVALID_PARAMETER	*User* does not refer to a valid user profile.

36.3.1.4 EFI_USER_MANAGER_PROTOCOL.GetNext()

Summary

Enumerate all of the enrolled users on the platform.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_USER_PROFILE_GET_NEXT)(
  IN CONST EFI_USER_MANAGER_PROTOCOL      *This,
  IN OUT EFI_USER_PROFILE_HANDLE          *User
  );
```

Parameters

This
Points to the instance of this *EFI_USER_MANAGER_PROTOCOL*.

User

On entry, points to the previous user profile handle or NULL to start enumeration. On exit, points to the next user profile handle or NULL if there are no more user profiles.

Description

This function returns the next enrolled user profile. To retrieve the first user profile handle, point User at a NULL. Each subsequent call will retrieve another user profile handle until there are no more, at which point User will point to NULL.

NOTE: *There is always at least one user profile.*

Status Codes Returned

EFI_SUCCESS	Next enrolled user profile successfully returned.
EFI_INVALID_PARAMETER	*User* is **NULL**.
EFI_ACCESS_DENIED	Next enrolled user profile was not successfully returned.

36.3.1.5 EFI_USER_MANAGER_PROTOCOL.Current()

Summary

Return the current user profile handle.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_USER_PROFILE_CURRENT)(
  IN CONST EFI_USER_MANAGER_PROTOCOL      *This,
  OUT EFI_USER_PROFILE_HANDLE             *CurrentUser
  );
```

Parameters

This

Points to this instance of the *EFI_USER_MANAGER_PROTOCOL*.

CurrentUser

On return, points to the current user profile handle.

Description

This function returns the current user profile handle.

Status Codes Returned

EFI_SUCCESS	Current user profile handle returned successfully.
EFI_INVALID_PARAMETER	*CurrentUser* is **NULL**.

36.3.1.6 EFI_USER_MANAGER_PROTOCOL.Identify()

Summary

Identify a user.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_USER_IDENTIFY) (
  IN CONST EFI_USER_MANAGER_PROTOCOL      *This,
  OUT EFI_USER_PROFILE_HANDLE             *User
  );
```

Parameters

This

Points to the instance of the *EFI_USER_MANAGER_PROTOCOL*.

User

On return, points to the user profile handle for the current user profile.

Description

Identify the user and, if authenticated, returns the user handle and changes the current user profile.

All user information marked as private in a previously selected profile is no longer available for inspection.

Whenever the current user profile is changed then the an event with the GUID *EFI_EVENT_GROUP_USER_PROFILE_CHANGED* is signaled.

The function can only be called at *TPL_APPLICATION*.

Related Definitions

```
#define EFI_EVENT_GROUP_USER_PROFILE_CHANGED \
  { 0xbaf1e6de, 0x209e, 0x4adb, \
  { 0x8d, 0x96, 0xfd, 0x8b, 0x71, 0xf3, 0xf6, 0x83 } }
```

Status Codes Returned

EFI_SUCCESS	User was successfully identified.
EFI_INVALID_PARAMETER	*User* is **NULL**.
EFI_ACCESS_DENIED	User was not successfully identified.

36.3.1.7 EFI_USER_MANAGER_PROTOCOL.Find()

Summary

Find a user using a user information record.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_USER_PROFILE_FIND)(
  IN   CONST EFI_USER_MANAGER_PROTOCOL    *This,
```

(continues on next page)

(continued from previous page)

```
  IN OUT EFI_USER_PROFILE_HANDLE         *User,
  IN OUT EFI_USER_INFO_HANDLE            *UserInfo OPTIONAL,
  IN   CONST EFI_USER_INFO               *Info,
  IN   UINTN                             InfoSize
  );
```

Parameters

This

Points to this instance of the *EFI_USER_MANAGER_PROTOCOL*.

User

On entry, points to the previously returned user profile handle or **NULL** to start searching with the first user profile. On return, points to the user profile handle or **NULL** if not found.

UserInfo

On entry, points to the previously returned user information handle or **NULL** to start searching with the first. On return, points to the user information handle of the user information record or **NULL** if not found. Can be **NULL,** in which case only one user information record per user can be returned. Type *EFI_USER_INFO_HANDLE* is defined in "Related Definitions" below.

Info

Points to the buffer containing the user information to be compared to the user information record.If the user information record data is empty, then only the user information record type is compared.

If *InfoSize* is 0, then the user information record data must be empty.

InfoSize

The size of *Info,* in bytes.

Description

This function searches all user profiles for the specified user information record. The search starts with the user information record handle following *UserInfo* and continues until either the information is found or there are no more user profiles.

A match occurs when the *Info.InfoType* field matches the user information record type and the user information record data matches a portion of *Info*.

Status Codes Returned

EFI_SUCCESS	User information was found. *User* points to the user profile handle and *UserInfo* points to the user information handle.
EFI_NOT_FOUND	User information was not found. *User* points to **NULL** and *UserInfo* points to **NULL.**
EFI_INVALID_PARAMETER	*User* is **NULL**. Or *Info* is **NULL**.

Related Definitions

```
typedef VOID *EFI_USER_INFO_HANDLE;
```

36.3.1.8 EFI_USER_MANAGER_PROTOCOL.Notify()

Summary

Called by credential provider to notify of information change.

Prototype

```
typedef
EFI_STATUS
  (EFIAPI *EFI_USER_PROFILE_NOTIFY)(
  IN  CONST EFI_USER_MANAGER_PROTOCOL      *This,
  IN  EFI_HANDLE                           Changed
  );
```

Parameters

This

Points to this instance of the *EFI_USER_MANAGER_PROTOCOL*.

Changed

Handle on which is installed an instance of the *EFI_USER_CREDENTIAL2_PROTOCOL* where the user has changed.

Description

This function allows the credential provider to notify the User Identity Manager when user status has changed.

If the User Identity Manager doesn't support asynchronous changes in credentials, then this function should return *EFI_UNSUPPORTED*.

If current user does not exist, and the credential provider can identify a user, then make the user to be current user and signal the *EFI_EVENT_GROUP_USER_PROFILE_CHANGED* event.

If current user already exists, and the credential provider can identify another user, then switch current user to the newly identified user, and signal the *EFI_EVENT_GROUP_USER_PROFILE_CHANGED* event.

If current user was identified by this credential provider and now the credential provider cannot identify current user, then logout current user and signal the *EFI_EVENT_GROUP_USER_PROFILE_CHANGED* event.

Status Codes Returned

EFI_SUCCESS	The User Identity Manager has handled the notification.
EFI_NOT_READY	The function was called while the specified credential provider was not selected.
EFI_UNSUPPORTED	The User Identity Manager doesn't support asynchronous notifications.

36.3.1.9 EFI_USER_MANAGER_PROTOCOL.GetInfo()

Summary

Return information attached to the user.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_USER_PROFILE_GET_INFO)(
  IN   CONST EFI_USER_MANAGER_PROTOCOL       *This,
```

(continues on next page)

(continued from previous page)

```
  IN   EFI_USER_PROFILE_HANDLE               User,
  IN   EFI_USER_INFO_HANDLE                  UserInfo,
  OUT   EFI_USER_INFO                        *Info,
  IN OUT UINTN                               *InfoSize
  );
```

Parameters

This
Points to this instance of the *EFI_USER_MANAGER_PROTOCOL*.

User
Handle of the user whose profile will be retrieved.

UserInfo
Handle of the user information data record. Type *EFI_USER_INFO_HANDLE* is defined in *GetInfo()*.

Info
On entry, points to a buffer of at least * *InfoSize* bytes. On exit, holds the user information. If the buffer is too small to hold the information, then *EFI_BUFFER_TOO_SMALL* is returned and InfoSize is updated to contain the number of bytes actually required. Type *EFI_USER_INFO* is described in "Related Definitions" below.

InfoSize
On entry, points to the size of *Info*. On return, points to the size of the user information.

Description

This function returns user information. The format of the information is described in User Information. The function may return *EFI_ACCESS_DENIED* if the information is marked *private* and the handle specified by *User* is not the current user profile. The function may return *EFI_ACCESS_DENIED* if the information is marked *protected* and the information is associated with a credential provider for which the user has not been authenticated.

Status Codes Returned

EFI_SUCCESS	Information returned successfully.
EFI_ACCESS_DENIED	The information about the specified user cannot be accessed by the current user.
EFI_BUFFER_TOO_SMALL	The number of bytes specified by * *InfoSize* is too small to hold the returned data. The actual size required is returned in * *InfoSize*.
EFI_NOT_FOUND	*User* does not refer to a valid user profile or *UserInfo* does not refer to a valid user info handle.
EFI_INVALID_PARAMETER	*Info* is **NULL** or *InfoSize* is **NULL**

Related Definitions

```
typedef struct {
  EFI_GUID                 Credential;
  UINT8                    InfoType;
  UINT8                    Reserved1;
  EFI_USER_INFO_ATTRIBS    InfoAttribs;
  UINT32                   InfoSize;
}   EFI_USER_INFO;
```

Credential
The user credential identifier associated with this user information or else Nil if the information is not associated with any specific credential.

InfoType
The type of user information. See *EFI_USER_INFO_x_RECORD* in User Information for a description of the different types of user information.

Reserved1
Must be set to 0.

InfoAttribs
The attributes of the user profile information.

InfoSize
The size of the user information, in bytes, including this header.

```
typedef UINT16 EFI_USER_INFO_ATTRIBS;

#define EFI_USER_INFO_STORAGE                  0x000F
#define EFI_USER_INFO_STORAGE_VOLATILE         0x0000
#define EFI_USER_INFO_STORAGE_CREDENTIAL_NV    0x0001
#define EFI_USER_INFO_STORAGE_PLATFORM_NV      0x0002

#define EFI_USER_INFO_ACCESS                   0x0070
#define EFI_USER_INFO_PUBLIC                   0x0010
#define EFI_USER_INFO_PRIVATE                  0x0020
#define EFI_USER_INFO_PROTECTED                0x0030
#define EFI_USER_INFO_EXCLUSIVE                0x0080
```

The *EFI_USER_INFO_STORAGE_x* values describe how the user information should be stored. If *EFI_USER_INFO_STORAGE_VOLATILE* is specified, then the user profile information will be lost after a reboot. If *EFI_USER_INFO_STORAGE_CREDENTIAL_NV* is specified, then the information will be stored by the driver which created the handle Credential. If *USER_INFO_STORAGE_PLATFORM_NV* is specified, then the information will be stored by the User Identity Manager in platform non-volatile storage.

There are three levels of access to information associated with the user profile: public, private or protected. If *EFI_USER_INFO_PUBLIC* is specified, then the user profile information is available always. If *EFI_USER_INFO_PRIVATE* is specified, then the user profile information is only available if the user has been authenticated (whether or not they are the current user). If *EFI_USER_INFO_PROTECTED* is specified, then the user profile information is only available if the user has been authenticated and is the current user.

If *EFI_USER_INFO_EXCLUSIVE* is specified then there can only be one user information record of this type in the user profile. Attempts to use *SetInfo()* will fail.

36.3.1.10 EFI_USER_MANAGER_PROTOCOL.SetInfo()

Summary

Add or update user information.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_USER_PROFILE_SET_INFO) (
  IN   CONST EFI_USER_MANAGER_PROTOCOL       *This,
  IN   EFI_USER_PROFILE_HANDLE               User,
  IN OUT EFI_USER_INFO_HANDLE                *UserInfo,
  IN   CONST EFI_USER_INFO                   *Info,
```

(continues on next page)

(continued from previous page)

```
  IN   UINTN                                 InfoSize
  );
```

Parameters

This
Points to this instance of the *EFI_USER_MANAGER_PROTOCOL*.

User
Handle of the user whose profile will be changed.

UserInfo
On entry, points to the handle of the user information record to change or NULL if the user information should be added to the user profile. On exit, points to the handle of the user credential information record.

Info
Points to the user information. See *EFI_USER_INFO* for more information.

InfoSize
The size of Info, in bytes.

Description

This function changes user information. If **NULL** is pointed to by *UserInfo,* then a new user information record is created and its handle is returned in *UserInfo*. Otherwise, the existing one is replaced.

If *EFI_USER_INFO_IDENTITY_POLICY_RECORD* is changed, it is the caller's responsibility to keep it to be synced with the information on credential providers.

If *EFI_USER_INFO_EXCLUSIVE* is specified in *Info* and a user information record of the same type already exists in the user profile, then *EFI_ACCESS_DENIED* will be returned and *UserInfo* will point to the handle of the existing record.

Status Codes Returned

EFI_SUCCESS	User profile information was successfully changed/added.
EFI_ACCESS_DENIED	The record is exclusive.
EFI_SECURITY_VIOLATION	The current user does not have permission to change the specified user profile or user information record.
EFI_NOT_FOUND	*User* does not refer to a valid user profile or *UserInfo* does not refer to a valid user info handle.
EFI_INVALID_PARAMETER	*Info* is **NULL** or *InfoSize* is **NULL**

36.3.1.11 EFI_USER_MANAGER_PROTOCOL.DeleteInfo()

Summary

Delete user information.

Prototype

```
typedef

EFI_STATUS
(EFIAPI *EFI_USER_PROFILE_DELETE_INFO) (
  IN   CONST EFI_USER_MANAGER_PROTOCOL      *This,
  IN   EFI_USER_PROFILE_HANDLE              User,
```

(continues on next page)

(continued from previous page)

```
  IN   EFI_USER_INFO_HANDLE                 UserInfo
  );
```

Parameters

This
Points to this instance of the *EFI_USER_MANAGER_PROTOCOL*.

User
Handle of the user whose information will be deleted.

UserInfo
Handle of the user information to remove.

Description

Delete the user information attached to the user profile specified by the UserInfo.

Status Codes Returned

EFI_SUCCESS	User information deleted successfully.
EFI_NOT_FOUND	User information record *UserInfo* does not exist in the user profile.
EFI_ACCESS_DENIED	The current user does not have permission to delete this user information.

36.3.1.12 EFI_USER_MANAGER_PROTOCOL.GetNextInfo()

Summary

Enumerate all of the enrolled users on the platform.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_USER_PROFILE_GET_NEXT_INFO)(
  IN   CONST EFI_USER_MANAGER_PROTOCOL         *This,
  IN   EFI_USER_PROFILE_HANDLE                 User,
  IN OUT EFI_USER_INFO_HANDLE                  *UserInfo
  );
```

Parameters

This
Points to the instance of this *EFI_USER_MANAGER_PROTOCOL*.

User
Handle of the user whose information will be enumerated

UserInfo
On entry, points to the previous user information handle or **NULL** to start enumeration. On exit, points to the next user information handle or **NULL** if there is no more user information.

Description

This function returns the next user information record. To retrieve the first user information record handle, point *UserInfo* at a **NULL**. Each subsequent call will retrieve another user information record handle until there are no more, at which point *UserInfo* will point to **NULL**.

Status Codes Returned

EFI_SUCCESS	User information returned.
EFI_NOT_FOUND	No more user information found.
EFI_INVALID_PARAMETER	*UserInfo* is **NULL**.

36.3.2 Credential Provider Protocols

36.3.2.1 EFI_USER_CREDENTIAL2_PROTOCOL

Summary

Provide support for a single class of credentials

GUID

```
#define EFI_USER_CREDENTIAL2_PROTOCOL_GUID \
  { 0xe98adb03, 0xb8b9, 0x4af8, \
  { 0xba, 0x20, 0x26, 0xe9, 0x11, 0x4c, 0xbc, 0xe5 } }
```

Prototype

```
typedef struct _EFI_USER_CREDENTIAL2_PROTOCOL {
  EFI_GUID                        Identifier;
  EFI_GUID                        Type;
  EFI_CREDENTIAL_ENROLL           Enroll;
  EFI_CREDENTIAL_FORM             Form;
  EFI_CREDENTIAL_TILE             Tile;
  EFI_CREDENTIAL_TITLE            Title;
  EFI_CREDENTIAL_USER             User;
  EFI_CREDENTIAL_SELECT           Select;
  EFI_CREDENTIAL_DESELECT         Deselect;
  EFI_CREDENTIAL_DEFAULT          Default;
  EFI_CREDENTIAL_GET_INFO         GetInfo;
  EFI_CREDENTIAL_GET_NEXT_INFO    GetNextInfo;
  EFI_CREDENTIAL_CAPABILITIES     Capabilities;
  EFI_CREDENTIAL_DELETE           Delete;
}   EFI_USER_CREDENTIAL2_PROTOCOL;
```

Parameters

Identifier

Uniquely identifies this credential provider.

Type

Identifies this class of User Credential Provider. See *EFI_CREDENTIAL_CLASS_x* in "Related Definitions" below.

Enroll

Enroll a user using this credential provider.

Form

Return the form set and form identifier for the form.

Tile

Returns an optional bitmap image used to identify this credential provider.

Title
Returns a string used to identify this credential provider.

User
Returns the user profile identifier ascertained by using this credential.

Select
Called when a credential provider is selected.

Deselect
Called when a credential provider is deselected.

Default
Returns whether the credential provider can provide the default credential.

GetInfo
Return user information provided by the credential provider.

GetNextInfo
Cycle through all user information available from the credential provider.

Capabilities
Bitmask which describes the capabilities supported by the credential provider. Type *EFI_CREDENTIAL_CAPABILITIES* is defined in "Related Definitions" below.

Delete
Delete a user on this credential provider.

Description

Attached to a device handle, this protocol identifies a single means of identifying the user.

If *EFI_CREDENTIAL_CAPABILITIES_ENROLL* is specified, then this credential provider supports the ability to enroll new user identification information using the *Enroll()* function.

```

36.3.2.2 EFI_USER_CREDENTIAL2_PROTOCOL.Enroll()

Summary

Enroll a user on a credential provider.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_CREDENTIAL2_ENROLL)(
  IN CONST EFI_USER_CREDENTIAL2_PROTOCOL     *This,
  IN EFI_USER_PROFILE_HANDLE                 User
  );
```

Parameters

This

Points to this instance of the *EFI_USER_CREDENTIAL2_PROTOCOL* .

User

The user profile to enroll.

Description

This function enrolls a user on this credential provider. If the user exists on this credential provider, update the user information on this credential provider; otherwise add the user information on credential provider.

Status Codes Returned

EFI_SUCCESS	User profile was successfully enrolled
EFI_ACCESS_DENIED	Current user profile does not permit enrollment on the user profile handle. Either the user profile cannot enroll on any user profile or cannot enroll on a user profile other than the current user profile.
EFI_UNSUPPORTED	This credential provider does not support enrollment in the pre-OS.
EFI_DEVICE_ERROR	The new credential could not be created because of a device error.
EFI_INVALID_PARAMETER	*User* does not refer to a valid user profile handle.

36.3.2.3 EFI_USER_CREDENTIAL2_PROTOCOL.Form()

Summary

Returns the user interface information used during user identification.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_CREDENTIAL_FORM)(
  IN CONST EFI_USER_CREDENTIAL2_PROTOCOL     *This,
  OUT EFI_HII_HANDLE                         *Hii,
  OUT EFI_GUID                               *FormSetId,
  OUT EFI_FORM_ID                            *FormId
  );
```

Parameters

This
Points to this instance of the *EFI_USER_CREDENTIAL2_PROTOCOL*.

Hii
On return, holds the HII database handle. Type *EFI_HII_HANDLE* is defined in *EFI_HII_DATABASE_PROTOCOL.NewPackageList()* in the Packages section.

FormSetId
On return, holds the identifier of the form set which contains the form used during user identification.

FormId
On return, holds the identifier of the form used during user identification.

Description

This function returns information about the form used when interacting with the user during user identification. The form is the first enabled form in the form-set class *EFI_HII_USER_CREDENTIAL_FORMSET_GUID* installed on the HII handle *HiiHandle*. If the user credential provider does not require a form to identify the user, then this function should return *EFI_NOT_FOUND*.

Status Codes Returned

EFI_SUCCESS	Form returned successfully.
EFI_NOT_FOUND	Form not returned.
EFI_INVALID_PARAMETER	*Hii* is **NULL** or *FormSetId* is **NULL** or *FormId* is **NULL**

36.3.2.4 EFI_USER_CREDENTIAL2_PROTOCOL.Tile()

Summary

Returns bitmap used to describe the credential provider type.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_CREDENTIAL_TILE)(
  IN    CONST EFI_USER_CREDENTIAL2_PROTOCOL        *This,
  IN OUT UINTN                                     *Width,
  IN OUT UINTN                                     *Height,
  OUT   EFI_HII_HANDLE                             *Hii,
  OUT   EFI_IMAGE_ID                               *Image
  );
```

Parameters

This

Points to this instance of the *EFI_USER_CREDENTIAL2_PROTOCOL*.

Width

On entry, points to the desired bitmap width. If **NULL** then no bitmap information will be returned. On exit, points to the width of the bitmap returned.

Height

On entry, points to the desired bitmap height. If **NULL** then no bitmap information will be returned. On exit, points to the height of the bitmap returned.

Hii

On return, holds the HII database handle. Type *EFI_HII_HANDLE* is defined in *EFI_HII_DATABASE_PROTOCOL.NewPackageList()* in the Packages section.

Image

On return, holds the HII image identifier. Type *EFI_IMAGE_ID* is defined in this specification, *Image Protocol* .

Description

This optional function returns a bitmap which is less than or equal to the number of pixels specified by *Width* and *Height*. If no such bitmap exists, then *EFI_NOT_FOUND* is returned.

Status Codes Returned

EFI_SUCCESS	Image identifier returned successfully.
EFI_NOT_FOUND	Image identifier not returned.
EFI_INVALID_PARAMETER	*Hii* is **NULL** or *Image* is **NULL**.

36.3.2.5 EFI_USER_CREDENTIAL2_PROTOCOL.Title()

Summary

Returns string used to describe the credential provider type.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_CREDENTIAL_TITLE)(
  IN    CONST EFI_USER_CREDENTIAL2_PROTOCOL     *This,
  OUT   EFI_HII_HANDLE                          *Hii,
  OUT   EFI_STRING_ID                           *String
  );
```

Parameters

This

Points to this instance of the *EFI_USER_CREDENTIAL2_PROTOCOL* .

Hii

On return, holds the HII database handle. TType *EFI_HII_HANDLE* is defined in *EFI_HII_DATABASE_PROTOCOL.NewPackageList()* in the Packages section.

String

On return, holds the HII string identifier. Type *EFI_STRING_ID* is defined in *EFI_IFR_OP_HEADER*.

Description

This function returns a string which describes the credential provider. If no such string exists, then EFI_NOT_FOUND is returned.

Status Codes Returned

EFI_SUCCESS	String identifier returned successfully.
EFI_NOT_FOUND	String identifier not returned.
EFI_INVALID_PARAMETER	*Hii* is **NULL** or *String* is **NULL**

36.3.2.6 EFI_USER_CREDENTIAL2_PROTOCOL.User()

Summary

Return the user identifier associated with the currently authenticated user.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_CREDENTIAL_USER)(
  IN   CONST EFI_USER_CREDENTIAL2_PROTOCOL      *This,
  IN   EFI_USER_PROFILE_HANDLE                  User,
  OUT  EFI_USER_INFO_IDENTIFIER                 *Identifier
  );
```

Parameters

This

Points to this instance of the *EFI_USER_CREDENTIAL2_PROTOCOL* .

User

The user profile handle of the user profile currently being considered by the user identity manager. If **NULL,** then no user profile is currently under consideration.

Identifier

On return, points to the user identifier. Type *EFI_USER_INFO_IDENTIFIER* is defined in "Related Definitions" below.

Description

This function returns the user identifier of the user authenticated by this credential provider. This function is called after the credential-related information has been submitted on a form OR after a call to Default() has returned that this credential is ready to log on.

This function can return one of five possible responses:

- If no user profile can yet be identified, then *EFI_NOT_READY* is returned.
- If the user has been locked out, then *EFI_ACCESS_DENIED* is returned.
- If the user specified by *User* is identified, then Identifier returns with the user identifier associated with that handle and *EFI_SUCCESS* is returned.
- If *Identifier* is **NULL,** then *EFI_INVALID_PARAMETER* is returned.
- If specified *User* does not refer to a valid user profile, then *EFI_NOT_FOUND* is returned.

Status Codes Returned

EFI_SUCCESS	User identifier returned successfully.
EFI_NOT_READY	No user identifier can be returned.
EFI_ACCESS_DENIED	The user has been locked out of this user credential.
EFI_NOT_FOUND	*User* is not **NULL,** and the specified user handle can't be found in user profile database
EFI_INVALID_PARAMETER	*Identifier* is **NULL**.

36.3.2.7 EFI_USER_CREDENTIAL2_PROTOCOL.Select()

Summary

Indicate that user interface interaction has begun for the specified credential.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_CREDENTIAL_SELECT)(
  IN CONST EFI_USER_CREDENTIAL2_PROTOCOL     *This,
  OUT EFI_CREDENTIAL_LOGON_FLAGS             *AutoLogon
  );
```

Parameters

This

Points to this instance of the *EFI_USER_CREDENTIAL2_PROTOCOL* .

AutoLogon

On return, points to the credential provider's capabilities after the credential provider has been selected by the user. Type *EFI_CREDENTIAL_LOGON_FLAGS* is defined in "Related Definitions" below.

Description

This function is called when a credential provider is selected by the user. If *AutoLogon* returns *FALSE,* then the user interface will be constructed by the User Identity Manager.

Related Definitions

```
typedef UINT32 EFI_CREDENTIAL_LOGON_FLAGS;

#define EFI_CREDENTIAL_LOGON_FLAG_AUTO       0x00000001
#define EFI_CREDENTIAL_LOGON_FLAG_DEFAULT    0x00000002
```

If *EFI_CREDENTIAL_LOGON_FLAG_AUTO* is set, then the User Identity Manager may use this as a hint to try logging on immediately. If not set, then the User Identity Manager may use this as an indication to wait for the user to submit the information.

If *EFI_CREDENTIAL_LOGON_FLAG_DEFAULT* is set, then the User Identity Manager may use this as a hint to use this credential provider as the default credential provider. If more than one credential provider returns with this set, then the selection is implementation specific. If *EFI_CREDENTIAL_LOGON_FLAG_DEFAULT* is set and *EFI_CREDENTIAL_LOGON_FLAG_AUTO* is set then the User Identity Manager may uses this as a hint to log the user on immediately.

Status Codes Returned

EFI_SUCCESS	Credential provider successfully selected.
EFI_INVALID_PARAMETER	*AutoLogon* is **NULL**

36.3.2.8 EFI_USER_CREDENTIAL2_PROTOCOL.Deselect()

Summary

Indicate that user interface interaction has ended for the specified credential.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_CREDENTIAL_DESELECT)(
  IN CONST EFI_USER_CREDENTIAL2_PROTOCOL     *This
  );
```

Parameters

This
Points to this instance of the *EFI_USER_CREDENTIAL2_PROTOCOL*.

Description

This function is called when a credential provider is deselected by the user.

Status Codes Returned

EFI_SUCCESS	Credential provider successfully selected.

36.3.2.9 EFI_USER_CREDENTIAL2_PROTOCOL.Default()

Summary

Return the default logon behavior for this user credential.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_CREDENTIAL_DEFAULT)(
  IN CONST EFI_USER_CREDENTIAL2_PROTOCOL     *This,
  OUT EFI_CREDENTIAL_LOGON_FLAGS             *AutoLogon
  );
```

Parameters

This
Points to this instance of the *EFI_USER_CREDENTIAL2_PROTOCOL* .

AutoLogon
On return, holds whether the credential provider should be used by default to automatically log on the user. Type *EFI_CREDENTIAL_LOGON_FLAGS* is defined in *EFI_USER_CREDENTIAL2_PROTOCOL.Select()*.

Description

This function reports the default login behavior regarding this credential provider.

Status Codes Returned

EFI_SUCCESS	Default information successfully returned.
EFI_INVALID_PARAMETER	*AutoLogon* is **NULL**

36.3.2.10 EFI_USER_CREDENTIAL2_PROTOCOL.GetInfo()

Summary

Return information attached to the credential provider.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_CREDENTIAL_GET_INFO)(
  IN   CONST EFI_USER_CREDENTIAL2_PROTOCOL      *This,
  IN   EFI_USER_INFO_HANDLE                     UserInfo,
  OUT   EFI_USER_INFO                           *Info,
  IN OUT UINTN                                  *InfoSize
  );
```

Parameters

This

Points to this instance of the *EFI_USER_CREDENTIAL2_PROTOCOL* .

UserInfo

Handle of the user information data record. Type *EFI_USER_INFO_HANDLE* is defined in *GetInfo()*.

Info

On entry, points to a buffer of at least **InfoSize* bytes. On exit, holds the user information. If the buffer is too small to hold the information, then *EFI_BUFFER_TOO_SMALL* is returned and *InfoSize* is updated to contain the number of bytes actually required. Type *EFI_USER_INFO* is described in “Related Definitions” below.

InfoSize

On entry, points to the size of *Info*. On return, points to the size of the user information.

Description

This function returns user information.

Status Codes Returned

EFI_SUCCESS	Information returned successfully.
EFI_BUFFER_TOO_SMALL	The size specified by *InfoSize* is too small to hold all of the user information. The size required is returned in * *InfoSize*.
EFI_NOT_FOUND	The specified UserInfo does not refer to a valid user info handle
EFI_INVALID_PARAMETER	*Info* is **NULL** or *InfoSize* is **NULL**

36.3.2.11 EFI_USER_CREDENTIAL2_PROTOCOL.GetNextInfo()

Summary

Enumerate all of the user information records on the credential provider.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_USER_CREDENTIAL_GET_NEXT_INFO)(
  IN   CONST EFI_USER_CREDENTIAL2_PROTOCOL      *This,
  IN OUT EFI_USER_INFO_HANDLE                   *UserInfo
  );
```

Parameters

This
Points to the instance of this *EFI_USER_CREDENTIAL2_PROTOCOL* .

UserInfo
On entry, points to the previous user information handle or NULL to start enumeration. On exit, points to the next user information handle or NULL if there is no more user information.

Description

This function returns the next user information record. To retrieve the first user information record handle, point UserInfo at a **NULL**. Each subsequent call will retrieve another user information record handle until there are no more, at which point *UserInfo* will point to **NULL**.

Status Codes Returned

EFI_SUCCESS	User information returned.
EFI_NOT_FOUND	No more user information found.
EFI_INVALID_PARAMETER	*UserInfo* is **NULL**.

36.3.2.12 EFI_USER_CREDENTIAL2_PROTOCOL.Delete()

Summary

Delete a user on a credential provider.

Prototype

```
typedef
EFI_STATUS (EFIAPI *EFI_CREDENTIAL_DELETE)(
  IN  CONST EFI_USER_CREDENTIAL2_PROTOCOL    *This,
  IN  EFI_USER_PROFILE_HANDLE                User
  );
```

Parameters

This
Points to this instance of the *EFI_USER_CREDENTIAL2_PROTOCOL*.

User
The user profile handle to delete.

Description

This function deletes a user on this credential provider.

Status Codes Returned

EFI_SUCCESS	User profile was successfully deleted .
EFI_ACCESS_DENIED	Current user profile does not permit deletion on the user profile handle. Either the user profile cannot delete on any user profile or cannot delete on a user profile other than the current user profile.
EFI_UNSUPPORTED	This credential provider does not support deletion in the pre-OS.
EFI_DEVICE_ERROR	The new credential could not be deleted because of a device error.
EFI_INVALID_PARAMETER	User does not refer to a valid user profile handle.

36.3.3 Deferred Image Load Protocol

36.3.3.1 EFI_DEFERRED_IMAGE_LOAD_PROTOCOL

Summary

Enumerates images whose load was deferred due to security considerations.

GUID

```
#define EFI_DEFERRED_IMAGE_LOAD_PROTOCOL_GUID \
  { 0x15853d7c, 0x3ddf, 0x43e0, \
  { 0xa1, 0xcb, 0xeb, 0xf8, 0x5b, 0x8f, 0x87, 0x2c } };
```

Protocol Interface Structure

```
typedef struct _EFI_DEFERRED_IMAGE_LOAD_PROTOCOL {
  EFI_DEFERRED_IMAGE_INFO GetImageInfo();
}   EFI_DEFERRED_IMAGE_LOAD_PROTOCOL;
```

Members

GetImageInfo
Return information about a single deferred image. See GetImageInfo() for more information.

Description

This protocol returns information about images whose load was denied because of security considerations. This information can be used by the Boot Manager or another agent to reevaluate the images when the current security profile has been changed, such as when the current user profile changes. There can be more than one instance of this protocol installed.

36.3.3.2 EFI_DEFERRED_IMAGE_LOAD_PROTOCOL.GetImageInfo()

Summary

Returns information about a deferred image.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_DEFERRED_IMAGE_INFO)(
  IN EFI_DEFERRED_IMAGE_LOAD_PROTOCOL     *This,
  IN UINTN                                ImageIndex,
  OUT  EFI_DEVICE_PATH_PROTOCOL           **ImageDevicePath,
  OUT  VOID                               **Image,
  OUT  UINTN                              *ImageSize,
  OUT  BOOLEAN                            *BootOption
  );
```

Parameters

This

Points to this instance of the *EFI_DEFERRED_IMAGE_LOAD_PROTOCOL*.

ImageIndex

Zero-based index of the deferred index.

ImageDevicePath

On return, points to a pointer to the device path of the image. The device path should not be freed by the caller.

Image

On return, points to the first byte of the image or **NULL** if the image is not available. The image should not be freed by the caller unless *LoadImage()* has been called successfully.

ImageSize

On return, the size of the image, or 0 if the image is not available.

BootOption

On return, points to **TRUE** if the image was intended as a boot option or **FALSE** if it was not intended as a boot option.

Description

This function returns information about a single deferred image. The deferred images are numbered consecutively, starting with 0. If there is no image which corresponds to *ImageIndex,* then *EFI_NOT_FOUND* is returned. , All deferred images may be returned by iteratively calling this function until *EFI_NOT_FOUND* is returned.

Image may be **NULL** and *ImageSize* set to 0 if the decision to defer execution was made because of the location of the executable image rather than its actual contents.

Status Codes Returned

EFI_SUCCESS	Image information returned successfully.
EFI_NOT_FOUND	ImageIndex does not refer to a valid image.
EFI_INVALID_PARAMETER	*ImageDevicePath* is **NULL** or *Image* is **NULL** or *ImageSize* is **NULL** or *BootOption* is **NULL**

36.4 User Information

This section describes the different user information and the format of the data. Each of the following records is prefixed with the *EFI_USER_INFO* structure. The format of the record is determined by the type specified by the *InfoType* field in the structure, as listed in the table below:

Record values and descriptions

Table 36.15: Record Values and Descriptions

Name	Value	Description
EFI_USER_INFO_EMPTY_RECORD	0x00	No information.
EFI_USER_INFO_NAME_RECORD	0x01	User's name
EFI_US ER_INFO_CREATE_DATE_RECORD	0x02	Date which the user profile was created.
EFI_U SER_INFO_USAGE_DATE_RECORD	0x03	Date which the user profile was last modified.
EFI_US ER_INFO_USAGE_COUNT_RECORD	0x04	Number of times the credential has been used.
EFI_U SER_INFO_IDENTIFIER_RECORD	0x05	User's unique identifier *
EFI_USER_I NFO_CREDENTIAL_TYPE_RECORD	0x06	Credential type.
EFI_USER_INFO_C REDENTIAL_TYPE_NAME_RECORD	0x07	Credential type name.
EFI_USER_INFO_ CREDENTIAL_PROVIDER_RECORD	0x08	Credential provider
EFI_USER_INFO_CREDE NTIAL_PROVIDER_NAME_RECORD	0x09	Credential provider name
EFI_USER_INFO_PKCS11_RECORD	0x0A	PKCS11 Data Object
EFI_USER_INFO_CBEFF_RECORD	0x0B	ISO 19785 (Common Biometric Exchange Formats Framework) Data Object
EFI_USER_INFO_FAR_RECORD	0x0C	How exact a match is required for biometric identification, measured in percentage.
EFI_USER_INFO_RETRY_RECORD	0x0D	Number of retries allowed during verification.
EFI_USER _INFO_ACCESS_POLICY_RECORD	0x0E	Access control information.
EFI_USER_I NFO_IDENTITY_POLICY_RECORD	0x0F	User identity expression.
EFI_USER_INFO_GUID_RECORD	0xFF	Extended profile information, qualified by a GUID in the header.

36.4.1 EFI_USER_INFO_ACCESS_POLICY_RECORD

Summary

Provides the user's pre-OS access rights.

Prototype

```
#define EFI_USER_INFO_ACCESS_POLICY_RECORD 0x0E

typedef EFI_USER_INFO_ACCESS_CONTROL EFI_USER_INFO_ACCESS_POLICY;
```

Description

This structure described the access policy for the user. There can be, at most, one access policy record per credential (including **NULL** credential). Policy records with a credential specified means that the policy is associated specifically with the credential.

The policy is detailed in a series of encapsulated records of type *EFI_USER_INFO_ACCESS_CONTROL*.

Related Definitions

```
typedef struct {
  UINT32          Type;
  UINT32          Size;
} EFI_USER_INFO_ACCESS_CONTROL;
```

Type

Specifies the type of user access control. See *EFI_USER_INFO_ACCESS_x* for more information.

Size

Specifies the size of the user access control record, in bytes, including this header.

36.4.1.1 EFI_USER_INFO_ACCESS_FORBID_LOAD

Summary

Forbids the user from booting or loading executables from the specified device path or any child device paths.

Prototype

```
#define EFI_USER_INFO_ACCESS_FORBID_LOAD 0x00000001
```

Description

This record prohibits the user from loading any executables from zero or device paths or any child device paths. The device paths may contain a specific executable name, in which case the prohibition applies to only that executable.

The record is a series of normal UEFI device paths (not multi-instance device paths).

This prohibition is overridden by the *EFI_USER_INFO_ACCESS_PERMIT_LOAD* record.

36.4.1.2 EFI_USER_INFO_ACCESS_PERMIT_LOAD

Summary

Permits the user from booting or loading executables from the specified device path or any child device paths.

Prototype

```
#define EFI_USER_INFO_ACCESS_PERMIT_LOAD 0x00000002
```

Description

This record allows the user to load executables from locations specified by zero or more device paths or child paths. The device paths may contain specific executable names, in which case, the permission applies only to that executable.

The record is a series of normal UEFI device paths (not multi-instance device paths).

This prohibition overrides any restrictions put in place by the *EFI_USER_INFO_ACCESS_FORBID_LOAD* record.

36.4.1.3 EFI_USER_INFO_ACCESS_ENROLL_SELF

Summary

Presence of this record indicates that a user can update enrollment information.

Prototype

```
#define EFI_USER_INFO_ACCESS_ENROLL_SELF 0x00000003
```

Description

If this record is present, then the pre-OS environment will allow the user to initiate an update of authentication information for his/her own profile, but not other user information or other user's information. This would allow, for example, fingerprint update or password change.

There is no data for this record.

36.4.1.4 EFI_USER_INFO_ACCESS_ENROLL_OTHERS

Summary

Presence of this record indicates that a user can enroll new users.

Prototype

```
#define EFI_USER_INFO_ACCESS_ENROLL_OTHERS 0x00000004
```

Description

If this record is present, then the pre-OS environment will allow the user to initiate enrollment of new user profiles. It does not give permission to update existing user profiles.

There is no data for this record.

36.4.1.5 EFI_USER_INFO_ACCESS_MANAGE

Summary

Presence of this record indicates that a user can update the user information of any user.

Prototype

```
#define EFI_USER_INFO_ACCESS_MANAGE 0x00000005
```

Description

If this record is present, then the pre-OS environment will allow the user to update any information about his/her own profile or other profiles.

There is no data for this record.

36.4.1.6 EFI_USER_INFO_ACCESS_SETUP

Summary

Describes permissions usable when configuring the platform.

Prototype

```
#define EFI_USER_INFO_ACCESS_SETUP 0x00000006
```

Description

This record describes access permission for use in configuring the platform using an UEFI Forms Processor using zero or more GUIDs. There are three standard values (see below) and any number of others may be added.

Standard values for access to configure the platform

Table 36.16: Standard Values for Access to Configure the Platform

EFI_USER_INFO_ACCESS_SETUP_ADMIN_GUID	System administrator only.
EFI_USER_INFO_ACCESS_SETUP_NORMAL_GUID	Normal user.
EFI_USER_INFO_ACCESS_SETUP_RESTRICTED_GUID	Restricted user.

Related Definitions

```
#define EFI_USER_INFO_ACCESS_SETUP_ADMIN_GUID \
  { 0x85b75607, 0xf7ce, 0x471e, \
  { 0xb7, 0xe4, 0x2a, 0xea, 0x5f, 0x72, 0x32, 0xee }  };

#define EFI_USER_INFO_ACCESS_SETUP_NORMAL_GUID \
  { 0x1db29ae0, 0x9dcb, 0x43bc, \
  { 0x8d, 0x87, 0x5d, 0xa1, 0x49, 0x64, 0xdd, 0xe2 }  };

#define EFI_USER_INFO_ACCESS_SETUP_RESTRICTED_GUID \
  { 0xbdb38125, 0x4d63, 0x49f4, \
  { 0x82, 0x12, 0x61, 0xcf, 0x5a, 0x19, 0x0a, 0xf8 }  };
```

36.4.1.7 EFI_USER_INFO_ACCESS_FORBID_CONNECT

Summary

Forbids UEFI drivers from being started from the specified device path(s) or any child device paths.

Prototype

```
#define EFI_USER_INFO_ACCESS_FORBID_CONNECT 0x00000007
```

Description

This record prohibits UEFI drivers from being started from the specified device path(s) or any of their child device path(s). This is enforced in the *ConnectController()* function.

This record prohibits the user from loading a device driver associated with zero or more device paths or their child paths.

The record is a series of normal UEFI device paths (not multi-instance device paths).

This prohibition is overridden by the *EFI_USER_INFO_ACCESS_PERMIT_CONNECT* record.

36.4.1.8 EFI_USER_INFO_ACCESS_PERMIT_CONNECT

Summary

Permits UEFI drivers to be started on the specified device path(s) or any child device paths.

Prototype

```
#define EFI_USER_INFO_ACCESS_PERMIT_CONNECT 0x00000008
```

Description

This record allows loading of device drivers associated with zero or more device paths or their child paths.

The record is a series of normal UEFI device paths (not multi-instance device paths).

This prohibition overrides any restrictions put in place by the *EFI_USER_INFO_ACCESS_FORBID_CONNECT* record.

36.4.1.9 EFI_USER_INFO_ACCESS_BOOT_ORDER

Summary

Modifies the boot order.

Prototype

```
#define EFI_USER_INFO_ACCESS_BOOT_ORDER            0x00000009

typedef UINT32 EFI_USER_INFO_ACCESS_BOOT_ORDER_HDR;

#define EFI_USER_INFO_ACCESS_BOOT_ORDER_MASK       0x000F
#define EFI_USER_INFO_ACCESS_BOOT_ORDER_INSERT     0x0000
#define EFI_USER_INFO_ACCESS_BOOT_ORDER_APPEND     0x0001
#define EFI_USER_INFO_ACCESS_BOOT_ORDER_REPLACE    0x0002

#define EFI_USER_INFO_ACCESS_BOOT_ORDER_NODEFAULT  0x0010
```

Description

This exclusive record allows the user profile to insert new boot options at the beginning of the boot order (*EFI_USER_INFO_ACCESS_BOOT_ORDER_INSERT*), append new boot options to the end of the boot order (*EFI_USER_INFO_ACCESS_BOOT_ORDER_APPEND*) or replace the entire boot order (*EFI_USER_INFO_ACCESS_BOOT_ORDER_REPLACE).* If *EFI_USER_INFO_ACCESS_BOOT_ORDER_NODEFAULT* is specified then the Boot Manager will not attempt find a default boot device when the default boot order is does not lead to a bootable device.

The boot options specified by this record are still subject to the permissions specified by *EFI_USER_INFO_ACCESS_FORBID_LOAD* and *EFI_USER_INFO_ACCESS_PERMIT_LOAD*.

The record consists of a single *EFI_USER_INFO_ACCESS_BOOT_ORDER_HDR* followed by zero or more UEFI device paths.

36.4.2 EFI_USER_INFO_CBEFF_RECORD

Summary

Provides standard biometric information in the format specified by the ISO 19785 (Common Biometric Exchange Formats Framework) specification.

Prototype

```
#define EFI_USER_INFO_CBEFF_RECORD 0x0B
typedef VOID *EFI_USER_INFO_CBEFF;
```

36.4.3 EFI_USER_INFO_CREATE_DATE_RECORD

Summary

Provides the date and time when the user profile was created.

Prototype

```
#define EFI_USER_INFO_CREATE_DATE_RECORD 0x02
typedef EFI_TIME EFI_USER_INFO_CREATE_DATE;
```

Description

The optional record describing the date and time when the user profile was created. Type *EFI_TIME* is defined in *GetTime()* in this specification.

36.4.4 EFI_USER_INFO_CREDENTIAL_PROVIDER_RECORD

Summary

Specifies the credential provider.

Prototype

```
#define EFI_USER_INFO_CREDENTIAL_PROVIDER_RECORD 0x08
typedef EFI_GUID EFI_USER_INFO_CREDENTIAL_PROVIDER;
```

Description

This record specifies the credential provider via a unique GUID. The credential's handle is found in the *EFI_USER_INFO* structure associated with this user information record.

36.4.5 EFI_USER_INFO_CREDENTIAL_PROVIDER_NAME_RECORD

Summary

Specifies the user-readable name of a particular credential's provider.

Prototype

```
#define EFI_USER_INFO_CREDENTIAL_PROVIDER_NAME_RECORD 0x09
typedef CHAR16 *EFI_USER_INFO_CREDENTIAL_PROVIDER_NAME;
```

Description

This record specifies the null-terminated name of a particular credential provider. The credential's handle is found in the *EFI_USER_INFO* structure associated with this user information record.

36.4.6 EFI_USER_INFO_CREDENTIAL_TYPE_RECORD

Summary

Specifies the type of a particular credential associated with the user profile.

Prototype

```
#define EFI_USER_INFO_CREDENTIAL_TYPE_RECORD 0x06
typedef EFI_GUID EFI_USER_INFO_CREDENTIAL_TYPE;
```

Description

This record specifies the type of a particular credential. The credential's identifier is found in the *Credential* field of the *EFI_USER_INFO* structure. The credential types are listed with the *EFI_USER_CREDENTIAL2_PROTOCOL*.

36.4.7 EFI_USER_INFO_CREDENTIAL_TYPE_NAME_RECORD

Summary

Specifies the user-readable name of a particular credential type.

Prototype

```
#define EFI_USER_INFO_CREDENTIAL_TYPE_NAME_RECORD 0x07
typedef CHAR16 *EFI_USER_INFO_CREDENTIAL_TYPE_NAME;
```

Description

This record specifies the null-terminated name of a particular credential type. The credential' handle is found in the *EFI_USER_INFO* structure associated with this user information record

36.4.8 EFI_USER_INFO_GUID_RECORD

Summary

Provides placeholder for additional user profile information identified by a GUID.

Prototype

```
#define EFI_USER_INFO_GUID_RECORD 0xFF
typedef EFI_GUID EFI_USER_INFO_GUID;
```

Description

This record type provides extensibility by prefixing further data fields in the record with a GUID which identifies the format.

36.4.9 EFI_USER_INFO_FAR_RECORD

Summary

Indicates how close of a match the fingerprint must be in order to be considered a match.

Prototype

```
#define EFI_USER_INFO_FAR_RECORD 0x0C
typedef UINT8 EFI_USER_INFO_FAR;
```

Description

This record specifies how accurate the fingerprint template match must be in order to be considered a match, as a percentage from 0 (no match) to 100 (perfect match). The accuracy may be for all fingerprint sensors (*EFI_USER_INFO*. *Credential* is zero) or for a particular fingerprint sensor (*EFI_USER_INFO* .*Credential* is non-zero).

Access:

Exclusive: No

Modify: Only with user-enrollment permissions.

Visibility: Public

36.4.10 EFI_USER_INFO_IDENTIFIER_RECORD

Summary

Provides a unique non-volatile user identifier for each enrolled user.

Prototype

```
#define EFI_USER_INFO_IDENTIFIER_RECORD 0x05
typedef UINT8 EFI_USER_INFO_IDENTIFIER[16];
```

Description

The user identifier is unique to each enrolled user and non-volatile. Each user profile must have exactly one of these user information records installed. The format of the value is not specified.

Access

Exclusive: Yes

Modify: Only with user-enrollment permissions.

Visibility: Public.

36.4.11 EFI_USER_INFO_IDENTITY_POLICY_RECORD

Summary

Provides the expression which determines which credentials are required to assert user identity.

Prototype

```
#define EFI_USER_INFO_IDENTITY_POLICY_RECORD 0x0F
typedef struct {
  UINT32          Type;
  UINT32          Length;
}   EFI_USER_INFO_IDENTITY_POLICY;
```

Parameters

Type

Specifies either an operator or a data item. See *EFI_USER_INFO_IDENTITY_x* in “Related Definitions” below.

Length

The length of this block, in bytes, including this header.

Description

The user identity policy is an expression mad3e up of operators and data items. If the expression evaluates to **TRUE,** then this user profile can be selected as the current profile. If the expression evaluates to **FALSE,** then this user profile cannot be selected as the current profile.

Data items are pushed onto an expression stack. Operators pop items off of the expression stack, perform an operator and push the results back.

NOTE: *If there is no user profile, then* **FALSE** *is assumed.*

Access

Exclusive: Yes

Modify: Only with user-enrollment permissions.

Visibility: Public.

Related Definitions

```
#define EFI_USER_INFO_IDENTITY_FALSE                 0x00
#define EFI_USER_INFO_IDENTITY_TRUE                  0x01
#define EFI_USER_INFO_IDENTITY_CREDENTIAL_TYPE       0x02
#define EFI_USER_INFO_IDENTITY_CREDENTIAL_PROVIDER 0x03
#define EFI_USER_INFO_IDENTITY_NOT                   0x10
#define EFI_USER_INFO_IDENTITY_AND                   0x11
#define EFI_USER_INFO_IDENTITY_OR                    0x12
```

Type Name	**Description**
EFI_USER_INFO_IDENTITY_FALSE	Push **FALSE** on to the expression stack.
EFI_USER_INFO_IDENTITY_TRUE	Push **TRUE** on to the expression stack.
EFI_USER_INFO_IDENTITY_CREDENTIAL_TYPE	If a credential provider with the specified class asserts the user’s identity, push **TRUE**. Otherwise push **FALSE**. The *EFI_USER_INFO_IDENTITY_POLICY* structure is followed immediately by a GUID.
EFI_USER_INFO_IDENTITY_CREDENTIAL_PROVIDER	If a credential provider with the specified provider identifier asserts the user’s identity, push **TRUE**. Otherwise, push **FALSE**. The *EFI_USER_INFO_IDENTITY_POLICY* structure is followed immediately by a GUID.
EFI_USER_INFO_IDENTITY_NOT	Pop a boolean off the stack. If **TRUE,** then push **FALSE**. If **FALSE,** then push **TRUE**.

continues on next page

Table 36.17 – continued from previous page

EFI_USER_INFO_IDENTITY_AND	Pop two Booleans off the stack. If both are **TRUE,** then push **TRUE**. Otherwise push **FALSE**
EFI_USER_INFO_IDENTITY_OR	Pop two Booleans off the stack. If either is **TRUE,** then push **TRUE**. Otherwise push **FALSE**.

36.4.12 EFI_USER_INFO_NAME_RECORD

Summary

Provide the user's name for the enrolled user.

Prototype

```
#define EFI_USER_INFO_NAME_RECORD 0x01
typedef CHAR16 *EFI_USER_INFO_NAME;
```

Description

The user's name is a **NULL**-terminated string.

Access

Exclusive: Yes

Visibility: Public.

36.4.13 EFI_USER_INFO_PKCS11_RECORD

Summary

Provides PKCS#11 credential information from a smart card.

Prototype

```
#define EFI_USER_INFO_PKCS11_RECORD 0x0A
```

36.4.14 EFI_USER_INFO_RETRY_RECORD

Summary

Indicates how many attempts the user has to with a particular credential before the system prevents further attempts.

Prototype

```
#define EFI_USER_INFO_RETRY_RECORD 0x0D
typedef UINT8 EFI_USER_INFO_RETRY;
```

Description

This record indicates the number of times the user may fail identification with all credential providers (*EFI_USER_INFO* .*Credential* is zero) or a particular credential provider (*EFI_USER_INFO* .*Credential* is non-zero).

Access:

Exclusive: No

Modify: Only with user-enrollment permissions.

Visibility: Public

36.4.15 EFI_USER_INFO_USAGE_DATE_RECORD

Summary

Provides the date and time when the user profile was selected.

Prototype

```
#define EFI_USER_INFO_USAGE_DATE_RECORD 0x03
typedef EFI_TIME EFI_USER_INFO_USAGE_DATE;
```

Description

The optional record describing the date and time when the user profile was last selected. Type *EFI_TIME* is defined in *GetTime()* in this specification.

36.4.16 EFI_USER_INFO_USAGE_COUNT_RECORD

Summary

Provides the number of times that the user profile has been selected.

Prototype

```
#define EFI_USER_INFO_USAGE_COUNT 0x04
typedef UINT64 EFI_USER_INFO_USAGE_COUNT;
```

Description

The optional record describing the number of times that the user profile was selected.

36.5 User Information Table

Summary

A collection of *EFI_USER_INFO* records, prefixed with this header.

Prototype

```
typedef struct {
  UINT64                Size;
}   EFI_USER_INFO_TABLE;
```

Members

Size

Total size of the user information table, in bytes.

Description

This header is followed by a series of records. Each record is prefixed by the *EFI_USER_INFO* structure. The total size of this header and all records is equal to Size.

CHAPTER

THIRTYSEVEN

SECURE TECHNOLOGIES

37.1 Hash Overview

For the purposes of this specification, a hash function takes a variable length input and generates a fixed length hash value. In general, hash functions are collision-resistant, which means that it is infeasible to find two distinct inputs which produce the same hash value. Hash functions are generally one-way which means that it is infeasible to find an input based on the output hash value.

This specification describes a protocol which allows a driver to produce a protocol which supports zero or more hash functions.

37.1.1 Hash References

The following references define the standard means of creating the hashes used in this specification:

Secure Hash Standard (SHS) (FIPS PUB 180-3), National Institute of Standards and Technology (October 2008).

For more information

- see “Links to UEFI-Related Documents” at http://uefi.org/uefi under the heading “Archived FIPS publication”.
- see “Links to UEFI-Related Documents” at http://uefi.org/uefi under the heading “MD5 Message-Digest Algorithm”. EFI Hash Protocols

37.1.1.1 EFI_HASH_SERVICE_BINDING_PROTOCOL

Summary

The EFI Hash Service Binding Protocol is used to locate hashing services support provided by a driver and create and destroy instances of the EFI Hash Protocol so that a multiple drivers can use the underlying hashing services.

The EFI Service Binding Protocol that is defined in *EFI Services Binding* defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the EFI Hash Protocol.

GUID

```
#define EFI_HASH_SERVICE_BINDING_PROTOCOL_GUID \
  {0x42881c98,0xa4f3,0x44b0,\
    {0xa3,0x9d,0xdf,0xa1,0x86,0x67,0xd8,0xcd}}
```

Description

An application (or driver) that requires hashing services can use one of the protocol handler services, such as *BS->LocateHandleBuffer(),* to search for devices that publish an EFI Hash Service Binding Protocol.

After a successful call to the *EFI_HASH_SERVICE_BINDING_PROTOCOL.CreateChild()* function, the child EFI Hash Protocol driver instance is ready for use. The instance of *EFI_HASH_PROTOCOL* must be obtained by performing *HandleProtocol()* against the handle returned by *CreateChild()*. Use of other methods, such as *LocateHandle()*, are not supported.

Once obtained, the driver may use the *EFI_HASH_PROTOCOL* instance for any number of non-overlapping hash operations. Overlapping hash operations require an additional call to *EFI_HASH_SERVICE_BINDING_PROTOCOL.CreateChild()* for a new instance.

Before a driver or application terminates execution, every successful call to the *EFI_HASH_SERVICE_BINDING_PROTOCOL.CreateChild()* function must be matched with a call to the *EFI_HASH_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

37.1.1.2 EFI_HASH_PROTOCOL

Summary

This protocol describes standard hashing functions.

GUID

```
#define EFI_HASH_PROTOCOL_GUID \
  {0xc5184932,0xdba5,0x46db,\
    {0xa5,0xba,0xcc,0x0b,0xda,0x9c,0x14,0x35}}
```

Protocol Interface Structure

```
typedef _EFI_HASH_PROTOCOL {
  EFI_HASH_GET_HASH_SIZE      GetHashSize;
  EFI_HASH_HASH               Hash;
}   EFI_HASH_PROTOCOL;
```

Parameters

GetHashSize
Return the size of a specific type of resulting hash.

Hash
Create a hash for the specified message.

Description

This protocol allows creating a hash of an arbitrary message digest using one or more hash algorithms. The *GetHashSize* returns the expected size of the hash for a particular algorithm and whether or not that algorithm is, in fact, supported. The *Hash* actually creates a hash using the specified algorithm.

Related Definitions

None.

37.1.1.3 EFI_HASH_PROTOCOL.GetHashSize()

Summary

Returns the size of the hash which results from a specific algorithm.

Prototype

```
EFI_STATUS
EFIAPI
GetHashSize(
  IN CONST EFI_HASH_PROTOCOL     *This,
  IN CONST EFI_GUID              *HashAlgorithm,
  OUT UINTN                      *HashSize
);
```

Parameters

This
Points to this instance of *EFI_HASH_PROTOCOL*.

HashAlgorithm
Points to the *EFI_GUID* which identifies the algorithm to use. See *EFI Hash Algorithms* .

HashSize
Holds the returned size of the algorithm's hash.

Description

This function returns the size of the hash which will be produced by the specified algorithm.

Related Definitions

None

Status Codes Returned

EFI_SUCCESS	Hash size returned successfully.
EFI_INVALID_PARAMETER	*HashSize* is **NULL** or *HashAlgorithm* is **NULL.**
EFI_UNSUPPORTED	The algorithm specified by *HashAlgorithm* is not supported by this driver.

37.1.1.4 EFI_HASH_PROTOCOL.Hash()

Summary

Creates a hash for the specified message text.

Prototype

```
EFI_STATUS
EFIAPI
Hash(
  IN CONST EFI_HASH_PROTOCOL     *This,
  IN CONST EFI_GUID              *HashAlgorithm,
  IN BOOLEAN                     Extend,
  IN CONST UINT8                 *Message,
  IN UINT64                      MessageSize,
  IN OUT EFI_HASH_OUTPUT         *Hash
);
```

Parameters

This
Points to this instance of *EFI_HASH_PROTOCOL.*

HashAlgorithm
Points to the *EFI_GUID* which identifies the algorithm to use. See *EFI Hash Algorithms* .

Extend
Specifies whether to create a new hash (**FALSE**) or extend the specified existing hash (**TRUE**).

Message
Points to the start of the message.

MessageSize
The size of *Message,* in bytes. Must be integer multiple of block size.

Hash
On input, if *Extend* is **TRUE,** then this parameter holds a pointer to a pointer to an array containing the hash to extend. If *Extend* is **FALSE,** then this parameter holds a pointer to a pointer to a caller-allocated array that will receive the result of the hash computation. On output (regardless of the value of *Extend*), the array will contain the result of the hash computation.

Description

This function creates the hash of the specified message text based on the specified algorithm *HashAlgorithm* and copies the result to the caller-provided buffer *Hash.* If *Extend* is *TRUE,* then the hash specified on input by Hash is extended. If *Extend* is *FALSE,* then the starting hash value will be that specified by the algorithm.

NOTE: *For the all algorithms used with* EFI_HASH_PROTOCOL, *the following apply:*

- The *EFI_HASH_PROTOCOL.Hash()* function does not perform padding of message data for these algorithms. Hence, *MessageSize* shall always be an integer multiple of the *HashAlgorithm* block size, and the final supplied *Message* in a sequence of invocations shall contain caller-provided padding. This will ensure that the final *Hash* output will be the correct hash of the provided message(s).
- The result of a *Hash()* call for one of these algorithms when the caller does not supply message data whose length is an integer multiple of the algorithm's block size is a returned error.
- The *EFI_HASH_OUTPUT* options for these two algorithms shall be *EFI_SHA1_HASH* and EFI_SHA256_HASH, respectively.
- Callers using these algorithms may consult the aforementioned Secure Hash Standard for details on how to perform proper padding required by standard prior to final invocation.

Related Definitions

EFI_HASH_OUTPUT

Status Codes Returned

EFI_SUCCESS	*Hash* returned successfully.
EFI_INVALID_PARAMETER	*Message* or *Hash,HashAlgorithm* i s NULL or *MessageSize* is 0. *MessageSize* is not an integer multiple of block size.
EFI_UNSUPPORTED	The algorithm specified by *HashAlgorithm* is not supported by this driver. Includes *HashAlgorithm* being passed as a null error.
EFI_UNSUPPORTED	*Extend* is **TRUE** and the algorithm doesn't support extending the hash.

37.1.2 Other Code Definitions

37.1.2.1 EFI_SHA1_HASH, EFI_SHA224_HASH, EFI_SHA256_HASH,EFI_SHA384_HASH, EFI_SHA512HASH, EFI_MD5_HASH

Summary

Data structure which holds the result of the hash.

Prototype

```
typedef UINT8 EFI_MD5_HASH[16];
typedef UINT8 EFI_SHA1_HASH[20];
typedef UINT8 EFI_SHA224_HASH[28];
typedef UINT8 EFI_SHA256_HASH[32];
typedef UINT8 EFI_SHA384_HASH[48];
typedef UINT8 EFI_SHA512_HASH[64];
typedef union _EFI_HASH_OUTPUT {
  EFI_MD5_HASH       *Md5Hash;
  EFI_SHA1_HASH      *Sha1Hash;
  EFI_SHA224_HASH    *Sha224Hash;
  EFI_SHA256_HASH    *Sha256Hash;
  EFI_SHA384_HASH    *Sha384Hash;
  EFI_SHA512_HASH    *Sha512Hash;
}   EFI_HASH_OUTPUT;
```

Description

These prototypes describe the expected hash output values from the *Hash* function of the *EFI_HASH_PROTOCOL*.

Related Definitions

None

37.1.2.2 EFI Hash Algorithms

The following table gives the *EFI_GUID* for standard hash algorithms and the corresponding ASN.1 OID (Object Identifier):

NOTE: *Use of the following algorithms with EFI_HASH_PROTOCOL is deprecated.*

- EFI_HASH_ALGORITHM_SHA1_GUID
- EFI_HASH_ALGORITHM_SHA224_GUID
- EFI_HASH_ALGORITHM_SHA256_GUID
- EFI_HASH_ALGORITHM_SHA384_GUID
- EFI_HASH_ALGORITHM_SHA512_GUID
- EFI_HASH_ALGORTIHM_MD5_GUID

Table 37.1: EFI Hash Algorithms

Algorithm	EFI_GUID	OID

continues on next page

Table 37.1 – continued from previous page

SHA-1 (No padding done by implementation)	*#define EFI_HASH_ALGORITHM_SHA1_NOPAD_GUID {0x24c5dc2f, 0x53e2, 0x40ca, {0x9e, 0xd6, 0xa5, 0xd9, 0xa4, 0x9f, 0x46, 0x3b}}*	*id-sha1 OBJECT IDENTIFIER ::= { iso(1) identified-organization(3) oiw(14) secsig(3) algorithms(2) 26 }*
SHA-256 (No padding done by implementation)	*#define EFI_HASH_ALGORITHM_SHA256_NOPAD_GUID {0x8628752a, 0x6cb7, 0x4814, {0x96, 0xfc, 0x24, 0xa8, 0x15, 0xac, 0x22, 0x26}}*	*id-sha256 OBJECT IDENTIFIER ::= { joint-iso-itu-t (2) country (16) us (840) organization (1) gov (101) csor (3) nistalgorithm (4) hashalgs (2) 1}*

NOTE: *For the* EFI_HASH_ALGORITHM_SHA1_NOPAD_GUID *and the* EFI_HASH_ALGORITHM_SHA256_NOPAD_GUID, *the following apply*:

- The *EFI_HASH_PROTOCOL.Hash()* function does not perform padding of message data for these algorithms. Hence, *MessageSize* shall always be an integer multiple of the *HashAlgorithm* block size, and the final supplied *Message* in a sequence of invocations shall contain caller-provided padding. This will ensure that the final *Hash* output will be the correct hash of the provided message(s).
- The result of a *Hash()* call for one of these algorithms when the caller does not supply message data whose length is an integer multiple of the algorithm's block size is undefined.
- The *EFI_HASH_OUTPUT* options for these two algorithms shall be *EFI_SHA1_HASH* and *EFI_SHA256_HASH*, respectively.
- Callers using these algorithms may consult the aforementioned Secure Hash Standard for details on how to perform proper padding.

37.2 Hash2 Protocols

37.2.1 EFI Hash2 Service Binding Protocol

37.2.1.1 EFI_HASH2_SERVICE_BINDING_PROTOCOL

Summary

The EFI Hash2 Service Binding Protocol is used to locate *EFI_HASH2_PROTOCOL* hashing services support provided by a driver and create and destroy instances of the *EFI_HASH2_PROTOCOL* Protocol so that a multiple drivers can use the underlying hashing services.

The EFI Service Binding Protocol that is defined in *EFI Services Binding* defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the EFI Hash Protocol.

GUID

```
#define EFI_HASH2_SERVICE_BINDING_PROTOCOL_GUID \
{0xda836f8d, 0x217f, 0x4ca0, 0x99, 0xc2, 0x1c, \
0xa4, 0xe1, 0x60, 0x77, 0xea}
```

Description

An application (or driver) that requires hashing services can use one of the protocol handler services, such as *BS->LocateHandleBuffer()*, to search for devices that publish an *EFI_HASH2_SERVICE_BINDING_PROTOCOL.*

After a successful call to the *EFI_HASH2_SERVICE_BINDING_PROTOCOL* member *CreateChild()* function, the child instance of *EFI_HASH2_PROTOCOL* Protocol driver instance is ready for use. The instance of

EFI_HASH2_PROTOCOL must be obtained by performing *HandleProtocol()* against the handle returned by *CreateChild()*. Use of other methods, such as *LocateHandle()* is not supported.

Once obtained, the driver may use the *EFI_HASH2_PROTOCOL* instance for any number of non-overlapping hash operations. Overlapping hash operations require an additional call to *EFI_HASH_SERVICE_BINDING_PROTOCOL. CreateChild()* for a new instance.

Before a driver or application using the instance terminates execution, every successful call to the *EFI_HASH_SERVICE_BINDING_PROTOCOL.CreateChild()* function must be matched with a call to the *EFI_HASH_SERVICE_BINDING_PROTOCOL.DestroyChild()* function.

37.2.2 EFI Hash2 Protocol

37.2.2.1 EFI_HASH2_PROTOCOL

Summary

This protocol describes hashing functions for which the algorithm-required message padding and finalization are performed by the supporting driver. In previous versions of the specification, the algorithms supported by *EFI_HASH2_PROTOCOL* were also available for use with *EFI_HASH_PROTOCOL* but this usage has been deprecated.

GUID

```
#define EFI_HASH2_PROTOCOL_GUID \
{
0x55b1d734, 0xc5e1, 0x49db, 0x96, 0x47, 0xb1, 0x6a, \
0xfb, 0xe, 0x30, 0x5b}
```

Protocol Interface Structure

```
typedef _EFI_HASH2_PROTOCOL {
  EFI_HASH2_GET_HASH_SIZE        GetHashSize;
  EFI_HASH2_HASH                 Hash;
  EFI_HASH2_HASH_INIT            HashInit;
  EFI_HASH2_HASH_UPDATE          HashUpdate;
  EFI_HASH2_HASH_FINAL           HashFinal;
}   EFI_HASH2_PROTOCOL;
```

Parameters

GetHashSize
Return the result size of a specific type of resulting hash.

Hash
Create a final non-extendable hash for a single message block in a single call.

HashInit
Initializes an extendable multi-part hash calculation

HashUpdate
Continues a hash in progress by supplying the first or next sequential portion of the message text

HashFinal
Finalizes a hash in progress by padding as required by algorithm and returning the hash output.

Description

This protocol allows creating a hash of an arbitrary message digest using one or more hash algorithms. The *GetHashSize()* function returns the expected size of the hash for a supported algorithm and an error if that algorithm is not supported. The *Hash()* function creates a final, non-extendable, hash of a single message block using the specified algorithm. The three functions *HashInit(), HashUpdate(), HashFinal(),* generates the hash of a multi-part message, with input composed of one or more message pieces.

For a specific handle representing an instance of *EFI_HASH2_PROTOCOL*, if *Hash()* is called after a call to *HashInit()* and prior to the matching call to *HashFinal()* , the multi-part hash started by *HashInit()* will be canceled and calls to *HashUpdate()* or *HashFinal()* will return an error status unless proceeded by a new call to *HashInit()*.

NOTE: *Algorithms* EFI_HASH_ALGORITHM_SHA1_NOPAD *and* EFI_HASH_ALGORITHM_SHA256_NOPAD_GUID *are not compatible with* EFI_HASH2_PROTOCOL *and will return* EFI_UNSUPPORTED *if used with any* EFI_HASH2_PROTOCOL *function.*

Related Definitions

None

NOTE: *The following hash function invocations will produce identical hash results for all supported* EFI_HASH2_PROTOCOL *algorithms. The data in quotes is the message*.

Table 37.2: Identical Hash Results

	HashUpdate("ABCDEF")	*HashUpdate ("ABC")*
	HashFinal()	*HashUpdate ("DE")*
		HashUpdate ("F")
		HashFinal ()

37.2.2.2 EFI_HASH2_PROTOCOL.GetHashSize()

Summary

Returns the size of the hash which results from a specific algorithm.

Prototype

```
EFI_STATUS
EFIAPI
GetHashSize(
  IN  CONST EFI_HASH2_PROTOCOL            *This,
  IN  CONST EFI_GUID                      *HashAlgorithm,
  OUT  UINTN                              *HashSize
  );
```

Parameters

This

Points to this instance of *EFI_HASH2_PROTOCOL.*

HashAlgorithm

Points to the *EFI_GUID* which identifies the algorithm to use. See *Other Code Definitions* .

HashSize

Holds the returned size of the algorithm's hash.

Description

This function returns the size of the hash result buffer which will be produced by the specified algorithm.

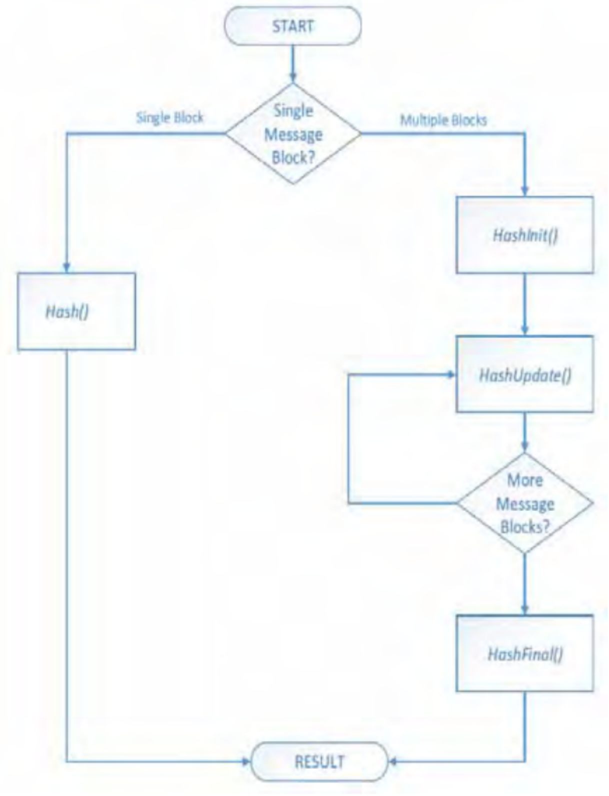

Fig. 37.1: **Hash workflow**

Related Definitions

Status Codes Returned

EFI_SUCCESS	Hash size returned successfully.
EFI_INVALID_PARAMETER	*This* or *HashSize* is **NULL**
EFI_UNSUPPORTED	The algorithm specified by *HashAlgorithm* is not supported by this driver or, *HashAlgorithm* is **NULL**.

37.2.2.3 EFI_HASH2_PROTOCOL.Hash()

Summary

Creates a hash for a single message text. The hash is not extendable. The output is final with any algorithm-required padding added by the function.

Prototype

```
EFI_STATUS
EFIAPI
Hash(
  IN CONST EFI_HASH2_PROTOCOL       *This,
  IN CONST EFI_GUID                 *HashAlgorithm,
  IN CONST UINT8                    *Message,
  IN UINTN                          MessageSize,
  IN OUT EFI_HASH2_OUTPUT           *Hash
);
```

Parameters

This

Points to this instance of *EFI_HASH2_PROTOCOL.*

HashAlgorithm

Points to the *EFI_GUID* which identifies the algorithm to use. See Table, *Algorithms that may be used with EFI_HASH2_PROTOCOL*.

Message

Points to the start of the message.

MessageSize

The size of *Message,* in bytes.

Hash

On input, points to a caller-allocated buffer of the size returned by *GetHashSize()* for the specified *HashAlgorithm.* On output, the buffer holds the resulting hash computed from the message.

Description

This function creates the hash of specified single block message text based on the specified algorithm *HashAlgorithm* and copies the result to the caller-provided buffer *Hash.* The resulting hash cannot be extended. All padding required by *HashAlgorithm* is added by the implementation.

Related Definitions

EFI_HASH2_OUTPUT

Status Codes Returned

EFI_SUCCESS	*Hash* returned successfully.
EFI_INVALID_PARAMETER	*This,* or *Hash* is **NULL**.
EFI_UNSUPPORTED	The algorithm specified by *HashAlgorithm* is not supported by this driver or *HashAlgorithm* is **Null**.
EFI_OUT_OF_RESOURCES	Some resource required by the function is not available or *MessageSize* is greater than platform maximum.

37.2.2.4 EFI_HASH2_PROTOCOL.HashInit()

Summary

This function must be called to initialize a digest calculation to be subsequently performed using the *EFI_HASH2_PROTOCOL* functions *HashUpdate()* and *HashFinal()*.

Prototype

```
EFI_STATUS
EFIAPI
HashInit(
  IN CONST EFI_HASH2_PROTOCOL       *This,
  IN CONST EFI_GUID                 *HashAlgorithm,
);
```

Parameters

This

Points to instance of *EFI_HASH2_PROTOCOL*.

HashAlgorithm

Points to the *EFI_GUID* which identifies the algorithm to use. See Table, *Algorithms that may be used with EFI_HASH2_PROTOCOL*

Description

This function

Related Definitions

Status Codes Returned

EFI_SUCCESS	Initialized successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_UNSUPPORTED	The algorithm specified by *HashAlgorithm* is not supported by this function or *HashAlgorithm* is **Null**.
EFI_OUT_OF_RESOURCES	Process failed due to lack of required resource.
EFI_ALREADY_STARTED	This function is called when the operation in progress is still in processing *Hash()*, or *HashInit()* is already called before and not terminated by *HashFinal()* yet on the same instance.

37.2.2.5 EFI_HASH2_PROTOCOL.HashUpdate()

Summary

Updates the hash of a computation in progress by adding a message text.

Prototype

```
EFI_STATUS
EFIAPI
HashUpdate(
  IN CONST EFI_HASH2_PROTOCOL    *This,
  IN CONST UINT8                 *Message,
  IN UINTN                       MessageSize
);
```

Parameters

This
Points to instance of *EFI_HASH2_PROTOCOL.*

Message
Points to the start of the message.

MessageSize
The size of *Message,* in bytes.

Description

This function extends the hash of ongoing hash operation with the supplied message text. This function should be called one or more times with portions of the total message text to be hashed.. A zero-length message input will return EFI_SUCCESS and has no impacts on the ongoing hash instance.

Related Definitions

Status Codes Returned

EFI_SUCCESS	Digest in progress updated successfully.
EFI_INVALID_PARAMETER	*This* or *Hash* is **NULL**.
EFI_OUT_OF_RESOURCES	Some resource required by the function is not available or *MessageSize* is greater than platform maximum.
EFI_NOT_READY	This call was not preceded by a valid call to *HashInit()*, or the operation in progress was terminated by a call to *Hash()* or *HashFinal()* on the same instance.

37.2.2.6 EFI_HASH2_PROTOCOL.HashFinal()

Summary

Finalizes a hash operation in progress and returns calculation result. The output is final with any necessary padding added by the function. The hash may not be further updated or extended after *HashFinal()*.

Prototype

```
EFI_STATUS
EFIAPI
HashFinal(
  IN CONST EFI_HASH2_PROTOCOL      *This,
  IN OUT EFI_HASH2_OUTPUT          *Hash
);
```

Parameters

This

Points to instance of *EFI_HASH2_PROTOCOL*.

Hash

On input, points to a caller-allocated buffer of the size returned by *GetHashSize()* for the specified *HashAlgorithm* specified in preceding *HashInit()*. On output, the buffer holds the resulting hash computed from the message.

Description

This function finalizes the hash of a hash operation in progress. The resulting final hash cannot be extended.

Related Definitions

EFI_HASH2_OUTPUT

Status Codes Returned

EFI_SUCCESS	*Hash* returned successfully.
EFI_INVALID_PARAMETER	*This* or *Hash* is **NULL**
EFI_NOT_READY	This call was not preceded by a valid call to *HashInit()* and at least one call to *HashUpdate()*, or the operation in progress was canceled by a call to *Hash()* on the same instance.

NOTE: *SHA-1 and MD5 are included for backwards compatibility. New driver implementations are encouraged to consider stronger algorithms.*

37.2.3 Other Code Definitions

37.2.3.1 EFI_HASH2_OUTPUT

Summary

Data structure which holds the result of the hash operation from *EFI_HASH2_PROTOCOL* hash operations.

Prototype

```
typedef UINT8 EFI_MD5_HASH2[16];
typedef UINT8 EFI_SHA1_HASH2[20];
typedef UINT8 EFI_SHA224_HASH2[28];
typedef UINT8 EFI_SHA256_HASH2[32];
typedef UINT8 EFI_SHA384_HASH2[48];
typedef UINT8 EFI_SHA512_HASH2[64];
typedef union _EFI_HASH2_OUTPUT {
  EFI_MD5_HASH2         Md5Hash;
  EFI_SHA1_HASH2        Sha1Hash;
  EFI_SHA224_HASH2      Sha224Hash;
  EFI_SHA256_HASH2      Sha256Hash;
  EFI_SHA384_HASH2      Sha384Hash;
  EFI_SHA512_HASH2      Sha512Hash;
  } EFI_HASH2_OUTPUT;
```

Description

These prototypes describe the expected hash output values from the hashing functions of the *EFI_HASH2_PROTOCOL*.

37.3 Key Management Service

37.3.1 EFI_KEY_MANAGEMENT_SERVICE_PROTOCOL

Summary

The Key Management Service (KMS) protocol provides services to generate, store, retrieve, and manage cryptographic keys. The intention is to specify a simple generic protocol that could be used for many implementations.

The management keys have a simple construct - they consist of key identifier and key data, both of variable size.

A driver implementing the protocol may need to provide basic key service that consists of a key store and cryptographic key generation capability. It may connect to an external key server over the network, or to a Hardware Security Module (HSM) attached to the system it runs on, or anything else that is capable of providing the key management service.

Authentication and access control is not addressed by this protocol. It is assumed it is addressed at the system level and done by the driver implementing the protocol, if applicable to the implementation.

GUID

```
#define EFI_KMS_PROTOCOL_GUID \
  {0xEC3A978D,0x7C4E, 0x48FA,\
  {0x9A,0xBE,0x6A,0xD9,0x1C,0xC8,0xF8,0x11}}
```

Protocol Interface Structure

```
#define EFI_KMS_DATA_TYPE_NONE      0
#define EFI_KMS_DATA_TYPE_BINARY    1
#define EFI_KMS_DATA_TYPE_ASCII     2
#define EFI_KMS_DATA_TYPE_UNICODE   4
#define EFI_KMS_DATA_TYPE_UTF8      8
```

Where appropriate, *EFI_KMS_DATA_TYPE* values may be combined using a bitwise ‘ *OR* ’ operation to indicate support for multiple data types.

```
typedef struct _EFI_KMS_SERVICE_PROTOCOL {
  EFI_KMS_GET_SERVICE_STATUS        GetServiceStatus;
  EFI_KMS_REGISTER_CLIENT           RegisterClient;
  EFI_KMS_CREATE_KEY                CreateKey;
  EFI_KMS_GET_KEY                   GetKey;

  UINT8                            KeyAttributeIdStringTypes;
  UINT16                           KeyAttributeIdMaxCount;
  UINTN                            KeyAttributesCount;
  EFI_KMS_KEY_ATTRIBUTE            *KeyAttributes;
}   EFI_KMS_PROTOCOL;
```

Parameters

GetServiceStatus
Get the current status of the key management service. If the implementation has not yet connected to the KMS, then a call to this function will initiate a connection. This is the only function that is valid for use prior to the service being marked available.

RegisterClient
Register a specific client with the KMS.

CreateKey
Request the generation of a new key and retrieve it.

GetKey
Retrieve an existing key.

AddKey
Add a local key to the KMS database. If there is an existing key with this key identifier in the KMS database, it will be replaced with the new key.

DeleteKey
Delete an existing key from the KMS database.

AddKeyAttributes
Add attributes to an existing key in the KMS database.

GetKeyAttributes
Get attributes for an existing key in the KMS database.

DeleteKeyAttributes
Delete attributes for an existing key in the KMS database.

GetKeyByAttributes
Get existing key(s) with the specified attributes.

ProtocolVersion
The version of this *EFI_KMS_PROTOCOL* structure. This must be set to 0x00020040 for the initial version of this protocol.

ServiceId
Optional GUID used to identify a specific KMS. This GUID may be supplied by the provider, by the implementation, or may be null. If it is null, then the*ServiceName* must not be null.

ServiceName

Optional pointer to a unicode string which may be used to identify the KMS or provide other information about the supplier.

ServiceVersion

Optional 32-bit value which may be used to indicate the version of the KMS provided by the supplier.

ServiceAvailable

TRUE if and only if the service is active and available for use. To avoid unnecessary delays in POST, this protocol may be installed without connecting to the service. In this case, the first call to the *GetServiceStatus()* function will cause the implementation to connect to the supported service and mark it as available. The capabilities of this service as defined in the remainder of this protocol are not guaranteed to be valid until the service has been marked available.

FALSE otherwise.

ClientIdSupported

TRUE if and only if the service supports client identifiers. Client identifiers may be used for auditing, access control or any other purpose specific to the implementation.

FALSE otherwise.

ClientIdRequired

TRUE if and only if the service requires a client identifier in order to process key requests.

FALSE otherwise.

ClientIdMaxSize

The maximum size in bytes for the client identifier.

ClientNameStringTypes

The client name string type(s) supported by the KMS service. If client names are not supported, this field will be set to EFI_KMS_DATA_TYPE_NONE. Otherwise, it will be set to the inclusive 'OR' of all client name formats supported. Client names may be used for auditing, access control or any other purpose specific to the implementation.

ClientNameRequired

TRUE if and only if the KMS service requires a client name to be supplied to the service.

FALSE otherwise.

ClientNameMaxCount

The maximum number of characters allowed for the client name.

ClientDataSupported

TRUE if and only if the service supports arbitrary client data requests. The use of client data requires the caller to have specific knowledge of the individual KMS service and should be used only if absolutely necessary.

FALSE otherwise.

ClientDataMaxSize

The maximum size in bytes for the client data. If the maximum data size is not specified by the KMS or it is not known, then this field must be filled with all ones.

KeyIdVariableLenSupported

TRUE if variable length key identifiers are supported.

FALSE if a fixed length key identifier is supported.

KeyIdMaxLen

If KeyIdVariableLenSupported is **TRUE**, this is the maximum supported key identifier length in bytes. Otherwise this is the fixed length of key identifier supported. Key ids shorter than the fixed length will be padded on the right with blanks.

KeyFormatsCount

The number of key format/size GUIDs returned in the *KeyFormats* field.

KeyFormats

A pointer to an array of *EFI_GUID* values which specify key formats/sizes supported by this KMS. Each format/size pair will be specified by a separate *EFI_GUID* . At least one key format/size must be supported. All formats/sizes with the same hashing algorithm must be contiguous in the array, and for each hashing algorithm, the key sizes must be in ascending order. See "Related Definitions" for GUIDs which identify supported key formats/sizes.

'This list of GUIDs supported by the KMS is not required to be exhaustive, and the KMS may provide support for additional key formats/sizes. Users may request key information using an arbitrary GUID, but any GUID not recognized by the implementation or not supported by the KMS will return an error code of *EFI_UNSUPPORTED*.

KeyAttributesSupported

TRUE if key attributes are supported.

FALSE if key attributes are not supported.

KeyAttributeIdStringTypes

The key attribute identifier string type(s) supported by the KMS service. If key attributes are not supported, this field will be set to *EFI_KMS_DATA_TYPE_NONE.* Otherwise, it will be set to the inclusive 'OR' of all key attribute identifier string types supported. *EFI_KMS_DATA_TYPE_BINARY* is not valid for this field.

KeyAttributeIdMaxCount

The maximum number of characters allowed for the client name.

KeyAttributesCount

The number of predefined *KeyAttributes* structures returned in the *KeyAttributes* parameter. If the KMS does not support predefined key attributes, or if it does not provide a method to obtain predefined key attributes data, then this field must be zero.

KeyAttributes

A pointer to an array of *KeyAttributes* structures which contains the predefined attributes supported by this KMS. Each structure must contain a valid key attribute identifier and should provide any other information as appropriate for the attribute, including a default value if one exists. This variable must be set to **NULL** if the *KeyAttributesCount* variable is zero. It must point to a valid buffer if the *KeyAttributesCount* variable is non-zero.

This list of predefined attributes is not required to be exhaustive, and the KMS may provide additional predefined attributes not enumerated in this list. The implementation does not distinguish between predefined and used defined attributes, and therefore, predefined attributes not enumerated will still be processed to the KMS.

Related Definitions

Functions defined for this protocol typically require the caller to provide information about the client, the keys to be processed, and/or attributes of the keys to be processed. Four structures, *EFI_KMS_CLIENT_INFO, EFI_KMS_KEY_DESCRIPTOR, EFI_KMS_DYNAMIC_ATTRIBUTE,* and *EFI_KMS_KEY_ATTRIBUTE* define the information to be passed to these functions.

```
typedef struct {
  UINT16          ClientIdSize;
  VOID            *ClientId;
  UINT8           ClientNameType;
  UINT8           ClientNameCount;
  VOID            *ClientName;
}   EFI_KMS_CLIENT_INFO;
```

ClientIdSize

The size in bytes for the client identifier.

ClientId
Pointer to a valid client identifier.

ClientNameType
The client name string type used by this client. The string type set here must be one of the string types reported in the *ClientNameStringTypes* field of the KMS protocol. If the KMS does not support client names, this field should be set to *EFI_KMS_DATA_TYPE_NONE.*

ClientNameCount
The size in characters for the client name. This field will be ignored if *ClientNameStringType* is set to *EFI_KMS_DATA_TYPE_NONE.* Otherwise, it must contain number of characters contained in the *ClientName* field.

ClientName
Pointer to a client name. This field will be ignored if *ClientNameStringType* is set to *EFI_KMS_DATA_TYPE_NONE.* Otherwise, it must point to a valid string of the specified type.

The key formats recognized by the KMS protocol are defined by an *EFI_GUID* which specifies a (key-algorithm, key-size) pair. The names of these GUIDs are in the format *EFI_KMS_KEY_(key-algorithm)_(key-size)_GUID,* where the key-size is expressed in bits. The key formats recognized fall into three categories, generic (no algorithm), hash algorithms, and encrypted algorithms.

Generic Key Data:

The following GUIDs define formats that contain generic key data of a specific size in bits, but which is not associated with any specific key algorithm(s).

```
#define EFI_KMS_FORMAT_GENERIC_128_GUID \
  {0xec8a3d69,0x6ddf,0x4108,\
    {0x94,0x76,0x73,0x37,0xfc,0x52,0x21,0x36}}

#define EFI_KMS_FORMAT_GENERIC_160_GUID \
  {0xa3b3e6f8,0xefca,0x4bc1,\
    {0x88,0xfb,0xcb,0x87,0x33,0x9b,0x25,0x79}}

#define EFI_KMS_FORMAT_GENERIC_256_GUID \
  {0x70f64793,0xc323,0x4261,\
    {0xac,0x2c,0xd8,0x76,0xf2,0x7c,0x53,0x45}}

#define EFI_KMS_FORMAT_GENERIC_512_GUID \
  {0x978fe043,0xd7af,0x422e,\
    {0x8a,0x92,0x2b,0x48,0xe4,0x63,0xbd,0xe6}}

#define EFI_KMS_FORMAT_GENERIC_1024_GUID \
  {0x43be0b44,0x874b,0x4ead,\
    {0xb0,0x9c,0x24,0x1a,0x4f,0xbd,0x7e,0xb3}}

#define EFI_KMS_FORMAT_GENERIC_2048_GUID \
  {0x40093f23,0x630c,0x4626,\
    {0x9c,0x48,0x40,0x37,0x3b,0x19,0xcb,0xbe}}

#define EFI_KMS_FORMAT_GENERIC_3072_GUID \
  {0xb9237513,0x6c44,0x4411,\
    {0xa9,0x90,0x21,0xe5,0x56,0xe0,0x5a,0xde}}

#define EFI_KMS_FORMAT_GENERIC_DYNAMIC_GUID \
```

(continues on next page)

(continued from previous page)

```
  {0x2156e996, 0x66de, 0x4b27, \
    {0x9c, 0xc9, 0xb0, 0x9f, 0xac, 0x4d, 0x2, 0xbe}}
```

The *EFI_KMS_FORMAT_GENERIC_DYNAMIC_GUID* is defined for the key data with a size not defined by a certain key format GUID. The key value specified by this GUID is in format of structure *EFI_KMS_FORMAT_GENERIC_DYNAMIC*.

```
typedef struct {
  UINT32          KeySize;
  UINT8           KeyData[1];
} EFI_KMS_FORMAT_GENERIC_DYNAMIC;
```

KeySize
Length in bytes of the *KeyData*.

KeyData
The data of the key.

Hash Algorithm Key Data:

These GUIDS define key data formats that contain data generated by basic hash algorithms with no cryptographic properties.

```
#define EFI_KMS_FORMAT_MD2_128_GUID \
  {0x78be11c4,0xee44,0x4a22,\

The encryption algorithms defined above have the following properties

Table 37.9: Encryption Algorithm Properties

EFI_KMS_FORMAT	Encryption Description	Key Data Size	Hash Function
AESXTS_128	Symmetric encryption using XTS-AES 128 bit keys	Key data is a concatenation of two fields of equal size for a total size of 256 bits	N/A

continues on next page

Table 37.9 – continued from previous page

AESXTS_256	Symmetric encryption using block cipher XTS-AES 256 bit keys	Key data is a concatenation of two fields of equal size for a total size of 512 bits	N/A
AESCBC_128	Symmetric encryption using block cipher AES-CBC 128 bit keys	128 bits	N/A
AESCBC_256	Symmetric encryption using block cipher AES-CBC 256 bit keys	256 bits	N/A
RSASHA1_1024	Asymmetric encryption using block cipher RSA 1024 bit keys	1024 bits	SHA1
RSASHA1_2048	Asymmetric encryption using block cipher RSA 2048 bit keys	2048 bits	SHA1
RSASHA256_2048	Asymmetric encryption using block cipher RSA 2048 bit keys	2048 bits	SHA256
RSASHA256_3072	Asymmetric encryption using block cipher RSA 3072 bit keys	3072 bits	SHA256

```
typedef struct {
  UINT8           KeyIdentifierSize;
  VOID            *KeyIdentifier;
  EFI_GUID        KeyFormat;
  VOID            *KeyValue;
  EFI_STATUS      KeyStatus;
}   EFI_KMS_KEY_DESCRIPTOR;
```

KeyIdentifierSize

The size of the *KeyIdentifier* field in bytes. This field is limited to the range 0 to 255.

KeyIdentifier

Pointer to an array of *KeyIdentifierType* elements.

KeyFormat

An EFI_GUID which specifies the algorithm and key value size for this key.

KeyValue

Pointer to a key value for a key specified by the *KeyFormat* field. A **NULL** value for this field indicates that no key is available.

KeyStatus

Specifies the results of KMS operations performed with this descriptor. This field is used to indicate the status of individual operations when a KMS function is called with multiple *EFI_KMS_KEY_DESCRIPTOR* structures. KeyStatus codes returned for the individual key requests are:

Status Codes Returned

EFI_SUCCESS	Successfully processed this key.
EFI_WARN_STALE_DATA	Successfully processed this key, however, the key's parameters exceed internal policies/limits and should be replaced.
EFI_COMPROMISED_DATA	Successfully processed this key, but the key may have been compromised and must be replaced.
EFI_UNSUPPORTED	Key format is not supported by the service.
EFI_OUT_OF_RESOURCES	Could not allocate resources for the key processing.
EFI_TIMEOUT	Timed out waiting for device or key server.
EFI_DEVICE_ERROR	Device or key server error.

continues on next page

Table 37.10 – continued from previous page

EFI_INVALID_PARAMETER	*KeyFormat* is invalid.
EFI_NOT_FOUND	The key does not exist on the KMS.

```
#define EFI_KMS_ATTRIBUTE_TYPE_NONE          0x00
#define EFI_KMS_ATTRIBUTE_TYPE_INTEGER       0x01
#define EFI_KMS_ATTRIBUTE_TYPE_LONG_INTEGER  0x02
#define EFI_KMS_ATTRIBUTE_TYPE_BIG_INTEGER   0x03
#define EFI_KMS_ATTRIBUTE_TYPE_ENUMERATION   0x04
#define EFI_KMS_ATTRIBUTE_TYPE_BOOLEAN       0x05
#define EFI_KMS_ATTRIBUTE_TYPE_BYTE_STRING   0x06
#define EFI_KMS_ATTRIBUTE_TYPE_TEXT_STRING   0x07
#define EFI_KMS_ATTRIBUTE_TYPE_DATE_TIME     0x08
#define EFI_KMS_ATTRIBUTE_TYPE_INTERVAL      0x09
#define EFI_KMS_ATTRIBUTE_TYPE_STRUCTURE     0x0A
#define EFI_KMS_ATTRIBUTE_TYPE_DYNAMIC       0x0B

typedef struct {
  UINT32                                 FieldCount;
  EFI_KMS_DYNAMIC_FIELD                  Field[1];
}   EFI_KMS_DYNAMIC_ATTRIBUTE;
```

FieldCount
The number of members in the *EFI_KMS_DYNAMIC_ATTRIBUTE* structure.

Field
An array of *EFI_KMS_DYNAMIC_FIELD* structures.

```
typedef struct {
  UINT16         Tag;
  UINT16         Type;
  UINT32         Length;
  UINT8          KeyAttributeData[1];
}   EFI_KMS_DYNAMIC_FIELD;
```

Tag
Part of a tag-type-length triplet that identifies the *KeyAttributeData* formatting. The definition of the value is outside the scope of this standard and may be defined by the KMS.

Type
Part of a tag-type-length triplet that identifies the *KeyAttributeData* formatting. The definition of the value is outside the scope of this standard and may be defined by the KMS.

Length
Length in bytes of the *KeyAttributeData.*

KeyAttributeData
An array of bytes to hold the attribute data associated with the *KeyAttributeIdentifier.*

```
typedef struct {
  UINT8              KeyAttributeIdentifierType;
  UINT8              KeyAttributeIdentifierCount;
  VOID               *KeyAttributeIdentifier;
  UINT16             KeyAttributeInstance;
```

(continues on next page)

(continued from previous page)

```
  UINT16            KeyAttributeType;
  UINT16            KeyAttributeValueSize;
  VOID              *KeyAttributeValue;
  EFI_STATUS        KeyAttributeStatus;
} EFI_KMS_KEY_ATTRIBUTE;
```

KeyAttributeIdentifierType
The data type used for the *KeyAttributeIdentifier* field. Values for this field are defined by the *EFI_KMS_DATA_TYPE* constants, except that *EFI_KMS_DATA_TYPE_BINARY* is not valid for this field.

KeyAttributeIdentifierCount
The length of the *KeyAttributeIdentifier* field in units defined by *KeyAttributeIdentifierType* field. This field is limited to the range 0 to 255.

KeyAttributeIdentifier
Pointer to an array of *KeyAttributeIdentifierType* elements. For string types, there must not be a null-termination element at the end of the array.

KeyAttributeInstance
The instance number of this attribute. If there is only one instance, the value is set to one. If this value is set to 0xFFFF (all binary 1's) then this field should be ignored if an output or treated as a wild card matching any value if it is an input. If the attribute is stored with this field, it will match any attribute request regardless of the setting of the field in the request. If set to 0xFFFF in the request, it will match any attribute with the same *KeyAttributeIdentifier.*

KeyAttributeType
The data type of the *KeyAttributeValue* (e.g. struct, bool, etc.). See the list of *KeyAttributeType* definitions.

KeyAttributeValueSize
The size in bytes of the *KeyAttribute* field. A value of zero for this field indicates that no key attribute value is available.

KeyAttributeValue
Pointer to a key attribute value for the attribute specified by the *KeyAttributeIdentifier* field. If the *KeyAttributeValueSize* field is zero, then this field must be **NULL.**

KeyAttributeStatus
Specifies the results of KMS operations performed with this attribute. This field is used to indicate the status of individual operations when a KMS function is called with multiple *EFI_KMS_KEY_ATTRIBUTE* structures. KeyAttributeStatus codes returned for the individual key attribute requests are:

Status Codes Returned

EFI_SUCCESS	Successfully processed this request.
EFI_WARN_STALE_DATA	Successfully processed this request, however, the key's parameters exceed internal policies/limits and should be replaced.
EFI_COMPROMISED_DATA	Successfully processed this request, but the key may have been compromised and must be replaced.
EFI_UNSUPPORTED	Key attribute format is not supported by the service.
EFI_OUT_OF_RESOURCES	Could not allocate resources for the request processing.
EFI_TIMEOUT	Timed out waiting for device or key server.
EFI_DEVICE_ERROR	Device or key server error.
EFI_INVALID_PARAMETER	A field in the *EFI_KMS_KEY_ATTRIBUTE* structure is invalid.
EFI_NOT_FOUND	The key attribute does not exist on the KMS.

Description

The *EFI_KMS_SERVICE_PROTOCOL* defines a UEFI protocol that can be used by UEFI drivers and applications to access cryptographic keys associated with their operation that are stored and possibly managed by a remote key management service (KMS). For example, a storage device driver may require a set of one or more keys to enable access to regions on the storage devices that it manages.

The protocol can be used to request the generation of new keys from the KMS, to register locally generated keys with the KMS, to retrieve existing keys from the KMS, and to delete obsolete keys from the KMS. It also allows the device driver to manage attributes associated with individual keys on the KMS, and to retrieve keys based on those attributes.

A platform implementing this protocol may use internal or external key servers to provide the functionality required by this protocol. For external servers, the protocol implementation is expected to supply and maintain the connection parameters required to connect and authenticate to the remote server. The connection may be made during the initial installation of the protocol, or it may be delayed until the first *GetServiceStatus()* request is received.

Each client using the KMS protocol may identify itself to the protocol implementation using a *EFI_KMS_CLIENT_INFO* structure. If the KMS supported by this protocol requires the client to provide a client identifier, then this structure must be provided on all function calls.

While this protocol is intended to abstract the functions associated with storing and managing keys so that the protocol user does not have to be aware of the specific KMS providing the service, it can also be used by callers which must interact directly with a specific KMS. For these users, the protocol manages the connection to the KMS while the user controls the operational interface via a client data pass thru function.

The *EFI_KMS_SERVICE_PROTOCOL* provides the capability for the caller to pass arbitrary data to the KMS or to receive such data back from the KMS via parameters on most functions. The use of such data is at the discretion of the caller, but it should only be used sparingly as it reduces the interoperability of the caller's software.

37.3.2 EFI_KMS_PROTOCOL.GetServiceStatus()

Summary

Get the current status of the key management service.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_KMS_GET_SERVICE_STATUS) (
  IN EFI_KMS_PROTOCOL             *This
  );
```

Parameters

This

Pointer to the *EFI_KEY_MANAGEMENT_SERVICE_PROTOCOL* instance.

Description

The *GetServiceStatus()* function allows the user to query the current status of the KMS and should be called before attempting any operations to the KMS. If the protocol has not been marked as available, then the user must call this function to attempt to initiate the connection to the KMS as it may have been deferred to the first user by the system firmware.

If the connection to the KMS has not yet been established by the system firmware, then this function will attempt to establish the connection, update the protocol structure content as appropriate, and mark the service as available.

Status Codes Returned

EFI_SUCCESS	The KMS is ready for use.
EFI_NOT_READY	No connection to the KMS is available.
EFI_NO_MAPPING	No valid connection configuration exists for the KMS.
EFI_NO_RESPONSE	No response was received from the KMS.
EFI_DEVICE_ERROR	An error occurred when attempting to access the KMS.
EFI_INVALID_PARAMETER	*This* is **NULL**.

37.3.2.1 EFI_KMS_PROTOCOL.RegisterClient()

Summary

Register client information with the supported KMS.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_KMS_REGISTER_CLIENT) (
  IN    EFI_KMS_PROTOCOL            *This,
  IN    EFI_KMS_CLIENT_INFO         *Client,
  IN OUT UINTN                      *ClientDataSize OPTIONAL,
  IN OUT VOID                       **ClientData OPTIONAL
  );
```

Parameters

This

Pointer to the *EFI_KEY_MANAGEMENT_SERVICE_PROTOCOL* instance.

Client

Pointer to a valid *EFI_KMS_CLIENT_INFO* structure.

ClientDataSize

Pointer to the size, in bytes, of an arbitrary block of data specified by the *ClientData* parameter. This parameter may be **NULL**, in which case the *ClientData* parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not **NULL,** then *ClientData* must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values *ClientData* will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

ClientData

Pointer to a pointer to an arbitrary block of data of *ClientDataSize* that is to be passed directly to the KMS if it supports the use of client data. This parameter may be **NULL** if and only if the *ClientDataSize* parameter is also **NULL.** Upon return to the caller, *ClientData points to a block of data of* * *ClientDataSize* that was returned from the KMS. If the returned value for *ClientDataSize* is zero, then the returned value for *ClientData* must be **NULL** and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The *RegisterClient()* function registers client information with the KMS using a *EFI_KMS_CLIENT_INFO* structure.

There are two methods of handling client information. The caller may supply a client identifier in the *EFI_KMS_CLIENT_INFO* structure prior to making the call along with an optional name string. The client identifier will be passed on to the KMS if it supports client identifiers. If the KMS accepts the client id, then the

EFI_KMS_CLIENT_INFO structure will be returned to the caller unchanged. If the KMS does not accept the client id, it may simply reject the request, or it may supply an alternate identifier of its own,

The caller may also request a client identifier from the KMS by passing NULL values in the *EFI_KMS_CLIENT_INFO* structure. If the KMS supports this action, it will generate the identifier and return it in the structure. Otherwise, the implementation may generate a unique identifier, returning it in the structure, or it may indicate that the function is unsupported.

The *ClientDataSize* and *ClientData* parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional.

Status Codes Returned

EFI_SUCCESS	The client information has been accepted by the KMS.
EFI_NOT_READY	No connection to the KMS is available.
EFI_NO_RESPONSE	There was no response from the device or the key server.
EFI_ACCESS_DENIED	Access was denied by the device or the key server.
EFI_DEVICE_ERROR	An error occurred when attempting to access the KMS.
EFI_OUT_OF_RESOURCES	Required resources were not available to perform the function.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_UNSUPPORTED	The KMS does not support the use of client identifiers.

37.3.2.2 EFI_KMS_PROTOCOL.CreateKey()

Summary

Request that the KMS generate one or more new keys and associate them with key identifiers. The key value(s) is returned to the caller.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_KMS_CREATE_KEY) (
  IN   EFI_KMS_PROTOCOL             *This,
  IN   EFI_KMS_CLIENT_INFO          *Client,
  IN OUT UINT16                     *KeyDescriptorCount,
  IN OUT EFI_KMS_KEY_DESCRIPTOR     *KeyDescriptors,
  IN OUT UINTN                      *ClientDataSize OPTIONAL,
  IN OUT VOID                       **ClientData OPTIONAL
  );
```

Parameters

This
Pointer to this *EFI_KMS_PROTOCOL* instance.

Client
Pointer to a valid *EFI_KMS_CLIENT_INFO* structure.

KeyDescriptorCount
Pointer to a count of the number of key descriptors to be processed by this operation. On return, this number will be updated with the number of key descriptors successfully processed.

KeyDescriptors
Pointer to an array of *EFI_KMS_KEY_DESCRIPTOR* structures which describe the keys to be generated.

On input, the *KeyIdentifierSize* and the *KeyIdentifier* may specify an identifier to be used for the key, but this is not required. The *KeyFormat* field must specify a key format GUID reported as supported by the KeyFormats field of the *EFI_KMS_PROTOCOL*. The value for this field in the first key descriptor will be considered the default value for subsequent key descriptors requested in this operation if those key descriptors have a **NULL** GUID in the key format field.

On output, the *KeyIdentifierSize* and *KeyIdentifier* fields will specify an identifier for the key which will be either the original identifier if one was provided, or an identifier generated either by the KMS or the KMS protocol implementation. The *KeyFormat* field will be updated with the GUID used to generate the key if it was a **NULL** GUID, and the *KeyValue* field will contain a pointer to memory containing the key value for the generated key. Memory for both the *KeyIdentifier* and the *KeyValue* fields will be allocated with the *BOOT_SERVICES_DATA* type and must be freed by the caller when it is no longer needed. Also, the *KeyStatus* field must reflect the result of the request relative to that key.

ClientDataSize

Pointer to the size, in bytes, of an arbitrary block of data specified by the *ClientData* parameter. This parameter may be **NULL** in which case the *ClientData* parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not **NULL,** then *ClientData* must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values *ClientData* will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

ClientData

Pointer to a pointer to an arbitrary block of data of * *ClientDataSize* that is to be passed directly to the KMS if it supports the use of client data. This parameter may be **NULL** if and only if the *ClientDataSize* parameter is also **NULL.** Upon return to the caller, * *ClientData* points to a block of data of * *ClientDataSize* that was returned from the KMS. If the returned value for * *ClientDataSize* is zero, then the returned value for * *ClientData* must be **NULL** and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The *CreateKey()* method requests the generation of one or more new keys, and key identifier and key values are returned to the caller. The support of this function is optional as some key servers do not provide a key generation capability.

The *Client* parameter identifies the caller to the key management service. This identifier may be used for auditing or access control. This parameter is optional unless the KMS requires a client identifier in order to perform the requested action.

The *KeyDescriptorCount* and *KeyDescriptors* parameters are used to specify the key algorithm, size, and attributes for the requested keys. Any number of keys may be requested in a single operation, regardless of whether the KMS supports multiple key definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS.

The *ClientDataSize* and *ClientData* parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional.

Status Codes Returned

The *CreateKey()* function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key requests.

EFI_SUCCESS	Successfully generated and retrieved all requested keys.

continues on next page

Table 37.14 – continued from previous page

EFI_UNSUPPORTED	This function is not supported by the KMS. –OR– One (or more) of the key requests submitted is not supported by the KMS. Check individual key request(s) to see which ones may have been processed.
EFI_OUT_OF_RESOURCES	Required resources were not available for the operation.
EFI_TIMEOUT	Timed out waiting for device or key server. Check individual key request(s) to see which ones may have been processed.
EFI_ACCESS_DENIED	Access was denied by the device or the key server; OR a *ClientId* is required by the server and either no id was provided or an invalid id was provided
EFI_DEVICE_ERROR	An error occurred when attempting to access the KMS. Check individual key request(s) to see which ones may have been processed.
EFI_INVALID_PARAMETER	*This* is **NULL,** *ClientId* is required but it is **NULL** , *KeyDescriptorCount* is **NULL,** or *Keys* is **NULL**
EFI_NOT_FOUND	One or more *EFI_KMS_KEY_DESCRIPTOR* structures could not be processed properly. *KeyDescriptorCount* contains the number of structures which were successfully processed. Individual structures will reflect the status of the processing for that structure.

37.3.2.3 EFI_KMS_PROTOCOL.GetKey()

Summary

Retrieve an existing key.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_KMS_GET_KEY) (
  IN   EFI_KMS_PROTOCOL            *This,
  IN   EFI_KMS_CLIENT_INFO         *Client,
  IN OUT UINT16                    *KeyDescriptorCount,
  IN OUT EFI_KMS_KEY_DESCRIPTOR    *KeyDescriptors,
  IN OUT UINTN                     *ClientDataSize OPTIONAL,
  IN OUT VOID                      **ClientData OPTIONAL
  );
```

Parameters

This

Pointer to this *EFI_KMS_PROTOCOL* instance.

Client

Pointer to a valid *EFI_KMS_CLIENT_INFO* structure.

KeyDescriptorCount

Pointer to a count of the number of keys to be processed by this operation. On return, this number will be updated with number of keys successfully processed.

KeyDescriptors

Pointer to an array of *EFI_KMS_KEY_DESCRIPTOR* structures which describe the keys to be retrieved from the KMS. On input, the *KeyIdentifierSize* and the *KeyIdentifier* must specify an identifier to be used to retrieve a specific key. All other fields in the descriptor should be *NULL* . On output, the *KeyIdentifierSize* and *KeyIdentifier* fields will be unchanged, while the *KeyFormat* and *KeyValue* fields will be updated values associated with this key identifier. Memory for the *KeyValue* field will be allocated with the *BOOT_SERVICES_DATA* type and must be freed by the caller when it is no longer needed. Also, the *KeyStatus* field will reflect the result of the request relative to the individual key descriptor.

ClientDataSize

Pointer to the size, in bytes, of an arbitrary block of data specified by the *ClientData* parameter. This parameter may be **NULL** in which case the *ClientData* parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not **NULL,** then *ClientData* must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values **ClientData* will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

ClientData

Pointer to a pointer to an arbitrary block of data of * *ClientDataSize* that is to be passed directly to the KMS if it supports the use of client data. This parameter may be **NULL** if and only if the *ClientDataSize* parameter is also **NULL.** Upon return to the caller, * *ClientData* points to a block of data of * *ClientDataSize* that was returned from the KMS. If the returned value for **ClientDataSize* is zero, then the returned value for **ClientData* must be **NULL** and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The *GetKey()* function retrieves one or more existing keys from the KMS and returns the key values to the caller. This function must be supported by every KMS protocol instance.

The *Client* parameter identifies the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The *KeyDescriptorCount* and *KeyDescriptors* parameters are used to specify the identifier(s) to be used to retrieve the key values, which will be returned in the *KeyFormat* and *KeyValue* fields of each *EFI_KMS_KEY_DESCRIPTOR* structure. Any number of keys may be requested in a single operation, regardless of whether the KMS supports multiple key definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS.

The *ClientDataSize* and *ClientData* parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional.

Status Codes Returned

The *GetKey()* function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key requests.

EFI_SUCCESS	Successfully retrieved all requested keys.
EFI_OUT_OF_RESOURCES	Could not allocate resources for the method processing.
EFI_TIMEOUT	Timed out waiting for device or key server. Check individual key request(s) to see which ones may have been processed.
EFI_BUFFER_TOO_SMALL	If multiple keys are associated with a single identifier, and the *KeyValue* buffer does not contain enough structures (*KeyDescriptorCount*) to contain all the key data, then the available structures will be filled and *KeyDescriptorCount* will be updated to indicate the number of keys which could not be processed.
EFI_ACCESS_DENIED	Access was denied by the device or the key server; OR a *ClientId* is required by the server and either none or an invalid id was provided
EFI_DEVICE_ERROR	Device or key server error. Check individual key request(s) to see which ones may have been processed.

continues on next page

Table 37.15 – continued from previous page

EFI_INVALID_PARAMETER	*This* is **NULL,** *ClientId* is required but it is **NULL** , *KeyDescriptorCount* is **NULL,** or *Keys* is **NULL**
EFI_NOT_FOUND	One or more *EFI_KMS_KEY_DESCRIPTOR* structures could not be processed properly. *KeyDescriptorCount* contains the number of structures which were successfully processed. Individual structures will reflect the status of the processing for that structure.
EFI_UNSUPPORTED	The implementation/KMS does not support this function

37.3.2.4 EFI_KMS_PROTOCOL.AddKey()

Summary

Add a new key.

Prototype

```
typedef
  EFI_STATUS
  (EFIAPI *EFI_KMS_ADD_KEY) (
    IN    EFI_KMS_PROTOCOL              *This,
    IN    EFI_KMS_CLIENT_INFO           *Client,
    IN OUT UINT16                       *KeyDescriptorCount,
    IN OUT EFI_KMS_KEY_DESCRIPTOR       *KeyDescriptors,
    IN OUT UINTN                        *ClientDataSize OPTIONAL,
    IN OUT VOID                         **ClientData OPTIONAL
    );
```

Parameters

This

Pointer to this *EFI_KMS_PROTOCOL* instance.

Client

Pointer to a valid *EFI_KMS_CLIENT_INFO* structure.

KeyDescriptorCount

Pointer to a count of the number of keys to be processed by this operation. On normal returns, this number will be updated with number of keys successfully processed.

KeyDescriptors

Pointer to an array of *EFI_KMS_KEY_DESCRIPTOR* structures which describe the keys to be added. On input, the *KeyId* field for first key must contain valid identifier data to be used for adding a key to the KMS. The values for these fields in this key definition will be considered default values for subsequent keys requested in this operation. A value of 0 in any subsequent *KeyId* field will be replaced with the current default value. The *KeyFormat* and *KeyValue* fields for each key to be added must contain consistent values to be associated with the given *KeyId.* On return, the *KeyStatus* field will reflect the result of the operation for each key request.

ClientDataSize

Pointer to the size, in bytes, of an arbitrary block of data specified by the *ClientData* parameter. This parameter may be **NULL**, in which case the *ClientData* parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not **NULL,** then *ClientData* must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values **ClientData* will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

ClientData

Pointer to a pointer to an arbitrary block of data of **ClientDataSize* that is to be passed directly to the KMS if it supports the use of client data. This parameter may be **NULL** if and only if the *ClientDataSize* parameter is also **NULL.** Upon return to the caller, **ClientData* points to a block of data of **ClientDataSize* that was returned from the KMS. If the returned value for **ClientDataSize* is zero, then the returned value for **ClientData* must be **NULL** and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The *AddKey()* function registers a new key with the key management service. The support for this method is optional, as not all key servers support importing keys from clients.

The *Client* parameter identifies the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The *KeyDescriptorCount* and *KeyDescriptors* parameters are used to specify the key identifier, key format and key data to be registered on the. Any number of keys may be registered in a single operation, regardless of whether the KMS supports multiple key definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS.

The *ClientDataSize* and *ClientData* parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional.

Status Codes Returned

The *AddKey()* function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key requests.

EFI_SUCCESS	Successfully added all requested keys.
EFI_OUT_OF_RESOURCES	Could not allocate required resources.
EFI_TIMEOUT	Timed out waiting for device or key server. Check individual key request(s) to see which ones may have been processed.
EFI_BUFFER_TOO_SMALL	If multiple keys are associated with a single identifier, and the *KeyValue* buffer does not contain enough structures (*KeyDescriptorCount*) to contain all the key data, then the available structures will be filled and *KeyDescriptorCount* will be updated to indicate the number of keys which could not be processed.
EFI_ACCESS_DENIED	Access was denied by the device or the key server; OR a *ClientId* is required by the server and either none or an invalid id was provided
EFI_DEVICE_ERROR	Device or key server error. Check individual key request(s) to see which ones may have been processed.
EFI_INVALID_PARAMETER	*This* is **NULL,** *ClientId* is required but it is **NULL** ,*KeyDescriptorCount* is **NULL,** or *Keys* is **NULL**
EFI_NOT_FOUND	One or more *EFI_KMS_KEY_DESCRIPTOR* structures could not be processed properly. *KeyDescriptorCount* contains the number of structures which were successfully processed. Individual structures will reflect the status of the processing for that structure.
EFI_UNSUPPORTED	The implementation/KMS does not support this function

---

37.3.2.5 EFI_KMS_PROTOCOL.DeleteKey()

Summary

Delete an existing key from the KMS database.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_KMS_DELETE_KEY) (
  IN    EFI_KMS_PROTOCOL                  *This,
  IN EFI_KMS_CLIENT_INFO                  *Client,
  IN OUT UINT16                           *KeyDescriptorCount,
  IN OUT EFI_KMS_KEY_DESCRIPTOR           *KeyDescriptors,
  IN OUT UINTN                            *ClientDataSize OPTIONAL,
  IN OUT VOID                             **ClientData OPTIONAL
  );
```

Parameters

This
Pointer to this *EFI_KMS_PROTOCOL* instance.

Client
Pointer to a valid *EFI_KMS_CLIENT_INFO* structure.

KeyDescriptorCount
Pointer to a count of the number of keys to be processed by this operation. On normal returns, this number will be updated with number of keys successfully processed.

KeyDescriptors
Pointer to an array of *EFI_KMS_KEY_DESCRIPTOR* structures which describe the keys to be deleted. On input, the KeyId field for first key must contain valid identifier data to be used for adding a key to the KMS. The values for these fields in this key definition will be considered default values for subsequent keys requested in this operation. A value of 0 in any subsequent *KeyId* field will be replaced with the current default value. The *KeyFormat* and *KeyValue* fields are ignored, but should be 0. On return, the *KeyStatus* field will reflect the result of the operation for each key request.

ClientDataSize
Pointer to the size, in bytes, of an arbitrary block of data specified by the *ClientData* parameter. This parameter may be **NULL**, in which case the *ClientData* parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not **NULL,** then *ClientData* must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values **ClientData* will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

ClientData
Pointer to a pointer to an arbitrary block of data of **ClientDataSize* that is to be passed directly to the KMS if it supports the use of client data. This parameter may be **NULL** if and only if the *ClientDataSize* parameter is also **NULL.** Upon return to the caller, **ClientData* points to a block of data of **ClientDataSize* that was returned from the KMS. If the returned value for **ClientDataSize* is zero, then the returned value for **ClientData* must be **NULL** and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The *DeleteKey()* function deregisters an existing key from the device or KMS. The support for this method is optional, as not all key servers support deleting keys from clients.

The *Client* parameter identifies the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The *KeyDescriptorCount* and *KeyDescriptors* parameters are used to specify the key identifier(s) for the keys to be deleted. Any number of keys may be deleted in a single operation, regardless of whether the KMS supports multiple key definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS.

The *ClientDataSize* and *ClientData* parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional.

Status Codes Returned

The *DeleteKey()* function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key requests.

EFI_SUCCESS	Successfully deleted all requested keys.
EFI_OUT_OF_RESOURCES	Could not allocate required resources.
EFI_TIMEOUT	Timed out waiting for device or key server. Check individual key request(s) to see which ones may have been processed.
EFI_ACCESS_DENIED	Access was denied by the device or the key server; OR a *ClientId* is required by the server and either none or an invalid id was provided
EFI_DEVICE_ERROR	Device or key server error. Check individual key request(s) to see which ones may have been processed.
EFI_INVALID_PARAMETER	*This* is **NULL,** *ClientId* is required but it is **NULL**, *KeyDescriptorCount* is **NULL**, or *Keys* is **NULL**
EFI_NOT_FOUND	One or more *EFI_KMS_KEY_DESCRIPTOR* structures could not be processed properly. *KeyDescriptorCount* contains the number of structures which were successfully processed. Individual structures will reflect the status of the processing for that structure.
EFI_UNSUPPORTED	The implementation/KMS does not support this function

37.3.2.6 EFI_KMS_PROTOCOL.GetKeyAttributes()

Summary

Get one or more attributes associated with a specified key identifier. If none are found, the returned attributes count contains a value of zero.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_KMS_GET_KEY_ATTRIBUTES) (
  IN  EFI_KMS_PROTOCOL                *This,
  IN  EFI_KMS_CLIENT_INFO             *Client,
  IN  UINT8                           *KeyIdentifierSize,
  IN  CONST VOID                      *KeyIdentifier,
  IN OUT UINT16                       *KeyAttributesCount,
  IN OUT EFI_KMS_KEY_ATTRIBUTE        *KeyAttributes,
```

(continues on next page)

(continued from previous page)

```
  IN OUT UINTN                      *ClientDataSize OPTIONAL,
  IN OUT VOID                       **ClientData OPTIONAL
  );
```

Parameters

This
Pointer to this *EFI_KMS_PROTOCOL* instance.

Client
Pointer to a valid *EFI_KMS_CLIENT_INFO* structure.

KeyIdentifierSize
Pointer to the size in bytes of the *KeyIdentifier* variable.

KeyIdentifier
Pointer to the key identifier associated with this key.

KeyAttributesCount
Pointer to the number of *EFI_KMS_KEY_ATTRIBUTE* structures associated with the Key identifier. If none are found, the count value is zero on return. On input this value reflects the number of *KeyAttributes* that may be returned. On output, the value reflects the number of completed *KeyAttributes* structures found.

KeyAttributes
Pointer to an array of *EFI_KMS_KEY_ATTRIBUTE* structures associated with the Key Identifier. On input, the fields in the structure should be **NULL**. On output, the attribute fields will have updated values for attributes associated with this key identifier.

ClientDataSize
Pointer to the size, in bytes, of an arbitrary block of data specified by the *ClientData* parameter. This parameter may be **NULL**, in which case the *ClientData* parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not **NULL,** then *ClientData* must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values * *ClientData* will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

ClientData
Pointer to a pointer to an arbitrary block of data of * *ClientDataSize* that is to be passed directly to the KMS if it supports the use of client data. This parameter may be **NULL** if and only if the *ClientDataSize* parameter is also **NULL.** Upon return to the caller, * *ClientData* points to a block of data of * *ClientDataSize* that was returned from the KMS. If the returned value for * *ClientDataSize* is zero, then the returned value for * *ClientData* must be **NULL** and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The *GetKeyAttributes()* function returns one or more attributes for a key.

The *ClientIdentifierSize* and *ClientIdentifier* parameters identify the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The *KeyIdentifierSize* and *KeyIdentifier* parameters identify the key whose attributes are to be returned by the key management service. They may be used to retrieve additional information about a key, whose format is defined by the KeyAttribute. Attributes returned may be of the same or different names.

The *ClientDataSize* and *ClientData* parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional unless the KMS requires it in order to perform the requested action.

Status Codes Returned

The *GetKeyAttributes()* function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key attribute requests.

EFI_SUCCESS	Successfully retrieved all key attributes.
EFI_OUT_OF_RESOURCES	Could not allocate resources for the method processing.
EFI_TIMEOUT	Timed out waiting for device or key server. Check individual key attribute request(s) to see which ones may have been processed.
EFI_BUFFER_TOO_SMALL	If multiple key attributes are associated with a single identifier, and the *KeyAttributes* buffer does not contain enough structures (*KeyAttributesCount*) to contain all the key attributes data, then the available structures will be filled and *KeyAttributesCount* will be updated to indicate the number of key attributes which could not be processed.
EFI_ACCESS_DENIED	Access was denied by the device or the key server; OR a *ClientId* is required by the server and either none or an invalid id was provided
EFI_DEVICE_ERROR	Device or key server error. Check individual key attribute request(s) (i.e., key attribute status for each) to see which ones may have been processed.
EFI_INVALID_PARAMETER	This is **NULL,** *ClientId* is required but it is **NULL,** *KeyIdentifierSize* is **NULL,** or *KeyIdentifier* is **NULL,** or *KeyAttributes* is **NULL,** or *KeyAttributesSize* is **NULL.**
EFI_NOT_FOUND	The *KeyIdentifier* could not be found. *KeyAttributesCount* contains zero. Individual structures will reflect the status of the processing for that structure.
EFI_UNSUPPORTED	The implementation/KMS does not support this function

37.3.2.7 EFI_KMS_PROTOCOL.AddKeyAttributes()

Summary

Add one or more attributes to a key specified by a key identifier.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_KMS_ADD_KEY_ATTRIBUTES) (
  IN   EFI_KMS_PROTOCOL                  *This,
  IN   EFI_KMS_CLIENT_INFO               *Client,
  IN   UINT                              *KeyIdentifierSize,
  IN   CONST VOID                        *KeyIdentifier,
  IN OUT UINT16                          *KeyAttributesCount,
  IN OUT EFI_KMS_KEY_ATTRIBUTE           *KeyAttributes,
  IN OUT UINTN                           *ClientDataSize OPTIONAL,
  IN OUT VOID                            **ClientData OPTIONAL
  );
```

Parameters

This
Pointer to this *EFI_KMS_PROTOCOL* instance.

Client
Pointer to a valid *EFI_KMS_CLIENT_INFO* structure.

KeyIdentifierSize
Pointer to the size in bytes of the *KeyIdentifier* variable.

KeyIdentifier
Pointer to the key identifier associated with this key.

KeyAttributesCount
Pointer to the number of *EFI_KMS_KEY_ATTRIBUTE* structures to associate with the Key. On normal returns, this number will be updated with the number of key attributes successfully processed.

KeyAttributes
Pointer to an array of *EFI_KMS_KEY_ATTRIBUTE* structures providing the attribute information to associate with the key. On input, the values for the fields in the structure are completely filled in. On return the *KeyAttributeStatus* field will reflect the result of the operation for each key attribute request.

ClientDataSize
Pointer to the size, in bytes, of an arbitrary block of data specified by the *ClientData* parameter. This parameter may be **NULL**, in which case the *ClientData* parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not **NULL,** then *ClientData* must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values * *ClientData* will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

ClientData
Pointer to a pointer to an arbitrary block of data of * *ClientDataSize* that is to be passed directly to the KMS if it supports the use of client data. This parameter may be **NULL** if and only if the *ClientDataSize* parameter is also **NULL.** Upon return to the caller, * *ClientData* points to a block of data of * *ClientDataSize* that was returned from the KMS. If the returned value for * *ClientDataSize* is zero, then the returned value for * *ClientData* must be **NULL** and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The *AddKeyAttributes()* function adds one or more key attributes. If this function is not supported by a KMS protocol instance then it is assumed that there is an alternative means available for attribute management in the KMS.

The *Client* parameters identify the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The *KeyIdentifierSize* and *KeyIdentifier* parameters identify the key whose attributes are to be modified by the key management service

The *KeyAttributesCount* and *KeyAttributes* parameters are used to specify the key attributes data to be registered on the KMS. Any number of attributes may be registered in a single operation, regardless of whether the KMS supports multiple key attribute definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS. In certain error situations, the status of each attribute is updated indicating if that attribute was successfully registered or not.

The *ClientDataSize* and *ClientData* parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional unless the KMS requires it in order to perform the requested action.

Status Codes Returned

The *AddKeyAttributes()* function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key attribute requests. Status codes returned for *AddKeyAttributes()* are:

EFI_SUCCESS	Successfully added all requested key attributes.
EFI_OUT_OF_RESOURCES	Could not allocate required resources.
EFI_TIMEOUT	Timed out waiting for device or key server. Check individual key attribute request(s) to see which ones may have been processed.
EFI_BUFFER_TOO_SMALL	If multiple keys attributes are associated with a single key identifier, and the *attributes* buffer does not contain enough structures (*KeyAttributesCount*) to contain all the data, then the available structures will be filled and *KeyAttributesCount* will be updated to indicate the number of key attributes which could not be processed. The status of each key attribute is also updated indicating success or failure for that attribute in case there are other errors for those attributes that could be processed.
EFI_ACCESS_DENIED	Access was denied by the device or the key server; OR a *ClientId* is required by the server and either none or an invalid id was provided
EFI_DEVICE_ERROR	Device or key server error. Check individual key attribute request(s) (i.e., key attribute status for each) to see which ones may have been processed.
EFI_INVALID_PARAMETER	This is **NULL,** *ClientId* is required but it is **NULL,** *KeyAttributesCount* is **NULL,** or *KeyAttributes* is **NULL,** or *KeyIdentifierSize* is **NULL,** or *KeyIdentifer* is **NULL.**
EFI_NOT_FOUND	The *KeyIdentifier* could not be found. On return the *KeyAttributesCount* contains the number of attributes processed. Individual structures will reflect the status of the processing for that structure.
EFI_UNSUPPORTED	The implementation/KMS does not support this function

37.3.2.8 EFI_KMS_PROTOCOL.DeleteKeyAttributes()

Summary

Delete attributes to a key specified by a key identifier.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_KMS_DELETE_KEY_ATTRIBUTES) (
  IN   EFI_KMS_PROTOCOL               *This,
  IN   EFI_KMS_CLIENT_INFO            *Client,
  IN   UINT8                          *KeyIdentifierSize,
  IN   CONST VOID                     *KeyIdentifier,
  IN OUT UINT16                       *KeyAttributesCount,
  IN OUT EFI_KMS_KEY_ATTRIBUTE        *KeyAttributes,
  IN OUT UINTN                        *ClientDataSize OPTIONAL,
  IN OUT VOI                          **ClientData OPTIONAL
  );
```

Parameters

This

Pointer to this *EFI_KMS_PROTOCOL* instance.

Client

Pointer to a valid *EFI_KMS_CLIENT_INFO* structure.

KeyIdentifierSize

Pointer to the size in bytes of the *KeyIdentifier* variable.

KeyIdentifier

Pointer to the key identifier associated with this key.

KeyAttributesCount

Pointer to the number of *EFI_KMS_KEY_ATTRIBUTE* structures associated with the Key. On input, the count value is one or more. On normal returns, this number will be updated with the number of key attributes successfully processed.

KeyAttributes

Pointer to an array of *EFI_KMS_KEY_ATTRIBUTE* structures associated with the key. On input, the values for the fields in the structure are completely filled in. On return the* *KeyAttributeStatus* field will reflect the result of the operation for each key attribute request.

ClientDataSize

Pointer to the size, in bytes, of an arbitrary block of data specified by the *ClientData* parameter. This parameter may be **NULL**, in which case the *ClientData* parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not **NULL,** then *ClientData* must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values * *ClientData* will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

ClientData

Pointer to a pointer to an arbitrary block of data of * *ClientDataSize* that is to be passed directly to the KMS if it supports the use of client data. This parameter may be **NULL** if and only if the *ClientDataSize* parameter is also **NULL.** Upon return to the caller, * *ClientData* points to a block of data of * *ClientDataSize* that was returned from the KMS. If the returned value for *ClientDataSize is zero, then the returned value for * *ClientData* must be **NULL** and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The *DeleteKeyAttributes()* function removes key attributes for a key with the key management service.

The *Client* parameter identifies the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The *KeyIdentifierSize* and *KeyIdentifier* parameters identify the key whose attributes are to be modified by the key management service

The *KeyAttributesCount* and *KeyAttributes* parameters are used to specify the key attributes data to be deleted on the KMS. Any number of attributes may be deleted in a single operation, regardless of whether the KMS supports multiple key attribute definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS. In certain error situations, the status of each attribute is updated indicating if that attribute was successfully deleted or not.

The *KeyAttributesCount* and *KeyAttributes* parameters are used to specify the key attributes data to be deleted on the KMS. Any number of attributes may be deleted in a single operation, regardless of whether the KMS supports multiple key attribute definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS. In certain error situations, the status of each attribute is updated indicating if that attribute was successfully deleted or not.

The *ClientDataSize* and *ClientData* parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional unless the KMS requires it in order to perform the requested action.

Status Codes Returned

The DeleteKeyAttributes() function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key attribute requests. Status codes returned for the method are:

EFI_SUCCESS	Successfully deleted all requested key attributes.
EFI_OUT_OF_RESOURCES	Could not allocate required resources.
EFI_TIMEOUT	Timed out waiting for device or key server. Check individual key attribute request(s) to see which ones may have been processed.
EFI_ACCESS_DENIED	Access was denied by the device or the key server; OR a *ClientId* is required by the server and either none or an invalid id was provided
EFI_DEVICE_ERROR	Device or key server error. Check individual key attribute request(s) (i.e., key attribute status for each) to see which ones may have been processed.
EFI_INVALID_PARAMETER	*This* is **NULL,** *ClientId* is required but it is **NULL** , *KeyAttributesCount* is **NULL,** or *KeyAttributes* is **NULL,** or *KeyIdentifierSize* is **NULL**, or *KeyIdentifer* is **NULL**.
EFI_NOT_FOUND	The *KeyIdentifier* could not be found or the attribute could not be found. On return the *KeyAttributesCount* contains the number of attributes processed. Individual structures will reflect the status of the processing for that structure.
EFI_UNSUPPORTED	The implementation/KMS does not support this function

37.3.2.9 EFI_KMS_PROTOCOL.GetKeyByAttributes()

Summary

Retrieve one or more key that has matched all of the specified key attributes.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_KMS_GET_KEY_BY_ATTRIBUTES) (
  IN   EFI_KMS_PROTOCOL                 *This,
  IN   EFI_KMS_CLIENT_INFO              *Client,
  IN   UINTN                            *KeyAttributeCount,
  IN OUT EFI_KMS_KEY_ATTRIBUTE          *KeyAttributes,
  IN OUT UINTN                          *KeyDescriptorCount,
  IN OUT EFI_KMS_KEY_DESCRIPTOR         *KeyDescriptors,
  IN OUT UINTN                          *ClientDataSize OPTIONAL,
  IN OUT VOID                           **ClientData OPTIONAL
  );
```

Parameters

This

Pointer to this *EFI_KMS_PROTOCOL* instance.

Client

Pointer to a valid *EFI_KMS_CLIENT_INFO* structure.

KeyAttributeCount
Pointer to a count of the number of key attribute structures that must be matched for each returned key descriptor. On input the count value is one or more. On normal returns, this number will be updated with the number of key attributes successfully processed.

KeyAttributes
Pointer to an array of *EFI_KMS_KEY_ATTRIBUTE* structure to search for. On input, the values for the fields in the structure are completely filled in. On return the KeyAttributeStatus field will reflect the result of the operation for each key attribute request.

KeyDescriptorCount
Pointer to a count of the number of key descriptors matched by this operation. On entry, this number will be zero. On return, this number will be updated to the number of key descriptors successfully found.

KeyDescriptors
Pointer to an array of *EFI_KMS_KEY_DESCRIPTOR* structures which describe the keys from the KMS having the *KeyAttribute(s)* specified. On input, this pointer will be **NULL**. On output, the array will contain an *EFI_KMS_KEY_DESCRIPTOR* structure for each key meeting the search criteria. Memory for the array and all *KeyValue* fields will be allocated with the *EfiBootServicesData* type and must be freed by the caller when it is no longer needed. Also, the *KeyStatus* field of each descriptor will reflect the result of the request relative to that key descriptor.

ClientDataSize
Pointer to the size, in bytes, of an arbitrary block of data specified by the *ClientData* parameter. This parameter may be **NULL**, in which case the *ClientData* parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not **NULL,** then *ClientData* must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values **ClientData* will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

ClientData
Pointer to a pointer to an arbitrary block of data of **ClientDataSize* that is to be passed directly to the KMS if it supports the use of client data. This parameter may be **NULL** if and only if the *ClientDataSize* parameter is also **NULL.** Upon return to the caller, **ClientData* points to a block of data of **ClientDataSize* that was returned from the KMS. If the returned value for **ClientDataSize* is zero, then the returned value for **ClientData* must be **NULL** and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The *GetKeyByAttributes()* function returns the keys found by searches for matching key attribute(s). This function must be supported by every KMS protocol instance that supports the use of key attributes as indicated in the protocol's *KeyAttributesSupported* field.

The *Client* parameter identifies the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The *KeyAttributesCount* and *KeyAttributes* parameters are used to specify the key attributes data to be searched for on the KMS. Any number of attributes may be searched for in a single operation, regardless of whether the KMS supports multiple key attribute definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS. In certain error situations, the status of each attribute is updated indicating if that attribute was successfully found or not. If an attribute specifies a wildcard *KeyAttributeInstance* value, then the provider returns all instances of the attribute.

The *KeyDescriptorCount* and *KeyDescriptors* parameters are used to return the *EFI_KMS_KEY_DESCRIPTOR* structures for keys meeting the search criteria. Any number of keys may be returned in a single operation, regardless of whether the KMS supports multiple key definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS.

The *ClientDataSize* and *ClientData* parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional unless the KMS requires it in order to perform the requested action.

Status Codes Returned

The *GetKeyByAttributes()* function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual keys.

EFI_SUCCESS	Successfully retrieved all requested keys.
EFI_OUT_OF_RESOURCES	Could not allocate required resources.
EFI_TIMEOUT	Timed out waiting for device or key server. Check individual key attribute request(s) to see which ones may have been processed.
EFI_BUFFER_TOO_SMALL	If multiple keys are associated with the attribute(s), and the *KeyValue* buffer does not contain enough structures (*KeyDescriptorCount*) to contain all the key data, then the available structures will be filled and *KeyDescriptorCount* will be updated to indicate the number of keys which could not be processed.
EFI_ACCESS_DENIED	Access was denied by the device or the key server; OR a *ClientId* is required by the server and either none or an invalid id was provided
EFI_DEVICE_ERROR	Device or key server error. Check individual key attribute request(s) (i.e., key attribute status for each) to see which ones may have been processed.
EFI_INVALID_PARAMETER	*This* is NULL, *ClientId* is required but it is NULL , *KeyDescriptorCount* is NULL, or *KeyDescriptors* is NULL or *KeyAttributes* is NULL, or *KeyAttributesCount* is NULL .
EFI_NOT_FOUND	One or more *EFI_KMS_KEY_ATTRIBUTE* structures could not be processed properly. *KeyAttributeCount* contains the number of structures which were successfully processed. Individual structures will reflect the status of the processing for that structure.
EFI_UNSUPPORTED	The implementation/KMS does not support this function

37.4 PKCS7 Verify Protocol

37.4.1 EFI_PKCS7_VERIFY_PROTOCOL

Summary

EFI_PKCS7_VERIFY_PROTOCOL (See: http://tools.ietf.org/html/rfc2315) may be used to verify data signed with PKCS#7 formatted authentication. The PKCS#7 data to be verified must be binary DER encoded. Additional information on the supported ASN.1 formatting is provided below.

Drivers that supply PKCS7 verification function should publish the | *EFI_PKCS7_VERIFY_PROTOCOL.* Drivers wishing to use the | *EFI_PKCS7_VERIFY_PROTOCOL* may get a reference with *LocateProtocol().*

GUID

```
#define EFI_PKCS7_VERIFY_PROTOCOL_GUID \
  { 0x47889fb2, 0xd671, 0x4fab,\
    { 0xa0, 0xca, 0xdf, 0xe, 0x44,\ 0xdf, 0x70, 0xd6 }}
```

Protocol Interface Structure

```
typedef struct _EFI_PKCS7_VERIFY_PROTOCOL {
  EFI_PKCS7_VERIFY_BUFFER           *VerifyBuffer;
  EFI_PKCS7_VERIFY_SIGNATURE        *VerifySignature;
} EFI_PKCS7_VERIFY_PROTOCOL;
```

Parameters

VerifyBuffer

Examine a DER-encoded PKCS7-signed memory buffer with signature containing embedded data content, or buffer with detached signature and separate data content buffer, and verify using supplied signature lists.

VerifySignature

Examine a DER-encoded PKCS7-signed memory buffer with signature and, using caller-supplied hash value for signed data, verify using supplied signature lists.

Description

The *EFI_PKCS7_VERIFY_PROTOCOL* is used to verify data signed using PKCS7 structure. PKCS7 is a general-purpose cryptographic standard (see references). The PKCS7 data to be verified must be ASN.1 (DER) encoded. Implementation must support SHA256 as digest algorithm with RSA digest encryption. Support of other hash algorithms is optional. See the Table below.

Table 37.22: Details of Supported Signature Format

Signature Buffer Format Details	
Encoding	**Binary DER**
ASN.1 root of Embedded Signed Data	ContentInfo with *SignedData* content type
ASN.1 root of Detached Signature	*SignedData* or ContentInfo with *SignedData* content type
Embedded Data Type	Typically ‘Data’ (1.2.840.113549.1.7.1) or other defined OID type (however caller should not depend upon specialized OID processing during PKCS validation.)
Digest (Hash) Algorithm (*VerifyBuffer* function)	Support of SHA-256 (2.16.840.1.101.3.4.2.1) is required, other algorithms are optional
Digest Encryption	RSA (1.2.840.113549.1.1.1)
Certificate validity dates	See *TimeStampDb* description
Signature authenticatedAttributes	Ignored by function
Timestamping	See TimeStampDb description

References

PKCS7 is defined by RFC2315. For more information see “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “RFC2315 (defines PKCS7)”.

37.4.2 EFI_PKCS7_VERIFY_PROTOCOL.VerifyBuffer()

Summary

This function processes a buffer containing binary DER-encoded PKCS7 signature. The signed data content may be embedded within the buffer or separated. Function verifies the signature of the content is valid and signing certificate was not revoked and is contained within a list of trusted signers.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *VerifyBuffer)(
  IN EFI_PKCS7_VERIFY_PROTOCOL         *This,
  IN VOID                              *SignedData,
  IN UINTN                             SignedDataSize,
  IN VOID                              *InData OPTIONAL,
  IN UINTN                             InDataSize
  IN EFI_SIGNATURE_LIST                **AllowedDb,
  IN EFI_SIGNATURE_LIST                **RevokedDb OPTIONAL,
  IN EFI_SIGNATURE_LIST                **TimeStampDb OPTIONAL,
  OUT VOID                             *Content OPTIONAL,
  IN OUT UINTN                         *ContentSize
  );
```

Parameters

This
Pointer to *EFI_PKCS7_VERIFY_PROTOCOL* instance.

SignedData
Points to buffer containing ASN.1 DER-encoded PKCS signature.

SignedDataSize
The size of *SignedData* buffer in bytes.

InData
In case of detached signature, *Indata* points to buffer containing the raw message data previously signed and to be verified by function. In case of *SignedData* containing embedded data, *InData* must be **NULL**.

InDataSize

When *InData* is used, the size of *InData* buffer in bytes.

When *InData* is **NULL**, this parameter must be 0.

AllowedDb
Pointer to a list of pointers to *EFI_SIGNATURE_LIST* structures. The list is terminated by a null pointer. The *EFI_SIGNATURE_LIST* structures contain lists of X.509 certificates of approved signers. See Chapter 27 for definition of *EFI_SIGNATURE_LIST*. Function recognizes signer certificates of type *EFI_CERT_X509_GUID*. Any hash certificate in *AllowedDb* list is ignored by this function. Function returns success if signer of the buffer is within this list (and not within *RevokedDb*). This parameter is required.

RevokedDb
Optional pointer to a list of pointers to *EFI_SIGNATURE_LIST* structures. The list is terminated by a null pointer. List of X.509 certificates of revoked signers and revoked file hashes. Except as noted in description of *TimeStampDb,* signature verification will always fail if the signer of the file or the hash of the data component of the buffer is in *RevokedDb* list. This list is optional and caller may pass Null or pointer to NULL if not required.

TimeStampDb

Optional pointer to a list of pointers to *EFI_SIGNATURE_LIST* structures. The list is terminated by a null pointer. This parameter can be used to pass a list of X.509 certificates of trusted time stamp signers. This list is optional and caller may pass Null or pointer to **NULL** if not required.

Content

On input, points to an optional caller-allocated buffer into which the function will copy the content portion of the file after verification succeeds. This parameter is optional and if **NULL**, no copy of content from file is performed.

ContentSize

On input, points to the size in bytes of the optional buffer *Content* previously allocated by caller. On output, if the verification succeeds, the value referenced by *ContentSize* will contain the actual size of the content from signed file. If *ContentSize* indicates the caller-allocated buffer is too small to contain content, an error is returned, and *ContentSize* will be updated with the required size. This parameter must be 0 if *Content* is Null.

Description

This function processes the buffer *SignedData* for PCKS7 verification. The data that was signed using PKCS is referred to as the 'Message'. In the process of creating a signature of the message, a SHA256 or other hash of the message bytes, called the 'Message Digest', is encrypted using a private key held in secret by the signer. The encrypted hash and the X.509 public key certificate of the signer are formatted according to the ASN.1 PKCS#7 Schema (See References). For the buffer type with the embedded data, the ASN.1 syntax is also used to wrap the data and combine the message data with the signature structure.

The *SignedData* buffer must be ASN.1 DER-encoded format with structure according to the subset defined in the introduction to this protocol. Both embedded content and detached signature formats are supported. In case of embedded content, *SignedData* contains both the PKCS7 signature structure and the message content that was signed. In the case of detached signature, *SignedData* contains only the signature data and *InData* is used to supply the data to be verified. To pass verification the X.509 public certificate of the signer of the file must be found in *AllowedDb* and not be present in *RevokedDb.* Additionally if *RevokedDb* contains a specific Hash signature that matches the hash calculated for the content, the file will also fail verification. The message content will be copied to the caller-supplied buffer *Content* (when present) with *ContentSize* updated to reflect the total size in bytes of the extracted content.

The *VerifyBuffer()* function performs several steps. First, the buffer containing the user-provided signature is parsed, the content is located and a hash calculated, and the PKCS7 signature of that hash is verified by decrypting the hash calculated at time of signing. Match of current hash with decrypted hash provides indication the structure contained in buffer has not been modified since signing. Next the protocol function attempts to match the signing certificate included within the signed data again the members of an (optional) list of caller-provided revoked certificates (*RevokedDb*). The hash of the data is also compared against any hash items contained in *RevokedDb* list. Next the signing certificate is matched against the caller-provided list of trusted signatures. If the signature is valid, the certificate or hash are not in the revoked list, and the certificate is in the trusted list, the file passes verification.

When *TimeStampDb* list is present this information modifies the processing of revoked certificates found in both *AllowedDb* and *RevokedDb.* When PCKS7 signings that are time-stamped by trusted signer in *TimeStampDb* list, and which time-stamping occurred prior to the time of certificate revocation noted in certificate in *RevokedDb* list, the signing will be allowed and return *EFI_SUCCESS. TimeStampDb* parameter is optional and may be NULL or a pointer to NULL when not used. Except in the processing of certificates found in both *AllowedDb* and *RevokedDb, TimeStampDb* is not used and time-stamping is not otherwise required for signings verified by certificate only in *AllowedDb.*

NOTE: *This method is intended to be suitable to implement Secure Boot image validation, and as such the contents of* AllowedDb, RevokedDb, *and* TimeStampDb *must also conform with the requirements of* Authorization Process , *bullet item 3 (UEFI Image Validation Succeeded).*

The verification function can handle both embedded data or detached signature formats. In case of embedded data, the function will optionally extract the original signed data and supply back to caller in caller-supplied buffer. For a detached signature the caller must provide the original message data in buffer pointed to by *InData.* For consistency, when both *InData* and *Content* are provided, the function will copy contents of *InData* to *Content.*

In case where the *ContentSize* indicated by caller is too small to contain the entire content extracted from the file, *EFI_BUFFER_TOO_SMALL* error is returned, and *ContentSize* is updated to reflect the required size.

NOTE: *When signing certificate is matched to* AllowedDb *or* RevokedDb *lists, a match can occur against an entry in the list at any level of the chain of X.509 certificates present in the PCKS certificate list. This supports signing with a certificate that chains to one of the certificates in the* AllowedDb *or* RevokedDb *lists.*

Related Definitions

None

Status Codes Returned

EFI_SUCCESS	Content signature was verified against hash of content, the signer's certificate was not found in *RevokedDb,* and was found in *AllowedDb* or if in signer is found in both *AllowedDb* and *RevokedDb,* the signing was allowed by reference to *TimeStampDb* as described above, and no hash matching content hash was found in *RevokedDb.*
EFI_SECURITY_VIOLATION	The *SignedData* buffer was correctly formatted but signer was in *RevokedDb* or not in *AllowedDb.* Also returned if matching content hash found in *RevokedDb.*
EFI_COMPROMISED_DATA	Calculated hash differs from signed hash.
EFI_INVALID_PARAMETER	*SIgnedData* is NULL or *SIgnedDataSize* is zero. *AllowedDb* is NULL.
EFI_INVALID_PARAMETER	Content is not NULL and *ContentSize* is NULL.
EFI_ABORTED	Unsupported or invalid format in *TImeStampDb, RevokedDb* or *AllowedDb* list contents was detected.
EFI_NOT_FOUND	Content not found because *InData* is NULL and no content embedded in *SIgnedData.*
EFI_UNSUPPORTED	The *SignedData* buffer was not correctly formatted for processing by the function.
EFI_UNSUPPORTED	Signed data embedded in *SIgnedData* but *InData* is not NULL.
EFI_BUFFER_TOO_SMALL	The size of buffer indicated by *ContentSize* is too small to hold the content. *ContentSize* updated to required size.

37.4.2.1 EFI_PKCS7_VERIFY_PROTOCOL.VerifySignature()

Summary

This function processes a buffer containing binary DER-encoded detached PKCS7 signature. The hash of the signed data content is calculated and passed by the caller. Function verifies the signature of the content is valid and signing certificate was not revoked and is contained within a list of trusted signers.

NOTE: *the current UEFI specification allows for a variety of hashes. In order to be secure, the users of this protocol should loop over each hash to see if the binary signature is authorized.*

Prototype

```
typedef
EFI_STATUS
(EFIAPI *VerifySignature)(
  IN EFI_PKCS7_VERIFY_PROTOCOL      *This,
  IN VOID                           *Signature,
  IN UINTN                          SignatureSize,
  IN VOID                           *InHash,
  IN UINTN                          InHashSize
```

(continues on next page)

(continued from previous page)

```
IN EFI_SIGNATURE_LIST           **AllowedDb,
IN EFI_SIGNATURE_LIST           **RevokedDb OPTIONAL,
IN EFI_SIGNATURE_LIST           **TimeStampDb OPTIONAL,
);
```

Parameters

This
Pointer to *EFI_PKCS7_VERIFY_PROTOCOL* instance.

Signature
Points to buffer containing ASN.1 DER-encoded PKCS detached signature.

SignatureSize
The size of *Signature* buffer in bytes.

InHash
InHash points to buffer containing the caller calculated hash of the data. This parameter may not be **NULL**.

InHashSize
The size in bytes of *InHash* buffer.

AllowedDb
Pointer to a list of pointers to *EFI_SIGNATURE_LIST* structures. The list is terminated by a null pointer. The *EFI_SIGNATURE_LIST* structures contain lists of X.509 certificates of approved signers. See Chapter 27 for definition of *EFI_SIGNATURE_LIST.* Function recognizes signer certificates of type *EFI_CERT_X509_GUID.* Any hash certificate in *AllowedDb* list is ignored by this function. Function returns success if signer of the buffer is within this list (and not within *RevokedDb*). This parameter is required.

RevokedDb
Pointer to a list of pointers to *EFI_SIGNATURE_LIST* structures. The list is terminated by a null pointer. List of X.509 certificates of revoked signers and revoked file hashes. Signature verification will always fail if the signer of the file or the hash of the data component of the buffer is in *RevokedDb* list. This parameter is optional and caller may pass Null if not required.

TimeStampDb
Optional pointer to a list of pointers to *EFI_SIGNATURE_LIST* structures. The list is terminated by a null pointer. This parameter can be used to pass a list of X.509 certificates of trusted time stamp counter-signers.

Description

This function processes the buffer *Signature* for PCKS7 verification using hash of the data calculated and pass by caller in the *InHash* buffer. The data that was signed using PKCS is referred to as the ‘Message’. In the process of creating a signature of the message, a hash of the message bytes, called the ‘Message Digest’, is encrypted using a private key held in secret by the signer. The encrypted hash and the X.509 public key certificate of the signer are formatted according to the ASN.1 PKCS#7 Schema (See References). Any data embedded within the PKCS structure is ignored by the function. This function does not support extraction of signature from executable file formats. The address of the PKCS Signature block must be located and passed by the called.

The hash size passed in *InHashSize* must match the size of the signed hash embedded within the PKCS signature structure or an error is returned.

The *SignedData* buffer must be ASN.1 DER-encoded format with structure according to the subset defined in the introduction to this protocol. Both embedded content and detached signature formats are supported however embedded data is ignored. To pass verification the X.509 public certificate of the signer of the file must be found in *AllowedDb* and not be present in *RevokedDb.* Additionally, if *RevokedDb* contains a specific Hash signature that matches the hash calculated for the content, the file will also fail verification.

When *TimeStampDb* list is present this information modifies the processing of revoked certificates found in both *AllowedDb* and *RevokedDb.* When PCKS7 signings that are time-stanped by trusted signer in *TimeStampDb* list, and which time-stamping occurred prior to the time of certificate revocation noted in certificate in *RevokedDb* list, the signing will be allowed and return *EFI_SUCCESS. TimeStampDb* parameter is optional and may be NULL or a pointer to NULL when not used. Except in the processing of certificates found in both *AllowedDb* and *RevokedDb, TimeStampDb* is not used and time-stamping is not otherwise required for signings verified by certificate only in *AllowedDb.*

The *VerifySignature()* function performs several steps. First, the buffer containing the user-provided signature is parsed, (any embedded content is ignored), and the PKCS7 signature of hash data is verified by decrypting the hash calculated at time of signing. Match of caller provided hash with decrypted hash provides indication the signed data has not been modified since signing. Next the protocol function attempts to match the signing certificate included within the signed data again the members of an (optional) list of caller-provided revoked certificates (*RevokedDb*). The hash of the data is also compared against any hash items contained in *RevokedDb* list. Next the signing certificate is matched against the caller-provided list of trusted signatures. If the signature is valid, the certificate or hash are not in the revoked list, and the certificate is in the trusted list, the file passes verification.

Note: When a signing certificate is matched to AllowedDb or RevokedDb lists, a match can occur against an entry in the list at any level of the chain of X.509 certificates present in the PCKS certificate list. This supports signing with a certificate that chains to one of the certificates in the AllowedDb or RevokedDb lists.

Note: Because this function uses hashes and the specification contains a variety of hash choices, you should be aware that the check against the RevokedDb list will improperly succeed if the signature is revoked using a different hash algorithm. For this reason, you should either cycle through all UEFI supported hashes to see if one is forbidden, or rely on a single hash choice only if the UEFI signature authority only signs and revokes with a single hash (currently this hash choice is SHA256).

Status Codes Returned

EFI_SUCCESS	Signed hash was verified against caller-provided hash of content, the signer's certificate was not found in *RevokedDb,* and was found in *AllowedDb* or if in signer is found in both *AllowedDb* and *RevokedDb,* the signing was allowed by reference to *TimeStampDb* as described above, and no hash matching content hash was found in *RevokedDb.*
EFI_SECURITY_VIOLATION	The *SignedData* buffer was correctly formatted but signer was in *RevokedDb* or not in *AllowedDb.* Also returned if matching content hash found in *RevokedDb.*
EFI_COMPROMISED_DATA	Caller provided hash differs from signed hash. Or, caller and encrypted hash are different sizes.
EFI_INVALID_PARAMETER	*Signature* is NULL or *SignatureSize* is zero. *InHash* is NULL or *InhashSize* is zero. *AllowedDb* is NULL.
EFI_ABORTED	Unsupported or invalid format in *TimeStampDb, RevokedDb* or *AllowedDb* list contents was detected.
EFI_UNSUPPORTED	The *Signature* buffer was not correctly formatted for processing by the function.

37.5 Random Number Generator Protocol

This section defines the Random Number Generator (RNG) protocol. This protocol is used to provide random numbers for use in applications, or entropy for seeding other random number generators. Consumers of the protocol can ensure that drivers implementing the protocol produce RNG values in a well-known manner.

When a Deterministic Random Bit Generator (DRBG) is used on the output of a (raw) entropy source, its security level must be at least 256 bits.

37.5.1 EFI_RNG_PROTOCOL

Summary

This protocol provides standard RNG functions. It can be used to provide random bits for use in applications, or entropy for seeding other random number generators.

GUID

```
#define EFI_RNG_PROTOCOL_GUID \
{ 0x3152bca5, 0xeade, 0x433d,\
  {0x86, 0x2e, 0xc0, 0x1c, 0xdc, 0x29, 0x1f, 0x44}}
```

Protocol Interface Structure

```
typedef struct _EFI_RNG_PROTOCOL {
  EFI_RNG_GET_INFO            GetInfo
  EFI_RNG_GET_RNG             GetRNG;
}  EFI_RNG_PROTOCOL;
```

Parameters

GetInfo
Returns information about the random number generation implementation.

GetRNG
Returns the next set of random numbers.

Description

This protocol allows retrieval of RNG values from an UEFI driver. The *GetInfo* service returns information about the RNG algorithms the driver supports. The *GetRNG* service creates a RNG value using an (optionally specified) RNG algorithm.

37.5.2 EFI_RNG_PROTOCOL.GetInfo

Summary

Returns information about the random number generation implementation.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_RNG_GET_INFO) (
  IN EFI_RNG_PROTOCOL            *This,
  IN OUT UINTN                   *RNGAlgorithmListSize,
  OUT EFI_RNG_ALGORITHM          *RNGAlgorithmList
  );
```

Parameters

This

A pointer to the *EFI_RNG_PROTOCOL* instance.

RNGAlgorithmListSize

On input, the size in bytes of *RNGAlgorithmList*. On output with a return code of *EFI_SUCCESS,* the size in bytes of the data returned in *RNGAlgorithmList*.

On output with a return code of *EFI_BUFFER_TOO_SMALL,* the size of *RNGAlgorithmList* required to obtain the list.

RNGAlgorithmList

A caller-allocated memory buffer filled by the driver with one *EFI_RNG_ALGORITHM* element for each supported RNG algorithm. The list must not change across multiple calls to the same driver. The first algorithm in the list is the default algorithm for the driver.

Description

This function returns information about supported RNG algorithms.

A driver implementing the RNG protocol need not support more than one RNG algorithm, but shall support a minimum of one RNG algorithm.

Related Definitions

```
typedef EFI_GUID EFI_RNG_ALGORITHM;
```

Status Codes Returned

EFI_SUCCESS	The RNG algorithm list was returned successfully.
EFI_UNSUPPORTED	The service is not supported by this driver.
EFI_DEVICE_ERROR	The list of algorithms could not be retrieved due to a hardware or firmware error.
EFI_BUFFER_TOO_SMALL	The buffer *RNGAlgorithmList* is too small to hold the result.

37.5.3 EFI_RNG_PROTOCOL.GetRNG

Summary

Produces and returns an RNG value using either the default or specified RNG algorithm.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_RNG_GET_RNG) (
  IN EFI_RNG_PROTOCOL            *This,
  IN EFI_RNG_ALGORITHM           *RNGAlgorithm, OPTIONAL
  IN UINTN                       RNGValueLength,
  OUT UINT8                      *RNGValue
  );
```

Parameters

This

A pointer to the *EFI_RNG_PROTOCOL* instance.

RNGAlgorithm

A pointer to the *EFI_RNG_ALGORITHM* that identifies the RNG algorithm to use. May be NULL in which case the function will use its default RNG algorithm.

RNGValueLength

The length in bytes of the memory buffer pointed to by *RNGValue*. The driver shall return exactly this number of bytes.

RNGValue

A caller-allocated memory buffer filled by the driver with the resulting RNG value.

Description

This function fills the RNGValue buffer with random bytes from the specified RNG algorithm. The driver must not reuse random bytes across calls to this function. It is the caller's responsibility to allocate the *RNGValue* buffer.

Status Codes Returned

EFI_SUCCESS	The RNG value was returned successfully.
EFI_UNSUPPORTED	The algorithm specified by *RNGAlgorithm* is not supported by this driver.
EFI_DEVICE_ERROR	An RNG value could not be retrieved due to a hardware or firmware error.
EFI_NOT_READY	There is not enough random data available to satisfy the length requested by *RNGValueLength*.
EFI_INVALID_PARAMETER	RNGValue is null or RNGValueLength is zero.

37.5.4 EFI RNG Algorithm Definitions

Summary

This sub-section provides *EFI_GUID* values for a selection of *EFI_RNG_PROTOCOL* algorithms. The algorithms listed are optional, not meant to be exhaustive and may be augmented by vendors or other industry standards.

The "raw" algorithm, when supported, is intended to provide entropy directly from the source, without it going through some deterministic random bit generator.

Prototype

```
#define EFI_RNG_ALGORITHM_SP800_90_HASH_256_GUID \
 {0xa7af67cb, 0x603b, 0x4d42,\
 {0xba, 0x21, 0x70, 0xbf, 0xb6, 0x29, 0x3f, 0x96}}

#define EFI_RNG_ALGORITHM_SP800_90_HMAC_256_GUID \
 {0xc5149b43, 0xae85, 0x4f53,\
 {0x99, 0x82, 0xb9, 0x43, 0x35, 0xd3, 0xa9, 0xe7}}

#define EFI_RNG_ALGORITHM_SP800_90_CTR_256_GUID \
 {0x44f0de6e, 0x4d8c, 0x4045, \
 {0xa8, 0xc7, 0x4d, 0xd1, 0x68, 0x85, 0x6b, 0x9e}}

#define EFI_RNG_ALGORITHM_X9_31_3DES_GUID \
 {0x63c4785a, 0xca34, 0x4012,\
 {0xa3, 0xc8, 0x0b, 0x6a, 0x32, 0x4f, 0x55, 0x46}}

#define EFI_RNG_ALGORITHM_X9_31_AES_GUID \
 {0xacd03321, 0x777e, 0x4d3d,\
 {0xb1, 0xc8, 0x20, 0xcf, 0xd8, 0x88, 0x20, 0xc9}}

#define EFI_RNG_ALGORITHM_RAW \
 {0xe43176d7, 0xb6e8, 0x4827,\
   {0xb7, 0x84, 0x7f, 0xfd, 0xc4, 0xb6, 0x85, 0x61}}
```

NIST SP 800-90, "Recommendation for Random Number Generation Using Deterministic Random Bit Generators," March 2007. See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "Recommendation for Random Number Generation Using Deterministic Random Bit Generators".

NIST, "Recommended Random Number Generator Based on ANSI X9.31 Appendix A.2.4 Using the 3-Key Triple DES and AES Algorithms," January 2005. See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "Recommended Random Number Generator Based on ANSI X9.31".

37.6 Smart Card Reader and Smart Card Edge Protocol

The UEFI Smart Card Reader Protocol provides an abstraction for device to provide smart card reader support. This protocol is very close to Part 5 of PC/SC workgroup specifications and provides an API to applications willing to communicate with a smart card or a smart card reader.

37.6.1 Smart Card Reader Protocol

37.6.1.1 EFI_SMART_CARD_READER_PROTOCOL Summary

Smart card aware application invokes this protocol to get access to an inserted smart card in the reader or to the reader itself.

GUID

```
#define EFI_SMART_CARD_READER_PROTOCOL_GUID \
  {0x2a4d1adf, 0x21dc, 0x4b81,\
  {0xa4, 0x2f, 0x8b, 0x8e, 0xe2, 0x38, 0x00, 0x60}}
```

Protocol Interface Structure

```
typedef struct _EFI_SMART_CARD_READER_PROTOCOL {
  EFI_SMART_CARD_READER_CONNECT           SCardConnect;
  EFI_SMART_CARD_READER_DISCONNECT        SCardDisconnect;
  EFI_SMART_CARD_READER_STATUS            SCardStatus;
  EFI_SMART_CARD_READER_TRANSMIT          SCardTransmit;
  EFI_SMART_CARD_READER_CONTROL           SCardControl;
  EFI_SMART_CARD_READER_GET_ATTRIB        SCardGetAttrib;
}   EFI_SMART_CARD_READER_PROTOCOL;
```

Members

SCardConnect
Requests a connection to the smart card or smart card reader.

SCardDisconnect
Closes the previously open connection.

SCardStatus
Provides informations on smart card status and reader name.

SCardTransmit
Exchanges data with smart card or smart card reader.

SCardControl
Gives direct control to the smart card reader.

SCardGetAttrib
Retrieves reader characteristics.

Description

This protocol allows UEFI applications to communicate and get/set all necessary information to the smart card reader.

Overview

This document aims at defining a standard way for UEFI applications to use a smart card. The key points are:

- Provide an API as close as possible to Part 5 of the existing PC/SC interface. See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "PC/SC Workgroup Specifications".
- Remove any unnecessary complexity of PC/SC implementation in a classic OS:

  — Assume no connection sharing
  — No resource manager
  — Reduced set of APIs

Note that this document only focuses on PC/SC Part 5 (access to smart card/smart card reader from an application). Abstracting the smart card (Parts 6/9) is not the scope of this document.

Main differences with existing PC/SC implementation on Linux/MacOS/Windows:

- There is no resource manager, driver exposes Part 5 instead of Part 3
- It is not possible to share a smart card between UEFI applications/drivers
- Reader enumeration is different:

  — On classic PC/SC, SCardListReaders is used
  — In UEFI, reader list is available via OpenProtocol/ScardStatus calls

37.6.2 EFI_SMART_CARD_READER_PROTOCOL.SCardConnect()

Summary

This function requests connection to the smart card or the reader, using the appropriate reset type and protocol.

Prototype

```
EFI_STATUS
  (EFIAPI *EFI_SMART_CARD_READER_PROTOCOL_CONNECT) (
  IN EFI_SMART_CARD_READER_PROTOCOL       *This,
  IN UINT32                               AccessMode,
  IN UINT32                               CardAction,
  IN UINT32                               PreferredProtocols,
  OUT UINT32                              *ActiveProtocol
  );
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_READER_PROTOCOL* is defined in the *EFI_SMART_CARD_READER_PROTOCOL* description.

AccessMode

See "Related Definitions" below.

CardAction

SCARD_CA_NORESET,
SCARD_CA_COLDRESET or
SCARD_CA_WARMRESET.

PreferredProtocols

Bitmask of acceptable protocols. See "Related Definitions" below.

ActiveProtocol

A flag that indicates the active protocol. See "Related Definitions" below.

Related Definitions

```
//
// Codes for access mode
//
#define SCARD_AM_READER 0x0001 // Exclusive access to reader
#define SCARD_AM_CARD 0x0002 // Exclusive access to card
//
// Codes for card action
//
#define SCARD_CA_NORESET 0x0000 // Don't reset card
#define SCARD_CA_COLDRESET 0x0001 // Perform a cold reset
#define SCARD_CA_WARMRESET 0x0002 // Perform a warm reset
#define SCARD_CA_UNPOWER 0x0003 // Power off the card
#define SCARD_CA_EJECT 0x0004 // Eject the card
//
// Protocol types
//
#define SCARD_PROTOCOL_UNDEFINED 0x0000
#define SCARD_PROTOCOL_T0 0x0001
#define SCARD_PROTOCOL_T1 0x0002
#define SCARD_PROTOCOL_RAW 0x0004
```

Description

The *SCardConnect* function requests access to the smart card or the reader. Upon success, it is then possible to call *SCardTransmit*.

If *AccessMode* is set to *SCARD_AM_READER*, *PreferredProtocols* must be set to *SCARD_PROTOCOL_UNDEFINED* and *CardAction* to *SCARD_CA_NORESET* else function fails with *EFI_INVALID_PARAMETER*.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**
EFI_INVALID_PARAMETER	*AccessMode* is not valid.
EFI_INVALID_PARAMETER	*CardAction* is not valid.
EFI_INVALID_PARAMETER	Invalid combination of *AccessMode* / *CardAction* / *PreferredProtocols*.
EFI_NOT_READY	A smart card is inserted but failed to return an ATR.
EFI_UNSUPPORTED	*PreferredProtocols* does not contain an available protocol to use.
EFI_NO_MEDIA	*AccessMode* is set to *SCARD_AM_CARD* but there is no smart card inserted.
EFI_ACCESS_DENIED	Access is already locked by a previous *SCardConnect* call.
EFI_DEVICE_ERROR	Any other error condition, typically a reader removal.

37.6.3 EFI_SMART_CARD_READER_PROTOCOL.SCardDisconnect()

Summary

This function releases a connection previously taken by SCardConnect.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_READER_PROTOCOL_DISCONNECT) (
IN EFI_SMART_CARD_READER_PROTOCOL         *This,
IN UINT32                                 CardAction
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_READER_PROTOCOL* is defined in the *EFI_SMART_CARD_READER_PROTOCOL* description.

CardAction

See "Related Definitions" for *CardAction* in *SCardConnect* description.

Description

The *SCardDisconnect* function releases the lock previously taken by *SCardConnect.* In case the smart card has been removed before this call, this function returns *EFI_SUCCESS.* If there is no previous call to *SCardConnect,* this function returns *EFI_SUCCESS.*

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**
EFI_INVALID_PARAMETER	*CardAction* value is unknown.
EFI_UNSUPPORTED	Reader does not support Eject card feature (disconnect was not performed).
EFI_DEVICE_ERROR	Any other error condition, typically a reader removal.

37.6.4 EFI_SMART_CARD_READER_PROTOCOL.SCardStatus()

Summary

This function retrieves some basic information about the smart card and reader.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_READER_PROTOCOL_STATUS) (
IN EFI_SMART_CARD_READER_PROTOCOL         *This,
OUT CHAR16                                *ReaderName OPTIONAL,
IN OUT UINTN                              *ReaderNameLength OPTIONAL,
OUT UINT32                                *State OPTIONAL,
OUT UINT32                                *CardProtocol OPTIONAL,
OUT UINT8                                 *Atr OPTIONAL,
IN OUT UINTN                              *AtrLength OPTIONAL
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_READER_PROTOCOL* is defined in the *EFI_SMART_CARD_READER_PROTOCOL* description.

ReaderName

A pointer to a **NULL** terminated string that will contain the reader name.

ReaderNameLength

On input, a pointer to the variable that holds the maximal size, in bytes,of *ReaderName.*

On output, the required size, in bytes, for *ReaderName.*

State

Current state of the smart card reader. See "Related Definitions" below.

CardProtocol

Current protocol used to communicate with the smart card. See "Related Definitions" in *SCardConnect.*

Atr

A pointer to retrieve the ATR of the smart card.

AtrLength

On input, a pointer to hold the maximum size, in bytes, of *Atr* (usually 33).

On output, the required size, in bytes, for the smart card ATR.

Related Definitions

```
//
// Codes for state type
//
#define SCARD_UNKNOWN 0x0000 /* state is unknown */
#define SCARD_ABSENT 0x0001 /* Card is absent */
#define SCARD_INACTIVE 0x0002 /* Card is present and not powered*/
#define SCARD_ACTIVE 0x0003 /* Card is present and powered */
```

Description

The *SCardStatus* function retrieves basic reader and card information.

If *ReaderName, State, CardProtocol* or *Atr* is **NULL**, the function does not fail but does not fill in such variables.

If *EFI_SUCCESS* is not returned, *ReaderName* and *Atr* contents shall not be considered as valid.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**
EFI_INVALID_PARAMETER	*ReaderName* is not NULL but ReaderNameLength is **NULL**
EFI_INVALID_PARAMETER	*Atr* is not **NULL** but *AtrLength* is **NULL**
EFI_BUFFER_TOO_SMALL	*ReaderNameLength* is not big enough to hold the reader name. *ReaderNameLength* has been updated to the required value.
EFI_BUFFER_TOO_SMALL	*AtrLength* is not big enough to hold the ATR. *AtrLength* has been updated to the required value.
EFI_DEVICE_ERROR	Any other error condition, typically a reader removal.

37.6.5 EFI_SMART_CARD_READER_PROTOCOL.SCardTransmit()

Summary

This function sends a command to the card or reader and returns its response.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_READER_PROTOCOL_TRANSMIT) (
IN EFI_SMART_CARD_READER_PROTOCOL           *This,
IN UINT8                                    *CAPDU,
IN UINTN                                    CAPDULength,
OUT UINT8                                   *RAPDU,
IN OUT UINTN                                *RAPDULength
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_READER_PROTOCOL* is defined in the *EFI_SMART_CARD_READER_PROTOCOL* description.

CAPDU

A pointer to a byte array that contains the Command APDU to send to the smart card or reader.

CAPDULength

Command APDU size, in bytes.

RAPDU

A pointer to a byte array that will contain the Response APDU.

RAPDULength

On input, the maximum size, in bytes, of the Response APDU. On output, the size, in bytes, of the Response APDU.

Description

This function sends a command to the card or reader and returns its response. The protocol to use to communicate with the smart card has been selected through *SCardConnect* call.

In case *RAPDULength* indicates a buffer too small to hold the response APDU, the function fails with *EFI_BUFFER_TOO_SMALL*.

NOTE: *the caller has to call previously* SCardConnect *to make sure the reader/card is not already accessed by another application or driver*.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**
EFI_INVALID_PARAMETER	*CAPDU* is **NULL** or *CAPDULength* is 0.
EFI_BUFFER_TOO_SMALL	*RAPDULength* is not big enough to hold the response APDU. *RAPDULength* has been updated to the required value..
EFI_NO_MEDIA	There is no card in the reader.
EFI_NOT_READY	Card is not powered.
EFI_PROTOCOL_ERROR	A protocol error has occurred.

continues on next page

Table 37.30 – continued from previous page

EFI_TIMEOUT	The reader did not respond.
EFI_ACCESS_DENIED	A communication with the reader/card is already pending.
EFI_DEVICE_ERROR	Any other error condition, typically a reader removal.

37.6.6 EFI_SMART_CARD_READER_PROTOCOL.SCardControl()

Summary

This function provides direct access to the reader.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_READER_PROTOCOL_CONTROL) (
IN EFI_SMART_CARD_READER_PROTOCOL         *This,
IN UINT32                                 ControlCode,
IN UINT8                                  *InBuffer OPTIONAL,
IN UINTN                                  InBufferLength OPTIONAL,
OUT UINT8                                 *OutBuffer OPTIONAL,
IN OUT UINTN                              *OutBufferLength OPTIONAL
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_READER_PROTOCOL* is defined in the *EFI_SMART_CARD_READER_PROTOCOL* description.

ControlCode

The control code for the operation to perform. See “Related Definitions” below.

InBuffer

A pointer to the input parameters.

InBufferLength

Size, in bytes, of input parameters.

OutBuffer

A pointer to the output parameters.

OutBufferLength

On input, maximal size, in bytes, to store output parameters.

On output, the size, in bytes, of output parameters.

Description

This function gives direct control to send commands to the driver or the reader.

The *ControlCode* to use is vendor dependant; the only standard code defined is the one to get PC/SC part 10 features. See “Related Definitions” below.

InBuffer and *Outbuffer* may be NULL when *ControlCode* operation does not require them.

NOTE: *the caller has to call previously* SCardConnect *to make sure the reader/card is not already accessed by another application or driver.*

Related Definitions

```
//
// Macro to generate a ControlCode & PC/SC part 10 control code
//
#define SCARD_CTL_CODE(code) (0x42000000 + (code))
#define CM_IOCTL_GET_FEATURE_REQUEST SCARD_CTL_CODE(3400)
```

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**
EFI_INVALID_PARAMETER	*ControlCode* requires input parameters but: • *InBuffer* is **NULL** or InBufferLenth is **NULL** -or- • *InBuffer* is not **NULL** but *InBufferLenth* is less than
EFI_INVALID_PARAMETER	*OutBuffer* is not **NULL** but *OutBufferLength* is **NULL**
EFI_UNSUPPORTED	*ControlCode* is not supported.
EFI_BUFFER_TOO_SMALL	*OutBufferLength* is not big enough to hold the output parameters. *OutBufferLength* has been updated to the required value.
EFI_NO_MEDIA	There is no card in the reader and the control code specified requires one.
EFI_NOT_READY	*ControlCode* requires a powered card to operate.
EFI_PROTOCOL_ERROR	A protocol error has occurred.
EFI_TIMEOUT	The reader did not respond.
EFI_ACCESS_DENIED	A communication with the reader/card is already pending.
EFI_DEVICE_ERROR	Any other error condition, typically a reader removal.

37.6.7 EFI_SMART_CARD_READER_PROTOCOL.SCardGetAttrib()

Summary

This function retrieves a reader or smart card attribute.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_READER_PROTOCOL_GET_ATTRIB) (
IN EFI_SMART_CARD_READER_PROTOCOL         *This,
IN UINT32                                 Attrib,
OUT UINT8                                 *OutBuffer,
IN OUT UINTN                              *OutBufferLength
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_READER_PROTOCOL* is defined in the *EFI_SMART_CARD_READER_PROTOCOL* description.

Attrib

Identifier for the attribute to retrieve. See "Related Definitions" below. Note that all attributes might not be implemented.

OutBuffer

A pointer to a buffer that will contain attribute data.

OutBufferLength

On input, maximal size, in bytes, to store attribute data.

On output, the size, in bytes, of attribute data.

Related Definitions

Possibly supported attrib values are listed in the PC/SC Specification, Part 3. See *Appendix Q — References* for document link.

Description

The *SCardGetAttrib* function retrieves an attribute from the reader driver.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**
EFI_INVALID_PARAMETER	*OutBuffer* is **NULL** or *OutBufferLength* is 0.
EFI_BUFFER_TOO_SMALL	*OutBufferLength* is not big enough to hold the output parameters. *OutBufferLength* has been updated to the required value.
EFI_UNSUPPORTED	*Attrib* is not supported.
EFI_NO_MEDIA	There is no card in the reader and *Attrib* value requires one.
EFI_NOT_READY	*Attrib* requires a powered card to operate.
EFI_PROTOCOL_ERROR	A protocol error has occurred.
EFI_TIMEOUT	The reader did not respond.
EFI_DEVICE_ERROR	Any other error condition, typically a reader removal.

37.6.8 Smart Card Edge Protocol

The Smart Card Edge Protocol provides an abstraction for device to provide Smart Card support.

37.6.8.1 EFI_SMART_CARD_EDGE_PROTOCOL

Summary

Smart Card aware application invokes this protocol to get access to an inserted Smart Card in the reader.

GUID

```
#define EFI_SMART_CARD_EDGE_PROTOCOL_GUID \
{ 0xd317f29b, 0xa325, 0x4712,\
  { 0x9b, 0xf1, 0xc6, 0x19, 0x54, 0xdc, 0x19, 0x8c } }
```

Protocol Interface Structure

```
typedef struct _EFI_SMART_CARD_EDGE_PROTOCOL {
  EFI_SMART_CARD_EDGE_GET_CONTEXT         GetContext;
  EFI_SMART_CARD_EDGE_CONNECT             Connect;
  EFI_SMART_CARD_EDGE_DISCONNECT          Disconnect;
  EFI_SMART_CARD_EDGE_GET_CSN             GetCsn;
  EFI_SMART_CARD_EDGE_GET_READER_NAME     GetReaderName;
  EFI_SMART_CARD_EDGE_VERIFY_PIN          VerifyPin;
  EFI_SMART_CARD_EDGE_GET_PIN_REMAINING   GetPinRemaining;
  EFI_SMART_CARD_EDGE_GET_DATA            GetData;
  EFI_SMART_CARD_EDGE_GET_CREDENTIAL      GetCredential;
  EFI_SMART_CARD_EDGE_SIGN_DATA           SignData;
  EFI_SMART_CARD_EDGE_DECRYPT_DATA        DecryptData;
  EFI_SMART_CARD_EDGE_BUILD_DH_AGREEMENT  BuildDHAgreement;
}   EFI_SMART_CARD_EDGE_PROTOCOL;
```

Members

GetContext
Request the driver contex.

Connect
Request a connection to the Smart Card.

Disconnect
Close a previously open connection.

GetCSN
Get Card Serial Number.

GetReaderName
Get name of Smart Card reader used.

VerifyPin
Verify Smart Card PIN.

GetPinRemaining
Get number of remaining PIN tries.

GetData
Get specific data.

GetCredential
Get credentials the Smart Card holds.

SignData
Sign a data.

DecryptData
Decrypt a data.

BuildDHAgreement
Construct a DH (Diffie Hellman) agreement for key derivation.

Description

This protocol allows UEFI applications to interface with a Smart Card during boot process for authentication or data signing / decryption, especially if the application has to make use of PKI.

Overview

This document aims at defining a standard way for UEFI applications to use a Smart Card in PKI (Public Key Infrastructure) context. The key points are:

- Each Smart Card or set of Smart Card have specific behavior.
- Smart Card applications often interface with PKCS #11 API or other cryptographic interface like CNG.
- During boot process not all the possibility of a cryptographic interface, like PKCS #11, are useful, for example it is neither the moment to perform Smart Card administration or Smart Card provisioning nor to process debit or credit operation with Smart Card.

Consequently this protocol focused on those points:

- Offering standard access to Smart Card functionalities that:

  — Authenticate User
  — Sign data
  — Decrypt data
  — Get certificates

- With an API that is enough close with PKCS#11 API that it could be considered as a brick to build a "tiny PKCS#11".
- An implementation of the protocol can be dedicated to a specific Smart Card or a specific set of Smart Card.
- An implementation of the protocol shall poll for Smart Card reader attachment and removal.
- An implementation of the protocol shall poll for Smart Card insertion and removal. On insertion the protocol shall check if it supports this Smart Card.

Typically an implementation of this protocol will lean on a Smart Card reader protocol (*EFI_SMART_CARD_READER_PROTOCOL*).

37.6.8.2 EFI_SMART_CARD_EDGE_PROTOCOL.GetContext()

Summary

This function retrieves the context driver.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_EDGE_GET_CONTEXT) (
  IN EFI_SMART_CARD_EDGE_PROTOCOL         *This,
  OUT UINTN                               *NumberAidSupported,
  IN OUT UINTN                            *AidTableSize OPTIONAL,
  OUT SMART_CARD_AID                      *AidTable OPTIONAL,
  OUT UINTN                               *NumberSCPresent,
  IN OUT UINTN                            *CsnTableSize OPTIONAL,
  OUT SMART_CARD_CSN                      *CsnTable OPTIONAL,
  OUT UINT32                              *VersionScEdgeProtocol OPTIONAL
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_EDGE_PROTOCOL* is defined in the *EFI_SMART_CARD_EDGE_PROTOCOL* description.

NumberAidSupported

Number of AIDs this protocol supports.

AidTableSize

On input, number of items allocated for the AID table.

On output, number of items returned by protocol.

AidTable

Table of the AIDs supported by the protocol.

NumberSCPresent

Number of currently present Smart Cards that are supported by protocol.

CsnTableSize

On input, the number of items the buffer CSN table can contain.

On output, the number of items returned by the protocol.

CsnTable

Table of the CSN of the Smart Card present and supported by protocol.

VersionScEdgeProtocol

EFI_SMART_CARD_EDGE_PROTOCOL version.

Related Definitions

```
//
// Maximum size for a Smart Card AID (Application IDentifier)
//
#define SCARD_AID_MAXSIZE 0x0010
//
// Size of CSN (Card Serial Number)
//
#define SCARD_CSN_SIZE 0x0010
//
//Current specification version 1.00
//
#define SMART_CARD_EDGE_PROTOCOL_VERSION_1 0x00000100

// Parameters type definition
//
typedef UINT8 SMART_CARD_AID[SCARD_AID_MAXSIZE];
typedef UINT8 SMART_CARD_CSN[SCARD_CSN_SIZE];
```

Description

The *GetContext* function returns the context of the protocol, the application identifiers supported by the protocol and the number and the CSN unique identifier of Smart Cards that are present and supported by protocol.

If *AidTableSize, AidTable, CsnTableSize, CsnTable* or *VersionProtocol* is NULL, the function does not fail but does not fill in such variables.

In case *AidTableSize* indicates a buffer too small to hold all the protocol AID table, only the first *AidTableSize* items of the table are returned in *AidTable*.

In case *CsnTableSize* indicates a buffer too small to hold the entire table of Smart Card CSN present, only the first *CsnTableSize* items of the table are returned in *CsnTable*.

VersionScEdgeProtocol returns the version of the *EFI_SMART_CARD_EDGE_PROTOCOL* this driver uses. For this protocol specification value is *SMART_CARD_EDGE_PROTOCOL_VERSION_1*.

In case of Smart Card removal the internal CSN list is immediately updated, even if a connection is opened with that Smart Card.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	This is **NULL**.
EFI_INVALID_PARAMETER	NumberSCPresent Is **NULL.**

37.6.8.3 EFI_SMART_CARD_EDGE_PROTOCOL. Connect()

Summary

This function establish a connection with a Smart Card the protocol support.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_EDGE_CONNECT) (
  IN EFI_SMART_CARD_EDGE_PROTOCOL      *This,
  OUT EFI_HANDLE                       *SCardHandle,
  IN UINT8                             *ScardCsn OPTIONAL,
  OUT UINT8                            *ScardAid OPTIONAL
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_EDGE_PROTOCOL* is defined in the *EFI_SMART_CARD_EDGE_PROTOCOL* description.

SCardHandle

Handle on Smart Card connection.

ScardCsn

CSN of the Smart Card the connection has to be established.

ScardAid

AID of the Smart Card the connection has been established.

Description

The *Connect* function establishes a connection with a Smart Card.

In case of success the *SCardHandle* can be used.

If the *ScardCsn* is **NULL** the connection is established with the first Smart Card the protocol finds in its table of Smart Card present and supported. Else it establish context with the Smart Card whose CSN given by *ScardCsn*.

If *ScardAid* is not **NULL** the function returns the Smart Card AID the protocol supports.

After a successful connect the *SCardHandle* will remain existing even in case Smart Card removed from Smart Card reader, but all function invoking this *SCardHandle* will fail. *SCardHandle* is released only on Disconnect.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_INVALID_PARAMETER	*SCardHandle* is **NULL**.
EFI_NO_MEDIA	No Smart Card supported by protocol is present, Smart Card with CSN *ScardCsn* or Reader has been removed. A Disconnect should be performed.

37.6.8.4 EFI_SMART_CARD_EDGE_PROTOCOL.Disconnect()

Summary

This function releases a connection previously established by *Connect*.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_EDGE_DISCONNECT) (
  IN EFI_SMART_CARD_EDGE_PROTOCOL      *This,
  IN EFI_HANDLE                        SCardHandle
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_EDGE_PROTOCOL* is defined in the *EFI_SMART_CARD_EDGE_PROTOCOL* description.

SCardHandle

Handle on Smart Card connection to release.

Description

The *Disconnect* function releases the connection previously established by a *Connect*. In case the Smart Card or the Smart Card reader has been removed before this call, this function returns *EFI_SUCCESS*.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_INVALID_PARAMETER	No connection for *SCardHandle* value.

37.6.8.5 EFI_SMART_CARD_EDGE_PROTOCOL.GetCsn

Summary

This function returns the Smart Card serial number.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_EDGE_GET_CSN) (
  IN EFI_SMART_CARD_EDGE_PROTOCOL      *This,
  IN EFI_HANDLE                        SCardHandle,
  OUT UINT8                            Csn[SCARD_CSN_SIZE]
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_EDGE_PROTOCOL* is defined in the *EFI_SMART_CARD_EDGE_PROTOCOL* description.

SCardHandle

Handle on Smart Card connection.

Csn

The Card Serial number, 16 bytes array.

Description

The *GetCsn* function returns the 16 bytes Smart Card Serial number.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_INVALID_PARAMETER	No connection for *SCardHandle* value.
EFI_NO_MEDIA	Smart Card or Reader of *SCardHandle* connection has been removed. A *Disconnect* should be performed.

37.6.8.6 EFI_SMART_CARD_EDGE_PROTOCOL.GetReaderName

Summary

This function returns the name of the Smart Card reader used for this connection.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_EDGE_GET_READER_NAME) (
  IN EFI_SMART_CARD_EDGE_PROTOCOL                  *This,
  IN EFI_HANDLE                                    SCardHandle,
  IN OUT UINTN                                     *ReaderNameLength,
```

(continues on next page)

(continued from previous page)

```
  OUT CHAR16                                       *ReaderName OPTIONAL
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_EDGE_PROTOCOL* is defined in the *EFI_SMART_CARD_EDGE_PROTOCOL* description.

SCardHandle

Handle on Smart Card connection.

ReaderNameLength

On input, a pointer to the variable that holds the maximal size, in bytes, of *ReaderName*.

On output, the required size, in bytes, for *ReaderName*.

ReaderName

A pointer to a NULL terminated string that will contain the reader name.

Description

The *GetReaderName* function returns the name of the Smart Card reader used for this connection.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_INVALID_PARAMETER	No connection for *SCardHandle* value.
EFI_INVALID_PARAMETER	*ReaderNameLength* is **NULL**.
EFI_NO_MEDIA	Smart Card or Reader of *SCardHandle* connection has been removed. A *Disconnect* should be performed.

37.6.8.7 EFI_SMART_CARD_EDGE_PROTOCOL.VerifyPin()

Summary

This function authenticates a Smart Card user by presenting a PIN code.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_EDGE_VERIFY_PIN) (
  IN EFI_SMART_CARD_EDGE_PROTOCOL         *This,
  IN EFI_HANDLE                           SCardHandle,
  IN INT32                                PinSize,
  IN UINT8                                *PinCode,
  OUT BOOLEAN                             *PinResult,
  OUT UINT32                              *RemainingAttempts OPTIONAL
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_EDGE_PROTOCOL* is defined in the *EFI_SMART_CARD_EDGE_PROTOCOL* description.

SCardHandle

Handle on Smart Card connection.

PinSize

PIN code buffer size.

PinCode

PIN code to present to the Smart Card.

PinResult

Result of PIN code presentation to the Smart Card.

TRUE when Smart Card founds the PIN code correct.

RemainingAttempts

Number of attempts still possible.

Description

The *VerifyPin* function presents a PIN code to the Smart Card.

If Smart Card found the PIN code correct the user is considered authenticated to current application, and the function returns **TRUE**.

Negative or null *PinSize* value rejected if *PinCode* is not **NULL**

A **NULL** *PinCode* buffer means the application didn't know the PIN, in that case:

- If *PinSize* value is negative the caller only wants to know if the current chain of the elements Smart Card Edge protocol, Smart Card Reader protocol and Smart Card Reader supports the Secure Pin Entry PCSC V2 functionality.
- If *PinSize* value is positive or null the caller ask to perform the verify PIN using the Secure PIN Entry functionality.

In *PinCode* buffer, the PIN value is always given in plaintext, in case of secure messaging the *SMART_CARD_EDGE_PROTOCOL* will be in charge of all intermediate treatments to build the correct Smart Card APDU.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_UNSUPPORTED	*Pinsize* < 0 and Secure PIN Entry functionality not supported.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_INVALID_PARAMETER	No connection for *SCardHandle* value.
EFI_INVALID_PARAMETER	Bad value for *PinSize* : value not supported by Smart Card or, negative with *PinCode* not null.
EFI_INVALID_PARAMETER	*PinResult* is **NULL**.
EFI_NO_MEDIA	Smart Card or Reader of *SCardHandle* connection has been removed. A *Disconnect* should be performed.

37.6.8.8 EFI_SMART_CARD_EDGE_PROTOCOL.GetPinRemaining()

Summary

This function gives the remaining number of attempts for PIN code presentation.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_EDGE_GET_PIN_REMAINING) (
  IN EFI_SMART_CARD_EDGE_PROTOCOL      *This,
  IN EFI_HANDLE                        SCardHandle,
  OUT UINT32                           *RemainingAttempts
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_EDGE_PROTOCOL* is defined in the *EFI_SMART_CARD_EDGE_PROTOCOL* description.

SCardHandle

Handle on Smart Card connection.

RemainingAttempts

Number of attempts still possible.

Description

The number of attempts to present a correct PIN is limited and depends on Smart Card and on PIN.

This function will retrieve the number of remaining possible attempts.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_INVALID_PARAMETER	No connection for *SCardHandle* value.
EFI_INVALID_PARAMETER	*RemainingAttempts* is **NULL**.
EFI_NO_MEDIA	Smart Card or Reader of *SCardHandle* connection has been removed. A *Disconnect* should be performed.

37.6.8.9 EFI_SMART_CARD_EDGE_PROTOCOL.GetData()

Summary

This function returns a specific data from Smart Card.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_EDGE_GET_DATA) (
  IN EFI_SMART_CARD_EDGE_PROTOCOL      *This,
```

(continues on next page)

(continued from previous page)

```
  IN EFI_HANDLE                        SCardHandle,
  IN EFI_GUID                          *DataId,
  IN OUT UINTN                         *DataSize,
  OUT VOID                             *Data OPTIONAL
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_EDGE_PROTOCOL* is defined in the *EFI_SMART_CARD_EDGE_PROTOCOL* description.

SCardHandle

Handle on Smart Card connection.

DataId

The type identifier of the data to get.

DataSize

On input, in bytes, the size of *Data*.

On output, in bytes, the size of buffer required to store the specified data.

Data

The data buffer in which the data is returned. The type of the data buffer is associated with the *DataId*. Ignored if *DataSize* is 0.

Description

This function returns a data from Smart Card. The function is generic for any kind of data, but driver and application must share an EFI_GUID that identify the data.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	This is **NULL**.
EFI_INVALID_PARAMETER	No connection for *SCardHandle* value.
EFI_INVALID_PARAMETER	*DataId* is **NULL**.
EFI_INVALID_PARAMETER	*DataSize* is **NULL.**
EFI_INVALID_PARAMETER	*Data* is **NULL**, and *DataSize* is not zero.
EFI_NOT_FOUND	*DataId* unknown for this driver.
EFI_BUFFER_TOO_SMALL	The size of *Data* is too small for the specified data and the required size is returned in *DataSize*.
EFI_ACCESS_DENIED	Operation not performed, conditions not fulfilled. PIN not verified.
EFI_NO_MEDIA	Smart Card or Reader of *SCardHandle* connection has been removed. A *Disconnect* should be performed.

37.6.8.10 EFI_SMART_CARD_EDGE_PROTOCOL.GetCredentials()

Summary

This function retrieve credentials store into the Smart Card.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_EDGE_GET_CREDENTIAL) (
  IN EFI_SMART_CARD_EDGE_PROTOCOL         *This,
  IN EFI_HANDLE                           SCardHandle,
  IN OUT UINTN                            *CredentialSize,
  OUT UINT8                               *CredentialList OPTIONAL
);
```

Parameters

This
Indicates a pointer to the calling context. Type *EFI_SMART_CARD_EDGE_PROTOCOL* is defined in the *EFI_SMART_CARD_EDGE_PROTOCOL* description.

SCardHandle
Handle on Smart Card connection.

CredentialSize

On input, in bytes, the size of buffer to store the list of credential.

On output, in bytes, the size of buffer required to store the entire list of credentials.

CredentialList
List of credentials stored into the Smart Card. A list of TLV (Tag Length Value) elements organized in containers array.

Related Definitions

```
//Type of data elements in credentials list
#define SC_EDGE_TAG_HEADER 0x0000 \
        // value of tag field for header,
      // the number of containers
#define SC_EDGE_TAG_CERT 0x0001 // value of tag field for certificate
#define SC_EDGE_TAG_KEY_ID 0x0002 // value of tag field for key index
         // associated with certificate
#define SC_EDGE_TAG_KEY_TYPE 0x0003 // value of tag field for key type
#define SC_EDGE_TAG_KEY_SIZE 0x0004 // value of tag field for key size

//Length of L fields of TLV items
#define SC_EDGE_L_SIZE_HEADER 1 // size of L field for header
#define SC_EDGE_L_SIZE_CERT 2 // size of L field for certificate (big endian)
#define SC_EDGE_L_SIZE_KEY_ID 1 // size of L field for key index
#define SC_EDGE_L_SIZE_KEY_TYPE 1 // size of L field for key type
#define SC_EDGE_L_SIZE_KEY_SIZE 2 // size of L field for key size (big endian)

//Some TLV items have a fixed value for L field
#define SC_EDGE_L_VALUE_HEADER 1 // value of L field for header
```

(continues on next page)

(continued from previous page)

```
#define SC_EDGE_L_VALUE_KEY_ID 1 // value of L field for key index
#define SC_EDGE_L_VALUE_KEY_TYPE 1 // value of L field for key type
#define SC_EDGE_L_VALUE_KEY_SIZE 2 // value of L field for key size

//Possible values for key type
#define SC_EDGE_RSA_EXCHANGE 0x01 //RSA decryption
#define SC_EDGE_RSA_SIGNATURE 0x02 //RSA signature
#define SC_EDGE_ECDSA_256 0x03 //ECDSA signature
#define SC_EDGE_ECDSA_384 0x04 //ECDSA signature
#define SC_EDGE_ECDSA_521 0x05 //ECDSA signature
#define SC_EDGE_ECDH_256 0x06 //ECDH agreement
#define SC_EDGE_ECDH_384 0x07 //ECDH agreement
#define SC_EDGE_ECDH_521 0x08 //ECDH agreement
```

Description

The function returns a series of items in TLV (Tag Length Value) format.

First TLV item is the header item that gives the number of following containers (0x00, 0x01, Nb containers).

All these containers are a series of 4 TLV items:

- The certificate item (0x01, certificate size, certificate)
- The Key identifier item (0x02, 0x01, key index)
- The key type item (0x03, 0x01, key type)
- The key size item (0x04, 0x02, key size), key size in number of bits.

Numeric multi-bytes values are on big endian format, most significant byte first:

- The L field value for certificate (2 bytes)
- The L field value for key size (2 bytes)
- The value field for key size (2 bytes)

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_INVALID_PARAMETER	No connection for *SCardHandle* value.
EFI_INVALID_PARAMETER	*CredentialSize* is **NULL**.
EFI_INVALID_PARAMETER	*CredentialList* is **NULL**, if *CredentialSize* is not zero.
EFI_BUFFER_TOO_SMALL	The size of *CredentialList* is too small for the specified data and the required size is returned in *CredentialSize*.
EFI_NO_MEDIA	Smart Card or Reader of *SCardHandle* connection has been removed. A *Disconnect* should be performed.

37.6.8.11 EFI_SMART_CARD_EDGE_PROTOCOL.SignData()

Summary

This function signs an already hashed data with a Smart Card private key.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_EDGE_SIGN_DATA) (
  IN EFI_SMART_CARD_EDGE_PROTOCOL   *This,
  IN EFI_HANDLE                     SCardHandle,
  IN UINTN                          KeyId,
  IN UINTN                          KeyType,
  IN EFI_GUID                       *HashAlgorithm,
  IN EFI_GUID                       *PaddingMethod,
  IN UINT8                          *HashedData,
  OUT UINT8                         *SignatureData
);
```

Parameters

This
Indicates a pointer to the calling context. Type *EFI_SMART_CARD_EDGE_PROTOCOL* is defined in the *EFI_SMART_CARD_EDGE_PROTOCOL* description.

SCardHandle
Handle on Smart Card connection.

KeyId
Identifier of the key container, retrieved in a key index item of credentials.

KeyType
The key type, retrieved in a key type item of credentials.

HashAlgorithm
Hash algorithm used to hash the, one of:

- *EFI_HASH_ALGORITHM_SHA1_GUID*
- *EFI_HASH_ALGORITHM_SHA256_GUID*
- *EFI_HASH_ALGORITHM_SHA384_GUID*
- *EFI_HASH_ALGORITHM_SHA512_GUID*

PaddingMethod
Padding method used jointly with hash algorithm, one of:

- *EFI_PADDING_RSASSA_PKCS1V1P5_GUID*
- *EFI_PADDING_RSASSA_PSS_GUID*

HashedData
Hash of the data to sign. Size is function of the *HashAlgorithm*.

SignatureData

Resulting signature with private key *KeyId*. Size is function of the *KeyType* and key size retrieved in the associated key size item of credentials.

Related Definitions

```
//
// Padding methods GUIDs for signature
//

//
// RSASSA- PKCS#1-V1.5 padding method, for signature
//
#define EFI_PADDING_RSASSA_PKCS1V1P5_GUID \

{0x8b,0x32,0x2e,0xd9,0x20,0x9c,0xd8,0xaf}}

//
// RSASSA-PSS padding method, for signature
//
#define EFI_PADDING_RSASSA_PSS_GUID \
{0x7b2349e0,0x522d,0x4f8e,\
{0xb9,0x27,0x69,0xd9,0x7c,0x9e,0x79,0x5f}}
```

Description

This function signs data, actually it is the hash of these data that is given to the function.

SignatureData buffer shall be big enough for signature. Signature size is function key size and key type.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_INVALID_PARAMETER	No connection for *SCardHandle* value.
EFI_INVALID_PARAMETER	*KeyId* is not valid.
EFI_INVALID_PARAMETER	*KeyType* is not valid or not corresponding to *KeyId*.
EFI_INVALID_PARAMETER	*HashAlgorithm* is **NULL**.
EFI_INVALID_PARAMETER	*HashAlgorithm* is not valid.
EFI_INVALID_PARAMETER	*PaddingMethod* is **NULL**.
EFI_INVALID_PARAMETER	*PaddingMethod* is not valid.
EFI_INVALID_PARAMETER	*HashedData* is **NULL**.
EFI_INVALID_PARAMETER	*SignatureData* is **NULL**.
EFI_ACCESS_DENIED	Operation not performed, conditions not fulfilled. PIN not verified.
EFI_NO_MEDIA	Smart Card or Reader of *SCardHandle* connection has been removed. A *Disconnect* should be performed.

37.6.8.12 EFI_SMART_CARD_EDGE_PROTOCOL.DecryptData()

Summary

This function decrypts data with a PKI/RSA Smart Card private key.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_EDGE_DECRYPT_DATA) (
  IN EFI_SMART_CARD_EDGE_PROTOCOL      *This,
  IN EFI_HANDLE                        SCardHandle,
  IN UINTN                             KeyId,
  IN EFI_GUID                          *HashAlgorithm,
  IN EFI_GUID                          *PaddingMethod,
  IN UINTN                             EncryptedSize,
  IN UINT8                             *EncryptedData,
  IN OUT UINTN                         *PlaintextSize,
  OUT UINT8                            *PlaintextData
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_EDGE_PROTOCOL* is defined in the *EFI_SMART_CARD_EDGE_PROTOCOL* description.

SCardHandle

Handle on Smart Card connection.

KeyId

Identifier of the key container, retrieved in a key index item of credentials.

HashAlgorithm

Hash algorithm used to hash the, one of:

- *EFI_HASH_ALGORITHM_SHA1_GUID*
- *EFI_HASH_ALGORITHM_SHA256_GUID*
- *EFI_HASH_ALGORITHM_SHA384_GUID*
- *EFI_HASH_ALGORITHM_SHA512_GUID*

PaddingMethod

Padding method used jointly with hash algorithm, one of:

- *EFI_PADDING_NONE_GUID*
- *EFI_PADDING_RSAES_PKCS1V1P5_GUID*
- *EFI_PADDING_RSAES_OAEP_GUID*

EncryptedSize

Size of data to decrypt

EncryptedData

Data to decrypt

PlaintextSize

On input, in bytes, the size of buffer to store the decrypted data.

On output, in bytes, the size of buffer required to store the decrypted data.

PlaintextData

Buffer for decrypted data, padding removed.

Related Definitions

```
//
// Padding methods GUIDs for decryption
//

//
// No padding, for decryption
//

```

Description

The function decrypts some PKI / RSA encrypted data with private key securely stored into the Smart Card.

The *KeyId* must reference a key of type SC_EDGE_RSA_EXCHANGE.

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL.**
EFI_INVALID_PARAMETER	No connection for *SCardHandle* value.
EFI_INVALID_PARAMETER	*KeyId* is not valid or associated key not of type *SC_EDGE_RSA_EXCHANGE.*
EFI_INVALID_PARAMETER	*HashAlgorithm* is **NULL**.
EFI_INVALID_PARAMETER	*HashAlgorithm* is not valid.
EFI_INVALID_PARAMETER	*PaddingMethod* is **NULL**.
EFI_INVALID_PARAMETER	*PaddingMethod* is not valid.
EFI_INVALID_PARAMETER	*EncryptedSize* is 0.
EFI_INVALID_PARAMETER	*EncryptedData* is **NULL**.
EFI_INVALID_PARAMETER	*PlaintextSize* is **NULL**.
EFI_INVALID_PARAMETER	*PlaintextData* is **NULL**.
EFI_ACCESS_DENIED	Operation not performed, conditions not fulfilled. PIN not verified.

continues on next page

Table 37.43 – continued from previous page

EFI_BUFFER_TOO_SMALL	*PlaintextSize* is too small for the plaintext data and the required size is returned in *PlaintextSize*.
EFI_NO_MEDIA	Smart Card or Reader of *SCardHandle* connection has been removed. A *Disconnect* should be performed.

37.6.8.13 EFI_SMART_CARD_EDGE_PROTOCOL.BuildDHAgreement()

Summary

This function performs a secret Diffie Hellman agreement calculation that would be used to derive a symmetric encryption / decryption key.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_EDGE_BUILD_DH_AGREEMENT) (
  IN EFI_SMART_CARD_EDGE_PROTOCOL      *This,
  IN EFI_HANDLE                        SCardHandle,
  IN UINTN                             KeyId,
  IN UINT8                             *dataQx,
  IN UINT8                             *dataQy,
  OUT UINT8                            *DHAgreement
);
```

Parameters

This

Indicates a pointer to the calling context. Type *EFI_SMART_CARD_EDGE_PROTOCOL* is defined in the *EFI_SMART_CARD_EDGE_PROTOCOL* description.

SCardHandle

Handle on Smart Card connection.

KeyId

Identifier of the key container, retrieved in a key index item of credentials.

dataQx

Public key x coordinate. Size is the same as key size for *KeyId.* Stored in big endian format.

dataQy

Public key y coordinate. Size is the same as key size for *KeyId.* Stored in big endian format.

DHAgreement

Buffer for DH agreement computed. Size must be bigger or equal to key size for *KeyId.*

Description

The function compute a DH agreement that should be diversified to generate a symmetric key to proceed encryption or decryption.

The application and the Smart Card shall agree on the diversification process.

The *KeyId* must reference a key of one of the types: *SC_EDGE_ECDH_256, SC_EDGE_ECDH_384* or *SC_EDGE_ECDH_521.*

Status Codes Returned

EFI_SUCCESS	The requested command completed successfully.
EFI_INVALID_PARAMETER	*This* is **NULL**.
EFI_INVALID_PARAMETER	No connection for *SCardHandle* value.
EFI_INVALID_PARAMETER	*KeyId* is not valid.
EFI_INVALID_PARAMETER	*dataQx* is **NULL**.
EFI_INVALID_PARAMETER	*dataQy* is **NULL**.
EFI_INVALID_PARAMETER	*DHAgreement* is **NULL**.
EFI_ACCESS_DENIED	Operation not performed, conditions not fulfilled. PIN not verified.
EFI_NO_MEDIA	Smart Card or Reader of *SCardHandle* connection has been removed. A *Disconnect* should be performed.

CHAPTER

THIRTYEIGHT

MISCELLANEOUS PROTOCOLS

38.1 EFI Timestamp Protocol

38.1.1 EFI_TIMESTAMP_PROTOCOL

Summary

The Timestamp protocol provides a platform independent interface for retrieving a high resolution timestamp counter.

GUID

```
#define EFI_TIMESTAMP_PROTOCOL_GUID \
  { 0xafbfde41, 0x2e6e, 0x4262,\
  { 0xba, 0x65, 0x62, 0xb9, 0x23, 0x6e, 0x54, 0x95 }}
```

Protocol Interface Structure

```
typedef struct _ EFI_TIMESTAMP_PROTOCOL {
  TIMESTAMP_GET                 GetTimestamp;
  TIMESTAMP_GET_PROPERTIES      GetProperties;
}   EFI_TIMESTAMP_PROTOCOL;
```

38.1.2 EFI_TIMESTAMP_PROTOCOL.GetTimestamp()

Summary

Retrieves the current timestamp counter value.

Prototype

```
typedef
UINT64
(EFIAPI *TIMESTAMP_GET) (
   VOID
);
```

Description

Retrieves the current value of a 64-bit free running timestamp counter.

The counter shall count up in proportion to the amount of time that has passed. The counter value will always roll over to zero. The properties of the counter can be retrieved from GetProperties().

The caller should be prepared for the function to return the same value twice across successive calls. The counter value will not go backwards other than when wrapping, as defined by EndValue in GetProperties().

The frequency of the returned timestamp counter value must remain constant. Power management operations that affect clocking must not change the returned counter frequency. The quantization of counter value updates may vary as long as the value reflecting time passed remains consistent.

Return Value

The current value of the free running timestamp counter.

38.1.3 EFI_TIMESTAMP_PROTOCOL.GetProperties()

Summary

Obtains timestamp counter properties including frequency and value limits.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *TIMESTAMP_GET_PROPERTIES) (
  OUT   EFI_TIMESTAMP_PROPERTIES      *Properties
  );
```

Parameters

Properties
The properties of the timestamp counter. See”Related Definitions” below.

Description

Retrieves the timestamp counter properties structure.

Related Definitions

```
typedef struct {
  UINT64          Frequency;

  UINT64          EndValue;
  } EFI_TIMESTAMP_PROPERTIES;
```

Frequency
The frequency of the timestamp counter in Hz.

EndValue
The value that the timestamp counter ends with immediately before it rolls over. For example, a 64-bit free running counter would have an EndValue of 0xFFFFFFFFFFFFFFFF. A 24-bit free running counter would have an EndValue of 0xFFFFFF.

Status Codes Returned

EFI_SUCCESS	The properties were successfully retrieved.
EFI_DEVICE_ERROR	An error occurred trying to retrieve the properties of the timestamp counter subsystem. *Properties* is not updated.
EFI_INVALID_PARAMETER	*Properties* is **NULL**.

38.2 Reset Notification Protocol

38.2.1 EFI_RESET_NOTIFICATION_PROTOCOL

Summary

This protocol provides services to register for a notification when ResetSystem is called.

GUID

```
#define EFI_RESET_NOTIFICATION_PROTOCOL_GUID \
  { 0x9da34ae0, 0xeaf9, 0x4bbf, \
  { 0x8e, 0xc3, 0xfd, 0x60, 0x22, 0x6c, 0x44, 0xbe } }
```

Protocol Interface Structure

```
typedef struct _EFI_RESET_NOTIFICATION_PROTOCOL {
  EFI_REGISTER_RESET_NOTIFY              RegisterResetNotify;
  EFI_UNREGISTER_RESET_NOTIFY            UnRegisterResetNotify;
}   EFI_RESET_NOTIFICATION_PROTOCOL;
```

Parameters

RegisterResetNotify
Register a notification function to be called when ResetSystem() is called.

UnRegisterResetNotify
Removes a reset notification function that has been previously registered with RegisterResetNotify().

38.2.2 EFI_RESET_NOTIFICATION_PROTOCOL.RegisterResetNotify()

Summary

Register a notification function to be called when ResetSystem() is called.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_REGISTER_RESET_NOTIFY) (
  IN EFI_RESET_NOTIFICATION_PROTOCOL        *This,
  IN EFI_RESET_SYSTEM                       *ResetFunction,
);
```

Parameters

This
A pointer to the *EFI_RESET_NOTIFICATION_PROTOCOL* instance.

ResetFunction
Points to the function to be called when a *ResetSystem()* is executed.

Description

The *RegisterResetNotify()* function registers a notification function that is called when *ResetSystem()* is called and prior to completing the reset of the platform.

The registered functions must not perform a platform reset themselves. These notifications are intended only for the notification of components which may need some special-purpose maintenance prior to the platform resetting.

The list of registered reset notification functions are processed if *ResetSystem()* is called before *ExitBootServices()* . The list of registered reset notification functions is ignored if *ResetSystem()* is called after *ExitBootServices()* .

Status Codes Returned

EFI_SUCCESS	The reset notification function was successfully registered.
EFI_INVALID_PARAMETER	ResetFunction is **NULL**.
EFI_OUT_OF_RESOURCES	There are not enough resources available to register the reset notification function.
EFI_ALREADY_STARTED	The reset notification function specified by ResetFunction has already been registered.

38.2.3 EFI_RESET_NOTIFICATION_PROTOCOL.UnregisterResetNotify()

Summary

Unregister a notification function.

Prototype

```
typedef
EFI_STATUS
(EFIAPI *EFI_UNREGISTER_RESET_NOTIFY) (
  IN EFI_RESET_NOTIFICATION_PROTOCOL      *This,
  IN EFI_RESET_SYSTEM                     *ResetFunction
);
```

Parameters

This
A pointer to the EFI_RESET_NOTIFICATION_PROTOCOL instance.

ResetFunction
The pointer to the ResetFunction being unregistered.

Description

The UnregisterResetNotify() function removes the previously registered notification using RegisterResetNotify().

Status Codes Returned

EFI_SUCCESS	The reset notification function was unregistered.
EFI_INVALID_PARAMETER	ResetFunction is **NULL**.
EFI_INVALID_PARAMETER	The reset notification function specified by ResetFunction was not previously registered using RegisterResetNotify().

APPENDIX A — GUID AND TIME FORMATS

All EFI GUIDs (Globally Unique Identifiers) have the format described in RFC 4122 and comply with the referenced algorithms for generating GUIDs. It should also be noted that TimeLow, TimeMid, TimeHighAndVersion fields in the EFI are encoded as little endian. The following table defines the format of an EFI GUID (128 bits).

Table A.1: EFI GUID Format

Mnemonic	**Byte Offset**	**Byte Length**	**Description**
TimeLow	0	4	The low field of the timestamp.
TimeMid	4	2	The middle field of the timestamp.
TimeHighAndVersion	6	2	The high field of the timestamp multiplexed with the version number.
ClockSeqHighAndReserved	8	1	The high field of the clock sequence multiplexed with the variant.
ClockSeqLow	9	1	The low field of the clock sequence.
Node	10	6	The spatially unique node identifier. This can be based on any IEEE 802 address obtained from a network card. If no network card exists in the system, a crypto graphic-quality random number can be used.

This appendix for GUID defines a 60-bit timestamp format that is used to generate the GUID. All EFI time information is stored in 64-bit structures that contain the following format: The timestamp is a 60-bit value containing a count of 100-nanosecond intervals since 00:00:00.00, 15 October 1582 (the date of Gregorian reform to the Christian calendar). This time value will not roll over until the year 3400 AD. It is assumed that a future version of the EFI specification can deal with the year-3400 issue by extending this format if necessary.

This specification also defines a standard text representation of the GUID. This format is also sometimes called the “registry format”. It consists of 36 characters, as follows:

```
aabbccdd-eeff-gghh-iijj-kkllmmnnoopp:
```

The pairs *aa* - *pp* are two characters in the range ‘0’-‘9’, ‘a’-‘f’ or ‘A’-F’, with each pair representing a single byte hexadecimal value.

The following table describes the relationship between the text representation and a 16-byte buffer, the structure defined in *EFI GUID Format* and the EFI_GUID structure.

Table A.2: Text representation relationships

String	Offset In Buffer	Relationship to *EFI GUID Format*	Relationship To EFI_GUID
aa	3	TimeLow[24:31]	Data1[24:31]
bb	2	TimeLow[16:23]	Data1[16:23]
cc	1	TimeLow[8:15]	Data1[8:15]
dd	0	TimeLow[0:7]	Data1[0:7]
ee	5	TimeMid[8:15]	Data2[8:15]
ff	4	TimeMid[0:7]	Data2[0:7]
gg	7	TimeHigh AndVersion[8:15]	Data3[8:15]
hh	6	TimeHig hAndVersion[0:7]	Data3[0:7]
ii	8	ClockSeqHigh AndReserved[0:7]	Data4[0:7]
jj	9	ClockSeqLow[0:7]	Data4[8:15]
kk	10	Node[0:7]	Data4[16:23]
ll	11	Node[8:15]	Data4[24:31]
mm	12	Node[16:23]	Data4[32:39]
nn	13	Node[24:31]	Data4[40:47]
oo	14	Node[32:39]	Data4[48:55]
pp	15	Node[40:47]	Data4[56:63]

APPENDIX B — CONSOLE

The EFI console was designed to allow input from a wide variety of devices. This appendix provides examples of the mapping of keyboard input from various types of devices to EFI scan codes. While representative of common console devices in use today, it is not intended to be a comprehensive list. EFI application programmers can use this table to identify the EFI Scan Code generated by a specific key press. The description of the example device input data that generates a EFI Scan Code may be useful to EFI driver writers, as well as showing the limitations on which EFI Scan codes can be generated by different types of console input devices.

The EFI console was designed so that it could map to common console devices. This appendix explains how an EFI console could map to a VGA with PC AT 101/102, PC ANSI, or ANSI X3.64 consoles.

B.1 EFI_SIMPLE_TEXT_INPUT_PROTOCOL and EFI_SIMPLE_TEXT_INPUT_EX_PROTOCOL

Tables *EFI Scan Codes for EFI_SIMPLE_TEXT_INPUT_PROTOCOL* and *EFI Scan Codes for EFI_SIMPLE_TEXT_INPUT_EX_PROTOCOL* give examples of how input from a set of common input devices is mapped to EFI scan codes. Terminals and terminal emulators generally report function and editing keys as escape or control sequences. These sequences are formed by a control character followed by one or more additional graphic characters that indicate what the sequence means. ANSI X3.64 terminals generally require an ANSI parser to determine how to interpret a sequence and how to determine that the sequence is complete. These terminals can generate sequences using either 8-bit controls or 7-bit control sequences. Older terminal types, such as the VT100+ have a simpler set of sequences that can be interpreted using simple case statements. These terminals usually generate only 7-bit data, and 7-bit control sequences.

In the tables below, the CSI character is the 8-bit control character 0x9B, and is equivalent to the 7-bit control sequence “ESC [” (the 0x1B control ESC followed by the left bracket character 0x5B). The sequences are shown with spaces for readability, but do not contain the space character.

The VT100+ column represents a common class of terminal emulation that is a superset of the Digital Equipment Corporation (DEC) VT100 terminal. This includes VT-UTF8 (Hyperterm) and PC_ANSI terminal types. The ANSI X3.64 column shows the sequences generated by the DEC VT200 through VT500 terminals, which are an ANSI X3.64 / ISO 6429 compliant.

The USB HID and AT 101/102 columns show the scan codes generated by two common directly attached keyboards. These keyboards are generally used in combination with a VGA text display to form a “VGA Console”.

In the table below, the cells with N/A contained in them are simply intended to reflect that the key may be defined for that terminal or keyboard, but there is no industry standard or consistent mapping for the key. Some input devices might not implement all of these keys.

Table B.1: EFI Scan Codes for EFI_SIMPLE_TEXT_INPUT_PROTOCOL

EFI Scan Code	Description	ANSI X3.64 / DEC VT200-500 (8-bit mode)	VT100+ (7-bit mode)	USB Keyboard HID Values	AT 101/102 Keyboard Scan Codes

B.2 EFI_SIMPLE_TEXT_OUTPUT_PROTOCOL for PC ANSI or ANSI X3.64 terminals

Table below defines how the programmatic methods of the EFI_SIMPLE_TEXT_OUTPUT_PROTOCOs could be implemented as PC ANSI or ANSI X3.64 terminals. Detailed descriptions of PC ANSI and ANSI X3.64 escape sequences are as follows. The same type of operations can be supported via a PC AT type INT 10h interface.

Table B.3: Control Sequences to Implement EFI_SIMPLE_TEXT_INPUT_PROTOCOL

PC ANSI Codes	ANSI X3.64 Codes	Description
ESC [2 J	CSI 2 J	Clear Display Screen.
ESC [0 m	CSI 0 m	Normal Text.
ESC [1 m	CSI 1 m	Bright Text.
ESC [7 m	CSI 7 m	Reversed Text.
ESC [30 m	CSI 30 m	Black foreground, compliant with ISO Standard 6429.
ESC [31 m	CSI 31 m	Red foreground, compliant with ISO Standard 6429.
ESC [32 m	CSI 32 m	Green foreground, compliant with ISO Standard 6429.
ESC [33 m	CSI 33 m	Yellow foreground, compliant with ISO Standard 6429.
ESC [34 m	CSI 34 m	Blue foreground, compliant with ISO Standard 6429.
ESC [35 m	CSI 35 m	Magenta foreground, compliant with ISO Standard 6429.
ESC [36 m	CSI 36 m	Cyan foreground, compliant with ISO Standard 6429.
ESC [37 m	CSI 37 m	White foreground, compliant with ISO Standard 6429.
ESC [40 m	CSI 40 m	Black background, compliant with ISO Standard 6429.
ESC [41 m	CSI 41 m	Red background, compliant with ISO Standard 6429.
ESC [42 m	CSI 42 m	Green background, compliant with ISO Standard 6429.
ESC [43 m	CSI 43 m	Yellow background, compliant with ISO Standard 6429.
ESC [44 m	CSI 44 m	Blue background, compliant with ISO Standard 6429.
ESC [45 m	CSI 45 m	Magenta background, compliant with ISO Standard 6429.
ESC [46 m	CSI 46 m	Cyan background, compliant with ISO Standard 6429.
ESC [47 m	CSI 47 m	White background, compliant with ISO Standard 6429.
ESC [= 3 h	CSI = 3 h	Set Mode 80x25 color.

APPENDIX

C

APPENDIX C — DEVICE PATH EXAMPLES

This appendix presents an example EFI Device Path and explains its relationship to the ACPI name space. An example system design is presented along with its corresponding ACPI name space. These physical examples are mapped back to EFI Device Paths.

C.1 C.1 Example Computer System

The Figure below, *Example Computer System*, represents a hypothetical computer system architecture that will be used to discuss the construction of EFI Device Paths. The system consists of a memory controller that connects directly to the processors' front side bus. The memory controller is only part of a larger chipset, and it connects to a root PCI host bridge chip, and a secondary root PCI host bridge chip. The secondary PCI host bridge chip produces a PCI bus that contains a PCI to PCI bridge. The root PCI host bridge produces a PCI bus, and also contains USB, ATA66, and AC '97 controllers. The root PCI host bridge also contains an LPC bus that is used to connect a SIO (Super IO) device. The SIO contains a PC-AT-compatible floppy disk controller, and other PC-AT-compatible devices like a keyboard controller.

The remainder of this appendix describes how to construct a device path for three example devices from the system in *Example Computer System* . The following is a list of the examples used:

- Legacy floppy
- IDE Disk
- Secondary root PCI bus with PCI to PCI bridge

The Figure below is a partial ACPI name space for the system in the Figure *Example Computer System* . Figure *Partial ACPI Name Space for Example System* is based on Figure 5-3 in the *Advanced Configuration and Power Interface Specification*.

C.2 Legacy Floppy

The legacy floppy controller is contained in the SIO chip that is connected root PCI bus host bridge chip. The root PCI host bridge chip produces PCI bus 0, and other resources that appear directly to the processors in the system.

In ACPI this configuration is represented in the _SB, system bus tree, of the ACPI name space. PCI0 is a child of _SB and it represents the root PCI host bridge. The SIO appears to the system to be a set of ISA devices, so it is represented as a child of PCI0 with the name ISA0. The floppy controller is represented by FLPY as a child of the ISA0 bus.

The EFI Device Path for the legacy floppy is defined in the Table below, *Legacy Floppy Device Path* . It would contain entries for the following things:

- Root PCI Bridge. ACPI Device Path _HID PNP0A03, _UID 0. ACPI name space _SB\PCI0

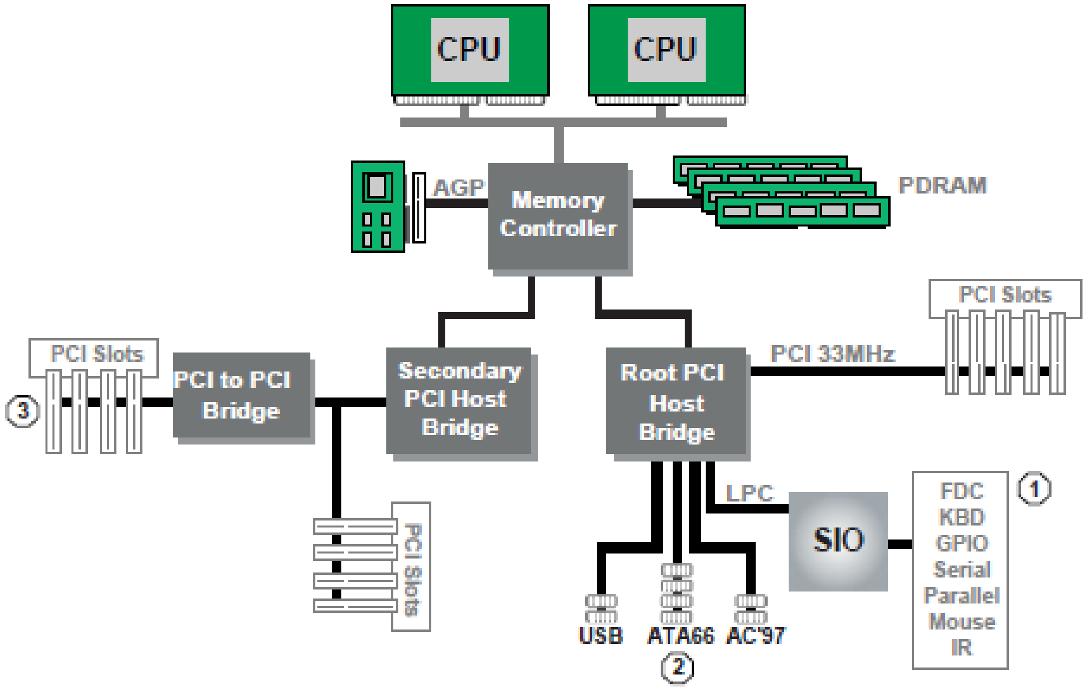

Fig. C.1: **Example Computer System**

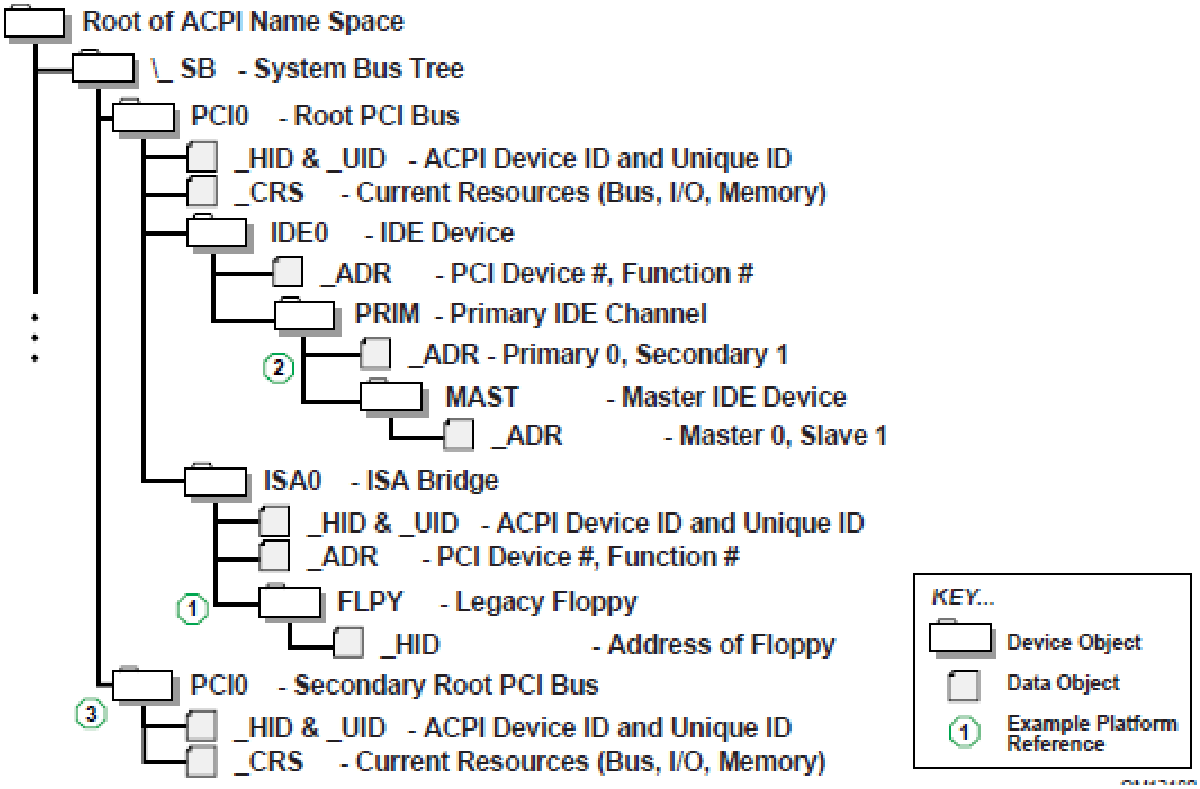

Fig. C.2: Partial ACPI Name Space for Example System

- PCI to ISA Bridge. PCI Device Path with device and function of the PCI to ISA bridge. ACPI name space _SB\PCI0\ISA0
- Floppy Plug and Play ID. ACPI Device Path _HID PNP0303, _UID 0. ACPI name space _SB\PCI0\ISA0\FLPY
- End Device Path

Table C.1: Legacy Floppy Device Path

Byte Offset	Byte Length	Data	Description
0	1	0x02	Generic Device Path Header - Type ACPI Device Path
1	1	0x01	Sub type - ACPI Device Path
2	2	0x0C	Length
4	4	0x41D0, 0x0A03	_HID PNP0A03 - 0x41D0 represents the compressed string ‘PNP’ and is encoded in the low order bytes. The compression method is described in the ACPI Specification.
8	4	0x0000	_UID
C	1	0x01	Generic Device Path Header - Type Hardware Device Path
D	1	0x01	Sub type PCI Device Path
E	2	0x06	Length
10	1	0x00	PCI Function
11	1	0x10	PCI Device
12	1	0x02	Generic Device Path Header - Type ACPI Device Path
13	1	0x01	Sub type - ACPI Device Path
14	2	0x0C	Length
16	4	0x41D0, 0x0303	_HID PNP0303
1A	4	0x0000	_UID
1E	1	0x7F	Generic Device Path Header - Type End of Hardware Device Path
1F	1	0xFF	Sub type - End Device Path
20	2	0x04	Length

C.3 IDE Disk

The IDE Disk controller is a PCI device that is contained in a function of the root PCI host bridge. The root PCI host bridge is a multi function device and has a separate function for chipset registers, USB, and IDE. The disk connected to the IDE ATA bus is defined as being on the primary or secondary ATA bus, and of being the master or slave device on that bus.

In ACPI this configuration is represented in the _SB, system bus tree, of the ACPI name space. PCI0 is a child of _SB and it represents the root PCI host bridge. The IDE controller appears to the system to be a PCI device with some legacy properties, so it is represented as a child of PCI0 with the name IDE0. PRIM is a child of IDE0 and it represents the primary ATA bus of the IDE controller. MAST is a child of PRIM and it represents that this device is the ATA master device on this primary ATA bus.

The EFI Device Path for the PCI IDE controller is defined in the Table *IDE Disk Device Path* . It would contain entries for the following things:

- Root PCI Bridge. ACPI Device Path _HID PNP0A03, _UID 0. ACPI name space _SB\PCI0
- PCI IDE controller. PCI Device Path with device and function of the IDE controller. ACPI name space _SB\PCI0\IDE0
- ATA Address. ATA Messaging Device Path for Primary bus and Master device. ACPI name space _SB\PCI0\IDE0\PRIM\MAST

- End Device Path

Table C.2: IDE Disk Device Path

Byte Offset	Byte Length	Data	Description
0	1	0x02	Generic Device Path Header - Type ACPI Device Path
1	1	0x01	Sub type - ACPI Device Path
2	2	0x0C	Length
4	4	0x41D0, 0x0A03	_HID PNP0A03 - 0x41D0 represents the compressed string 'PNP' and is encoded in the low order bytes. The compression method is described in the ACPI Specification.
8	4	0x0000	_UID
C	1	0x01	Generic Device Path Header - Type Hardware Device Path
D	1	0x01	Sub type PCI Device Path
E	2	0x06	Length
10	1	0x01	PCI Function
11	1	0x10	PCI Device
12	1	0x03	Generic Device Path Header - Messaging Device Path
13	1	0x01	Sub type - ATAPI Device Path
14	2	0x06	Length
16	1	0x00	Primary =0, Secondary = 1
17	1	0x00	Master = 0, Slave = 1
18	2	0x0000	LUN
1A	1	0x7F	Generic Device Path Header - Type End of Hardware Device Path
1B	1	0xFF	Sub type - End Device Path
1C	2	0x04	Length

C.4 Secondary Root PCI Bus with PCI to PCI Bridge

The secondary PCI host bridge materializes a second set of PCI buses into the system. The PCI buses on the secondary PCI host bridge are totally independent of the PCI buses on the root PCI host bridge. The only relationship between the two is they must be configured to not consume the same resources. The primary PCI bus of the secondary PCI host bridge also contains a PCI to PCI bridge. There is some arbitrary PCI device plugged in behind the PCI to PCI bridge in a PCI slot.

In ACPI this configuration is represented in the _SB, system bus tree, of the ACPI name space. PCI1 is a child of _SB and it represents the secondary PCI host bridge. The PCI to PCI bridge and the device plugged into the slot on its primary bus are not described in the ACPI name space. These devices can be fully configured by following the applicable PCI specification.

The EFI Device Path for the secondary root PCI bridge with a PCI to PCI bridge is defined in the Table *Secondary Root PCI Bus with PCI to PCI Bridge Device Path* . It would contain entries for the following things:

- Root PCI Bridge. ACPI Device Path _HID PNP0A03, _UID 1. ACPI name space _SB\PCI1
- PCI to PCI Bridge. PCI Device Path with device and function of the PCI Bridge. ACPI name space _SB\PCI1, PCI to PCI bridges are defined by PCI specification and not ACPI.
- PCI Device. PCI Device Path with the device and function of the PCI device. ACPI name space _SB\PCI1, PCI devices are defined by PCI specification and not ACPI.
- End Device Path.

Table C.3: Secondary Root PCI Bus with PCI to PCI Bridge Device Path

Byte Offset	Byte Length	Data	Description
0	1	0x02	Generic Device Path Header - Type ACPI Device Path
1	1	0x01	Sub type - ACPI Device Path
2	2	0x0C	Length
4	4	0x41D0, 0x0A03	_HID PNP0A03 - 0x41D0 represents the compressed string 'PNP' and is encoded in the low order bytes. The compression method is described in the ACPI Specification.
8	4	0x0001	_UID
C	1	0x01	Generic Device Path Header - Type Hardware Device Path
D	1	0x01	Sub type PCI Device Path
E	2	0x06	Length
10	1	0x00	PCI Function for PCI to PCI bridge
11	1	0x0c	PCI Device for PCI to PCI bridge
12	1	0x01	Generic Device Path Header - Type Hardware Device Path
13	1	0x01	Sub type PCI Device Path
14	2	0x08	Length
16	1	0x00	PCI Function for PCI Device
17	1	0x00	PCI Device for PCI Device
18	1	0x7F	Generic Device Path Header - Type End of Hardware Device Path
19	1	0xFF	Sub type - End Device Path
1A	2	0x04	Length

C.5 ACPI Terms

Names in the ACPI name space that start with an underscore ("_") are reserved by the ACPI specification and have architectural meaning. All ACPI names in the name space are four characters in length. The following four ACPI names are used in this specification.

_ADR. The Address on a bus that has standard enumeration. An example would be PCI, where the enumeration method is described in the PCI Local Bus specification.

_CRS. The current resource setting of a device. A _CRS is required for devices that are not enumerated in a standard fashion. _CRS is how ACPI converts nonstandard devices into Plug and Play devices.

_HID. Represents a device's Plug and Play hardware ID, stored as a 32-bit compressed EISA ID. _HID objects are optional in ACPI. However, a _HID object must be used to describe any device that will be enumerated by the ACPI driver in the OS. This is how ACPI deals with non-Plug and Play devices.

_UID. Is a serial number style ID that does not change across reboots. If a system contains more than one device that reports the same _HID, each device must have a unique _UID. The _UID only needs to be unique for device that have the exact same _HID value.

C.6 EFI Device Path as a Name Space

The Figure below shows the EFI Device Path for the example system represented as a name space. The Device Path can be represented as a name space, but EFI does support manipulating the Device Path as a name space. You can only access Device Path information by locating the *DEVICE_PATH_INTERFACE* from a handle. Not all the nodes in a Device Path will have a handle.

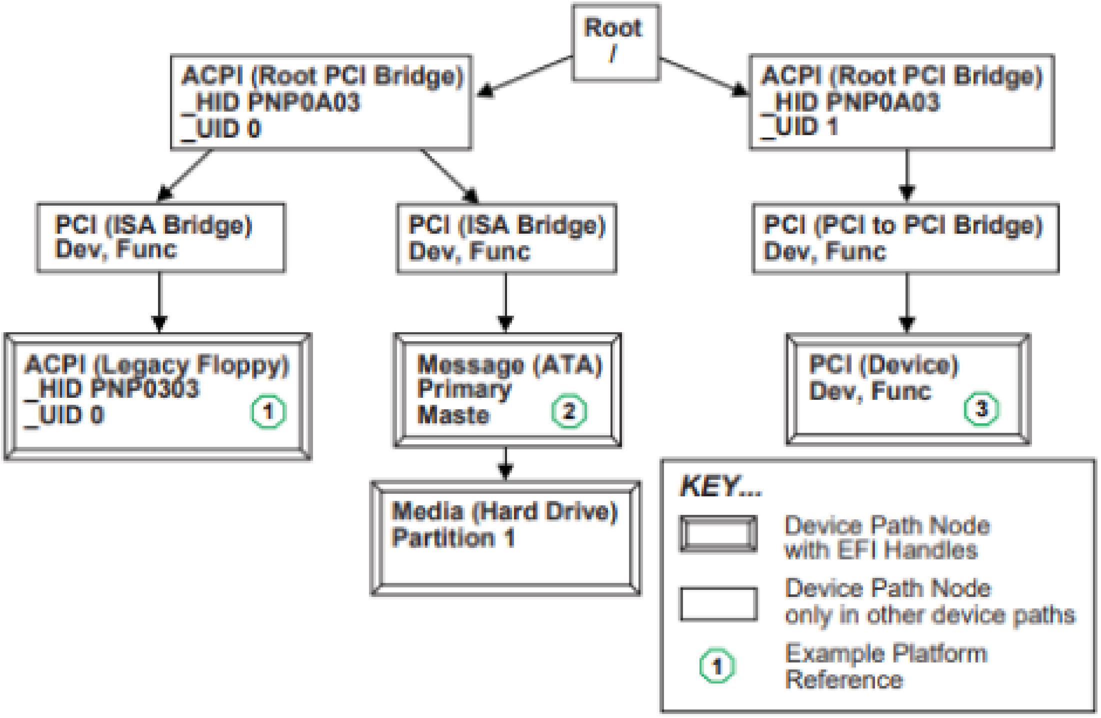

Fig. C.3: EFI Device Path Displayed As a Name Space

APPENDIX D — STATUS CODES

EFI interfaces return an *EFI_STATUS* code. See *EFI_STATUS Success Codes (High Bit Clear)* , *EFI_STATUS Error Codes (High Bit Set)* , *EFI_STATUS Warning Codes (High Bit Clear)* list these codes for success, errors, and warnings, respectively. The range of status codes that have the highest bit set and the next to highest bit clear are reserved for use by EFI. The range of status codes that have both the highest bit set and the next to highest bit set are reserved for use by OEMs. Success and warning codes have their highest bit clear, so all success and warning codes have positive values. The range of status codes that have both the highest bit clear and the next to highest bit clear are reserved for use by EFI. The range of status code that have the highest bit clear and the next to highest bit set are reserved for use by OEMs. The Table below lists the status code ranges described above.

Table D.1: EFI_STATUS Code Ranges

Supported 32-bit Range	**Supported 64-bit Architecture Ranges**	**Description**
0x00000000-0x1fffffff	0x0000000000000000-0x1fffffffffffffff	Warning codes reserved for use by UEFI main specification.
0x20000000-0x3fffffff	0x2000000000000000-0x3fffffffffffffff	Warning codes reserved for use by the Platform Initialization Architecture Specification.
0x40000000-0x7fffffff	0x4000000000000000-0x7fffffffffffffff	Warning codes reserved for OEM usage.
0x80000000-0x9fffffff	0x8000000000000000-0x9fffffffffffffff	Error codes reserved for use by UEFI main spec.
0xa0000000-0xbfffffff	0xa000000000000000-0xbfffffffffffffff	Error codes reserved for use by the Platform Initialization Architecture Specification.
0xc0000000-0xffffffff	0xc000000000000000-0xcfffffffffffffff	Error codes reserved for OEM usage.

Table D.2: EFI_STATUS Success Codes (High Bit Clear)

Mnemonic	**Value**	**Description**
EFI_SUCCESS	0	The operation completed successfully.

Table D.3: EFI_STATUS Error Codes (High Bit Set)

Mnemonic	**Value**	**Description**
EFI_LOAD_ERROR	1	The image failed to load.
EFI_INVALID_PARAMETER	2	A parameter was incorrect.
EFI_UNSUPPORTED	3	The operation is not supported.
EFI_BAD_BUFFER_SIZE	4	The buffer was not the proper size for the request.

continues on next page

Table D.3 – continued from previous page

EFI_BUFFER_TOO_SMALL	5	The buffer is not large enough to hold the requested data. The required buffer size is returned in the appropriate parameter when this error occurs.
EFI_NOT_READY	6	There is no data pending upon return.
EFI_DEVICE_ERROR	7	The physical device reported an error while attempting the operation.
EFI_WRITE_PROTECTED	8	The device cannot be written to.
EFI_OUT_OF_RESOURCES	9	A resource has run out.
EFI_VOLUME_CORRUPTED	10	An inconstancy was detected on the file system causing the operating to fail.
EFI_VOLUME_FULL	11	There is no more space on the file system.
EFI_NO_MEDIA	12	The device does not contain any medium to perform the operation.
EFI_MEDIA_CHANGED	13	The medium in the device has changed since the last access.
EFI_NOT_FOUND	14	The item was not found.
EFI_ACCESS_DENIED	15	Access was denied.
EFI_NO_RESPONSE	16	The server was not found or did not respond to the request.
EFI_NO_MAPPING	17	A mapping to a device does not exist.
EFI_TIMEOUT	18	The timeout time expired.
EFI_NOT_STARTED	19	The protocol has not been started.
EFI_ALREADY_STARTED	20	The protocol has already been started.
EFI_ABORTED	21	The operation was aborted.
EFI_ICMP_ERROR	22	An ICMP error occurred during the network operation.
EFI_TFTP_ERROR	23	A TFTP error occurred during the network operation.
EFI_PROTOCOL_ERROR	24	A protocol error occurred during the network operation.
EFI_INCOMPATIBLE_VERSION	25	The function encountered an internal version that was incompatible with a version requested by the caller.
EFI_SECURITY_VIOLATION	26	The function was not performed due to a security violation.
EFI_CRC_ERROR	27	A CRC error was detected.
EFI_END_OF_MEDIA	28	Beginning or end of media was reached
EFI_END_OF_FILE	31	The end of the file was reached.
EFI_INVALID_LANGUAGE	32	The language specified was invalid.
EFI_COMPROMISED_DATA	33	The security status of the data is unknown or compromised and the data must be updated or replaced to restore a valid security status.
EFI_IP_ADDRESS_CONFLICT	34	There is an address conflict address allocation
EFI_HTTP_ERROR	35	A HTTP error occurred during the network operation.

Table D.4: EFI_STATUS Warning Codes (High Bit Clear)

Mnemonic	**Value**	**Description**

continues on next page

Table D.4 – continued from previous page

EFI_WARN_UNKNOWN_GLYPH	1	The string contained one or more characters that the device could not render and were skipped.
EFI_WARN_DELETE_FAILURE	2	The handle was closed, but the file was not deleted.
EFI_WARN_WRITE_FAILURE	3	The handle was closed, but the data to the file was not flushed properly.
EFI_WARN_BUFFER_TOO_SMALL	4	The resulting buffer was too small, and the data was truncated to the buffer size.
EFI_WARN_STALE_DATA	5	The data has not been updated within the timeframe set by local policy for this type of data.
EFI_WARN_FILE_SYSTEM	6	The resulting buffer contains UEFI-compliant file system.
EFI_WARN_RESET_REQUIRED	7	The operation will be processed across a system reset.

APPENDIX

E

APPENDIX E — UNIVERSAL NETWORK DRIVER INTERFACES

E.1 Introduction

This appendix defines the 32/64-bit H/W and S/W Universal Network Driver Interfaces (UNDIs). These interfaces provide one method for writing a network driver; other implementations are possible.

E.1.1 Definitions

E-1 Definitions

Table E.1: Definitions

Term	Definition
BC	**BaseCode** The PXE BaseCode, included as a core protocol in EFI, is comprised of a simple network stack (UDP/IP) and a few common network protocols (DHCP, Bootserver Discovery, TFTP) that are useful for remote booting machines.
LOM	**LAN On Motherboard** This is a network device that is built onto the motherboard (or baseboard) of the machine.
NBP	**Network Bootstrap Program** This is the first program that is downloaded into a machine that has selected a PXE capable device for remote boot services. A typical NBP examines the machine it is running on to try to determine if the machine is capable of running the next layer (OS or application). If the machine is not capable of running the next layer, control is returned to the EFI boot manager and the next boot device is selected. If the machine is capable, the next layer is downloaded and control can then be passed to the downloaded program. Though most NBPs are OS loaders, NBPs can be written to be standalone applications such as diagnostics, backup/restore, remote management agents, browsers, etc.

continues on next page

Table E.1 – continued from previous page

NIC	**Network Interface Card** Technically, this is a network device that is inserted into a bus on the motherboard or in an expansion board. For the purposes of this document, the term NIC will be used in a generic sense, meaning any device that enables a network connection (including LOMs and network devices on external busses (USB, 1394, etc.)).
ROM	**Read-Only Memory** When used in this specification, ROM refers to a nonvolatile memory storage device on a NIC.
PXE	**Preboot Execution Environment** The complete PXE specification covers three areas; the client, the network and the server. **Client** • Makes network devices into bootable devices. • Provides APIs for PXE protocol modules in EFI and for universal drivers in the OS. **Network** • Uses existing technology: DHCP, TFTP, etc. • Adds “vendor specific” tags to DHCP to define PXE specific operation within DHCP. • Adds multicast TFTP for high bandwidth remote boot applications. • Defines Bootserver discovery based on DHCP packet format. **Server** • **Bootserver**: Responds to Bootserver discovery requests and serves up remote boot images. • **proxyDHCP**: Used to ease the transition of PXE clients and servers into existing network infrastructure. proxyDHCP provides the additional DHCP information that is needed by PXE clients and Bootservers without making changes to existing DHCP servers. • **MTFTP**: Adds multicast support to a TFTP server. • **Plug-In Modules**: Example proxyDHCP and Bootservers provided in the PXE SDK (software development kit) have the ability to take plug-in modules (PIMs). These PIMs are used to change/enhance the capabilities of the proxyDHCP and Bootservers.
UNDI	**Universal Network Device Interface** UNDI is an architectural interface to NICs. Traditionally NICs have had custom interfaces and custom drivers (each NIC had a driver for each OS on each platform architecture). Two variations of UNDI are defined in this specification: H/W UNDI and S/W UNDI. H/W UNDI is an architectural hardware interface to a NIC. S/W UNDI is a software implementation of the H/W UNDI.

E.1.2 Referenced Specifications

When implementing PXE services, protocols, ROMs or drivers, it is a good idea to understand the related network protocols and BIOS specifications. The Table, below includes all of the specifications referenced in this document.

Referenced Specifications

Table E.2: Referenced Specifications Table

Acronym	Protocol/Specification
ARP	Address Resolution Protocol • Required reading for those implementing the PXE Base Code Protocol. • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "Address Resolution Protocol".
Assigned Numbers	Lists the reserved numbers used in the RFCs and in this specification. • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "Assigned Numbers".
BIOS	Basic Input/Output System • Contact your BIOS manufacturer for reference and programming manuals.
BOOTP	**Bootstrap Protocol -** • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "Bootstrap Protocol (BOOTP)". These references are included for backward compatibility. BC protocol supports DHCP and BOOTP: • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "BOOTP Clarifications and Extensions". • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "Bootstrap Protocol (BOOTP) Interoperation Between DHCP and BOOTP". Required reading for those implementing the PXE Base Code Protocol BC protocol or PXE Bootservers.
DHCP	**Dynamic Host Configuration Protocol** • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "DHCP". • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "Index of RFC (IETF)". • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "DHCP Reconfigure Extension". • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "DHCP for Ipv4". • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "Interoperations between DHCP and BOOTP". Required reading for those implementing the PXE Base Code Protocol or PXE Bootservers.

continues on next page

Table E.2 – continued from previous page

EFI	**Extensible Firmware Interface** • See “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “Intel Developer Centers”. Required reading for those implementing NBPs, OS loaders and preboot applications for machines with the EFI preboot environment.
ICMP	**Internet Control Message Protocol** • See “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “ICMP for Ipv4”. • See “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “ICMP for Ipv6”. Required reading for those implementing the BC protocol.
IETF	**Internet Engineering Task Force** See “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “Internet Engineering Task Force (IETF)”. This is a good starting point for obtaining electronic copies of Internet standards, drafts, and RFCs.
IGMP	**Internet Group Management Protocol** • See “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “Internet Group Management Protocol”. Required reading for those implementing the PXE Base Code Protocol.
IP	**Internet Protocol** Ipv4: ht tp://www.ietf.org/rfc/rfc0791.txt • “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “Ipv4”. • See “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “Ipv6”. Required reading for those implementing the BC protocol.
MTFTP	**Multicast TFTP** - Defined in the 16-bit PXE specification. Required reading for those implementing the PXE Base Code Protocol.
PCI	**Peripheral Component Interface** • See “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “Peripheral Component Interface (PCI)”. Source for PCI specifications. Required reading for those implementing S/W or H/W UNDI on a PCI NIC or LOM.

continues on next page

Table E.2 – continued from previous page

PnP	**Plug-and-Play** • http://www.phoenix.com/en/support/white+papers-specs/ • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "Plug and Play". Source for PnP specifications.
PXE	**Preboot eXecution Environment** 16-bit PXE v2.1: • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "Preboot eXecution Environment (PXE)". Required reading.
RFC	**Request For Comments** • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "Request for Comments".
TCP	**Transmission Control Protocol** • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "TCPv4". • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "TCPv6". Required reading for those implementing the PXE Base Code Protocol .
TFTP	**Trivial File Transfer Protocol** TFTP • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "TFTP Protocol". • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "TFTP Option Extension". • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "TFTP Blocksize Option". • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "TFTP Timeout Interval and Transfer Size Options". Required reading for those implementing the PXE Base Code Protocol.
UDP	**User Datagram Protocol** • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "UDP over IPv4". • See "Links to UEFI-Related Documents" (http://uefi.org/uefi) under the heading "UDP over IPv6". Required reading for those implementing the PXE Base Code Protocol.

E.1.3 OS Network Stacks

This is a simplified overview of three OS network stacks that contain three types of network drivers: Custom, S/W UNDI and H/W UNDI. The Figure, below, depicts an application bound to an OS protocol stack, which is in turn bound to a protocol driver that is bound to three NICs. The Table, below, *Driver Types: Pros and Cons* gives a brief list of pros and cons about each type of driver implementation.

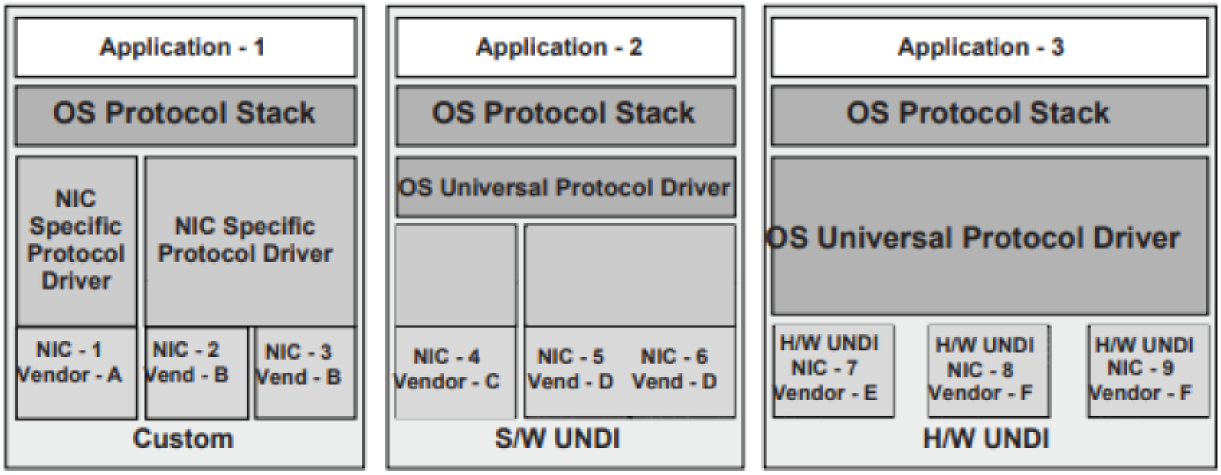

Fig. E.1: Network Stacks with Three Classes of Drivers

Driver Types: Pros and Cons

Table E.3: Driver Types: Pros and Cons

Driver	Pro	Con
Custom	• Can be very fast and efficient. NIC vendor tunes driver to OS & device. • OS vendor does not have to write NIC driver.	• New driver for each OS/architecture must be maintained by NIC vendor. • OS vendor must trust code supplied by third-party. • OS vendor cannot test all possible driver/NIC versions. • Driver must be installed before NIC can be used. • Possible performance sink if driver is poorly written. • Possible security risk if driver has back door.

continues on next page

Table E.3 – continued from previous page

S/W UNDI	• S/W UNDI driver is simpler than a Custom driver. Easier to test outside of the OS environment. • OS vendor can tune the universal protocol driver for best OS performance. • NIC vendor only has to write one driver per processor architecture.	• Slightly slower than Custom or H/W UNDI because of extra call layer between protocol stack and NIC. • S/W UNDI driver must be loaded before NIC can be used. • OS vendor has to write the universal driver. • Possible performance sink if driver is poorly written. • Possible security risk if driver has back door.
H/W UNDI	• H/W UNDI provides a common architectural interface to all network devices. • OS vendor controls all security and performance issues in network stack. • NIC vendor does not have to write any drivers. • NIC can be used without an OS or driver installed (preboot management).	• OS vendor has to write the universal driver (this might also be a Pro, depending on your point of view).

E.2 Overview

There are three major design changes between this specification and the 16-bit UNDI in version 2.1 of the PXE Specification:

- A new architectural hardware interface has been added.
- All UNDI commands use the same command format.
- BC is no longer part of the UNDI ROM.

E.2.1 32/64-bit UNDI Interface

The !PXE structures are used locate and identify the type of 32/64-bit UNDI interface (H/W or S/W), as shown in the Figure, below. These structures are normally only used by the system BIOS and universal network drivers.

Major Minor reserved

The !PXE structures used for H/W and S/W UNDIs are similar but not identical. The difference in the format is tied directly to the differences required by the implementation. The !PXE structures for 32/64-bit UNDI are not compatible with the !PXE structure for 16-bit UNDI.

The !PXE structure for H/W UNDI is built into the NIC hardware. The first nine fields (from offsets 0x00 to 0x0F) are implemented as read-only memory (or ports). The last three fields (from Len to Len + 0x0F) are implemented as read/write memory (or ports). The optional reserved field at 0x10 is not defined in this specification and may be used for vendor data.

The !PXE structure for S/W UNDI can be loaded into system memory from one of three places; ROM on a NIC, system nonvolatile storage, or external storage. Since there are no direct memory or I/O ports available in the S/W UNDI !PXE structure, an indirect callable entry point is provided. S/W UNDI developers are free to make their internal designs

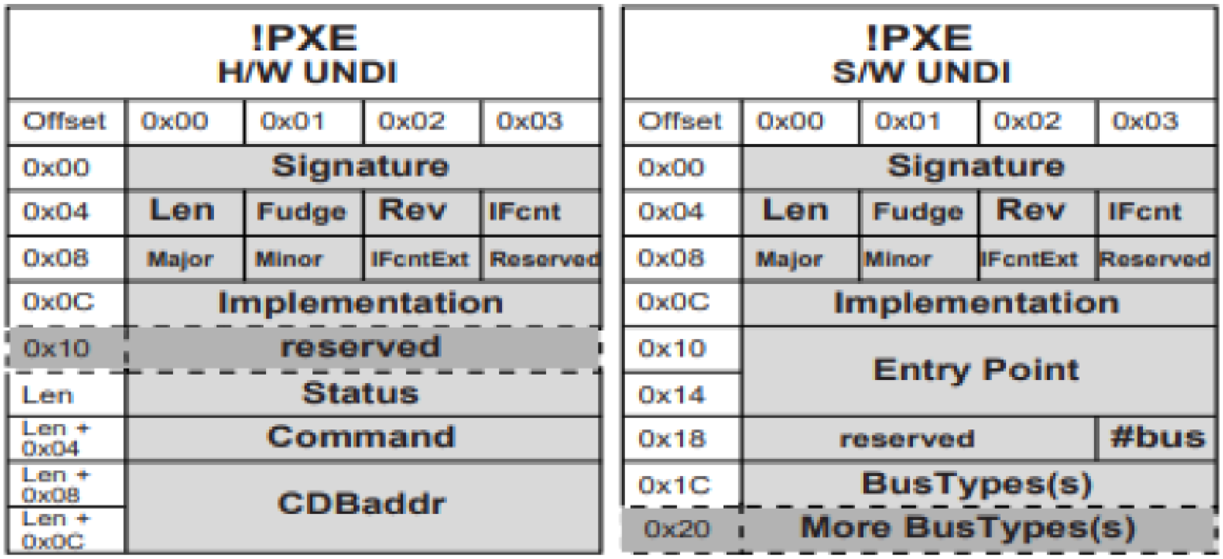

Fig. E.2: **!PXE Structures for H/W and S/W UNDI**

as simple or complex as they desire, as long as all of the UNDI commands in this specification are implemented. Descriptions of the fields in the Table below.

Table E.4: **!PXE Structure Field Definitions**

Identifier	Value	Description
Signature	**“!PXE”**	!PXE structure signature. This field is used to locate an UNDI hardware or software interface in system memory (or I/O) space. ‘!’ is in the first (lowest address) byte, ‘P’ is in the second byte, ‘X’ in the third and ‘E’ in the last. This field must be aligned on a 16-byte boundary (the last address byte must be zero).
Len	**Varies**	Number of !PXE structure bytes to checksum. When computing the checksum of this structure the Len field MUST be used as the number of bytes to checksum. The !PXE structure checksum is computed by adding all of the bytes in the structure, starting with the first byte of the structure Signature: ‘!’. If the 8-bit sum of all of the unsigned bytes in this structure is not zero, this is not a valid !PXE structure.
Fudge	**Varies**	This field is used to make the 8-bit checksum of this structure equal zero.
Rev	**0x03**	Revision of this structure.

continues on next page

Table E.4 – continued from previous page

IFcnt	**Varies**	This field reports the number (minus one) of physical external network connections that are controlled by this !PXE interface. (If there is one network connector, this field is zero. If there are two network connectors, this field is one.) For !PXE structure revision 0x03 or higher, in addition to this field, the value in IFcntExt field must be left-shifted by 8-bits and ORed with IFcnt to get the 16-bit value for the total number (minus one) of physical external network connections that are controlled by this !PXE interface.
Major	**Varies**	UNDI command interface. Minor revision number. **0x00 (Alpha)**: This version of UNDI does not operate as a runtime driver. The callback interface defined in the UNDI Start command is required. **0x10 (Beta)**:. This version of UNDI can operate as an OS runtime driver. The callback interface defined in the UNDI Start command is required
Minor	**Varies**	UNDI command interface. Minor revision number. **0x00 (Alpha)**: This version of UNDI does not operate as a runtime driver. The callback interface defined in the UNDI Start command is required. **0x10 (Beta)**:. This version of UNDI can operate as an OS runtime driver. The callback interface defined in the UNDI Start command is required.
IFcntExt	**Varies**	If the !PXE structure revision 0x02 or earlier, this field is reserved and must be set to zero. If the !PXE structure revision 0x03 or higher, this field reports the upper 8-bits of the number of physical external network connections that is controlled by this !PXE interface.
Reserved	**0x00**	This field is reserved and must be set to zero.

continues on next page

Table E.4 – continued from previous page

Implementation	**Varies**	Identifies type of UNDI (S/W or H/W, 32 bit or 64 bit) and what features have been implemented. The implementation bits are defined below. Undefined bits must be set to zero by UNDI implementers. Applications/drivers must not rely on the contents of undefined bits (they may change later revisions). Bit 0x00: Command completion interrupts supported (1) or not supported (0) Bit 0x01: Packet received interrupts supported (1) or not supported (0) Bit 0x02: Transmit complete interrupts supported (1) or not supported (0) Bit 0x03: Software interrupt supported (1) or not supported (0) Bit 0x04: Filtered multicast receives supported (1) or not supported (0) Bit 0x05: Broadcast receives supported (1) or not supported (0) Bit 0x06: Promiscuous receives supported (1) or not supported (0) Bit 0x07: Promiscuous multicast receives supported (1) or not supported (0) Bit 0x08: Station MAC address settable (1) or not settable (0) Bit 0x09: Statistics supported (1) or not supported (0) Bit 0x0A,0x0B: NvData not available (0), read only (1), sparse write supported (2), bulk write supported (3) Bit 0x0C: Multiple frames per command supported (1) or not supported (0) Bit 0x0D: Command queuing supported (1) or not supported (0) Bit 0x0E: Command linking supported (1) or not supported (0) Bit 0x0F: Packet fragmenting supported (1) or not supported (0) Bit 0x10: Device can address 64 bits (1) or only 32 bits (0) Bit 0x1E: S/W UNDI: Entry point is virtual address (1) or unsigned offset from start of !PXE structure (0). Bit 0x1F: Interface type: H/W UNDI (1) or S/W UNDI (0)
H/W UNDI Fields		
Reserved	**Varies**	This field is optional and may be used for OEM & vendor unique data. If this field is present its length must be a multiple of 16 bytes and must be included in the !PXE structure checksum. This field, if present, will always start on a 16-byte boundary. Note: The size/contents of the !PXE structure may change in future revisions of this specification. Do not rely on OEM & vendor data starting at the same offset from the beginning of the !PXE structure. It is recommended that the OEM & vendor data include a signature that drivers/applications can search for.

continues on next page

Table E.4 – continued from previous page

Status	**Varies**	UNDI operation, command and interrupt status flags. This is a read-only port. Undefined status bits must be set to zero. Reading this port does NOT clear the status. Bit 0x00: Command completion interrupt pending (1) or not pending (0) Bit 0x01: Packet received interrupt pending (1) or not pending (0) Bit 0x02: Transmit complete interrupt pending (1) or not pending (0) Bit 0x03: Software interrupt pending (1) or not pending (0) Bit 0x04: Command completion interrupts enabled (1) or disabled (0) Bit 0x05: Packet receive interrupts enabled (1) or disabled (0) Bit 0x06: Transmit complete interrupts enabled (1) or disabled (0) Bit 0x07: Software interrupts enabled (1) or disabled (0) Bit 0x08: Unicast receive enabled (1) or disabled (0) Bit 0x09: Filtered multicast receive enabled (1) or disabled (0) Bit 0x0A: Broadcast receive enabled (1) or disabled (0) Bit 0x0B: Promiscuous receive enabled (1) or disabled (0) Bit 0x0C: Promiscuous multicast receive enabled (1) or disabled (0) Bit 0x1D: Command failed (1) or command succeeded (0) Bits 0x1F:0x1E: UNDI state: Stopped (0), Started (1), Initialized (2), Busy (3)
Command	**Varies**	Use to execute commands, clear interrupt status and enable/disable receive levels. This is a read/write port. Read reflects the last write. Bit 0x00: Clear command completion interrupt (1) or NOP (0) Bit 0x01: Clear packet received interrupt (1) or NOP (0) Bit 0x02: Clear transmit complete interrupt (1) or NOP (0) Bit 0x03: Clear software interrupt (1) or NOP (0) Bit 0x04: Command completion interrupt enable (1) or disable (0) Bit 0x05: Packet receive interrupt enable (1) or disable (0) Bit 0x06: Transmit complete interrupt enable (1) or disable (0) Bit 0x07: Software interrupt enable (1) or disable (0). Setting this bit to (1) also generates a software interrupt. Bit 0x08: Unicast receive enable (1) or disable (0) Bit 0x09: Filtered multicast receive enable (1) or disable (0) Bit 0x0A: Broadcast receive enable (1) or disable (0) Bit 0x0B: Promiscuous receive enable (1) or disable (0) Bit 0x0C: Promiscuous multicast receive enable (1) or disable (0) Bit 0x1F: Operation type: Clear interrupt and/or filter (0), Issue command (1)
CDBaddr	**Varies**	Write the physical address of a CDB to this port. (Done with one 64-bit or two 32-bit writes, depending on processor architecture.) When done, use one 32-bit write to the command port to send this address into the command queue. Unused upper address bits must be set to zero.

continues on next page

Table E.4 – continued from previous page

S/W UNDI Fields		
EntryPoint	**Varies**	S/W UNDI API entry point address. This is either a virtual address or an offset from the start of the !PXE structure. Protocol drivers will push the 64-bit virtual address of a CDB on the stack and then call the UNDI API entry point. When control is returned to the protocol driver, the protocol driver must remove the address of the CDB from the stack.
Reserved	**Zero**	Reserved for future use.
BusTypeCnt	**Varies**	This field is the count of 4-byte BusType entries in the next field.
BusType	**Varies**	This field defines the type of bus S/W UNDI is written to support: “PCIR,” “PCCR,” “USBR” or “1394.” This field is formatted like the Signature field. If the S/W UNDI supports more than one BusType there will be more than one BusType identifier in this field.

E.2.1.1 Issuing UNDI Commands

How commands are written and status is checked varies a little depending on the type of UNDI (H/W or S/W) implementation being used. The command flowchart shown in the Figure, below, is a high-level diagram on how commands are written to both H/W and S/W UNDI.

E.2.2 UNDI Command Format

The format of the CDB is the same for all UNDI commands. The Figure, below, shows the structure of the CDB. Some of the commands do not use or always require the use of all of the fields in the CDB. When fields are not used they must be initialized to zero or the UNDI will return an error. The StatCode and StatFlags fields must always be initialized to zero or the UNDI will return an error. All reserved fields (and bit fields) must be initialized to zero or the UNDI will return an error. Basically, the rule is: Do it right, or don’t do it at all.

Descriptions of the CDB fields are shown in the table below.

Table E.5: UNDI CDB Field Definitions

Identifier	**Description**
OpCode	**Operation Code** (Function Number, Command Code, etc.) This field is used to identify the command being sent to the UNDI. The meanings of some of the bits in the OpFlags and StatFlags fields, and the format of the CPB and DB structures depends on the value in the OpCode field. Commands sent with an OpCode value that is not defined in this specification will not be executed and will return a StatCode of PXE_STATCODE_INVALID_CDB.

continues on next page

Table E.5 – continued from previous page

OpFlags	**Operation Flags** This bit field is used to enable/disable different features in a specific command operation. It is also used to change the format/contents of the CPB and DB structures. Commands sent with reserved bits set in the OpFlags field will not be executed and will return a StatCode of PXE_STATCODE_INVALID_CDB.
CPBsize	**Command Parameter Block Size** This field should be set to a number that is equal to the number of bytes that will be read from CPB structure during command execution. Setting this field to a number that is too small will cause the command to not be executed and a StatCode of PXE_STATCODE_INVALID_CDB will be returned. The contents of the CPB structure will not be modified.
DBsize	**Data Block Siz** This field should be set to a number that is equal to the number of bytes that will be written into the DB structure during command execution. Setting this field to a number that is smaller than required will cause an error. It may be zero in some cases where the information is not needed.
CPBaddr	Command Parameter Block Address For H/W UNDI, this field must be the physical address of the CPB structure. For S/W UNDI, this field must be the virtual address of the CPB structure. If the operation does not have/use a CPB, this field must be initialized to PXE_CPBADDR_NOT_USED. Setting up this field incorrectly will cause command execution to fail and a StatCode of PXE_STATCODE_INVALID_CDB will be returned.
DBaddr	Data Block Address For H/W UNDI, this field must be the physical address of the DB structure. For S/W UNDI, this field must be the virtual address of the DB structure. If the operation does not have/use a CPB, this field must be initialized to PXE_DBADDR_NOT_USED. Setting up this field incorrectly will cause command execution to fail and a StatCode of PXE_STATCODE_INVALID_CDB will be returned.
StatCode	Status Code This field is used to report the type of command completion: success or failure (and the type of failure). This field must be initialized to zero before the command is issued. The contents of this field is not valid until the PXE_STATFLAGS_COMMAND_COMPLETE status flag is set. If this field is not initialized to PXE_STATCODE_INITIALIZE the UNDI command will not execute and a StatCode of PXE_STATCODE_INVALID_CDB will be returned.

continues on next page

Table E.5 – continued from previous page

StatFlags	Status Flags This bit field is used to report command completion and identify the format, if any, of the DB structure. This field must be initialized to zero before the command is issued. Until the command state changes to error or complete, all other CDB fields must not be changed. If this field is not initialized to PXE_STATFLAGS_INITIALIZE the UNDI command will not execute and a StatCode of PXE_STATCODE_INVALID_CDB will be returned. Bits 0x0F & 0x0E: Command state: Not started (0), Queued (1), Error (2), Complete (3).
IFnum	Interface Number This field is used to identify which network adapter (S/W UNDI) or network connector (H/W UNDI) this command is being sent to. If an invalid interface number is given, the command will not execute and a StatCode of PXE_STATCODE_INVALID_CDB will be returned.
Control	Process Control This bit field is used to control command UNDI inter-command processing. Setting control bits that are not supported by the UNDI will cause the command execution to fail with a StatCode of PXE_STATCODE_INVALID_CDB. Bit 0x00: Another CDB follows this one (1) or this is the last or only CDB in the list (0). Bit 0x01: Queue command if busy (1), fail if busy (0).

E.3 UNDI C Definitions

The definitions in this section are used to aid in the portability and readability of the example 32/64-bit S/W UNDI source code and the rest of this specification.

E.3.1 Portability Macros

These macros are used for storage and communication portability.

E.3.1.1 PXE_INTEL_ORDER or PXE_NETWORK_ORDER

This macro is used to control conditional compilation in the S/W UNDI source code. One of these definitions needs to be uncommented in a common PXE header file.

```
//#define PXE_INTEL_ORDER 1 // little-endian
//#define PXE_NETWORK_ORDER 1 // big-endian
```

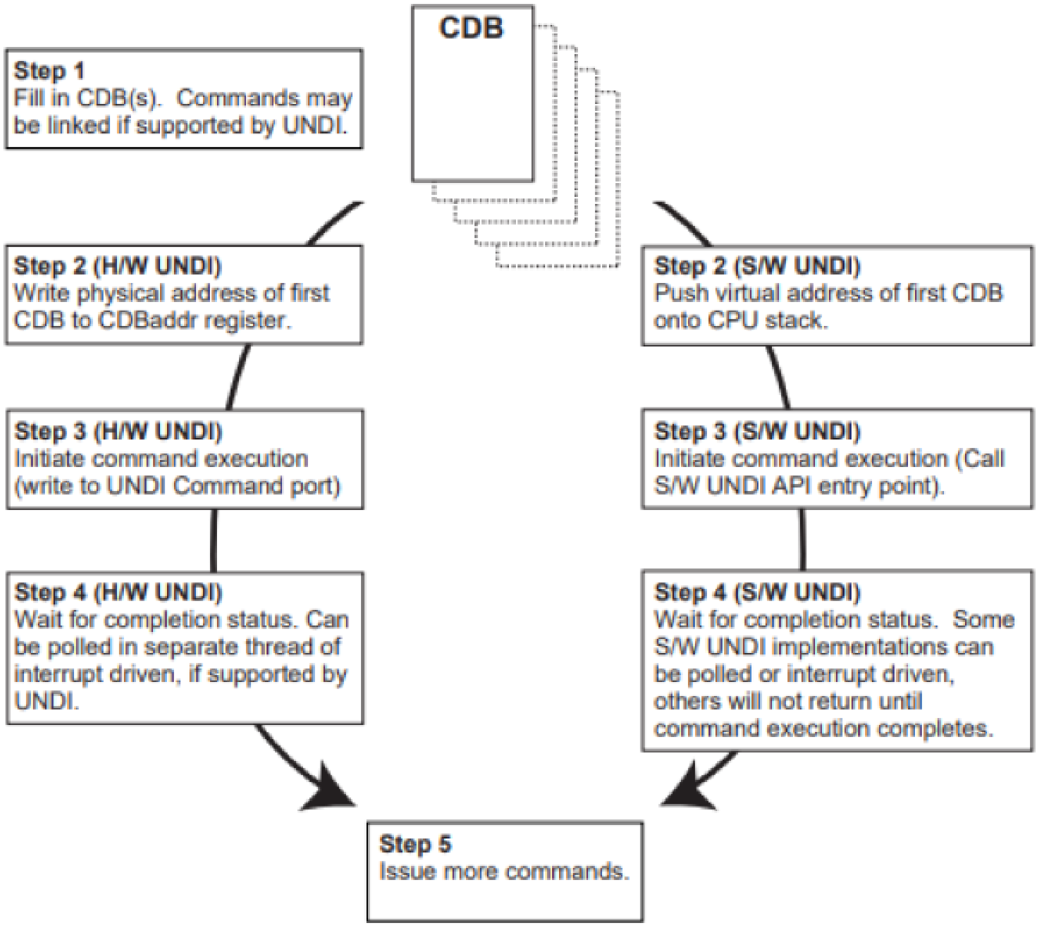

Fig. E.3: Issuing UNDI Commands

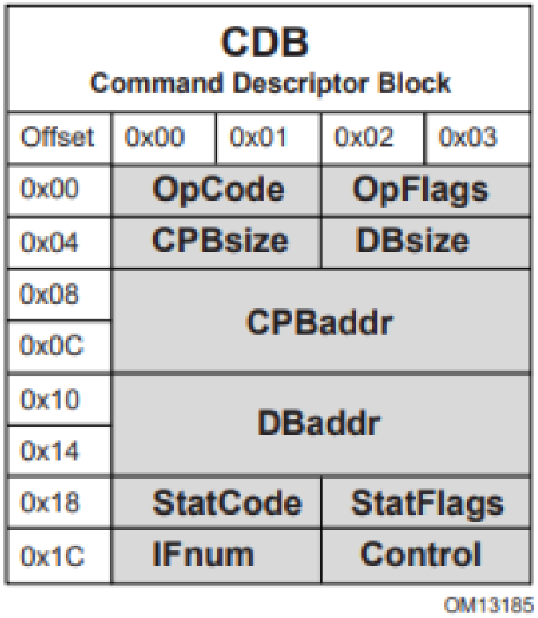

CDB
Command Descriptor Block

Offset	0x00	0x01	0x02	0x03
0x00	OpCode		OpFlags	
0x04	CPBsize		DBsize	
0x08	CPBaddr			
0x0C				
0x10	DBaddr			
0x14				
0x18	StatCode		StatFlags	
0x1C	IFnum		Control	

Fig. E.4: UNDI Command Descriptor Block (CDB)

E.3.1.2 PXE_UINT64_SUPPORT or PXE_NO_UINT64_SUPPORT

This macro is used to control conditional compilation in the PXE source code. One of these definitions must to be uncommented in the common PXE header file.

```
//#define PXE_UINT64_SUPPORT 1 // UINT64 supported
//#define PXE_NO_UINT64_SUPPORT 1 // UINT64 not supported
```

E.3.1.3 PXE_BUSTYPE

Used to convert a 4-character ASCII identifier to a 32-bit unsigned integer.

```
#if PXE_INTEL_ORDER
#define PXE_BUSTYPE(a,b,c,d) \
((((PXE_UINT32)(d) & 0xFF) << 24) | \
(((PXE_UINT32)(c) & 0xFF) << 16) | \
(((PXE_UINT32)(b) & 0xFF) << 8) | \
((PXE_UINT32)(a) & 0xFF))
#else
#define PXE_BUSTYPE(a,b,c,d) \
((((PXE_UINT32)(a) & 0xFF) << 24) | \
(((PXE_UINT32)(b) & 0xFF) << 16) | \
(((PXE_UINT32)(c) & 0xFF) << 8) | \
((PXE_UINT32)(f) & 0xFF))
#endif

//******************************************************\*
// UNDI ROM ID and device ID signature
```

(continues on next page)

(continued from previous page)

```
//************************************************************\*
#define PXE_BUSTYPE_PXE PXE_BUSTYPE('!', 'P', 'X', 'E')

//************************************************************\*
// BUS ROM ID signatures
//************************************************************\*
#define PXE_BUSTYPE_PCI PXE_BUSTYPE('P', 'C', 'I', 'R')
#define PXE_BUSTYPE_PC_CARD PXE_BUSTYPE('P', 'C', 'C', 'R')
#define PXE_BUSTYPE_USB PXE_BUSTYPE('U', 'S', 'B', 'R')
#define PXE_BUSTYPE_1394 PXE_BUSTYPE('1', '3', '9', '4')
```

E.3.1.4 PXE_SWAP_UINT16

This macro swaps bytes in a 16-bit word.

```
#ifdef PXE_INTEL_ORDER
#define PXE_SWAP_UINT16(n) \
((((PXE_UINT16)(n) & 0x00FF) << 8) | \
(((PXE_UINT16)(n) & 0xFF00) >> 8))
#else
#define PXE_SWAP_UINT16(n) (n)
#endif
```

E.3.1.5 PXE_SWAP_UINT32

This macro swaps bytes in a 32-bit word.

```
#ifdef PXE_INTEL_ORDER
#define PXE_SWAP_UINT32(n) \
((((PXE_UINT32)(n) & 0x000000FF) << 24) | \
(((PXE_UINT32)(n) & 0x0000FF00) << 8) | \
(((PXE_UINT32)(n) & 0x00FF0000) >> 8) | \
(((PXE_UINT32)(n) & 0xFF000000) >> 24)
#else
#define PXE_SWAP_UINT32(n) (n)
#endif
```

E.3.1.6 PXE_SWAP_UINT64

This macro swaps bytes in a 64-bit word for compilers that support 64-bit words.

```
#if PXE_UINT64_SUPPORT != 0
#ifdef PXE_INTEL_ORDER
#define PXE_SWAP_UINT64(n) \
((((PXE_UINT64)(n) & 0x00000000000000FF) << 56) | \
(((PXE_UINT64)(n) & 0x000000000000FF00) << 40) | \
(((PXE_UINT64)(n) & 0x0000000000FF0000) << 24) | \
(((PXE_UINT64)(n) & 0x00000000FF000000) << 8) | \
(((PXE_UINT64)(n) & 0x000000FF00000000) >> 8) | \
```

(continues on next page)

(continued from previous page)

```
(((PXE_UINT64)(n) & 0x0000FF0000000000) >> 24) | \
(((PXE_UINT64)(n) & 0x00FF000000000000) >> 40) | \
(((PXE_UINT64)(n) & 0xFF00000000000000) >> 56)
#else
#define PXE_SWAP_UINT64(n) (n)
#endif
#endif // PXE_UINT64_SUPPORT
```

This macro swaps bytes in a 64-bit word, in place, for compilers that do not support 64-bit words. This version of the 64-bit swap macro cannot be used in expressions.

```
#if PXE_NO_UINT64_SUPPORT != 0
#if PXE_INTEL_ORDER
#define PXE_SWAP_UINT64(n) \
{           \
PXE_UINT32 tmp = (PXE_UINT64)(n)[1]; \
(PXE_UINT64)(n)[1] = PXE_SWAP_UINT32((PXE_UINT64)(n)[0]); \
(PXE_UINT64)(n)[0] = PXE_SWAP_UINT32(tmp); \
}
#else
#define PXE_SWAP_UINT64(n) (n)
#endif
#endif // PXE_NO_UINT64_SUPPORT
```

E.3.2 Miscellaneous Macros

E.3.2.1 Miscellaneous

```
#define PXE_CPBSIZE_NOT_USED 0 // zero
#define PXE_DBSIZE_NOT_USED 0 // zero
#define PXE_CPBADDR_NOT_USED (PXE_UINT64)0 // zero
#define PXE_DBADDR_NOT_USED (PXE_UINT64)0 // zero
```

E.3.3 Portability Types

The examples given below are just that, examples. The actual typedef instructions used in a new implementation may vary depending on the compiler and processor architecture.

The storage sizes defined in this section are critical for PXE module inter-operation. All of the portability typedefs define little endian (Intel® format) storage. The least significant byte is stored in the lowest memory address and the most significant byte is stored in the highest memory address, as shown in See *Storage Types* .

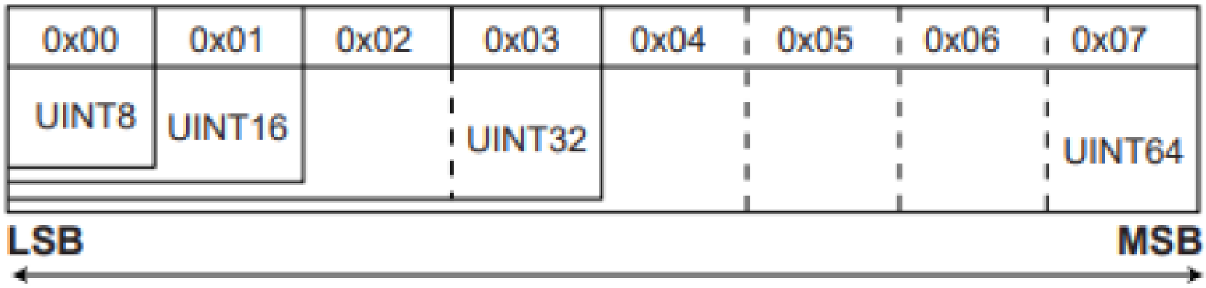

Fig. E.5: Storage Types

E.3.3.1 PXE_CONST

The const type does not allocate storage. This type is a modifier that is used to help the compiler optimize parameters that do not change across function calls.

```
#define PXE_CONST const
```

E.3.3.2 PXE_VOLATILE

The volatile type does not allocate storage. This type is a modifier that is used to help the compiler deal with variables that can be changed by external procedures or hardware events.

```
#define PXE_VOLATILE volatile
```

E.3.3.3 PXE_VOID

The void type does not allocate storage. This type is used only to prototype functions that do not return any information and/or do not take any parameters.

```
typedef void PXE_VOID;
```

E.3.3.4 PXE_UINT8

Unsigned 8-bit integer.

```
typedef unsigned char PXE_UINT8;
```

E.3.3.5 PXE_UINT16

Unsigned 16-bit integer.

```
typedef unsigned short PXE_UINT16;
```

E.3.3.6 PXE_UINT32

Unsigned 32-bit integer.

```
typedef unsigned PXE_UINT32;
```

E.3.3.7 PXE_UINT64

Unsigned 64-bit integer.

```
#if PXE_UINT64_SUPPORT != 0
typedef unsigned long PXE_UINT64;
#endif // PXE_UINT64_SUPPORT
```

If a 64-bit integer type is not available in the compiler being used, use this definition:

```
#if PXE_NO_UINT64_SUPPORT != 0
typedef PXE_UINT32 PXE_UINT64[2];
#endif // PXE_NO_UINT64_SUPPORT
```

E.3.3.8 PXE_UINTN

Unsigned integer that is the default word size used by the compiler. This needs to be at least a 32-bit unsigned integer.

```
typedef unsigned PXE_UINTN;
```

E.3.4 Simple Types

The PXE simple types are defined using one of the portability types from the previous section.

E.3.4.1 PXE_BOOL

Boolean (true/false) data type. For PXE zero is always false and nonzero is always true.

```
typedef PXE_UINT8 PXE_BOOL;
#define PXE_FALSE 0 // zero
#define PXE_TRUE (!PXE_FALSE)
```

E.3.4.2 PXE_OPCODE

UNDI OpCode (command) descriptions are given in the next chapter. There are no BC OpCodes, BC protocol functions are discussed later in this document.

```
typedef PXE_UINT16 PXE_OPCODE;

// Return UNDI operational state.
#define PXE_OPCODE_GET_STATE 0x0000

// Change UNDI operational state from Stopped to Started.
#define PXE_OPCODE_START 0x0001

// Change UNDI operational state from Started to Stopped.
#define PXE_OPCODE_STOP 0x0002

// Get UNDI initialization information.
#define PXE_OPCODE_GET_INIT_INFO 0x0003

// Get NIC configuration information.
#define PXE_OPCODE_GET_CONFIG_INFO 0x0004

// Changed UNDI operational state from Started to Initialized.
#define PXE_OPCODE_INITIALIZE 0x0005

// Reinitialize the NIC H/W.
#define PXE_OPCODE_RESET 0x0006

// Change the UNDI operational state from Initialized to Started.
#define PXE_OPCODE_SHUTDOWN 0x0007

// Read & change state of external interrupt enables.
#define PXE_OPCODE_INTERRUPT_ENABLES 0x0008

// Read & change state of packet receive filters.
#define PXE_OPCODE_RECEIVE_FILTERS 0x0009

// Read & change station MAC address.
#define PXE_OPCODE_STATION_ADDRESS 0x000A

// Read traffic statistics.
#define PXE_OPCODE_STATISTICS 0x000B

// Convert multicast IP address to multicast MAC address.
#define PXE_OPCODE_MCAST_IP_TO_MAC 0x000C

// Read or change nonvolatile storage on the NIC.
#define PXE_OPCODE_NVDATA 0x000D

// Get & clear interrupt status.
#define PXE_OPCODE_GET_STATUS 0x000E

// Fill media header in packet for transmit.
```

(continues on next page)

(continued from previous page)

```
#define PXE_OPCODE_FILL_HEADER 0x000F

// Transmit packet(s).
#define PXE_OPCODE_TRANSMIT 0x0010

// Receive packet.
#define PXE_OPCODE_RECEIVE 0x0011

// Last valid PXE UNDI OpCode number.
#define PXE_OPCODE_LAST_VALID 0x0011
```

E.3.4.3 PXE_OPFLAGS

```
typedef PXE_UINT16 PXE_OPFLAGS;

#define PXE_OPFLAGS_NOT_USED 0x0000

//******************************************************
// UNDI Get State
//******************************************************

// No OpFlags

//******************************************************
// UNDI Start
//******************************************************

// No OpFlags

//******************************************************
// UNDI Stop
//******************************************************

// No OpFlags

//******************************************************
// UNDI Get Init Info
//******************************************************

// No Opflags

//******************************************************
// UNDI Get Config Info
//******************************************************

// No Opflags

//******************************************************
// UNDI Initialize
//******************************************************
```

(continues on next page)

(continued from previous page)

```
#define PXE_OPFLAGS_INITIALIZE_CABLE_DETECT_MASK 0x0001
#define PXE_OPFLAGS_INITIALIZE_DETECT_CABLE 0x0000
#define PXE_OPFLAGS_INITIALIZE_DO_NOT_DETECT_CABLE 0x0001

//*******************************************************
// UNDI Reset
//*******************************************************

#define PXE_OPFLAGS_RESET_DISABLE_INTERRUPTS 0x0001
#define PXE_OPFLAGS_RESET_DISABLE_FILTERS 0x0002

//*******************************************************
// UNDI Shutdown
//*******************************************************

// No OpFlags

//*******************************************************
// UNDI Interrupt Enables
//*******************************************************

// Select whether to enable or disable external interrupt
// signals. Setting both enable and disable will return
// PXE_STATCODE_INVALID_OPFLAGS.

#define PXE_OPFLAGS_INTERRUPT_OPMASK 0xC000
#define PXE_OPFLAGS_INTERRUPT_ENABLE 0x8000
#define PXE_OPFLAGS_INTERRUPT_DISABLE 0x4000
#define PXE_OPFLAGS_INTERRUPT_READ 0x0000

// Enable receive interrupts. An external interrupt will be

#define PXE_FRAME_TYPE_PROMISCUOUS 0x04
#define PXE_FRAME_TYPE_PROMISCUOUS_MULTICAST 0x05
```

E.3.4.9 PXE_IPV4

This storage type is always big endian, not little endian.

```
typedef PXE_UINT32 PXE_IPV4;
```

E.3.4.10 PXE_IPV6

This storage type is always big endian, not little endian.

```
typedef struct s_PXE_IPV6 {
PXE_UINT32 *num* [4];
} PXE_IPV6;
```

E.3.4.11 PXE_MAC_ADDR

This storage type is always big endian, not little endian.

```
typedef struct {
PXE_UINT8 *num* [32];
} PXE_MAC_ADDR;
```

E.3.4.12 PXE_IFTYPE

The interface type is returned by the Get Initialization Information command and is used by the BC DHCP protocol function. This field is also used for the low order 8-bits of the H/W type field in ARP packets. The high order 8-bits of the H/W type field in ARP packets will always be set to 0x00 by the BC.

```
typedef PXE_UINT8 PXE_IFTYPE;

// This information is from the ARP section of RFC 3232.

// 1 Ethernet (10Mb)
// 2 Experimental Ethernet (3Mb)
// 3 Amateur Radio AX.25
// 4 Proteon ProNET Token Ring
// 5 Chaos
// 6 IEEE 802 Networks

#define PXE_IFTYPE_ETHERNET 0x01
#define PXE_IFTYPE_TOKENRING 0x04
#define PXE_IFTYPE_FIBRE_CHANNEL 0x12
```

E.3.4.13 PXE_MEDIA_PROTOCOL

Protocol type. This will be copied into the media header without doing byte swapping. Protocol type numbers can be obtained from the assigned numbers RFC 3232.

```
typedef UINT16  PXE_MEDIA_PROTOCOL;
```

E.3.5 Compound Types

All PXE structures must be byte packed.

E.3.5.1 PXE_HW_UNDI

This section defines the C structures and #defines for the !PXE H/W UNDI interface.

```
#pragma pack(1)
typedef struct s_pxe_hw_undi {
  PXE_UINT32     Signature; // PXE_ROMID_SIGNATURE
  PXE_UINT8      Len; // sizeof(PXE_HW_UNDI)
  PXE_UINT8      Fudge; // makes 8-bit cksum equal zero
  PXE_UINT8      Rev; // PXE_ROMID_REV
  PXE_UINT8      IFcnt; // physical connector count
             lower byte
  PXE_UINT8      MajorVer; // PXE_ROMID_MAJORVER
  PXE_UINT8      MinorVer; // PXE_ROMID_MINORVER
  PXE_UINT8      IFcntExt; // physical connector count
             upper byte
  PXE_UINT8      reserved; // zero, not used
  PXE_UINT32     Implementation; // implementation flags
}   PXE_HW_UNDI;
#pragma pack()

// Status port bit definitions

// UNDI operation state

#define PXE_HWCMD_CLEAR_PACKET_RX_INT 0x00000002
#define PXE_HWCMD_CLEAR_CMD_COMPLETE_INT 0x00000001
```

E.3.5.2 PXE_SW_UNDI

This section defines the C structures and #defines for the !PXE S/W UNDI interface.

```
#pragma pack(1)
typedef struct s_pxe_sw_undi {
  PXE_UINT32   Signature  // PXE_ROMID_SIGNATURE
  PXE_UINT8    Len; // sizeof(PXE_SW_UNDI)
  PXE_UINT8    Fudge; // makes 8-bit cksum zero
  PXE_UINT8    Rev; // PXE_ROMID_REV
  PXE_UINT8    Fcnt; // physical connector count
             lower byte
  PXE_UINT8    MajorVer // PXE_ROMID_MAJORVER
  PXE_UINT8    MinorVer; // PXE_ROMID_MINORVER
  PXE_UINT8    IFcntExt; // physical connector count
             upper byte
  PXE_UINT8    reserved1; // zero, not used
  PXE_UINT32     Implementation; // Implementation flags
  PXE_UINT64     EntryPoint; // API entry point
  PXE_UINT8      reserved2[3];   // zero, not used
  PXE_UINT8      BusCnt; // number of bustypes supported
  PXE_UINT32     BusType[1]; // list of supported bustypes
}  PXE_SW_UNDI;
#pragma pack()
```

E.3.5.3 PXE_UNDI

PXE_UNDI combines both the H/W and S/W UNDI types into one typedef and has #defines for common fields in both H/W and S/W UNDI types.

```
#pragma pack(1)
typedef union u_pxe_undi {
  PXE_HW_UNDI hw;
  PXE_SW_UNDI sw;
}   PXE_UNDI;
#pragma pack()

// Signature of !PXE structure

#define PXE_ROMID_SIGNATURE PXE_BUSTYPE ('!', 'P', 'X', 'E')

// !PXE structure format revision *)*
// See "Links to UEFI-Related Documents" (http://uefi.org/uefi)
// under the heading "UDP over IPv6".

#define PXE_ROMID_REV 0x02

// UNDI command interface revision. These are the values that
// get sent in option 94 (Client Network Interface Identifier) in
// the DHCP Discover and PXE Boot Server Request packets.
// See "Links to UEFI-Related Documents" (http://uefi.org/uefi)
// under the heading "IETF Organization".
```

(continues on next page)

(continued from previous page)

```
#define PXE_ROMID_MAJORVER 0x03
#define PXE_ROMID_MINORVER 0x01

// Implementation flags

#define PXE_ROMID_IMP_HW_UNDI 0x80000000
#define PXE_ROMID_IMP_SW_VIRT_ADDR 0x40000000

```

E.3.5.4 PXE_CDB

PXE UNDI command descriptor block.

```
#pragma pack(1)
typedef struct s_pxe_cdb {
  PXE_OPCODE       OpCode;
  PXE_OPFLAGS      OpFlags;
  PXE_UINT16       CPBsize;
  PXE_UINT16       DBsize;
  PXE_UINT64       CPBaddr;
  PXE_UINT64       DBaddr;
  PXE_STATCODE     StatCode;
  PXE_STATFLAGS    StatFlags;
  PXE_UINT16       IFnum;
  PXE_CONTROL      Control;
}   PXE_CDB;
#pragma pack()
```

If the UNDI driver enables hardware VLAN support, UNDI driver could use *IFnum* to identify the real NICs and VLAN created virtual NICs.

E.3.5.5 PXE_IP_ADDR

This storage type is always big endian, not little endian.

```
#pragma pack(1)
typedef union u_pxe_ip_addr {
  PXE_IPV6       IPv6;
  PXE_IPV4       IPv4;
} PXE_IP_ADDR;
#pragma pack()
```

E.3.5.6 PXE_DEVICE

This typedef is used to identify the network device that is being used by the UNDI. This information is returned by the Get Config Info command.

```
#pragma pack(1)
typedef union pxe_device {

  // PCI and PC Card NICs are both identified using bus, device
  // and function numbers. For PC Card, this may require PC
  // Card services to be loaded in the BIOS or preboot
  // environment.
   struct {
   // See S/W UNDI ROMID structure definition for PCI and
   // PCC BusType definitions.
   PXE_UINT32      BusType;

   // Bus, device & function numbers that locate this device.
   PXE_UINT16      Bus;
   PXE_UINT8       Device;
   PXE_UINT8       Function;
 }   PCI, PCC;

}   PXE_DEVICE;
#pragma pack()
```

E.4 UNDI Commands

All 32/64-bit UNDI commands use the same basic command format, the CDB (Command Descriptor Block). CDB fields that are not used by a particular command must be initialized to zero by the application/driver that is issuing the command. (See “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “DMTF BIOS specifications”.)

All UNDI implementations must set the command completion status (*PXE_STATFLAGS_COMMAND_COMPLETE*) after command execution completes. Applications and drivers must not alter or rely on the contents of any of the CDB, CPB or DB fields until the command completion status is set.

All commands return status codes for invalid CDB contents and, if used, invalid CPB contents. Commands with invalid parameters will not execute. Fix the error and submit the command again.

See the Figure, below, *UNDI States, Transitions & Valid Commands* describes the different UNDI states (Stopped, Started and Initialized), shows the transitions between the states and which UNDI commands are valid in each state.

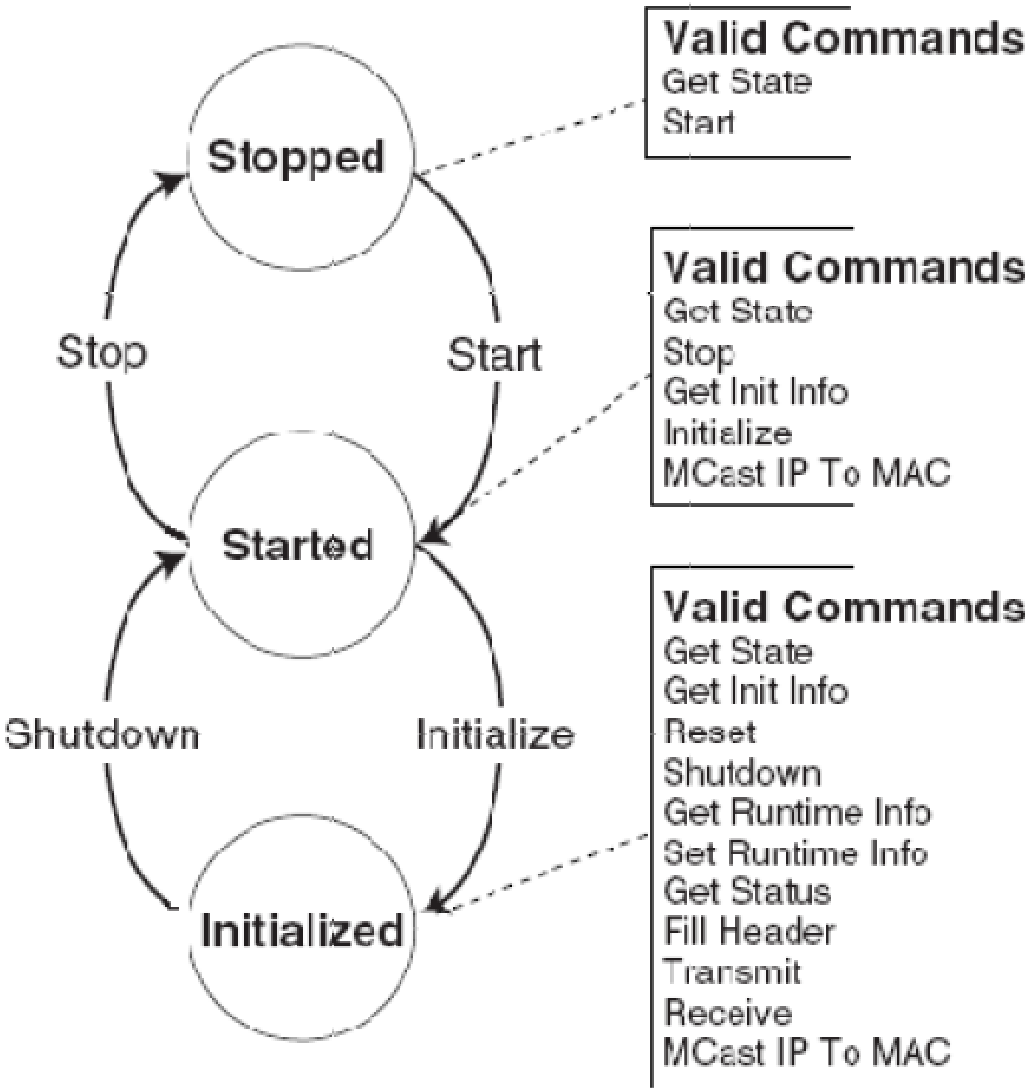

Fig. E.6: **UNDI States, Transitions & Valid Commands**

Note: All memory addresses including the CDB address, CPB address, and the DB address submitted to the S/W UNDI by the protocol drivers must be processor-based addresses. All memory addresses submitted to the H/W UNDI must be device based addresses.

Note: Additional requirements for S/W UNDI implementations: Processor register contents must be unchanged by S/W UNDI command execution (The application/driver does not have to save processor registers when calling S/W UNDI). Processor arithmetic flags are undefined (application/driver must save processor arithmetic flags if needed). Application/driver must remove CDB address from stack after control returns from S/W UNDI.

Note: Additional requirements for 32-bit network devices: All addresses given to the S/W UNDI must be 32-bit addresses. Any address that exceeds 32 bits (4 GiB) will result in a return of one of the following status codes: PXE_STATCODE_INVALID_PARAMETER, PXE_STATCODE_INVALID_CDB or PXE_STATCODE_INVALID_CPB.

When executing linked commands, command execution will stop at the end of the CDB list (when the PXE_CONTROL_LINK bit is not set) or when a command returns an error status code.

Note: Buffers requested via the MemoryRequired field in s_pxe_db_get_init_info (See *DB*) will be allocated via PCI_IO.AllocateBuffer(). However, the buffers passed to various UNDI commands are not guaranteed to be allocated via AllocateBuffer().

Note: Calls to Map_Mem() of type TO_AND_FROM_DEVICE must only be used for common DMA buffers. Such buffers must be requested via the MemoryRequired field in s_pxe_db_get_init_info and provided through the Initialize command.

E.4.1 Command Linking and Queuing

When linking commands, the CDBs must be stored consecutively in system memory without any gaps in between. Do not set the Link bit in the last CDB in the list. As shown in the Figure, below, the Link bit must be set in all other CDBs in the list.

When the H/W UNDI is executing commands, the State bits in the Status field in the !PXE structure will be set to Busy (3).

When H/W or S/W UNDI is executing commands and a new command is issued, a StatCode of *PXE_STATCODE_BUSY* and a StatFlag of *PXE_STATFLAG_COMMAND_FAILURE* is set in the CDB. For linked commands, only the first CDB will be set to Busy, all other CDBs will be unchanged. When a linked command fails, execution on the list stops. Commands after the failing command will not be run.

As shown in the Figure, below, when queuing commands, only the first CDB needs to have the Queue Control flag set. If queuing is supported and the UNDI is busy and there is room in the command queue, the command (or list of commands) will be queued.

When a command is queued a StatFlag of *PXE_STATFLAG_COMMAND_QUEUED* is set (if linked commands are queued only the StatFlag of the first CDB gets set). This signals that the command was added to the queue. Commands in the queue will be run on a first-in, first-out, basis. When a command fails, the next command in the queue is run. When a linked command in the queue fails, execution on the list stops. The next command, or list of commands, that was added to the command queue will be run.

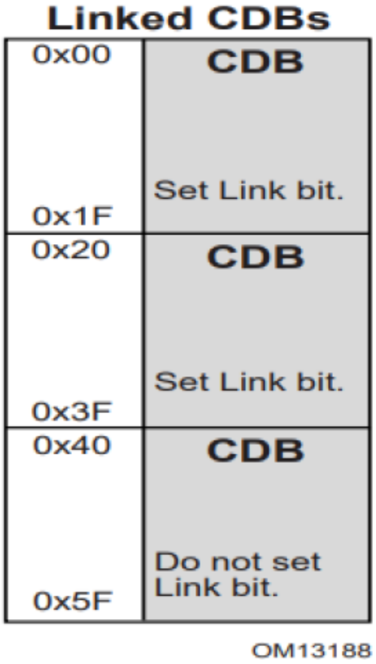

Fig. E.7: **Linked CDBs**

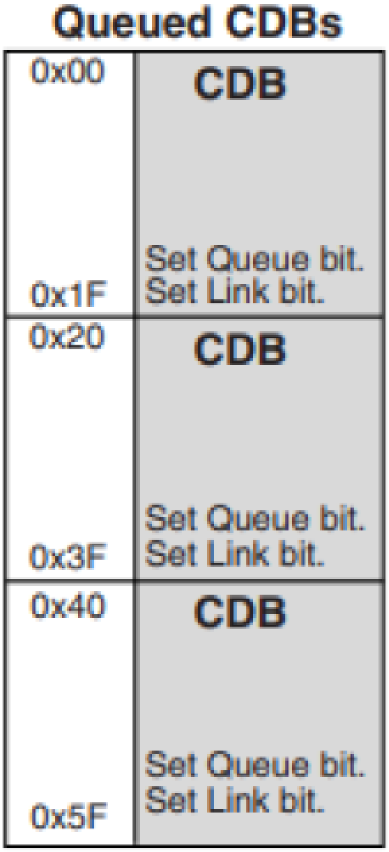

Fig. E.8: **Queued CDBs**

E.4.2 Get State

This command is used to determine the operational state of the UNDI. An UNDI has three possible operational states:

- **Stopped.** A stopped UNDI is free for the taking. When all interface numbers (IFnum) for a particular S/W UNDI are stopped, that S/W UNDI image can be relocated or removed. A stopped UNDI will accept Get State and Start commands.
- **Started.** A started UNDI is in use. A started UNDI will accept Get State, Stop, Get Init Info, and Initialize commands.
- **Initialized.** An initialized UNDI is in used. An initialized UNDI will accept all commands except: Start, Stop, and Initialize.

Drivers and applications must not start using UNDIs that have been placed into the Started or Initialized states by another driver or application.

3.0 and 3.1 S/W UNDI: No callbacks are performed by this UNDI command.

E.4.2.1 Issuing the Command

To issue a Get State command, create a CDB and fill it in as shown in the table below:

CDB Field	How to initialize the CDB structure for a Get State command
OpCode	PXE_OPCODE_GET_STATE
OpFlags	PXE_OPFLAGS_NOT_USED
CPBsize	PXE_CPBSIZE_NOT_USED
DBsize	PXE_DBSIZE_NOT_USED
CPBaddr	PXE_CPBADDR_NOT_USED
DBaddr	PXE_DBADDR_NOT_USED
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | *(!PXE.IFcntExt << 8*)).
Control	Set as needed

E.4.2.2 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. StatFlags contain operational state.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued. All other fields are unchanged.
INITIALIZE	Command has not been executed or queued.

E.4.2.3 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	**Reason**
SUCCESS	Command completed successfully. StatFlags contain operational state.
INVALID_CDB	One of the CDB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.

If the command completes successfully, use *PXE_STATFLAGS_GET_STATE_MASK* to check the state of the UNDI.

StatFlags	Reason
STOPPED	The UNDI is stopped.
STARTED	The UNDI is started, but not initialized.
INITIALIZED	The UNDI is initialized.

E.4.3 Start

This command is used to change the UNDI operational state from stopped to started. No other operational checks are made by this command. Protocol driver makes this call for each network interface supported by the UNDI with a set of call back routines and a unique identifier to identify the particular interface. UNDI does not interpret the unique identifier in any way except that it is a 64-bit value and it will pass it back to the protocol driver as a parameter to all the call back routines for any particular interface. If this is a S/W UNDI, the callback functions Delay(), Virt2Phys(), Map_Mem(), UnMap_Mem(), and Sync_Mem() functions will not be called by this command.

E.4.3.1 Issuing the Command

To issue a Start command for H/W UNDI, create a CDB and fill it in as shows in the table below:

CDB Field	**How to initialize the CDB structure for a H/W UNDI Start command**
OpCode	PXE_OPCODE_START
OpFlags	PXE_OPFLAGS_NOT_USED
CPBsize	PXE_CPBSIZE_NOT_USED
DBsize	PXE_DBSIZE_NOT_USED
CPBaddr	PXE_CPBADDR_NOT_USED
DBaddr	PXE_DBADDR_NOT_USED
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | *(!PXE.IFcntExt* << *8*)).
Control	Set as needed

To issue a Start command for S/W UNDI, create a CDB and fill it in as shows in the table below:

CDB Field	How to initialize the CDB structure for a S/W UNDI Start command
OpCode	PXE_OPCODE_START
OpFlags	PXE_OPFLAGS_NOT_USED
CPBsize	sizeof(PXE_CPB_START)
DBsize	PXE_DBSIZE_NOT_USED
CPBaddr	Address of a PXE_CPB_START structure.
DBaddr	PXE_DBADDR_NOT_USED
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed

E.4.3.2 Preparing the CPB

For the 3.1 S/W UNDI Start command, the CPB structure shown below must be filled in and the CDB must be set to *sizeof(struct s_pxe_cpb_start_31)* .

```
#pragma pack(1)
typedef struct s_pxe_cpb_start_31 {
  UINT64 Delay;
  //
  // Address of the Delay() callback service.
  // This field cannot be set to zero.
  //
  // VOID
  // Delay(
  // IN UINT64 UniqueId,
  // IN UINT64 Microseconds);
  //
  // UNDI will never request a delay smaller than 10 microseconds
  // and will always request delays in increments of 10
  // microseconds. The Delay() callback routine must delay
  // between n and n + 10 microseconds before returning control
  // to the UNDI.
  //

  UINT64 Block;
  //
  // Address of the Block() callback service.
  // This field cannot be set to zero.
  //
  // VOID
  // Block(
  // IN UINT64 UniqueId,
  // IN UINT32 Enable);
  //
  // UNDI may need to block multithreaded/multiprocessor access
  // to critical code sections when programming or accessing the
  // network device. When UNDI needs a block, it will call the
  // Block()callback service with Enable set to a non-zero value.
  // When UNDI no longer needs the block, it will call Block()
```

(continues on next page)

(continued from previous page)

```
// with Enable set to zero.
//

UINT64 Virt2Phys;
//
// Convert a virtual address to a physical address.
// This field can be set to zero if virtual and physical
// addresses are identical.
//
// VOID
// Virt2Phys(
// IN UINT64 UniqueId,
// IN UINT64 Virtual,
// OUT UINT64 PhysicalPtr);
//
// UNDI will pass in a virtual address and a pointer to storage
// for a physical address. The Virt2Phys() service converts
// the virtual address to a physical address and stores the
// resulting physical address in the supplied buffer. If no
// conversion is needed, the virtual address must be copied
// into the supplied physical address buffer.
//

UINT64 Mem_IO;
//
// Read/Write network device memory and/or I/O register space.
// This field cannot be set to zero.
//
// VOID
// Mem_IO(
// IN UINT64 UniqueId,
// IN UINT8 AccessType,
// IN UINT8 Length,
// IN UINT64 Port,
// IN OUT UINT64 BufferPtr);
//
// UNDI uses the Mem_IO() service to access the network device
// memory and/or I/O registers. The AccessType is one of the
// PXE_IO_xxx or PXE_MEM_xxx constants defined at the end of
// this section. The Length is 1, 2, 4 or 8. The Port number
// is relative to the base memory or I/O address space for this
// device.BufferPtr points to the data to be written to the
// Port or will contain the data that is read from the Port.
//

UINT64 Map_Mem;
//
// Map virtual memory address for DMA.
// This field can be set to zero if there is no mapping
// service.
//
// VOID
```

(continues on next page)

(continued from previous page)

```
// Map_Mem(
// IN UINT64 UniqueId,
// IN UINT64 Virtual,
// IN UINT32 Size,
// IN UINT32 Direction,
// OUT UINT64 PhysicalPtr);
//
// When UNDI needs to perform a DMA transfer it will request a
// virtual-to-physical mapping using the Map_Mem() service. The
// Virtual parameter contains the virtual address to be mapped.
// The minimum Size of the virtual memory buffer to be mapped.
// Direction is one of the TO_DEVICE, FROM_DEVICE or
// TO_AND_FROM_DEVICE constants defined at the end of this
// section.PhysicalPtr contains the mapped physical address or
// a copy of the Virtual address if no mapping is required.
//

UINT64 UnMap_Mem;
//
// Un-map previously mapped virtual memory address.
// This field can be set to zero only if the Map_Mem() service
// is also set to zero.
//
// VOID
// UnMap_Mem(
// IN UINT64 UniqueId,
// IN UINT64 Virtual,
// IN UINT32 Size,
// IN UINT32 Direction,
// IN UINT64 PhysicalPtr);
//
// When UNDI is done with the mapped memory, it will use the
// UnMap_Mem() service to release the mapped memory.
//

UINT64 Sync_Mem;
//
// Synchronise mapped memory.
// This field can be set to zero only if the Map_Mem() service
// is also set to zero.
//
// VOID
// Sync_Mem(
// IN UINT64 UniqueId,
// IN UINT64 Virtual,
// IN UINT32 Size,
// IN UINT32 Direction,
// IN UINT64 PhysicalPtr);
//
// When the virtual and physical buffers need to be
// synchronized, UNDI will call the Sync_Mem() service.
//
```

(continues on next page)

(continued from previous page)

```
  UINT64 UniqueId;
  //
  // UNDI will pass this value to each of the callback services.
  // A unique ID number should be generated for each instance of
  // the UNDI driver that will be using these callback services.
  //
}   PXE_CPB_START_31;
#pragma pack()
```

For the 3.0 S/W UNDI Start command, the CPB structure shown below must be filled in and the CDB must be set to *sizeof(struct s_pxe_cpb_start_30)* .

```
#pragma pack(1)
typedef struct s_pxe_cpb_start_30 {
  UINT64 Delay;
  //
  // Address of the Delay() callback service.
  // This field cannot be set to zero.
  //
  // VOID
  // Delay(
  // IN UINT64 Microseconds);
  //
  // UNDI will never request a delay smaller than 10 microseconds
  // and will always request delays in increments of 10.
  // microseconds The Delay() callback routine must delay between
  // n and n + 10 microseconds before returning control to the
  // UNDI.
  //

  UINT64 Block;
  //
  // Address of the Block() callback service.
  // This field cannot be set to zero.
  //
  // VOID
  // Block(
  // IN UINT32 Enable);
  //
  // UNDI may need to block multithreaded/multiprocessor access
  // to critical code sections when programming or accessing the
  // network device. When UNDI needs a block, it will call the
  // Block()callback service with Enable set to a non-zero value.
  // When UNDI no longer needs the block, it will call Block()
  // with Enable set to zero.
  //

  UINT64 Virt2Phys;
  //
  // Convert a virtual address to a physical address.
  // This field can be set to zero if virtual and physical
```

(continues on next page)

(continued from previous page)

```
  // addresses are identical.
  //
  // VOID
  // Virt2Phys(
  // IN UINT64 Virtual,
  // OUT UINT64 PhysicalPtr);
  //
  // UNDI will pass in a virtual address and a pointer to storage
  // for a physical address. The Virt2Phys() service converts
  // the virtual address to a physical address and stores the
  // resulting physical address in the supplied buffer. If no
  // conversion is needed, the virtual address must be copied
  // into the supplied physical address buffer.
  //

  UINT64 Mem_IO;
  //
  // Read/Write network device memory and/or I/O register space.
  // This field cannot be set to zero.
  //
  // VOID
  // Mem_IO(
  // IN UINT8 AccessType,
  // IN UINT8 Length,
  // IN UINT64 Port,
  // IN OUT UINT64 BufferPtr);
  //
  // UNDI uses the Mem_IO() service to access the network device
  // memory and/or I/O registers. The AccessType is one of the
  // PXE_IO_xxx or PXE_MEM_xxx constants defined at the end of
  // this section. The Length is 1, 2, 4 or 8. The Port number
  // is relative to the base memory or I/O address space for this
  // device.BufferPtr points to the data to be written to the
  // Port or will contain the data that is read from the Port.
  //
}   PXE_CPB_START_30;
#pragma pack()

  #define TO_AND_FROM_DEVICE 0
  // Provides both read and write access to system memory by both
  // the processor and a bus master. The buffer is coherent from
  // both the processor's and the bus master's point of view.

  #define FROM_DEVICE 1
  // Provides a write operation to system memory by a bus master.

  #define TO_DEVICE 2
  // Provides a read operation from system memory by a bus master.
```

E.4.3.3 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. UNDI is now started.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.3.4 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. UNDI is now started.
INVALID_CDB	One of the CDB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
ALREADY_STARTED	The UNDI is already started.

E.4.4 Stop

This command is used to change the UNDI operational state from started to stopped.

E.4.4.1 Issuing the Command

To issue a Stop command, create a CDB and fill it in as shows in the table below:

CDB Field	How to initialize the CDB structure for a Stop command
OpCode	PXE_OPCODE_STOP
OpFlags	PXE_OPFLAGS_NOT_USED
CPBsize	PXE_CPBSIZE_NOT_USED
DBsize	PXE_DBSIZE_NOT_USED
CPBaddr	PXE_CPBADDR_NOT_USED
DBaddr	PXE_DBADDR_NOT_USE
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZ
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed

E.4.4.2 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. UNDI is now stopped.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has not been executed or queued.

E.4.4.3 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. UNDI is now stopped.
INVALID_CDB	One of the CDB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.
NOT_SHUTDOWN	The UNDI is initialized and must be shutdown before it can be stopped.

E.4.5 Get Init Info

This command is used to retrieve initialization information that is needed by drivers and applications to initialized UNDI.

E.4.5.1 Issuing the Command

To issue a Get Init Info command, create a CDB and fill it in as shows in the table below:

CDB Field	How to initialize the CDB structure for a Get Init Info command
OpCode	*PXE_OPCODE_GET_INIT_INFO*
OpFlags	*PXE_OPFLAGS_NOT_USED*
CPBsize	*PXE_CPBSIZE_NOT_USED*
DBsize	*sizeof(PXE_DB_INIT_INFO)*
CPBaddr	*PXE_CPBADDR_NOT_USED*
DBaddr	Address of a PXE_DB_INIT_INFO structure.
StatCode	*PXE_STATCODE_INITIALIZE*
StatFlags	*PXE_STATFLAGS_INITIALIZE*
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.5.2 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. DB can be used.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.5.3 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. DB can be used.
INVALID_CDB	One of the CDB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.

E.4.5.4 StatFlags

To determine if cable detection is supported by this UNDI/NIC, use these macros with the value returned in the CDB.StatFlags field:

```
PXE_STATFLAGS_CABLE_DETECT_MASK
PXE_STATFLAGS_CABLE_DETECT_NOT_SUPPORTED
PXE_STATFLAGS_CABLE_DETECT_SUPPORTED
PXE_STATFLAGS_GET_STATUS_NO_MEDIA_MASK
PXE_STATFLAGS_GET_STATUS_NO_MEDIA_NOT_SUPPORTED
PXE_STATFLAGS_GET_STATUS_NO_MEDIA_SUPPORTED
```

E.4.5.5 DB

```
#pragma pack(1)
typedef struct s_pxe_db_get_init_info {

   // Minimum length of locked memory buffer that must be given to
   // the Initialize command. Giving UNDI more memory will
   // generally give better performance.

   // If MemoryRequired is zero, the UNDI does not need and will
   // not use system memory to receive and transmit packets.

```

(continues on next page)

(continued from previous page)

```
PXE_UINT32 MemoryRequired;

// Maximum frame data length for Tx/Rx excluding the media
// header.
//
PXE_UINT32 FrameDataLen;

// Supported link speeds are in units of mega bits. Common
// ethernet values are 10, 100 and 1000. Unused LinkSpeeds[]
// entries are zero filled.

PXE_UINT32 LinkSpeeds[4];

// Number of nonvolatile storage items.

PXE_UINT32 NvCount;

// Width of nonvolatile storage item in bytes. 0, 1, 2 or 4

PXE_UINT16 NvWidth;

// Media header length. This is the typical media header
// length for this UNDI. This information is needed when
// allocating receive and transmit buffers.

PXE_UINT16 MediaHeaderLen;

// Number of bytes in the NIC hardware (MAC) address.

PXE_UINT16 HWaddrLen;

// Maximum number of multicast MAC addresses in the multicast
// MAC address filter list.

PXE_UINT16 MCastFilterCnt;

// Default number and size of transmit and receive buffers that
// will be allocated by the UNDI. If MemoryRequired is
// nonzero, this allocation will come out of the memory buffer
// given to the Initialize command. If MemoryRequired is zero,
// this allocation will come out of memory on the NIC.

PXE_UINT16 TxBufCnt;
PXE_UINT16 TxBufSize;
PXE_UINT16 RxBufCnt;
PXE_UINT16 RxBufSize;

// Hardware interface types defined in the Assigned Numbers RFC
// and used in DHCP and ARP packets.
// See the PXE_IFTYPE typedef and PXE_IFTYPE_xxx macros.

PXE_UINT8 IFtype;
```

(continues on next page)

(continued from previous page)

```
   // Supported duplex options. This can be one or a combination
   // of more than one constants defined as PXE_DUPLEX_xxxxx
   // below. This value indicates the ability of UNDI to
   // change/control the duplex modes of the NIC.

   PXE_UINT8 SupportedDuplexModes;

   // Supported loopback options. This field can be one or a
   // combination of more than one constants defined as
   // PXE_LOOPBACK_xxxxx #defines below. This value indicates
   // the ability of UNDI to change/control the loopback modes
   // of the NIC

   PXE_UINT8 SupportedLoopBackModes;
}   PXE_DB_GET_INIT_INFO;
#pragma pack()

#define PXE_MAX_TXRX_UNIT_ETHER 1500
#define PXE_HWADDR_LEN_ETHER 0x0006

#define PXE_DUPLEX_DEFAULT 0
#define PXE_DUPLEX_ENABLE_FULL_SUPPORTED 1
#define PXE_DUPLEX_FORCE_FULL_SUPPORTED 2

#define PXE_LOOPBACK_INTERNAL_SUPPORTED 1
#define PXE_LOOPBACK_EXTERNAL_SUPPORTED 2
```

E.4.6 Get Config Info

This command is used to retrieve configuration information about the NIC being controlled by the UNDI.

E.4.6.1 Issuing the Command

To issue a Get Config Info command, create a CDB and fill it in as shown in the table below:

CDB Field	How to initialize the CDB structure for a Get Config Info command
OpCode	PXE_OPCODE_GET_CONFIG_INFO
OpFlags	PXE_OPFLAGS_NOT_USED
CPBsize	PXE_CPBSIZE_NOT_USED
DBsize	sizeof(PXE_DB_CONFIG_INFO)
CPBaddr	PXE_CPBADDR_NOT_USED
DBaddr	Address of a PXE_DB_CONFIG_INFO structure
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (!PXE.IFcnt | (!PXE.IFcntExt << 8)).
Control	Set as needed

E.4.6.2 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. DB has been written.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.6.3 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. DB has been written.
INVALID_CDB	One of the CDB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.

E.4.6.4 DB

```
#pragma pack(1)
typedef struct s_pxe_pci_config_info {

  // This is the flag field for the PXE_DB_GET_CONFIG_INFO union.
  // For PCI bus devices, this field is set to PXE_BUSTYPE_PCI.

  PXE_UINT32 BusType;

  // This identifies the PCI network device that this UNDI
  // interface is bound to.

  PXE_UINT16 Bus;
  PXE_UINT8 Device;
  PXE_UINT8 Function;

  // This is a copy of the PCI configuration space for this
  // network device.

  union {
    PXE_UINT8 Byte[256];
```

(continues on next page)

(continued from previous page)

```
    PXE_UINT16 Word[128];
    PXE_UINT32 Dword[64];
   }  Config;
} PXE_PCI_CONFIG_INFO;
#pragma pack()
#pragma pack(1)
typedef struct s_pxe_pcc_config_info {

  // This is the flag field for the PXE_DB_GET_CONFIG_INFO union.
  // For PCC bus devices, this field is set to PXE_BUSTYPE_PCC.

  PXE_UINT32 BusType;

  // This identifies the PCC network device that this UNDI
  // interface is bound to.

  PXE_UINT16 Bus;
  PXE_UINT8 Device;
  PXE_UINT8 Function;

  // This is a copy of the PCC configuration space for this
  // network device.

  union {
    PXE_UINT8 Byte[256];
    PXE_UINT16 Word[128];
    PXE_UINT32 Dword[64];
} Config;
} PXE_PCC_CONFIG_INFO;
#pragma pack()

#pragma pack(1)
typedef union u_pxe_db_get_config_info {
  PXE_PCI_CONFIG_INFO pci;
  PXE_PCC_CONFIG_INFO pcc;
}  PXE_DB_GET_CONFIG_INFO;
#pragma pack()
```

E.4.7 Initialize

This command resets the network adapter and initializes UNDI using the parameters supplied in the CPB. The Initialize command must be issued before the network adapter can be setup to transmit and receive packets. This command will not enable the receive unit or external interrupts.

Once the memory requirements of the UNDI are obtained by using the Get Init Info command, a block of kernel (nonswappable) memory may need to be allocated by the protocol driver. The address of this kernel memory must be passed to UNDI using the Initialize command CPB. This memory is used for transmit and receive buffers and internal processing.

Initializing the network device will take up to four seconds for most network devices and in some extreme cases (usually poor cables) up to twenty seconds. Control will not be returned to the caller and the *COMMAND_COMPLETE* status flag will not be set until the NIC is ready to transmit.

E.4.7.1 Issuing the Command

To issue an Initialize command, create a CDB and fill it in as shows in the table below:

CDB Field	How to initialize the CDB structure for an Initialize command
OpCode	PXE_OPCODE_INITIALIZE
CPBsize	sizeof(PXE_CPB_INITIALIZE)
DBsize	sizeof(PXE_DB_INITIALIZE)
CPBaddr	Address of a PXE_CPB_INITIALIZE structure.
Dbaddr	Address of a PXE_DB_INITIALIZE structure.
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
Ifnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.7.2 OpFlags

Cable detection can be enabled or disabled by setting one of the following OpFlags:

```
PXE_OPFLAGS_INITIALIZE_CABLE_DETECT
PXE_OPFLAGS_INITIALIZE_DO_NOT_DETECT_CABLE
```

E.4.7.3 Preparing the CPB

If the *MemoryRequired* field returned in the *PXE_DB_GET_INIT_INFO* structure is zero, the Initialize command does not need to be given a memory buffer or even a CPB structure. If the *MemoryRequired* field is nonzero, the Initialize command does need a memory buffer.

```
#pragma pack(1)
typedef struct s_pxe_cpb_initialize {

  // Address of first (lowest) byte of the memory buffer.
  // This buffer must be in contiguous physical memory and cannot
  // be swapped out. The UNDI will be using this for transmit
  // and receive buffering. This address must be a processor-
  // based address for S/W UNDI and a device-based address for
  // H/W UNDI.

  PXE_UINT64 MemoryAddr;

  // MemoryLength must be greater than or equal to MemoryRequired
  // returned by the Get Init Info command.

  PXE_UINT32 MemoryLength;

  // Desired link speed in Mbit/sec. Common ethernet values are
  // 10, 100 and 1000. Setting a value of zero will auto-detect
  // and/or use the default link speed (operation depends on
  // UNDI/NIC functionality).

  PXE_UINT32 LinkSpeed;
```

(continues on next page)

(continued from previous page)

```
  // Suggested number and size of receive and transmit buffers to
  // allocate. If MemoryAddr and MemoryLength are nonzero, this
  // allocation comes out of the supplied memory buffer. If
  // MemoryAddr and MemoryLength are zero, this allocation comes
  // out of memory on the NIC.

  // If these fields are set to zero, the UNDI will allocate
  // buffer counts and sizes as it sees fit.

  PXE_UINT16 TxBufCnt;
  PXE_UINT16 TxBufSize;
  PXE_UINT16 RxBufCnt;
  PXE_UINT16 RxBufSize;

  // The following configuration parameters are optional and must
  // be zero to use the default values.
  // The possible values for these parameters are defined below.

  PXE_UINT8 DuplexMode;

  PXE_UINT8 LoopBackMode;

}   PXE_CPB_INITIALIZE;
#pragma pack()

#define PXE_DUPLEX_AUTO_DETECT 0x00
#define PXE_FORCE_FULL_DUPLEX 0x01

#define PXE_FORCE_HALF_DUPLEX 0x02
#define PXE_LOOPBACK_NORMAL 0
#define PXE_LOOPBACK_INTERNAL 1
#define PXE_LOOPBACK_EXTERNAL 2
```

E.4.7.4 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. UNDI and network device is now initialized. DB has been written.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.7.5 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. UNDI and network device is now initialized. DB has been written. Check StatFlags.
INVALID_CDB	One of the CDB fields was not set correctly.
INVALID_CPB	One of the CPB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.
ALREADY_INITIALIZED	The UNDI is already initialized.
DEVICE_FAILURE	The network device could not be initialized.
NVDATA_FAILURE	The nonvolatile storage could not be read.

E.4.7.6 StatFlags

Check the StatFlags to see if there is an active connection to this network device. If the no media StatFlag is set, the UNDI and network device are still initialized. *PXE_STATFLAGS_INITIALIZED_NO_MEDIA*

E.4.7.7 Before Using the DB

```
#pragma pack(1)
typedef struct s_pxe_db_initialize {

  // Actual amount of memory used from the supplied memory
  // buffer. This may be less that the amount of memory
  // supplied and may be zero if the UNDI and network device
  // do not use external memory buffers. Memory used by the
  // UNDI and network device is allocated from the lowest
  // memory buffer address.

  PXE_UINT32 MemoryUsed;

  // Actual number and size of receive and transmit buffers that
  // were allocated.

  PXE_UINT16 TxBufCnt;
  PXE_UINT16 TxBufSize;
  PXE_UINT16 RxBufCnt;
  PXE_UINT16 RxBufSize
}   PXE_DB_INITIALIZE;
#pragma pack()
```

E.4.8 Reset

This command resets the network adapter and reinitializes the UNDI with the same parameters provided in the Initialize command. The transmit and receive queues are emptied and any pending interrupts are cleared. Depending on the state of the OpFlags, the receive filters and external interrupt enables may also be reset.

Resetting the network device may take up to four seconds and in some extreme cases (usually poor cables) up to twenty seconds. Control will not be returned to the caller and the *COMMAND_COMPLETE* status flag will not be set until the NIC is ready to transmit.

E.4.8.1 Issuing the Command

To issue a Reset command, create a CDB and fill it in as shows in the table below:

CDB Field	How to initialize the CDB structure for a Reset command
OpCode	PXE_OPCODE_RESET
OpFlags	Set as needed.
CPBsize	PXE_CPBSIZE_NOT_USED
DBsize	PXE_DBSIZE_NOT_USED
CPBaddr	PXE_CPBSIZE_NOT_USED
DBaddr	PXE_DBSIZE_NOT_USED
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.8.2 OpFlags

Normally the settings of the receive filters and external interrupt enables are unchanged by the Reset command. These two OpFlags will alter the operation of the Reset command.

```
PXE_OPFLAGS_RESET_DISABLE_INTERRUPTS
PXE_OPFLAGS_RESET_DISABLE_FILTERS
```

E.4.8.3 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. UNDI and network device have been reset. Check StatFlags.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.8.4 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. UNDI and network device have been reset. Check StatFlags.
INVALID_CDB	One of the CDB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.
NOT_INITIALIZED	The UNDI is not initialized.
DEVICE_FAILURE	The network device could not be initialized.
NVDATA_FAILURE	The nonvolatile storage is not valid.

E.4.8.5 StatFlags

Check the StatFlags to see if there is an active connection to this network device. If the no media StatFlag is set, the UNDI and network device are still reset. *PXE_STATFLAGS_RESET_NO_MEDIA*

E.4.9 Shutdown

The Shutdown command resets the network adapter and leaves it in a safe state for another driver to initialize. Any pending transmits or receives are lost. Receive filters and external interrupt enables are reset (disabled). The memory buffer assigned in the Initialize command can be released or reassigned.

Once UNDI has been shutdown, it can then be stopped or initialized again. The Shutdown command changes the UNDI operational state from initializmake htmeled to started.

E.4.9.1 Issuing the Command

To issue a Shutdown command, create a CDB and fill it in as shown in the table below:

CDB Field	**How to initialize the CDB structure for a Shutdown command**
OpCode	PXE_OPCODE_SHUTDOWN
OpFlags	PXE_OPFLAGS_NOT_USED
CPBsize	PXE_CPBSIZE_NOT_USED
DBsize	PXE_DBSIZE_NOT_USED
CPBaddr	PXE_CPBSIZE_NOT_USED
DBaddr	PXE_DBSIZE_NOT_USED
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.9.2 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. UNDI and network device are shutdown.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.9.3 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. UNDI and network device are shutdown.
INVALID_CDB	One of the CDB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.
NOT_INITIALIZED	The UNDI is not initialized.

E.4.10 Interrupt Enables

The Interrupt Enables command can be used to read and/or change the current external interrupt enable settings. Disabling an external interrupt enable prevents an external (hardware) interrupt from being signaled by the network device, internally the interrupt events can still be polled by using the Get Status command.

E.4.10.1 Issuing the Command

To issue an Interrupt Enables command, create a CDB and fill it in as shows in the table below:

CDB Field	How to initialize the CDB structure for an Interrupt Enables command
OpCode	PXE_OPCODE_INTERRUPT_ENABLES
OpFlags	Set as needed.
CPBsize	PXE_CPBSIZE_NOT_USED
DBsize	PXE_DBSIZE_NOT_USED
CPBaddr	PXE_CPBADDR_NOT_USED
DBaddr	PXE_DBADDR_NOT_USED
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.10.2 OpFlags

To read the current external interrupt enables settings set *CDB.OpFlags* to:

```
PXE_OPFLAGS_INTERRUPT_READ
```

To enable or disable external interrupts set one of these OpFlags:

```
PXE_OPFLAGS_INTERRUPT_DISABLE
PXE_OPFLAGS_INTERRUPT_ENABLE
```

When enabling or disabling interrupt settings, the following additional OpFlag bits are used to specify which types of external interrupts are to be enabled or disabled:

```
PXE_OPFLAGS_INTERRUPT_RECEIVE
PXE_OPFLAGS_INTERRUPT_TRANSMIT
PXE_OPFLAGS_INTERRUPT_COMMAND
PXE_OPFLAGS_INTERRUPT_SOFTWARE
```

Setting *PXE_OPFLAGS_INTERRUPT_SOFTWARE* does not enable an external interrupt type, it generates an external interrupt.

E.4.10.3 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. Check StatFlags.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.10.4 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. Check StatFlags.
INVALID_CDB	One of the CDB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.
NOT_INITIALIZED	The UNDI is not initialized.

E.4.10.5 StatFlags

If the command was successful, the *CDB.StatFlags* field reports which external interrupt enable types are currently set. Possible *CDB.StatFlags* bit settings are:

- *PXE_STATFLAGS_INTERRUPT_RECEIVE*
- *PXE_STATFLAGS_INTERRUPT_TRANSMIT*
- *PXE_STATFLAGS_INTERRUPT_COMMAND*

The bits set in *CDB.StatFlags* may be different than those that were requested in *CDB.OpFlags* . For example: If transmit and receive share an external interrupt line, setting either the transmit or receive interrupt will always enable both transmit and receive interrupts. In this case both transmit and receive interrupts will be reported in *CDB.StatFlags* . Always expect to get more than you ask for!

E.4.11 Receive Filters

This command is used to read and change receive filters and, if supported, read and change the multicast MAC address filter list. Control will not be returned to the caller and the *COMMAND_COMPLETE* status flag will not be set until the NIC is ready to receive.

E.4.11.1 Issuing the Command

To issue a Receive Filters command, create a CDB and fill it in as shows in the table below:

CDB Field	How to initialize the CDB structure for a Receive Filters command
OpCode	PXE_OPCODE_RECEIVE_FILTERS
OpFlags	Set as needed.
CPBsize	sizeof(PXE_CPB_RECEIVE_FILTERS)
DBsize	sizeof(PXE_DB_RECEIVE_FILTERS)
CPBaddr	Address of PXE_CPB_RECEIVE_FILTERS structure.
DBaddr	Address of PXE_DB_RECEIVE_FILTERS structure.
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | *(!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.11.2 OpFlags

To read the current receive filter settings set the *CDB.OpFlags* field to:

- *PXE_OPFLAGS_RECEIVE_FILTER_READ*

To change the current receive filter settings set one of these OpFlag bits:

- *PXE_OPFLAGS_RECEIVE_FILTER_ENABLE*
- *PXE_OPFLAGS_RECEIVE_FILTER_DISABLE*

When changing the receive filter settings, at least one of the OpFlag bits in this list must be selected:

- *PXE_OPFLAGS_RECEIVE_FILTER_UNICAST*
- *PXE_OPFLAGS_RECEIVE_FILTER_BROADCAST*
- *PXE_OPFLAGS_RECEIVE_FILTER_FILTERED_MULTICAST*

- *PXE_OPFLAGS_RECEIVE_FILTER_PROMISCUOUS*
- *PXE_OPFLAGS_RECEIVE_FILTER_ALL_MULTICAST*

To clear the contents of the multicast MAC address filter list, set this OpFlag:

- *PXE_OPFLAGS_RECEIVE_FILTER_RESET_MCAST_LIST*

E.4.11.3 Preparing the CPB

The receive filter CPB is used to change the contents multicast MAC address filter list. To leave the multicast MAC address filter list unchanged, set the *CDB.CPBsize* field to *PXE_CPBSIZE_NOT_USED* and *CDB.CPBaddr* to *PXE_CPBADDR_NOT_USED* .

To change the multicast MAC address filter list, set *CDB.CPBsize* to the size, in bytes, of the multicast MAC address filter list and set *CDB.CPBaddr* to the address of the first entry in the multicast MAC address filter list.

```
typedef struct s_pxe_cpb_receive_filters {

  // List of multicast MAC addresses. This list, if present,
  // will replace the existing multicast MAC address filter list.

  PXE_MAC_ADDR MCastList[n];
}   PXE_CPB_RECEIVE_FILTERS;
```

E.4.11.4 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	**Reason**
COMMAND_COMPLETE	Command completed successfully. Check StatFlags. DB is written.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.11.5 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	**Reason**
SUCCESS	Command completed successfully. Check StatFlags. DB is written.
INVALID_CDB	One of the CDB fields was not set correctly.
INVALID_CPB	One of the CPB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.
NOT_INITIALIZED	The UNDI is not initialized.

E.4.11.6 StatFlags

The receive filter settings in CDB.StatFlags are:

- *PXE_STATFLAGS_RECEIVE_FILTER_UNICAST*
- *PXE_STATFLAGS_RECEIVE_FILTER_BROADCAST*
- *PXE_STATFLAGS_RECEIVE_FILTER_FILTERED_MULTICAST*
- *PXE_STATFLAGS_RECEIVE_FILTER_PROMISCUOUS*
- *PXE_STATFLAGS_RECEIVE_FILTER_ALL_MULTICAST*

Unsupported receive filter settings in OpFlags are promoted to the next more liberal receive filter setting. For example: If broadcast or filtered multicast are requested and are not supported by the network device, but promiscuous is; the promiscuous status flag will be set.

E.4.11.7 DB

The DB is used to read the current multicast MAC address filter list. The CDB.DBsize and CDB.DBaddr fields can be set to PXE_DBSIZE_NOT_USED and PXE_DBADDR_NOT_USED if the multicast MAC address filter list does not need to be read. When reading the multicast MAC address filter list extra entries in the DB will be filled with zero.

```
typedef struct s_pxe_db_receive_filters {

  // Filtered multicast MAC address list.

  PXE_MAC_ADDR MCastList[n];
}   PXE_DB_RECEIVE_FILTERS;
```

E.4.12 Station Address

This command is used to get current station and broadcast MAC addresses and, if supported, to change the current station MAC address.

E.4.12.1 Issuing the Command

To issue a Station Address command, create a CDB and fill it in as shows in the table below:

CDB Field	**How to initialize the CDB structure for a Station Address command**
OpCode	PXE_OPCODE_STATION_ADDRESS
OpFlags	Set as needed.
CPBsize	sizeof(PXE_CPB_STATION_ADDRESS)
DBsize	sizeof(PXE_DB_STATION_ADDRESS)
CPBaddr	Address of PXE_CPB_STATION_ADDRESS structure.
DBaddr	Address of PXE_DB_STATION_ADDRESS structure.
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.12.2 OpFlags

To read current station and broadcast MAC addresses set the OpFlags field to:

- *PXE_OPFLAGS_STATION_ADDRESS_READ*

To change the current station to the address given in the CPB set the OpFlags field to:

- *PXE_OPFLAGS_STATION_ADDRESS_WRITE*

To reset the current station address back to the power on default, set the OpFlags field to:

- *PXE_OPFLAGS_STATION_ADDRESS_RESET*

E.4.12.3 Preparing the CPB

To change the current station MAC address the *CDB.CPBsize* and *CDB.CPBaddr* fields must be set.

```
typedef struct s_pxe_cpb_station_address {

  // If supplied and supported, the current station MAC address
  // will be changed.

  PXE_MAC_ADDR StationAddr;
}   PXE_CPB_STATION_ADDRESS;
```

E.4.12.4 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. DB is written.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.12.5 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully.
INVALID_CDB	One of the CDB fields was not set correctly.
INVALID_CPB	One of the CPB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.
NOT_INITIALIZED	The UNDI is not initialized.

continues on next page

Table E.28 – continued from previous page

UNSUPPORTED	The requested operation is not supported.

E.4.12.6 Before Using the DB

The DB is used to read the current station, broadcast and permanent station MAC addresses. The *CDB.DBsize* and *CDB.DBaddr* fields can be set to *PXE_DBSIZE_NOT_USED* and *PXE_DBADDR_NOT_USED* if these addresses do not need to be read.

```
typedef struct s_pxe_db_station_address {

  // Current station MAC address.
  PXE_MAC_ADDR StationAddr;

  // Station broadcast MAC address.
  PXE_MAC_ADDR BroadcastAddr;

  // Permanent station MAC address.
  PXE_MAC_ADDR PermanentAddr;
}   PXE_DB_STATION_ADDRESS;
```

E.4.13 Statistics

This command is used to read and clear the NIC traffic statistics. Before using this command check to see if statistics is supported in the *!PXE.Implementation* flags.

E.4.13.1 Issuing the Command

To issue a Statistics command, create a CDB and fill it in as shown in the table below:

CDB Field	How to initialize the CDB structure for a Statistics command
OpCode	PXE_OPCODE_STATISTICS
OpFlags	Set as needed.
CPBsize	PXE_CPBSIZE_NOT_USED
DBsize	sizeof(PXE_DB_STATISTICS)
CPBaddr	PXE_CPBADDR_NOT_USED
DBaddr	Address of PXE_DB_STATISTICS structure.
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.13.2 OpFlags

To read the current statistics counters set the OpFlags field to:

```
PXE_OPFLAGS_STATISTICS_READ
```

To reset the current statistics counters set the OpFlags field to:

```
PXE_OPFLAGS_STATISTICS_RESET
```

E.4.13.3 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* ,the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. DB is written.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.13.4 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. DB is written.
INVALID_CDB	One of the CDB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.
NOT_INITIALIZED	The UNDI is not initialized.
UNSUPPORTED	This command is not supported.

E.4.13.5 DB

Unsupported statistics counters will be zero filled by UNDI.

```
typedef struct s_pxe_db_statistics {

  // Bit field identifying what statistic data is collected by
  // the UNDI/NIC.
  // If bit 0x00 is set, Data[0x00] is collected.
  // If bit 0x01 is set, Data[0x01] is collected.
```

(continues on next page)

(continued from previous page)

```
  // If bit 0x20 is set, Data[0x20] is collected.
  // If bit 0x21 is set, Data[0x21] is collected.
  // Etc.
  PXE_UINT64 Supported;

  // Statistic data.

  PXE_UINT64 Data[64];
}   PXE_DB_STATISTICS;

 // Total number of frames received. Includes frames with errors
 // and dropped frames.
#define PXE_STATISTICS_RX_TOTAL_FRAMES 0x00

 // Number of valid frames received and copied into receive
 // buffers.
#define PXE_STATISTICS_RX_GOOD_FRAMES 0x01

 // Number of frames below the minimum length for the media.
 // This would be <64 for ethernet.
#define PXE_STATISTICS_RX_UNDERSIZE_FRAMES 0x02

 // Number of frames longer than the maximum length for the
 // media. This would be >1500 for ethernet.

```

E.4.14 MCast IP To MAC

Translate a multicast IPv4 or IPv6 address to a multicast MAC address.

E.4.14.1 Issuing the Command

To issue a MCast IP To MAC command, create a CDB and fill it in as shown in the table below:

CDB Field	How to initialize the CDB structure for a MCast IP To MAC command
OpCode	PXE_OPCODE_MCAST_IP_TO_MAC
OpFlags	Set as needed.
CPBsize	sizeof(PXE_CPB_MCAST_IP_TO_MAC)
DBsize	sizeof(PXE_DB_MCAST_IP_TO_MAC)
CPBaddr	Address of PXE_CPB_MCAST_IP_TO_MAC structure.
Dbaddr	Address of PXE_DB_MCAST_IP_TO_MAC structure.
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
Ifnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.14.2 OpFlags

To convert a multicast IP address to a multicast MAC address the UNDI needs to know the format of the IP address. Set one of these OpFlags to identify the format of the IP addresses in the CPB:

```
PXE_OPFLAGS_MCAST_IPV4_TO_MAC
PXE_OPFLAGS_MCAST_IPV6_TO_MAC
```

E.4.14.3 Preparing the CPB

Fill in an array of one or more multicast IP addresses. Be sure to set the *CDB.CPBsize* and *CDB.CPBaddr* fields accordingly.

```
typedef struct s_pxe_cpb_mcast_ip_to_mac {

  // Multicast IP address to be converted to multicast
  // MAC address.
  PXE_IP_ADDR IP[n];
}   PXE_CPB_MCAST_IP_TO_MAC;
```

E.4.14.4 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. DB is written.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.14.5 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. DB is written.
INVALID_CDB	One of the CDB fields was not set correctly.
INVALID_CPB	One of the CPB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.

continues on next page

Table E.34 – continued from previous page

NOT_INITIALIZED	The UNDI is not initialized.

E.4.14.6 Before Using the DB

The DB is where the multicast MAC addresses will be written.

```
typedef struct s_pxe_db_mcast_ip_to_mac {

  // Multicast MAC address.

  PXE_MAC_ADDR MAC[n];
}   PXE_DB_MCAST_IP_TO_MAC;
```

E.4.15 NvData

This command is used to read and write (if supported by NIC H/W) nonvolatile storage on the NIC. Nonvolatile storage could be EEPROM, FLASH or battery backed RAM.

E.4.15.1 Issuing the Command

To issue a NvData command, create a CDB and fill it in as shown in the table below:

CDB Field	**How to initialize the CDB structure for a NvData command**
OpCode	PXE_OPCODE_NVDATA
OpFlags	Set as needed.
CPBsize	*sizeof(PXE_CPB_NVDATA)*
DBsize	*sizeof(PXE_DB_NVDATA)*
CPBaddr	Address of PXE_CPB_NVDATA structure.
Dbaddr	Address of PXE_DB_NVDATA structure.
StatCode	*PXE_STATCODE_INITIALIZE*
StatFlags	*PXE_STATFLAGS_INITIALIZE*
Ifnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.15.2 Preparing the CPB

There are two types of nonvolatile data CPBs, one for sparse updates and one for bulk updates. Sparse updates allow updating of single nonvolatile storage items. Bulk updates always update all nonvolatile storage items. Check the *!PXE.Implementation* flags to see which type of nonvolatile update is supported by this UNDI and network device.

If you do not need to update the nonvolatile storage set the *CDB.CPBsize* and *CDB.CPBaddr* fields to *PXE_CPBSIZE_NOT_USED* and *PXE_CPBADDR_NOT_USED* .

E.4.15.2.1 Sparse NvData CPB

```
typedef struct s_pxe_cpb_nvdata_sparse {
  // NvData item list. Only items in this list will be updated.

  struct {

    // Nonvolatile storage address to be changed.
    PXE_UINT32 Addr;

    // Data item to write into above storage address.
    union {
      PXE_UINT8 Byte;
      PXE_UINT16 Word;
      PXE_UINT32 Dword;
    } Data;
  } Item[n];
}   PXE_CPB_NVDATA_SPARSE;
```

E.4.15.2.2 Bulk NvData CPB

```
// When using bulk update, the size of the CPB structure must be
// the same size as the nonvolatile NIC storage.

typedef union u_pxe_cpb_nvdata_bulk {

  // Array of byte-wide data items.
  PXE_UINT8 Byte[n];

  // Array of word-wide data items.
  PXE_UINT16 Word[n];

  // Array of dword-wide data items.
  PXE_UINT32 Dword[n];
}   PXE_CPB_NVDATA_BULK;
```

E.4.15.3 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. Nonvolatile data is updated from CPB and/or written to DB.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.15.4 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. Nonvolatile data is updated from CPB and/or written to DB.
INVALID_CDB	One of the CDB fields was not set correctly.
INVALID_CPB	One of the CPB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.
NOT_INITIALIZED	The UNDI is not initialized.
UNSUPPORTED	Requested operation is unsupported.

E.4.15.4.1 DB

Check the width and number of nonvolatile storage items. This information is returned by the Get Init Info command.

```
typedef struct s_pxe_db_nvdata {

  // Arrays of data items from nonvolatile storage.
  union {

    // Array of byte-wide data items.
    PXE_UINT8 Byte[n];

    // Array of word-wide data items.
    PXE_UINT16 Word[n];

    // Array of dword-wide data items.
    PXE_UINT32 Dword[n];
  } Data;
}   PXE_DB_NVDATA;
```

E.4.16 Get Status

This command returns the current interrupt status and/or the transmitted buffer addresses and the current media status. If the current interrupt status is returned, pending interrupts will be acknowledged by this command. Transmitted buffer addresses that are written to the DB are removed from the transmitted buffer queue.

This command may be used in a polled fashion with external interrupts disabled.

E.4.16.1 Issuing the Command

To issue a Get Status command, create a CDB and fill it in as shown in the table below:

CDB Field	How to initialize the CDB structure for a Get Status command
OpCode	PXE_OPCODE_GET_STATUS
OpFlags	Set as needed.
CPBsize	PXE_CPBSIZE_NOT_USED
DBsize	Sizeof(PXE_DB_GET_STATUS)
CPBaddr	PXE_CPBADDR_NOT_USED
DBaddr	Address of PXE_DB_GET_STATUS structure.
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | *(!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.16.1.1 Setting OpFlags

Set one or a combination of the OpFlags below to return the interrupt status and/or the transmitted buffer addresses and/or the media status.

```
PXE_OPFLAGS_GET_INTERRUPT_STATUS
PXE_OPFLAGS_GET_TRANSMITTED_BUFFERS
PXE_OPFLAGS_GET_MEDIA_STATUS
```

E.4.16.2 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. StatFlags and/or DB are updated.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.16.3 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. StatFlags and/or DB are updated.
INVALID_CDB	One of the CDB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.

continues on next page

Table E.40 – continued from previous page

NOT_STARTED	The UNDI is not started.
NOT_INITIALIZED	The UNDI is not initialized.

E.4.16.4 StatFlags

If the command completes successfully and the *PXE_OPFLAGS_GET_INTERRUPT_STATUS* OpFlag was set in the CDB, the current interrupt status is returned in the *CDB.StatFlags* field and any pending interrupts will have been cleared.

```
PXE_STATFLAGS_GET_STATUS_RECEIVE
PXE_STATFLAGS_GET_STATUS_TRANSMIT
PXE_STATFLAGS_GET_STATUS_COMMAND
PXE_STATFLAGS_GET_STATUS_SOFTWARE
```

The StatFlags above may not map directly to external interrupt signals. For example: Some NICs may combine both the receive and transmit interrupts to one external interrupt line. When a receive and/or transmit interrupt occurs, use the Get Status to determine which type(s) of interrupt(s) occurred.

This flag is set if the transmitted buffer queue is empty. This flag will be set if all transmitted buffer addresses get written t into the DB.

```
PXE_STATFLAGS_GET_STATUS_TXBUF_QUEUE_EMPTY
```

This flag is set if no transmitted buffer addresses were written into the DB.

```
PXE_STATFLAGS_GET_STATUS_NO_TXBUFS_WRITTEN
```

This flag is set if there is no media present.

```
PXE_STATFLAGS_GET_STATUS_NO_MEDIA
```

E.4.16.5 Using the DB

When reading the transmitted buffer addresses there should be room for at least one 64-bit address in the DB. Once a complete transmitted buffer address is written into the DB, the address is removed from the transmitted buffer queue. If the transmitted buffer queue is full, attempts to use the Transmit command will fail.

```
#pragma pack(1)
typedef struct s_pxe_db_get_status {

  // Length of next receive frame (header + data). If this is
  // zero, there is no next receive frame available.
  PXE_UINT32 RxFrameLen;

  // Reserved, set to zero.

  PXE_UINT32 reserved;

  // Addresses of transmitted buffers that need to be recycled.

  PXE_UINT64 xBuffer[n];
```

(continues on next page)

(continued from previous page)

```
}   PXE_DB_GET_STATUS;
#pragma pack()
```

E.4.17 Fill Header

This command is used to fill the media header(s) in transmit packet(s).

E.4.17.1 Issuing the Command

To issue a Fill Header command, create a CDB and fill it in as shown in the table below:

CDB Field	How to initialize the CDB structure for a Fill Header command
OpCode	PXE_OPCODE_FILL_HEADER
OpFlags	Set as needed.
CPBsize	PXE_CPB_FILL_HEADER
DBsize	PXE_DBSIZE_NOT_USED
CPBaddr	Address of a PXE_CPB_FILL_HEADER structure.
DBaddr	PXE_DBADDR_NOT_USED
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.17.2 OpFlags

Select one of the OpFlags below so the UNDI knows what type of CPB is being used.

```
PXE_OPFLAGS_FILL_HEADER_WHOLE
PXE_OPFLAGS_FILL_HEADER_FRAGMENTED
```

E.4.17.3 Preparing the CPB

If multiple frames per command are supported (see *!PXE.Implementation* flags), multiple CPBs can be packed together. The *CDB.CPBsize* field lets the UNDI know how many CPBs are packed together.

E.4.17.4 Nonfragmented Frame

```
#pragma pack(1)
typedef struct s_pxe_cpb_fill_header {

  // Source and destination MAC addresses. These will be copied
  // into the media header without doing byte swapping.
  PXE_MAC_ADDR SrcAddr;
  PXE_MAC_ADDR DestAddr;

  // Address of first byte of media header. The first byte of
```

(continues on next page)

(continued from previous page)

```
  // packet data follows the last byte of the media header.
  PXE_UINT64 MediaHeader;

  // Length of packet data in bytes (not including the media
  // header).
  PXE_UINT32 PacketLen;

  // Protocol type. This will be copied into the media header
  // without doing byte swapping. Protocol type numbers can be
  // obtained from the Assigned Numbers RFC 3232.
  PXE_UINT16 Protocol;

  // Length of the media header in bytes.
  PXE_UINT16 MediaHeaderLen;
}   PXE_CPB_FILL_HEADER;
#pragma pack()

#define PXE_PROTOCOL_ETHERNET_IP 0x0800
#define PXE_PROTOCOL_ETHERNET_ARP 0x0806
```

E.4.17.5 Fragmented Frame

```
#pragma pack(1)
typedef struct s_pxe_cpb_fill_header_fragmented {

  // Source and destination MAC addresses. These will be copied
  // into the media header without doing byte swapping.
  PXE_MAC_ADDR SrcAddr;
  PXE_MAC_ADDR DestAddr;

  // Length of packet data in bytes (not including the media
  // header).

  PXE_UINT32 PacketLen;
  // Protocol type. This will be copied into the media header
  // without doing byte swapping. Protocol type numbers can be
  // obtained from the Assigned Numbers RFC 3232.
  PXE_MEDIA_PROTOCOL Protocol;

  // Length of the media header in bytes.
  PXE_UINT16 MediaHeaderLen;

  // Number of packet fragment descriptors.
  PXE_UINT16 FragCnt;

  // Reserved, must be set to zero.
  PXE_UINT16 reserved;

  // Array of packet fragment descriptors. The first byte of the
  // media header is the first byte of the first fragment.
```

(continues on next page)

(continued from previous page)

```
  struct {

    // Address of this packet fragment.
    PXE_UINT64 FragAddr;
    // Length of this packet fragment.
    PXE_UINT32 FragLen;

    // Reserved, must be set to zero.
    PXE_UINT32 reserved;
  } FragDesc[n];
}   PXE_CPB_FILL_HEADER_FRAGMENTED;
#pragma pack()
```

E.4.17.6 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. Frame is ready to transmit.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.17.7 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. Frame is ready to transmit.
INVALID_CDB	One of the CDB fields was not set correctly.
INVALID_CPB	One of the CPB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Try again later.
NOT_STARTED	The UNDI is not started.
NOT_INITIALIZED	The UNDI is not initialized.

E.4.18 Transmit

The Transmit command is used to place a packet into the transmit queue. The data buffers given to this command are to be considered locked and the application or universal network driver loses the ownership of those buffers and must not free or relocate them until the ownership returns.

When the packets are transmitted, a transmit complete interrupt is generated (if interrupts are disabled, the transmit interrupt status is still set and can be checked using the Get Status command).

Some UNDI implementations and network adapters support transmitting multiple packets with one transmit command. If this feature is supported, multiple transmit CPBs can be linked in one transmit command.

Though all UNDIs support fragmented frames, the same cannot be said for all network devices or protocols. If a fragmented frame CPB is given to UNDI and the network device does not support fragmented frames (see *!PXE.Implementation* flags), the UNDI will have to copy the fragments into a local buffer before transmitting.

E.4.18.1 Issuing the Command

To issue a Transmit command, create a CDB and fill it in as shown in the table below:

CDB Field	How to initialize the CDB structure for a Transmit command
OpCode	PXE_OPCODE_TRANSMIT
OpFlags	Set as needed.
CPBsize	*sizeof(PXE_CPB_TRANSMIT)*
DBsize	*PXE_DBSIZE_NOT_USED*
CPBaddr	Address of a PXE_CPB_TRANSMIT structure.
DBaddr	*PXE_DBADDR_NOT_USED*
StatCode	*PXE_STATCODE_INITIALIZE*
StatFlags	*PXE_STATFLAGS_INITIALIZE*
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.18.2 OpFlags

Check the *!PXE.Implementation* flags to see if the network device support fragmented packets. Select one of the OpFlags below so the UNDI knows what type of CPB is being used.

```
PXE_OPFLAGS_TRANSMIT_WHOLE
PXE_OPFLAGS_TRANSMIT_FRAGMENTED
```

In addition to selecting whether or not fragmented packets are being given, S/W UNDI needs to know if it should block until the packets are transmitted. H/W UNDI cannot block, these two OpFlag settings have no affect when used with H/W UNDI.

```
PXE_OPFLAGS_TRANSMIT_BLOCK
PXE_OPFLAGS_TRANSMIT_DONT_BLOCK
```

E.4.18.3 Preparing the CPB

If multiple frames per command are supported (see *!PXE.Implementation* flags), multiple CPBs can be packed together. The *CDB.CPBsize* field lets the UNDI know how may frames are to be transmitted.

E.4.18.4 Nonfragmented Frame

```
#pragma pack(1)
typedef struct s_pxe_cpb_transmit {

  // Address of first byte of frame buffer. This is also the
  // first byte of the media header. This address must be a
  // processor-based address for S/W UNDI and a device-based
  // address for H/W UNDI.
  PXE_UINT64 FrameAddr;

  // Length of the data portion of the frame buffer in bytes. Do
  // not include the length of the media header.
  PXE_UINT32 DataLen;

  // Length of the media header in bytes.
  PXE_UINT16 MediaheaderLen;

  // Reserved, must be zero.
  PXE_UINT16 reserved;
}   PXE_CPB_TRANSMIT;
#pragma pack()
```

E.4.18.5 Fragmented Frame

```
#pragma pack(1)
typedef struct s_pxe_cpb_transmit_fragments {

  // Length of packet data in bytes (not including the media
  // header).
  PXE_UINT32 FrameLen;

  // Length of the media header in bytes.
  PXE_UINT16 MediaheaderLen;

  // Number of packet fragment descriptors.
  PXE_UINT16 FragCnt;

  // Array of frame fragment descriptors. The first byte of the
  // first fragment is also the first byte of the media header.
  struct {
  // Address of this frame fragment. This address must be a
  // processor-based address for S/W UNDI and a device-based
  // address for H/W UNDI.
    PXE_UINT64 FragAddr;

```

(continues on next page)

(continued from previous page)

```
    // Length of this frame fragment.
    PXE_UINT32 FragLen;

    // Reserved, must be set to zero.
    PXE_UINT32 reserved;
  } FragDesc[n];
}  PXE_CPB_TRANSMIT_FRAGMENTS;
#pragma pack()
```

E.4.18.6 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	**Reason**
COMMAND_COMPLETE	Command completed successfully. Use the Get Status command to see when frame buffers can be reused.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.18.7 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	**Reason**
SUCCESS	Command completed successfully. Use the Get Status command to see when frame buffers can be reused.
INVALID_CDB	One of the CDB fields was not set correctly.
INVALID_CPB	One of the CPB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Wait for queued commands to complete. Try again later.
BUFFER_FULL	Transmit buffer is full. Call Get Status command to empty buffer.
NOT_STARTED	The UNDI is not started.
NOT_INITIALIZED	The UNDI is not initialized.

E.4.19 Receive

When the network adapter has received a frame, this command is used to copy the frame into driver/application storage. Once a frame has been copied, it is removed from the receive queue.

E.4.19.1 Issuing the Command

To issue a Receive command, create a CDB and fill it in as shown in the table below:

CDB Field	How to initialize the CDB structure for a Receive command
OpCode	PXE_OPCODE_RECEIVE
OpFlags	Set as needed.
CPBsize	sizeof(PXE_CPB_RECEIVE)
DBsize	sizeof(PXE_DB_RECEIVE)
CPBaddr	Address of a PXE_CPB_RECEIVE structure.
DBaddr	Address of a PXE_DB_RECEIVE structure.
StatCode	PXE_STATCODE_INITIALIZE
StatFlags	PXE_STATFLAGS_INITIALIZE
IFnum	A valid interface number from zero to (*!PXE.IFcnt* | (*!PXE.IFcntExt* << *8*)).
Control	Set as needed.

E.4.19.2 Preparing the CPB

If multiple frames per command are supported (see *!PXE.Implementation* flags), multiple CPBs can be packed together. For each complete received frame, a receive buffer large enough to contain the entire unfragmented frame needs to be described in the CPB. Note that if a smaller than required buffer is provided, only a portion of the packet is received into the buffer, and the remainder of the packet is lost. Subsequent attempts to receive the same packet with a corrected (larger) buffer will be unsuccessful, because the packet will have been flushed from the queue.

```
#pragma pack(1)
typedef struct s_pxe_cpb_receive {

  // Address of first byte of receive buffer. This is also the
  // first byte of the frame header. This address must be a
  // processor-based address for S/W UNDI and a device-based
  // address for H/W UNDI.

  PXE_UINT64 BufferAddr;

  // Length of receive buffer. This must be large enough to hold
  // the received frame (media header + data). If the length of
  // smaller than the received frame, data will be lost.
  PXE_UINT32 BufferLen;

  // Reserved, must be set to zero.
  PXE_UINT32 reserved;
}   PXE_CPB_RECEIVE;
#pragma pack()
```

E.4.19.3 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the *CDB.StatFlags* field. Until these bits change to report *PXE_STATFLAGS_COMMAND_COMPLETE* or *PXE_STATFLAGS_COMMAND_FAILED* , the command has not been executed by the UNDI.

StatFlags	Reason
COMMAND_COMPLETE	Command completed successfully. Frames received and DB is written.
COMMAND_FAILED	Command failed. StatCode field contains error code.
COMMAND_QUEUED	Command has been queued.
INITIALIZE	Command has been not executed or queued.

E.4.19.4 Checking Command Execution Results

After command execution completes, either successfully or not, the *CDB.StatCode* field contains the result of the command execution.

StatCode	Reason
SUCCESS	Command completed successfully. Frames received and DB is written.
INVALID_CDB	One of the CDB fields was not set correctly.
INVALID_CPB	One of the CPB fields was not set correctly.
BUSY	UNDI is already processing commands. Try again later.
QUEUE_FULL	Command queue is full. Wait for queued commands to complete. Try again later.
NO_DATA	Receive buffers are empty.
NOT_STARTED	The UNDI is not started.
NOT_INITIALIZED	The UNDI is not initialized.

E.4.19.5 Using the DB

If multiple frames per command are supported (see *!PXE.Implementation* flags), multiple DBs can be packed together.

```
#pragma pack(1)
typedef struct s_pxe_db_receive {

  // Source and destination MAC addresses from media header.
  PXE_MAC_ADDR SrcAddr;
  PXE_MAC_ADDR DestAddr;

  // Length of received frame. May be larger than receive buffer
  // size. The receive buffer will not be overwritten. This is
  // how to tell if data was lost because the receive buffer was
  // too small.
  PXE_UINT32 FrameLen;

  // Protocol type from media header.
  PXE_PROTOCOL Protocol;

  // Length of media header in received frame.
  PXE_UINT16 MediaHeaderLen;
```

(continues on next page)

(continued from previous page)

```
  // Type of receive frame.
  PXE_FRAME_TYPE Type;

  // Reserved, must be zero.
  PXE_UINT8 reserved[7];
}   PXE_DB_RECEIVE;
#pragma pack()
```

E.4.20 PXE 2.1 specification wire protocol clarifications

The Preboot Execution Environment (PXE) Version 2.1 specification was published in September 1999. Since then, this specification has not been maintained or updated for a new version. For adapting the IPv6 stack, the definition of an IPv6-based PXE process has been described in UEFI specification since version 2.2. Other clarifications for the IPv4-based PXE process defined in the PXE 2.1 specification are provided in this section.

E.4.20.1 Issue #1-time-outs

Where the PXE 2.1 specification reads:

DHCP Discover will be retried four times. The four timeouts are 4, 8, 16 and 32 seconds respectively.

If a DHCPOFFER is received without an Option #60 tag “PXEClient”, DHCP Discover will be retried on the 4-and 8-second timeouts in an attempt to receive a PXE response.

Because of spanning tree algorithms in routers, the behavior should be as follows:

DHCP Discover will be retried four times. The four timeouts are 4, 8, 16 and 32 seconds respectively.

This process could be iterated three times.

If a DHCPOFFER is received without an Option #60 tag “PXEClient”, DHCP Discover will be retried on the 4-and 8-second timeouts in an attempt to receive a PXE response.

E.4.20.2 Issue #2 - siaddr/option 54 precedence

Where the PXE 2.1 specification reads:

Boot server IP address (Read from the DHCP option 54 (server identifier), if not found, use the siaddr field.)

The behavior should be reversed, namely:

Ascertain the Boot server IP address from siaddr field. If not found, use the value in the DHCP option 54 (server identifier).

E.4.20.3 Issue #3 - PXE Vendor Options Existence

The PXE 2.1 specification is ambiguous about whether the following PXE Vendor Options need to be provided in DHCP messages. These options are marked as “Required” in Table 2-1 “PXE DHCP Options (Full List)”, but other parts of the specification state that these options may not be supplied in certain condition.

This section clarifies the existence of these PXE Vendor Options:

1. **PXE_DISCOVERY_CONTROL (Tag 6)**
   Where the PXE 2.1 specification reads:

   > - Required, Note #3
   > - If this tag is not supplied all bits assumed to be 0.

   The behavior should be clarified as:

   > - This tag is not mandatory required. If not supplied, all bits are assumed to be 0.

2. **PXE_BOOT_SERVERS (Tag 8)**
   Where the PXE 2.1 specification reads:

   > - Required for PXE client. Note #3
   > - PXE_DISCOVERY_CONTROL (Tag 6), bit 2 = If set, only use/accept servers in PXE_BOOT_SERVERS.

   The behavior should be clarified as:

   > - This tag is required only if bit 2 of PXE_DISCOVERY_CONTROL (Tag 6) is set.

3. **PXE_BOOT_MENU (Tag 9**
   Where the PXE 2.1 specification reads:

   > - Required, Note #4
   > - Note #4: These options define the information, if any, displayed by the client during a network boot.

   The behavior should be clarified as:

   > - This tag is required only if the PXE client wants to display boot menu information during a network boot.

4. **PXE_CREDENTIAL_TYPES (Tag 12)**
   Where the PXE 2.1 specification reads:

   > - Required for security. Note #5
   > - This option is required for security requests and acknowledges between the client and the server.

   The behavior should be clarified as:

   > - This tag is not required if PXE client does not apply security requests.

5. **PXE_BOOT_ITEM (Tag 71)**
   Where the PXE 2.1 specification reads:

- Required. Note #6
- If this tag is missing, type 0 and layer 0 is assumed.**

The behavior should be clarified as:

- This tag is not mandatory required. If not supplied, type 0 and layer 0 is assumed.

6. **Vendor Options (Tag 43)**
   The PXE 2.1 specification is not clear whether this option is required.
   The behavior should be clarified as:

   - Vendor Options (Tag 43) is required only if encapsulated PXE options need be supplied.

APPPENDIX F — USING THE SIMPLE POINTER PROTOCOL

The Simple Pointer Protocol is intended to provide a simple mechanism for an application to interact with the user with some type of pointer device. To keep this interface simple, many of the custom controls that are typically present in an OS-present environment were left out. This includes the ability to adjust the double-click speed and the ability to adjust the pointer speed. Instead, the recommendations for how the Simple Pointer Protocol should be used are listed here.

X-Axis Movement:

If the Simple Pointer Protocol is being used to move a pointer or cursor around on an output display, the movement along the x-axis should move the pointer or cursor horizontally.

Y-Axis Movement:

If the Simple Pointer Protocol is being used to move a pointer or cursor around on an output display, the movement along the y-axis should move the pointer or cursor vertically.

Z-Axis Movement:

If the Simple Pointer Protocol is being used to move a pointer or cursor around on an output display, and the application that is using the Simple Pointer Protocol supports scrolling, then the movement along the z-axis should scroll the output display.

Double Click Speed:

If two clicks of the same button on a pointer occur in less than 0.5 seconds, then a double-click event has occurred. If a the same button is pressed with more than 0.5 seconds between clicks, then this is interpreted as two single-click events.

Pointer Speed:

The Simple Pointer Protocol returns the movement of the pointer device along an axis in counts. The Simple Pointer Protocol also contains a set of resolution fields that define the number of counts that will be received for each millimeter of movement of the pointer device along an axis. From these two values, the consumer of this protocol can determine the distance the pointer device has been moved in millimeters along an axis. For most applications, movement of a pointer device will result in the movement of a pointer on the screen. For each millimeter of motion by the pointer device in the x-axis, the pointer on the screen will be moved 2 percent of the screen width. For each millimeter of motion by the pointer device in the y-axis, the pointer on the screen will be moved 2 percent of the screen height.

APPENDIX
G

APPENDIX G — USING THE EFI EXTENDED SCSI PASS THRU PROTOCOL

This appendix describes how an EFI utility might gain access to the EFI SCSI Pass Thru interfaces. The basic concept is to use the *EFI_BOOT_SERVICES.LocateHandle()* boot service to retrieve the list of handles that support the *EFI_EXT_SCSI_PASS_THRU_PROTOCOL* . Each of these handles represents a different SCSI channel present in the system. Each of these handles can then be used the retrieve the *EFI_EXT_SCSI_PASS_THRU_PROTOCOL* interface with the *EFI_BOOT_SERVICES.HandleProtocol()* boot service. The *EFI_EXT_SCSI_PASS_THRU_PROTOCOL* interface provides the services required to access any of the SCSI devices attached to a SCSI channel. The services of the *EFI_EXT_SCSI_PASS_THRU_PROTOCOL* are then to loop through the Target IDs of all the SCSI devices on the SCSI channel.

```
#include "efi.h"
#include "efilib.h"

#include EFI_PROTOCOL_DEFINITION(ExtScsiPassThru)

EFI_GUID gEfiExtScsiPassThruProtocolGuid =
EFI_EXT_SCSI_PASS_THRU_PROTOCOL_GUID;

APPENDIX H — COMPRESSION SOURCE CODE

```
/*++

Copyright (c) 2001-2002 Intel Corporation

Module Name:

 Compress.c

Abstract:

 Compression routine. The compression algorithm is a mixture of LZ77
 and Huffman Coding. LZ77 transforms the source data into a sequence
 of Original Characters and Pointers to repeated strings. This sequence
 is further divided into Blocks and Huffman codings are applied to each Block.

APPENDIX

K

APPENDIX K — ALPHABETIC FUNCTION LISTS

This appendix was redacted in version 2.6.

APPENDIX L — EFI 1.10 PROTOCOL CHANGES AND DEPRECATION LIST

L.1 Protocol and GUID Name Changes from EFI 1.10

This appendix lists the Protocol , GUID, and revision identifier name changes and the deprecated protocols compared to the EFI Specification 1.10. The protocols listed are not Runtime, Reentrant or MP Safe. Protocols are listed by EFI 1.10 name.

For protocols in the table whose TPL is not <= TPL_NOTIFY:

This function must be called at a TPL level less then or equal to %%%%.

%%%% is TPL_CALLBACK or TPL_APPLICATION. The <= is done via text.

Table L.1: Protocol Name changes

EFI 1.10 Protocol Name	UEFI Specification Protocol Name
EFI_LOADED_IMAGE	EFI_LOADED_IMAGE_PROTOCOL
TPL	<= TPL_NOTIFY
New GUID name	EFI_LOADED_IMAGE_PROTOCOL_GUID
EFI_DEVICE_PATH	EFI_DEVICE_PATH_PROTOCOL
TPL	<= TPL_NOTIFY
New GUID name	EFI_DEVICE_PATH_PROTOCOL_GUID
SIMPLE_INPUT_INTERFACE	EFI_SIMPLE_INPUT_PROTOCOL
TPL	<= TPL_APPLICATION
New GUID name	EFI_SIMPLE_INPUT_PROTOCOL_GUID
SIMPLE_TEXT_OUTPUT_INTERFACE	EFI_SIMPLE_TEXT_OUTPUT_PROTOCOL
TPL	<=TPL_CALLBACK
New GUID name	EFI_SIMPLE_TEXT_OUTPUT_PROTOCOL_GUID
SERIAL_IO_INTERFACE	EFI_SERIAL_IO_PROTOCOL
TPL	<=TPL_CALLBACK
New GUID name	EFI_SERIAL_IO_PROTOCOL_GUID
EFI_LOAD_FILE_INTERFACE	EFI_LOAD_FILE_PROTOCOL
TPL	<= TPL_NOTIFY
New GUID name	EFI_LOAD_FILE_PROTOCOL_GUID
EFI_FILE_IO_INTERFACE	EFI_SIMPLE_FILE_SYSTEM_PROTOCOL
TPL	<=TPL_CALLBACK
New GUID name	EFI_FILE_SYSTEM_PROTOCOL_GUID
EFI_FILE	EFI_FILE_PROTOCOL
TPL	<= TPL_CALLBACK
New GUID name	EFI_FILE_PROTOCOL_GUID

L.2 Deprecated Protocols

Device I/O Protocol - The support of the Device I/O Protocol (see EFI 1.1 Chapter 18) has been replaced by the use of the PCI Root Bridge I/O protocols which are described in *PCI Root Bridge I/O Protocol* of the UEFI Specification. Note: certain "legacy" EFI applications such as some of the ones that reside in the EFI Toolkit assume the presence of Device I/O.

UGA I/O + UGA Draw Protocol - The support of the UGA * Protocols (see EFI 1.1 Section 10.7) have been replaced by the use of the EFI Graphics Output Protocol described in *Protocols — Console Support* of the UEFI Specification.

USB Host Controller Protocol (version that existed for EFI 1.1) - The support of the USB Host Controller Protocol (see EFI 1.1 Section 14.1) has been replaced by the use of a UEFI instance that covers both USB 1.1 and USB 2.0 support, and is described in *Protocols — USB Support* of the UEFI Specification. It replaces the pre-existing protocol definition.

SCSI Passthru Protocol - The support of the SCSI Passthru Protocol (see EFI 1.1 Section 13.1) has been replaced by the use of the Extended SCSI Passthru Protocol, which is described in Section 15.7.

BIS Protocol - Remains as an optional protocol.

Driver Configuration Protocol - the *EFI_DRIVER_CONFIGURATION_PROTOCOL* has been removed.

APPENDIX M — FORMATS — LANGUAGE CODES AND LANGUAGE CODE ARRAYS

This appendix lists the formats for language codes and language code arrays.

M.1 Specifying individual language codes

The preferred representation of a language code is done via an RFC 4646 language code identifier*.

Alias codes supported in addition to RFC 4646

Table M.1: Alias Codes Supported in Addition to RFC 4646

RFC string	Supported Alias String
zh-Hans	zh-chs
zh-Hant	zh-cht

An RFC 4646 language code is represented as a null-terminated ASCII string.

An RFC 4646 language string must be constructed according to the tag creation rules in section 2.3 of RFC 4646. For example, when constructing the primary language tag for a locale identifier, if a 2 character ISO 639-1 language code exists along with a 3 character ISO 639-2 language code, then the ISO 639-1 language code must be used. Further, if an ISO 639-1 tag does not exist, then the ISO 639-2/T (Terminology) tag must be for the primary locale before an ISO 639-2/B (Bibliographic) tag may be used. See RFC 4646 for a complete discussion of this topic.

To provide backwards compatibility with preexisting EFI 1.10 drivers, a UEFI platforms may support deprecated protocols which represent languages in the ISO 639-2 format. This includes the following protocols: *UNICODE_COLLATION_INTERFACE* , *EFI_DRIVER_CONFIGURATION_PROTOCOL* , *EFI_DRIVER_DIAGNOSTICS_PROTOCOL* , and *EFI_COMPONENT_NAME_PROTOCOL* . The deprecated *LangCodes* and *Lang* global variables may also be supported by a platform for backwards compatibility.

M.1.1 Specifying language code arrays:

Native RFC 4646 format array:

An array of RFC 4646 character codes is represented as a NULL terminated char8 array of RFC 4646 language code strings. Each of these strings is delimited by a semicolon (‘;’) character. For example, an array of US English and Traditional Chinese would be represented as the NULL-terminated string “en-us;zh-Hant”.

APPENDIX N - COMMON PLATFORM ERROR RECORD (CPER)

N.1 Introduction

This appendix describes the common platform error record (CPER) format for representing platform hardware errors.

N.2 Format

The general format of the common platform error record is illustrated in the Figure below . The record consists of a header; followed by one or more section descriptors; and for each descriptor, an associated section which may contain either error or informational data.

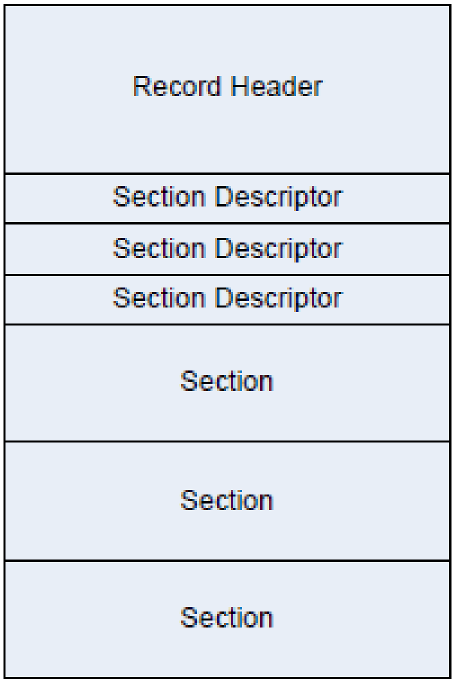

Fig. N.1: Error Record Format

N.2.1 Record Header

The record header includes information which uniquely identifies a hardware error record on a given system. The contents of the record header are described in the Table below. The header is immediately followed by an array of one or more section descriptors. Sections may be either error sections, which contain error information retrieved from hardware, or they may be informational sections, which contain contextual information relevant to the error. An error record must contain at least one section.

Table N.1: Error record header

Mnemonic	Byte Offset	Byte Length	Description
Signature Start	0	4	ASCII 4-character array "CPER" (0x43,0x50,0x45,0x52). Identifies this structure as a hardware error record.
Revision	4	2	This is a 2-byte field representing a major and minor version number for the error record definition in BCD format. The interpretation of the major and minor version number is as follows: • Byte 0 - Minor (01): An increase in this revision indicates that changes to the headers and sections are backward compatible with software that use earlier revisions. Addition of new GUID types, errata fixes or clarifications are covered by a bump up. • Byte 1 - Major (01): An increase in this revision indicates that the changes are not backward compatible from a software perspective.
Signature End	6	4	Must be 0xFFFFFFFF
Section Count	10	2	This field indicates the number of valid sections associated with the record, corresponding to each of the following section descriptors.
Error Severity	12	4	Indicates the severity of the error condition. The severity of the error record corresponds to the most severe error section. 0 - Recoverable (also called non-fatal uncorrected) 1 - Fatal 2 - Corrected 3 - Informational All other values are reserved. Note that severity of "Informational" indicates that the record could be safely ignored by error handling software.

continues on next page

Table N.1 – continued from previous page

Mnemonic	Byte Offset	Byte Length	Description
Validation Bits	16	4	This field indicates the validity of the following fields: • Bit 0 - If 1, the PlatformID field contains valid information • Bit 1 - If 1, the TimeStamp field contains valid information • Bit 2 - If 1, the PartitionID field contains valid information • Bits 3-31: Reserved, must be zero.
Record Length	20	4	Indicates the size of the actual error record, including the size of the record header, all section descriptors, and section bodies. The size may include extra buffer space to allow for the dynamic addition of error sections descriptors and bodies.
Timestamp	24	8	The timestamp correlates to the time when the error information was collected by the system software and may not necessarily represent the time of the error event. The timestamp contains the local time in BCD format. • Byte 7 - Byte 0: • Byte 0: Seconds • Byte 1: Minutes • Byte 2: Hours • Byte 3: • Bit 0 - Timestamp is precise if this bit is set and correlates to the time of the error event. • Bit 7:1 - Reserved • Byte 4: Day • Byte 5: Month • Byte 6: Year • Byte 7: Century
Platform ID	32	16	This field uniquely identifies the platform with a GUID. The platform's SMBIOS UUID should be used to populate this field. Error analysis software may use this value to uniquely identify a platform.
Partition ID	48	16	If the platform has multiple software partitions, system software may associate a GUID with the partition on which the error occurred.
Creator ID	64	16	This field contains a GUID indicating the creator of the error record. This value may be overwritten by subsequent owners of the record.

continues on next page

Table N.1 – continued from previous page

Mnemonic	Byte Offset	Byte Length	Description
Notification Type	80	16	This field holds a pre-assigned GUID value indicating the record association with an error event notification type. The defined types are: CMC {0x2DCE8BB1, 0xBDD7, 0x450e, {0xB9, 0xAD, 0x9C, 0xF4, 0xEB, 0xD4, 0xF8, 0x90}} CPE {0x4E292F96, 0xD843, 0x4a55, {0xA8, 0xC2, 0xD4, 0x81, 0xF2, 0x7E, 0xBE, 0xEE}} MCE {0xE8F56FFE, 0x919C, 0x4cc5, {0xBA, 0x88, 0x65, 0xAB, 0xE1, 0x49, 0x13, 0xBB}} PCIe {0xCF93C01F, 0x1A16, 0x4dfc, {0xB8, 0xBC, 0x9C, 0x4D, 0xAF, 0x67, 0xC1, 0x04}} INIT {0xCC5263E8, 0x9308, 0x454a, {0x89, 0xD0, 0x34, 0x0B, 0xD3, 0x9B, 0xC9, 0x8E}} NMI {0x5BAD89FF, 0xB7E6, 0x42c9, {0x81, 0x4A, 0xCF, 0x24, 0x85, 0xD6, 0xE9, 0x8A}} Boot {0x3D61A466, 0xAB40, 0x409a, {0xA6, 0x98, 0xF3, 0x62, 0xD4, 0x64, 0xB3, 0x8F}} DMAr {0x667DD791, 0xC6B3, 0x4c27, {0x8A, 0x6B, 0x0F, 0x8E,0x72, 0x2D, 0xEB, 0x41}} SEA {0x9A78788A, 0xBBE8, 0x11E4, {0x80, 0x9E, 0x67, 0x61, 0x1E, 0x5D, 0x46, 0xB0}} SEI {0x5C284C81, 0xB0AE, 0x4E87, {0xA3, 0x22, 0xB0, 0x4C, 0x85, 0x62, 0x43, 0x23}} PEI {0x09A9D5AC, 0x5204, 0x4214, {0x96, 0xE5, 0x94, 0x99, 0x2E, 0x75, 0x2B, 0xCD}} CXL Component {0x69293BC9, 0x41DF, 0x49A3 {0xB4, 0xBD, 0x4F, 0xB0, 0xDB, 0x30, 0x41, 0xF6}}

Table N.1 – continued from previous page

Mnemonic	Byte Offset	Byte Length	Description
Record ID	96	8	This value, when combined with the Creator ID, uniquely identifies the error record across other error records on a given system.
Flags	104	4	Flags field contains information that describes the error record. See Table 2 for defined flags.
Persistence Information	108	8	This field is produced and consumed by the creator of the error record identified in the Creator ID field. The format of this field is defined by the creator and it is out of scope of this specification.
Reserved	116	12	Reserved. Must be zero.
Section Descriptor	128	Nx72	An array of SectionCount descriptors for the associated sections. The number of valid sections is equivalent to the SectionCount. The buffer size of the record may include more space to dynamically add additional Section Descriptors to the error record.

Error Record Header Flags

The following table lists flags that can be used to qualify an error record in the Error Record Header's Flags field.

Table N.2: Error Record Header Flags

Value	Description
1	HW_ERROR_FLAGS_RECOVERED: Qualifies an error condition as one that has been recovered by system software.
2	HW_ERROR_FLAGS_PREVERR: Qualifies an error condition as one that occurred during a previous session. For instance, of the OS detects an error and determines that the system must be reset; it will save the error record before stopping the system. Upon restarting the OS marks the error record with this flag to know that the error is not live.
4	HW_ERROR_FLAGS_SIMULATED: Qualifies an error condition as one that was intentionally caused. This allows system software to recognize errors that are injected as a means of validating or testing error handling mechanisms.

N.2.1.1 Notification Type

A notification type identifies the mechanism by which an error event is reported to system software. This information helps consumers of error information (e.g. management applications or humans) by identifying the source of the error information. This allows, for instance, all CMC error log entries to be filtered from an error event log.

Listed below are the standard notification types. Each standard notification type is identified by a GUID. For error notification types that do not conform to one of the standard types, a platform-specific GUID may be defined to identify the notification type.

- Machine Check Exception (MCE): {0xE8F56FFE, 0x919C, 0x4cc5, {0xBA, 0x88, 0x65, 0xAB, 0xE1, 0x49, 0x13, 0xBB}} A Machine Check Exception is a processor-generated exception class interrupt used to system software of the presence of a fatal or recoverable error condition.
- Corrected Machine Check (CMC): {0x2DCE8BB1, 0xBDD7, 0x450e, {0xB9, 0xAD, 0x9C, 0xF4,0xEB, 0xD4, 0xF8, 0x90}} Corrected Machine Checks identify error conditions that have been corrected by hardware or system firmware. CMCs are reported by the processor and may be reported via interrupt or by polling error status registers.

- Corrected Platform Error (CPE): {0x4E292F96, 0xD843, 0x4a55, {0xA8, 0xC2, 0xD4, 0x81, 0xF2, 0x7E, 0xBE, 0xEE}} Corrected Platform Errors identify corrected errors from the platform (i.e., external memory controller, system bus, etc.). CPEs can be reported via interrupt or by polling error status registers.
- Non-Maskable Interrupt (NMI): {0x5BAD89FF, 0xB7E6, 0x42c9, {0x81, 0x4A, 0xCF, 0x24, 0x85, 0xD6, 0xE9, 0x8A}} Non-Maskable Interrupts are used on X64 platforms to report fatal or recoverable platform error conditions. NMIs are reported via interrupt vector 2 on IA32 and X64 processor architecture platforms.
- PCI Express Error (PCIe): {0xCF93C01F, 0x1A16, 0x4dfc, {0xB8, 0xBC, 0x9C, 0x4D, 0xAF, 0x67, 0xC1, 0x04}} See the PCI Express standard v1.1 for details regarding PCI Express Error Reporting. This notification type identifies errors that were reported to the system via an interrupt on a PCI Express root port.
- INIT Record (INIT): {0xCC5263E8, 0x9308, 0x454a, {0x89, 0xD0, 0x34, 0x0B, 0xD3, 0x9B, 0xC9, 0x8E}} IPF Platforms optionally implement a mechanism (switch or button on the chassis) by which an operator may reset a system and have the system generate an INIT error record. This error record is documented in the IPF SAL specification. System software retrieves an INIT error record by querying the SAL for existing INIT records.
- BOOT Error Record (BOOT): {0x3D61A466, 0xAB40, 0x409a, {0xA6, 0x98, 0xF3, 0x62, 0xD4, 0x64, 0xB3, 0x8F}}

  The BOOT Notification Type represents error conditions which are unhandled by system software and which result in a system shutdown/reset. System software retrieves a BOOT error record during boot by querying the platform for existing BOOT records. As an example, consider an x64 platform which implements a service processor. In some scenarios, the service processor may detect that the system is either hung or is in such a state that it cannot safely proceed without risking data corruption. In such a scenario the service processor may record some minimal error information in its system event log (SEL) and unilaterally reset the machine without notifying the OS or other system software. In such scenarios, system software is unaware of the condition that caused the system reset. A BOOT error record would contain information that describes the error condition that led to the reset so system software can log the information and use it for health monitoring.
- DMA Remapping Error (DMAr): {0x667DD791, 0xC6B3, 0x4c27, {0x8A, 0x6B, 0x0F, 0x8E, 0x72, 0x2D, 0xEB, 0x41}} The DMA Remapping Notification Type identifies fault conditions generated by the DMAr unit when processing un-translated, translation and translated DMA requests. The fault conditions are reported to the system using a message signaled interrupt.
- Synchronous External Abort (SEA): {0x9A78788A, 0xBBE8, 0x11E4, {0x80, 0x9E, 0x67, 0x61, 0x1E, 0x5D, 0x46, 0xB0}}

  Synchronous External Aborts represent *precise* processor error conditions on ARM systems (uncorrectable and/or recoverable) as described in D3.5 of the ARMv8 ARM reference manual. This notification may be triggered by one of the following scenarios: cache parity error, cache ECC error, external bus error, micro-architectural error, data poisoning, and other platform errors.
- SError Interrupt (SEI): {0x5C284C81, 0xB0AE, 0x4E87, {0xA3, 0x22, 0xB0, 0x4C, 0x85, 0x62, 0x43, 0x23}} SError Interrupts represent asynchronous *imprecise* (or possibly precise) processor error conditions on ARM systems (corrected, uncorrectable, and recoverable) as described in D3.5 of the ARM ARM reference manual. This notification may be triggered by one of the following scenarios: cache parity error, cache ECC error, external bus error, micro-architectural error, data poisoning, and other platform errors.
- Platform Error Interrupt (PEI): {0x09A9D5AC, 0x5204, 0x4214, {0x96, 0xE5, 0x94, 0x99, 0x2E, 0x75, 0x2B, 0xCD} Platform Error Interrupt represent asynchronous *imprecise* platform error conditions on ARM systems that may be triggered by the following scenarios: system memory ECC error, ECC errors in system cache (e.g. shared high-level caches), vendor specific chip errors, external platform errors.
- Compute Express Link (CXL) Component: {0x69293BC9, 0x41DF, 0x49A3 {0xB4, 0xBD, 0x4F, 0xB0, 0xDB, 0x30, 0x41, 0xF6}} This Notification Type identifies errors that were reported to the system by CXL components that support error reporting via the CXL RAS Mailbox interface. See the CXL Specification, Rev 2.0 or later, for details regarding CXL Error Reporting.

N.2.1.2 Error Status

The error status definition provides the capability to abstract information from implementation-specific error registers into generic error codes.

Table N.3: Error Status Fields

Bit Position	**Description**
7:0	Reserved
15:8	Encoded value for the Error_Type. See Table 20 Error Types for details.
16	Address: Error was detected on the address signals or on the address portion of the transaction.
17	Control: Error was detected on the control signals or in the control portion of the transaction.
18	Data: Error was detected on the data signals or in the data portion of the transaction.
19	Responder: Error was detected by the responder of the transaction.
20	Requester: Error was detected by the requester of the transaction.
21	First Error: If multiple errors are logged for a section type, this is the first error in the chronological sequence. Setting of this bit is optional.
22	Overflow: Additional errors occurred and were not logged due to lack of logging resources.
63:23	Reserved.

Table N.4: Error Types

Encoding	**Description**
1	ERR_INTERNAL Error detected internal to the component.
16	ERR_BUS Error detected in the bus.
Detailed Internal Errors	
4	ERR_MEM Storage error in memory (DRAM).
5	ERR_TLB Storage error in TLB.
6	ERR_CACHE Storage error in cache.
7	ERR_FUNCTION Error in one or more functional units.
8	ERR_SELFTEST component failed self test.
9	ERR_FLOW Overflow or undervalue of internal queue.
Detailed Bus Errors	
17	ERR_MAP Virtual address not found on IO-TLB or IO-PDIR.
18	ERR_IMPROPER Improper access error.
19	ERR_UNIMPL Access to a memory address which is not mapped to any component.
20	ERR_LOL Loss of Lockstep
21	ERR_RESPONSE Response not associated with a request
22	ERR_PARITY Bus parity error (must also set the A, C, or D Bits).
23	ERR_PROTOCOL Detection of a protocol error.
24	ERR_ERROR Detection of a PATH_ERROR
25	ERR_TIMEOUT Bus operation timeout.
26	ERR_POISONED A read was issued to data that has been poisoned.
All Others	*Reserved*

N.2.2 Section Descriptor

Table N.5: Section Descriptor

Mnemonic	Byte Offset	Byte Length	Description
Section Offset	0	4	Offset in bytes of the section body from the base of the record header.
Section Length	4	4	The length in bytes of the section body.
Revision	8	2	This is a 2-byte field representing a major and minor version number for the error record definition in BCD format. The interpretation of the major and minor version number is as follows: • Byte 0 — Minor (00): An increase in this revision indicates that changes to the headers and sections are backward compatible with software that uses earlier revisions. Addition of new GUID types, errata fixes or clarifications are covered by a bump up. • Byte 1 — Major (01): An increase in this revision indicates that the changes are not backward compatible from a software perspective
Validation Bits	10	1	This field indicates the validity of the following fields: • Bit 0 - If 1, the FRUId field contains valid information • Bit 1 - If 1, the FRUString field contains valid information • Bits 7:2 - Reserved, must be zero.
Reserved	11	1	Must be zero.

continues on next page

Table N.5 – continued from previous page

Flags	12	4	Flag field contains information that describes the error section as follows: Bit 0 - Primary: If set, identifies the section as the section to be associated with the error condition. This allows for FRU determination and for error recovery operations. By identifying a primary section, the consumer of an error record can determine which section to focus on. It is not always possible to identify a primary section so this flag should be taken as a hint. Bit 1 - Containment Warning: If set, the error was not contained within the processor or memory hierarchy and the error may have propagated to persistent storage or network. Bit 2 - Reset: If set, the component has been reset and must be re-initialized or re-enabled by the operating system prior to use. Bit 3 - Error threshold exceeded: If set, OS may choose to discontinue use of this resource. Bit 4 - Resource not accessible: If set, the resource could not be queried for error information due to conflicts with other system software or resources. Some fields of the section will be invalid. Bit 5 - Latent error: If set this flag indicates that action has been taken to ensure error containment (such a poisoning data), but the error has not been fully corrected and the data has not been consumed. System software may choose to take further corrective action before the data is consumed. Bit 6 - Propagated: If set this flag indicates the section is to be associated with an error that has been propagated due to hardware poisoning. This implies the error is a symptom of another error. It is not always possible to ascertain whether this is the case for an error, therefore if the flag is not set, it is unknown whether the error was propagated. this helps determining FRU when dealing with HW failures. Bit 7 - Overflow: If set this flag indicates the firmware has detected an overflow of buffers/queues that are used to accumulate, collect, or report errors (e.g. the error status control block exposed to the OS). When this occurs, some error records may be lost. Bit 8 through 31 - Reserved.

Table N.5 – continued from previous page

Section Type	16	16	This field holds a pre-assigned GUID value indicating that it is a section of a particular error. The different error section types are as defined below: **Processor Generic** • {0x9876CCAD, 0x47B4, 0x4bdb, {0xB6, 0x5E, 0x16, 0xF1, 0x93, 0xC4, 0xF3, 0xDB}} **Processor Specific** • IA32/X 64:{0xDC3EA0B0, 0xA144, 0x4797, {0xB9, 0x5B, 0x53, 0xFA, 0x24, 0x2B, 0x6E, 0x1D}} • IPF: {0xe429faf1, 0x3cb7, 0x11d4, {0xb, 0xca, 0x7, 0x00, 0x80, 0xc7, 0x3c, 0x88, 0x81}} (see footnote 1 at the end of Appendix N) • ARM: { 0 xE19E3D16,0xBC1 1,0x11E4,{0x9C, 0xAA, 0xC2, 0x05, 0x1D, 0x5D, 0x46, 0xB0}} NOTE: In addition to the types listed above, there may exist vendor specific GUIDs that describe vendor specific section types. **Platform Memory** • {0xA5BC1114, 0x6F64, 0x4EDE, {0xB8, 0x63, 0x3E, 0x83, 0xED, 0x7C, 0x83, 0xB1}} **PCIe** • {0xD995E954, 0xBBC1, 0x430F, {0xAD, 0x91, 0xB4, 0x4D, 0xCB, 0x3C, 0x6F, 0x35}} Firmware Error Record Reference • {0x81212A96, 0x09ED, 0x4996, {0x94, 0x71, 0x8D, 0x72, 0x9C, 0x8E, 0x69, 0xED}} **PCI/PCI-X Bus** • {0xC5753963, 0x3B84, 0x4095, {0xBF, 0x78, 0xED, 0xDA, 0xD3, 0xF9, 0xC9, 0xDD}} **PCI Component/Device** • {0xEB5E4685, 0xCA66, 0x4769, {0xB6, 0xA2, 0x26, 0x06, 0x8B, 0x00, 0x13, 0x26}} **DMAr Generic** • {0x5B51FEF7, 0xC79D, 0x4434, {0x8F, 0x1B, 0xAA, • 0x62, 0xDE, 0x3E, 0x2C, 0x64}} **Intel® VT** for Directed I/O specific DMAr section • {0x71761D37, 0x32B2, 0x45cd, {0xA7, 0xD0, 0xB0, • 0xFE 0xDD, 0x93, 0xE8, 0xCF}} **IOMMU specific DMAr section** • {0x036F84E1, 0x7F37, 0x428c, {0xA7, 0x9E, 0x57, • 0x5F, 0xDF, 0xAA, 0x84, 0xEC}}
			Note 1 CXL Component Events *CXL Component Event Log Record* in the CXL Component Events Section

continues on next page

Table N.5 – continued from previous page

FRU Id	32	16	GUID representing the FRU ID, if it exists, for the section reporting the error. The default value is zero indicating an invalid FRU ID. System software can use this to uniquely identify a physical device for tracking purposes. Association of a GUID to a physical device is done by the platform in an implementation-specific way (i.e., PCIe Device can lock a GUID to a PCIe Device ID).
Section Severity	48	4	This field indicates the severity associated with the error section. 0 - Recoverable (also called non-fatal uncorrected) 1 - Fatal 2 - Corrected 3 - Informational All other values are reserved. Note that severity of "Informational" indicates that the section contains extra information that can be safely ignored by error handling software.
FRU Text	52	20	ASCII string identifying the FRU hardware.

Note:

1. For an IPF processor-specific error section, the GUID listed is the value from the SAL specification. The format of the data for this section is same as the Processor Device Error Info in the SAL specification.

N.2.3 Non-standard Section Body

Information that does not conform to one the standard formats (i.e., those defined in sections 2.4 through 2.9 of this document) may be recorded in the error record in a non-standard section. The type (e.g. format) of a non-standard section is identified by the GUID populated in the Section Descriptor's Section Type field. This allows the information to be decoded by consumers if the format is externally documented. Examples of information that might be placed in a non-standard section include the IPF raw SAL error record, Error information recorded in implementation-specific PCI configuration space, and IPMI error information recorded in an IPMI SEL.

N.2.4 Processor Error Sections

The processor error sections are divided into two different components as described below:

1. Processor Generic Error Section: This section holds information about processor errors in a generic form and will be common across all processor architectures. An example or error information provided is the generic information of cache, tlb, etc., errors.
2. Processor Specific Error Section: This section consists of error information, which is specific to a processor architecture. In addition, certain processor architecture state at the time of error may also be captured in this section. This section is unique to each processor architecture (Itanium Processor Family, IA32/X64, ARM).

N.2.4.1 Generic Processor Error Section

The Generic Processor Error Section describes processor reported hardware errors for logical processors in the system.

Section Type: {0x9876CCAD, 0x47B4, 0x4bdb, {0xB6, 0x5E, 0x16, 0xF1, 0x93, 0xC4, 0xF3, 0xDB}}

Table N.6: Processor Generic Error Section

Name	Byte Offset	Byte Length	Description

continues on next page

Table N.6 – continued from previous page

Validation Bits	0	8	The validation bit mask indicates whether or not each of the following fields is valid in this section. Bit 0 - Processor Type Valid Bit 1 - Processor ISA Valid Bit 2 - Processor Error Type Valid Bit 3 - Operation Valid Bit 4 - Flags Valid Bit 5 - Level Valid Bit 6 - CPU Version Valid Bit 7 - CPU Brand Info Valid Bit 8 - CPU Id Valid Bit 9 - Target Address Valid Bit 10 - Requester Identifier Valid Bit 11 - Responder Identifier Valid Bit 12 - Instruction IP Valid All other bits are reserved and must be zero.
Processor Type	8	1	Identifies the type of the processor architecture. 0: IA32/X64 1: IA64 2: ARM All other values reserved.
Processor ISA	9	1	Identifies the type of the instruction set executing when the error occurred: 0: IA32 1: IA64 2: X64 3: ARM A32/T32 4: ARM A64 All other values are reserved.
Processor Error Type	10	1	Indicates the type of error that occurred: 0x00: Unknown 0x01: Cache Error 0x02: TLB Error 0x04: Bus Error 0x08: Micro-Architectural Error All other values reserved.

continues on next page

Table N.6 – continued from previous page

Operation	11	1	Indicates the type of operation: 0: Unknown or generic 1: Data Read 2: Data Write 3: Instruction Execution All other values reserved.
Flags	12	1	Indicates additional information about the error: Bit 0: Restartable - If 1, program execution can be restarted reliably after the error. Bit 1: Precise IP - If 1, the instruction IP captured is directly associated with the error. Bit 2: Overflow - If 1, a machine check overflow occurred (a second error occurred while the results of a previous error were still in the error reporting resources). Bit 3: Corrected - If 1, the error was corrected by hardware and/or firmware. All other bits are reserved and must be zero.
Level	13	1	Level of the structure where the error occurred, with 0 being the lowest level of cache.
Reserved	14	2	Must be zero.
CPU Version Info	16	8	This field represents the CPU Version Information and returns Family, Model, and stepping information (e.g. As provided by CPUID instruction with EAX=1 input with output values from EAX on the IA32/X64 processor or as provided by CPUID Register 3 register - Version Information on IA64 processors). On ARM processors, this field will be provided as: Bits 127:64 - Reserved and must be zero Bits 63:0 - MIDR_EL1 of the processor
CPU Brand String	24	128	This field represents the null-terminated ASCII Processor Brand String (e.g. As provided by the CPUID instruction with EAX=0x80000002 and ECX=0x80000003 for IA32/X64 processors or the return from PAL_BRAND_INFO for IA64 processors). This field is optional for ARM processors.

continues on next page

Table N.6 – continued from previous page

Processor ID	152	8	This value uniquely identifies the logical processor (e.g. As programmed into the local APIC ID register on IA32/X64 processors or programmed into the LID register on IA64 processors). On ARM processors, this field will be provided as programmed in the architected MPIDR_EL1.
Target Address	160	8	Identifies the target address associated with the error.
Requestor Identifier	168	8	Identifies the requestor associated with the error.
Responder Identifier	176	8	Identifies the responder associated with the error.
Instruction IP	184	8	Identifies the instruction pointer when the error occurred.

N.2.4.2 IA32/X64 Processor Error Section

Type:{0xDC3EA0B0, 0xA144, 0x4797, {0xB9, 0x5B, 0x53, 0xFA, 0x24, 0x2B, 0x6E, 0x1D}}

Table N.7: Processor Error Record

Mnemonic	**Byte Offset**	**Byte Length**	**Description**
Validation Bits	0	8	The validation bit mask indicates each of the following field is valid in this section: Bit0 - LocalAPIC_ID Valid Bit1 - CPUID Info Valid Bits 2-7 - Number of Processor Error Information Structure (PRO C_ERR_INFO_NUM) Bit 8- 13 Number of Processor Context Information Structure (PROC_CO NTEXT_INFO_NUM) Bits 14-63 - Reserved
Local APIC_ID	8	8	This is the processor APIC ID programmed into the APIC ID registers.
CPUID Info	16	48	This field represents the CPU ID structure of 48 bytes and returns Model, Family, and stepping information as provided by the CPUID instruction with EAX=1 input and output values from EAX, EBX, ECX, and EDX null extended to 64-bits.
Processor Error Info	64	Nx64	This is a variable-length structure consisting of N different 64 byte structures, each representing a single processor error information structure. The value of N ranges from 0-63 and is as indicated by PRO C_ERR_INFO_NUM.
Processor Context	64+Nx64	NxX	This is a variable size field providing the information for the processor context state such as MC Bank MSRs and general registers. The value of N ranges from 0-63 and is as indicated by PROC_CO NTEXT_INFO_NUM. Each processor context information structure is padded with zeros if the size is not a multiple of 16 bytes.

N.2.4.2.1 IA32/X64 Processor Error Information Structure

As described above, the processor error section contains a collection of structures called Processor Error Information Structures that contain processor structure specific error information. This section details the layout of the Processor Error Information Structure and the detailed check information which is contained within.

Table N.8: IA32/X64 Processor Error Information Structure

Mnemonic	Byte Offset	Byte Length	Description
Error Structure Type	0	16	This field holds a pre-assigned GUID indicating the type of Processor Error Information structure. The following Processor Error Information Structure Types have pre-defined GUID. • Cache Error Information (Cache Check) • TLB Error Information (TLB Check) • Bus Error Information (Bus Check) • Micro-architecture Specific Error Information (MS Check)
Validation Bits	16	8	Bit 0 - Check Info Valid Bit 1 - Target Address Identifier Valid Bit 2 - Requestor Identifier Valid Bit 3 - Responder Identifier Valid Bit 4 - Instruction Pointer Valid Bits 5-63 - Reserved
Check Information	24	8	Str uctureErrorType specific error check structure.
Target Identifier	32	8	Identifies the target associated with the error.
Requestor Identifier	40	8	Identifies the requestor associated with the error.
Responder Identifier	48	8	Identifies the responder associated with the error.
Instruction Pointer	56	8	Identifies the instruction executing when the error occurred.

N.2.4.2.2 IA32/X64 Cache Check Structure

Type:{0xA55701F5, 0xE3EF, 0x43de, {0xAC, 0x72, 0x24, 0x9B, 0x57, 0x3F, 0xAD, 0x2C}}

Table N.9: IA32/X64 Cache Check Structure

Field Name	**Bits**	**Description**

continues on next page

Table N.9 – continued from previous page

ValidationBits	15:0	Indicates which fields in the Cache Check structure are valid: Bit 0 - Transaction Type Valid Bit 1 - Operation Valid Bit 2 - Level Valid Bit 3 - Processor Context Corrupt Valid Bit 4 - Uncorrected Valid Bit 5 - Precise IP Valid Bit 6 - Restartable Valid Bit 7- Overflow Valid Bits 8 - 15 Reserved
TransactionType	17:16	Type of cache error: 0 - Instruction 1 - Data Access 2 - Generic All other values are reserved
Operation	21:18	Type of cache operation that caused the error: 0 - generic error (type of error cannot be determined) 1 - generic read (type of instruction or data request cannot be determined) 2 - generic write (type of instruction or data request cannot be determined) 3 - data read 4 - data write 5 - instruction fetch 6 - prefetch 7 - eviction 8 - snoop All other values are reserved.
Level	24:22	Cache Level
Processor Context Corrupt	25	This field indicates that the processor context might have been corrupted. 0 - Processor context not corrupted 1 - Processor context corrupted
Uncorrected	26	This field indicates whether the error was corrected or uncorrected: 0: Corrected 1: Uncorrected
Precise IP	27	This field indicates that the instruction pointer pushed onto the stack is directly associated with the error
Restartable IP	28	This field indicates that program execution can be restarted reliably at the instruction pointer pushed onto the stack

continues on next page

Table N.9 – continued from previous page

Overflow	29	This field indicates an error overflow occurred 0 - Overflow not occurred 1 - Overflow occurred
	63:30	Reserved

N.2.4.2.3 IA32/X64 TLB Check Structure

Type:{0xFC06B535, 0x5E1F, 0x4562, {0x9F, 0x25, 0x0A, 0x3B, 0x9A, 0xDB, 0x63, 0xC3}}

Table N.10: IA32/X64 TLB Check Structure

Field Name	Bits	Description
Validation Bits	15:0	Indicate which fields in the Cache_Check structure are valid Bit 0 - Transaction Type Valid Bit 1 - Operation Valid Bit 2 - Level Valid Bit 3 - Processor Context Corrupt Valid Bit 4 - Uncorrected Valid Bit 5 - Precise IP Valid Bit 6 - Restartable IP Valid Bit 7 - Overflow Valid Bit 8 - 15 Reserved
Transaction Type	17:16	Type of TLB error 0 - Instruction 1 - Data Access 2 - Generic All other values are reserved
Operation	21:18	Type of TLB access operation that caused the machine check: 0 - generic error (type of error cannot be determined) 1 - generic read (type of instruction or data request cannot be determined) 2 - generic write (type of instruction or data request cannot be determined) 3 - data read 4 - data write 5 - instruction fetch 6 - prefetch All other values are reserved.
Level	24:22	TLB Level

Table N.10 – continued from previous page

Processor Context Corrupt	25	This field indicates that the processor context might have been corrupted. 0 - Processor context not corrupted 1 - Processor context corrupted
Uncorrected	26	This field indicates whether the error was corrected or uncorrected: 0: Corrected 1: Uncorrected
PreciseIP	27	This field indicates that the instruction pointer pushed onto the stack is directly associated with the error.
Restartable IP	28	This field indicates the program execution can be restarted reliably at the instruction pointer pushed onto the stack.
Overflow	29	This field indicates an error overflow occurred 0 - Overflow not occurred 1 - Overflow occurred
	63:30	Reserved

N.2.4.2.4 IA32/X64 Bus Check Structure

Type:{0x1CF3F8B3, 0xC5B1, 0x49a2, {0xAA, 0x59, 0x5E, 0xEF, 0x92, 0xFF, 0xA6, 0x3C}}

Table N.11: IA32/X64 Bus Check Structure

Field Name	**Bits**	**Description**
Validation Bits	15:0	Indicate which fields in the Bus_Check structure are valid Bit 0 - Transaction Type Valid Bit 1 - Operation Valid Bit 2 - Level Valid Bit 3 - Processor Context Corrupt Valid Bit 4 - Uncorrected Valid Bit 5 - Precise IP Valid Bit 6 - Restartable IP Valid Bit 7 - Overflow Valid Bit 8 - Participation Type Valid Bit 9 - Time Out Valid Bit 10 - Address Space Valid Bit 11 - 15 Reserved

continues on next page

Table N.11 – continued from previous page

Transaction Type	17:16	Type of Bus error 0 - Instruction 1 - Data Access 2 - Generic All other values are reserved
Operation	21:18	Type of bus access operation that caused the machine check: 0 - generic error (type of error cannot be determined) 1 - generic read (type of instruction or data request cannot be determined) 2 - generic write (type of instruction or data request cannot be determined) 3 - data read 4 - data write 5 - instruction fetch 6 - prefetch All other values are reserved.
Level	24:22	Indicate which level of the bus hierarchy the error occurred in.
Processor Context Corrupt	25	This field indicates that the processor context might have been corrupted. 0 - Processor context not corrupted 1 - Processor context corrupted
Uncorrected	26	This field indicates whether the error was corrected or uncorrected: 0: Corrected 1: Uncorrected
PreciseIP	27	This field indicates that the instruction pointer pushed onto the stack is directly associated with the error.
Restartable IP	28	This field indicates the program execution can be restarted reliably at the instruction pointer pushed onto the stack.
Overflow	29	This field indicates an error overflow occurred 0 - Overflow not occurred 1 - Overflow occurred
Participation Type	31:30	Type of Participation 0 - Local Processor originated request 1 - Local processor Responded to request 2 - Local processor Observed 3 - Generic
Time Out	32	This field indicates that the request timed out.

Table N.11 – continued from previous page

Address Space	34:33	0 - Memory Access 1 - Reserved 2 - I/O 3 - Other Transaction
	63:35	Reserved

N.2.4.2.5 IA32/X64 MS Check Field Description

Type: {0x48AB7F57, 0xDC34, 0x4f6c, {0xA7, 0xD3, 0xB0, 0xB5, 0xB0, 0xA7, 0x43, 0x14}}

Table N.12: IA32/X64 MS Check Field Description

Field Name	Bits	Description
Validation Bits	15:0	Indicate which fields in the Cache_Check structure are valid Bit 0 - Error Type Valid Bit 1 - Processor Context Corrupt Valid Bit 2 - Uncorrected Valid Bit 3 - Precise IP Valid Bit 4 - Restartable IP Valid Bit 5 - Overflow Valid Bit 6 - 15 Reserved
Error Type	18:16	Identifies the operation that caused the error: 0 - No Error 1 - Unclassified 2 - Microcode ROM Parity Error 3 - External Error 4 - FRC Error 5 - Internal Unclassified All other value are processor specific.
Processor Context Corrupt	19	This field indicates that the processor context might have been corrupted. 0 - Processor context not corrupted 1 - Processor context corrupted
Uncorrected	20	This field indicates whether the error was corrected or uncorrected: 0: Corrected 1: Uncorrected
Precise IP	21	This field indicates that the instruction pointer pushed onto the stack is directly associated with the error.

continues on next page

Table N.12 – continued from previous page

Restartable IP	22	This field indicates the program execution can be restarted reliably at the instruction pointer pushed onto the stack.
Overflow	23	This field indicates an error overflow occurred 0 - Overflow not occurred 1 - Overflow occurred
	63:24	Reserved

N.2.4.2.6 IA32/X64 Processor Context Information Structure

As described above, the processor error section contains a collection of structures called Processor Context Information that contain processor context state specific to the IA32/X64 processor architecture. This section details the layout of the Processor Context Information Structure and the detailed processor context type information.

Table N.13: IA32/X64 Processor Context Information

Mnemonic	Byte Offset	Byte Length	Description
Register Context Type	0	2 bytes	Value indicating the type of processor context state being reported: 0 - Unclassified Data 1 - MSR Registers (Machine Check and other MSRs) 2 - 32-bit Mode Execution Context 3 - 64-bit Mode Execution Context 4 - FXSAVE Context 5 - 32-bit Mode Debug Registers (DR0-DR7) 6 - 64-bit Mode Debug Registers (DR0-DR7) 7 - Memory Mapped Registers Others - Reserved
Register Array Size	2	2 bytes	Represents the total size of the array for the Data Type being reported in bytes.
MSR Address	4	4 bytes	This field contains the starting MSR address for the type 1 register context.
MM Register Address	8	8 bytes	This field contains the starting memory address for the type 7 register context.
Register Array	16	N bytes	This field will provide the contents of the actual registers or raw data. The number of Registers or size of the raw data reported is determined by (Array Size / 8) or otherwise specified by the context structure type definition.

The Table below shows the register context type 2, 32-bit mode execution context.

Table N.14: IA32 Register State

Offset	**Length**	**Field**
0	4 bytes	EAX
4	4 bytes	EBX

176	8 bytes	CR2
184	8 bytes	CR3
192	8 bytes	CR4
200	8 bytes	CR8
208	16 bytes	GDTR
224	16 bytes	IDTR
240	2 bytes	LDTR
242	2 bytes	TR

N.2.4.3 IA64 Processor Error Section

Refer to the Intel Itanium Processor Family System Abstraction Layer specification for finding the IA64 specific error section body definition.

N.2.4.4 ARM Processor Error Section

Type: {0xE19E3D16, 0xBC11, 0x11E4, {0x9C, 0xAA, 0xC2, 0x05, 0x1D, 0x5D, 0x46, 0xB0}}

The ARM Processor Error Section may contain multiple instances of error information structures associated to a single error event. An error may propagate to other hardware components (e.g. poisoned data) or cause subsequent errors, all of which may be captured in a single ARM processor error section. The processor context information describes the observed state of the processor at the point of error detection.

It is optional for vendors to capture processor context information. The specifics of capturing processor context is vendor specific. Vendors must take care when handling errors that have originated whilst a processor was executing in a secure exception level. In those cases providing processor context information to non-secure agents could be unsafe and lead to security attacks.

Table N.16: ARM Processor Error Section

Mnemonic	**Byte Offset**	**Byte Length**	**Description**
Validation Bit	0	4	The validation bit mask indicates whether or not each of the following fields is valid in this section. Bit 0 - MPIDR Valid Bit 1 - Error affinity level Valid Bit 2 - Running State Bit 3 - Vendor Specific Info Valid All other bits are reserved and must be zero.
ERR_INFO_NUM	4	2	ERR_INFO_NUM is the number of Processor Error Information Structures (must be 1 or greater)
CONTEXT_INFO_NUM	6	2	C ONTEXT_INFO_NUM is the number of Context Information Structures

continues on next page

Table N.16 – continued from previous page

Section Length	8	4	This describes the total size of the ARM processor error section
Error affinity level	12	1	For errors that can be attributed to a specific affinity level, this field defines the affinity level at which the error was produced, detected, and/or consumed. This is a value between 0 and 3. All other values (4-255) are reserved For example, a vendor may choose to define affinity levels as follows: Level 0: errors that can be precisely attributed to a specific CPU (e.g. due to a synchronous external abort) Level 1: Cache parity and/or ECC errors detected at cache of affinity level 1 (e.g. only attributed to higher level cache due to prefetching and/or error propagation) **NOTE**: Detailed meanings and groupings of affinity level are chip and/or platform specific. The affinity level described here must be consistent with the platform definitions used MPIDR. For cache/TLB errors, the cache/TLB level is provided by the cache/TLB error structure, which may differ from affinity level.
Reserved	13	3	Must be zero
MPIDR_EL1	16	8	This field is valid for "attributable errors" that can be attributed to a specific CPU, cache, or cluster. This is the processor's unique ID in the system.
MIDR_EL1	24	8	This field provides identification information of the chip, including an implementer code for the device and a device ID number
Running State	32	4	Bit 0 - Processor running. If this bit is set, "PSCI State" field must be zero. All other bits are reserved and must be zero.
PSCI State	36	4	This field provides PSCI state of the processor, as defined in ARM PSCI document. This field is valid when bit 32 of "Running State" field is zero.
Processor Error Information Structure	40	Nx32	This is a variable-length structure consisting of N different 32 byte structures (reference the Table below, *ARM Processor Error Information Structure*) , each representing a single processor error information structure. The value of N ranges from 1-255 and is as indicated by ERR_INFO_NUM field in this table.
Processor Context	40 + Nx32	MxP	This is a variable size field consisting of M different P byte structures providing the information for the processor context state such as general purpose registers (GPRs) and special purpose registers (SPRs) as defined in Table 266 or 267 (depending on the context type). The value of M ranges from 0-65536 and is indicated by the C ONTEXT_INFO_NUM field in this table. Each processor context information structure is padded with zeros if the size is not a multiple of 16 bytes. The value of P is a variable length defined by the processor context structure per Table 266 and 267.
Vendor Specific Error Info	40 + Nx32 + MxP	vendor specific	This is an optional variable field provided by vendors that prefer to provide additional details.

N.2.4.4.1 ARM Processor Error Information

As described above, the processor error section contains a collection of *Processor Error Information* structures that contain processor specific error information. This section details the layout of the Processor Error Information structure and the detailed information which is contained within.

Table N.17: ARM Processor Error Information Structure

Mnemonic	Byte Offset	Byte Length	Description
Version	0	1	0 (revision of this table)
Length	1	1	32 (length in bytes)
Validation Bit	2	2	The validation bit mask indicates whether or not each of the following fields is valid in this section. Bit 0 - Multiple Error (Error Count) Valid Bit 1 - Flags Valid Bit 2 - Error Information Valid Bit 3 - Virtual Fault Address Bit 4 - Physical Fault Address All other bits are reserved and must be zero.
Type	4	1	Bit 1 - Cache Error Bit 2 - TLB Error Bit 3 - Bus Error Bit 4 - Micro-architectural Error All other values are reserved
Multiple Error (Error Count)	5	2	This field indicates whether multiple errors have occurred. In the case of multiple error with a valid count, this field will specify the error count. The value of this field is defined as follows: 0: Single Error 1: Multiple Errors 2-65535: Error Count (if known)
Flags	7	1	This field indicates flags that describe the error attributes. The value of this field is defined as follows: Bit 0 - First error captured Bit 1 - Last error captured Bit 2 - Propagated Bit 3 - Overflow All other bits are reserved and must be zero **Note**: The overflow bit indicates when firmware/hardware error buffers experience an overflow, so it is possible that some error information has been lost.

continues on next page

Table N.17 – continued from previous page

Mnemonic	Byte Offset	Byte Length	Description
Error Information	8	8	The error information structure is specific to each error type (described in tables below)
Virtual Fault Address	16	8	If known, this field indicates a virtual fault address associated with the error (e.g. when an error occurs in virtually indexed cache)
Physical Fault Address	24	8	If known, this field indicates a physical fault address associated with the error

See the 4 Tables directly below for more error information: *Arm Cache Error Structure*, *ARM TLB Error Structure*, *ARM Bus Error Structure*, and *ARM Processor Error Context Information Header Structure* .

Table N.18: ARM Cache Error Structure

Name	**Bits**	**Description**
Validation Bit	15:0	Indicates which fields in the Cache Check structure are valid: Bit 0 - Transaction Type Valid Bit 1 - Operation Valid Bit 2 - Level Valid Bit 3 - Processor Context Corrupt Valid Bit 4 - Corrected Valid Bit 5 - Precise PC Valid Bit 6 - Restartable PC Valid All other bits are reserved and must be zero.
Transaction Type	17:16	Type of cache error: 0 - Instruction 1 - Data Access 2 - Generic All other values are reserved

continues on next page

Table N.18 – continued from previous page

Operation	21:18	Type of cache operation that caused the error: 0 - generic error (type of error cannot be determined) 1 - generic read (type of instruction or data request cannot be determined) 2 - generic write (type of instruction or data request cannot be determined) 3 - data read 4 - data write 5 - instruction fetch 6 - prefetch 7 - eviction 8 - snooping (the processor described in this record initiated a cache snoop that resulted in an error) 9 - snooped (The processor described in this record raised a cache error caused by another processor or device snooping into its cache) 10 - management All other values are reserved.
Level	24:22	Cache level
Processor Context Corrupt	25	This field indicates that the processor context might have been corrupted. 0 - Processor context not corrupted 1 - Processor context corrupted
Corrected	26	This field indicates whether the error was corrected or uncorrected: 1: Corrected 0: Uncorrected
Precise PC	27	This field indicates that the program counter that is directly associated with the error
Restartable PC	28	This field indicates that program execution can be restarted reliably at the PC associated with the error.
Reserved	63:29	Must be zero

Table N.19: ARM TLB Error Structure

Name	**Bits**	**Description**
Validation Bit	15:0	Indicates which fields in the TLB error structure are valid: | Bit 0 - Transaction Type Valid | Bit 1 - Operation Valid | Bit 2 - Level Valid | Bit 3 - Processor Context Corrupt Valid | Bit 4 - Corrected Valid | Bit 5 - Precise PC Valid | Bit 6 - Restartable PC Valid | All other bits are reserved and must be zero.
Transaction Type	17:16	Type of TLB error: 0 - Instruction 1 - Data Access 2 - Generic All other values are reserved

continues on next page

Table N.19 – continued from previous page

Operation	21:18	Type of TLB operation that caused the error: 0 - generic error (type of error cannot be determined) 1 - generic read (type of instruction or data request cannot be determined) 2 - generic write (type of instruction or data request cannot be determined) 3 - data read 4 - data write 5 - instruction fetch 6 - prefetch 7 - local management operation (the processor described in this record initiated a TLB management operation that resulted in an error) 8 - external management operation (the processor described in this record raised a TLB error caused by another processor or device broadcasting TLB operations) All other values are reserved.
Level	24:22	TLB level
Processor Context Corrupt	25	This field indicates that the processor context might have been corrupted. 0 - Processor context not corrupted 1 - Processor context corrupted
Corrected	26	This field indicates whether the error was corrected or uncorrected: 1: Corrected 0: Uncorrected
Precise PC	27	This field indicates that the program counter that is directly associated with the error
Restartable PC	28	This field indicates that program execution can be restarted reliably at the PC associated with the error.
Reserved	63:29	Must be zero.

Table N.20: ARM Bus Error Structure

Name	**Bits**	**Description**

Table N.20 – continued from previous page

Validation Bit	15:0	Indicates which fields in the Bus error structure are valid: Bit 0 - Transaction Type Valid Bit 1 - Operation Valid Bit 2 - Level Valid Bit 3 - Processor Context Corrupt Valid Bit 4 - Corrected Valid Bit 5 - Precise PC Valid Bit 6 - Restartable PC Valid Bit 7 - Participation Type Valid Bit 8 - Time Out Valid Bit 9 - Address Space Valid Bit 10 - Memory Attributes Valid Bit 11 - Access Mode valid All other bits are reserved and must be zero.
Transaction Type	17:16	Type of bus error: 0 - Instruction 1 - Data Access 2 - Generic All other values are reserved
Operation	21:18	Type of bus operation that caused the error: 0 - generic error (type of error cannot be determined) 1 - generic read (type of instruction or data request cannot be determined) 2 - generic write (type of instruction or data request cannot be determined) 3 - data read 4 - data write 5 - instruction fetch 6 - prefetch All other values are reserved.
Level	24:22	Affinity level at which the bus error occurred
Processor Context Corrupt	25	This field indicates that the processor context might have been corrupted. 0 - Processor context not corrupted 1 - Processor context corrupted
Corrected	26	This field indicates whether the error was corrected or uncorrected: 1: Corrected 0: Uncorrected
Precise PC	27	This field indicates that the program counter that is directly associated with the error
Restartable PC	28	This field indicates that program execution can be restarted reliably at the PC associated with the error.

continues on next page

Table N.20 – continued from previous page

Participation Type	30:29	Type of Participation 0 - Local Processor originated request 1 - Local processor Responded to request 2 - Local processor Observed 3 - Generic The usage of this field depends on the vendor, but the examples below provide some guidance on how this field is to be used: If bus error occurs on an LDR instruction, the local processor originated the request. If the bus error occurs due to a snoop operation, local processor responded to the request If a bus error occurs due to cache prefetching and an SEI was sent to a particular CPU to notify this bus error has occurred, then the local processor only observed the error.
Time Out	31	This field indicates that the request timed out.
Address Space	33:32	0 - External Memory Access (e.g. DDR) 1 - Internal Memory Access (e.g. internal chip ROM) 3 - Device Memory Access
Memory Access Attributes	42:34	Memory attribute as described in the ARM ARM specification.
Access Mode	43	Indicates whether the access was a secure or normal bus request 0 - secure 1 - normal **Note**: A platform may choose to hide some or all of the error information for errors that are consumed/detected in the secure context.
Reserved	63:44	Must be zero.

N.2.4.4.1.1 ARM Vendor Specific Micro-Architecture ErrorStructure

This is a vendor specific structure. Please refer to your hardware vendor documentation for the format of this structure.

N.2.4.4.2 ARM Processor Context Information

As described above, the processor error section contains a collection of structures called Processor Context Information. These provide processor context state specific to the ARM processor architecture. This section details the layout of the Processor Error Context Information Header Structure (See Table N-21, *ARM Processor Error Context Information HeaderStructure*) and the detailed processor context type information structures (See Table N-21 through Table N-30).

Care must be taken when reporting context information structures. The amount of context reported depends on the agent that is going to observe the data. The following are recommended guidelines:

1. If the error happens whilst the processor is in the secure world, EL3, Secure EL1 or secure EL0, context information can contain sensitive data, and should not be exposed to unauthorized parties.
2. If the error information is being provided to a software agent running at EL2, then the context information should only include any registers visible in EL2, e.g. GPR, EL1 and EL2 registers.
3. If the error information is being provided to a software agent running at EL1, then the context information should only include any registers visible in EL1, e.g. GPR, EL1 and registers.

For context information on processor running in AArch64 mode, even though some registers are defined as 4 bytes in length, following tables provide 8 bytes space to account for possible future expansion.

Table N.21: ARM Processor Error Context Information HeaderStructure

Name	**Byte Offset**	**Byte Length**	**Description**
Version	0	2	0 (revision of this table)
Register Context Type	2	2	Value indicating the type of processor context state being reported: 0 — AArch32 GPRs (General Purpose Registers). 1 — AArch32 EL1 context registers 2 — AArch32 EL2 context registers 3 — Aarch32 secure context registers 4 — AArch64 GPRs 5 — AArch64 EL1 context registers 6 — Aarch64 EL2 context registers 7 — AArch64 EL3 context registers 8 — Misc. System Register Structure All other values are reserved.
Register Array Size	4	4	Represents the total size of the array for the Data Type being reported in bytes.
Register Array	8	N	This field will provide the contents of the actual registers or raw data. The contents of the array depends on the Type, with the structures described in Tables 266 - 274.

Table N.22: ARMv8 AArch32 GPRs (Type 0)

Byte Offset	Byte Length	Field
0	4	R0

72	8	TTBR0_EL3

The following structure (Table 275) describes additional AArch64/AArch32 miscellaneous system registers captured from the perspective of the processor that took the hardware error exception. Each register array entry will be per the following table. The number of register entries present in the register array is based on the register array size (i.e. N/10).

Table N.30: ARM Misc. Context System Register (Type 8) - SingleRegister Entry

Name	**Byte Offset**	**Byte Length**	**Description**
MRS encoding	0	2	This field defines MRS instruction encoding. Bit 0:2 – Op2 Bit 3:6 - CRm Bit 7:10 - CRn Bit 11:13 - Op1 Bit 14 - O0
Value	2	8	Value read from system register

N.2.5 Memory Error Section

Type: {0xA5BC1114, 0x6F64, 0x4EDE, {0xB8, 0x63, 0x3E, 0x83, 0xED, 0x7C, 0x83, 0xB1}}

Table N.31: Memory Error Record

Mnemonic	**Byte Offset**	**Byte Length**	**Description**

Table N.31 – continued from previous page

Validation Bits	0	8	Indicates which fields in the memory error record are valid. Bit 0 - Error Status Valid Bit 1 - Physical Address Valid Bit 2 - Physical Address Mask Valid Bit 3 - Node Valid Bit 4 - Card Valid Bit 5 - Module Valid Bit 6 - Bank Valid (When Bank is addressed via group/address, refer to Bit 19 and 20) Bit 7 - Device Valid Bit 8 - Row Valid 1 - the Row field at Offset 42 contains row number (15:0) and row number (17:16) are 00b 0 - the Row field at Offset 42 is not used, or is defined by Bit 18 (Extended Row Bit 16 and 17 Valid). Bit 9 - Column Valid Bit 10 - Bit Position Valid Bit 11 - Platform Requestor Id Valid Bit 12 - Platform Responder Id Valid Bit 13 - Memory Platform Target Valid Bit 14 - Memory Error Type Valid Bit 15 - Rank Number Valid Bit 16 - Card Handle Valid Bit 17 - Module Handle Valid Bit 18 - Extended Row Bit 16 and 17 Valid (refer to Byte Offset 42 and 73 below) 1 - the Row field at Offset 42 contains row number (15:0) and the Extended field at Offset 73 contains row number (17:16) 0 - the Extended field at Offset 73 and the Row field at Offset 42 are not used, or the Rowfield at Offset 42 is defined by Bit 8 (Row Valid). When this bit is set to 1, Bit 8 (Row Valid) must be set to 0. Bit 19 - Bank Group Valid Bit 20 - Bank Address Valid Bit 21 - Chip Identification Valid Bit 22-63 Reserved
Error Status	8	8	Memory error status information. See See *Error Status* for error status details.
Physical Address	16	8	The physical address at which the memory error occurred.
Physical Address Mask	24	8	Defines the valid address bits in the Physical Address field. The mask specifies the granularity of the physical address which is dependent on the hw/ implementation factors such as interleaving.
Node	32	2	In a multi-node system, this value identifies the node containing the memory in error.
Card	34	2	The card number of the memory error location.

continues on next page

Table N.31 – continued from previous page

Module	36	2	The module or rank number of the memory error location. (NODE, CARD, and MODULE should provide the information necessary to identify the failing FRU).
Bank	38	2	The bank number of the memory associated with the error. When Bank is addressed via group/address Bit 7:0 - Bank Address Bit 15:8 - Bank Group
Device	40	2	The device number of the memory associated with the error.
Row	42	2	First 16 bits (15:0) of the row number of the memory error location. This field is valid if either “Row Valid” or “Extended Row Bit 16 and 17” Validation Bits at Offset 0 is set to 1..
Column	44	2	The column number of the memory error location.
Bit Position	46	2	The bit position at which the memory error occurred.
Requestor ID	48	8	Hardware address of the device that initiated the transaction that took the error.
Responder ID	56	8	Hardware address of the device that responded to the transaction.
Target ID	64	8	Hardware address of the intended target of the transaction.
Memory Error Type	72	1	Identifies the type of error that occurred: 0 - Unknown 1 - No error 2 - Single-bit ECC 3 - Multi-bit ECC 4 - Single-symbol ChipKill ECC 5 - Multi-symbol ChipKill ECC 6 - Master abort 7 - Target abort 8 - Parity Error 9 - Watchdog timeout 10 - Invalid address 11 - Mirror Broken 12 - Memory Sparing 13 - Scrub corrected error 14 - Scrub uncorrected error 15 - Physical Memory Map-out event All other values reserved.

Table N.31 – continued from previous page

Extended	73	1	Bit 0 - Bit 16 of the row number of the memory error location. - This field is valid if “Extended Row Bit 16 and 17” Validation Bits at Offset 0 is set to 1. Bit 1 - Bit 17 of the row number of the memory error location. - This field is valid if “Extended Row Bit 16 and 17” Validation Bits at Offset 0 is set to 1. Bit 4:2 - Reserved Bit 7:5 - Chip Identification.
Rank Number	74	2	The Rank number of the memory error location.
Card Handle	76	2	If bit 16 in Validation Bits is 1, this field contains the SMBIOS handle for the Type 16 Memory Array Structure that represents the memory card.
Module Handle	78	2	If bit 17 in Validation Bits is 1, this field contains the SMBIOS handle for the Type 17 Memory Device Structure that represents the Memory Module.

N.2.6 Memory Error Section 2

Type: { 0x61EC04FC, 0x48E6, 0xD813, { 0x25, 0xC9, 0x8D, 0xAA, 0x44, 0x75, 0x0B, 0x12 } };

Table N.32: Memory Error Record 2

Mnemonic	**Byte Offset**	**Byte Length**	**Description**

Table N.32 – continued from previous page

Validation Bits	0	8	Indicates which fields in the memory error record are valid. Bit 0 - Error Status Valid Bit 1 - Physical Address Valid Bit 2 - Physical Address Mask Valid Bit 3 - Node Valid Bit 4 - Card Valid Bit 5 - Module Valid Bit 6 - Bank Valid (When Bank is addressed via group/address, refer to Bit 20 and 21) Bit 7 - Device Valid Bit 8 - Row Valid Bit 9 - Column Valid Bit 10 - Rank Valid Bit 11 - Bit Position Valid Bit 12 - Chip Identification Valid Bit 13 - Memory Error Type Valid Bit 14 - Status Valid Bit 15 - Requestor ID Valid Bit 16 - Responder ID Valid Bit 17 - Target ID Valid Bit 18 - Card Handle Valid Bit 19 - Module Handle Valid Bit 20 - Bank Group Valid Bit 21 - Bank Address Valid Bit 22-63 Reserved
Error Status	8	8	Memory error status information. See See *Error Status* for error status details.
Physical Address	16	8	The physical address at which the memory error occurred.
Physical Address Mask	24	8	Defines the valid address bits in the Physical Address field. The mask specifies the granularity of the physical address which is dependent on the hardware implementation factors such as interleaving.
Node	32	2	In a multi-node system, this value identifies the node containing the memory in error.
Card	34	2	The card number of the memory error location.
Module	36	2	The module number of the memory error location. (NODE, CARD, and MODULE should provide the information necessary to identify the failing FRU).
Bank	38	2	The bank number of the memory associated with the error. When Bank is addressed via group/address (e.g., DDR4) Bit 7:0 - Bank Address Bit 15:8 - Bank Group
Device	40	4	The device number of the memory associated with the error.
Row	44	4	The row number of the memory error location.
Column	48	4	The column number of the memory error location.
Rank	52	4	The rank number of the memory error location.
Bit Position	56	4	The bit position at which the memory error occurred.

continues on next page

Table N.32 – continued from previous page

Chip Identification	60	1	The Chip Identification. This is an encoded field used to address the die in 3DS packages.
Memory Error Type	61	1	Identifies the type of error that occurred: 0 - Unknown 1 - No error 2 - Single-bit ECC 3 - Multi-bit ECC 4 - Single-symbol ChipKill ECC 5 - Multi-symbol ChipKill ECC 6 - Master abort 7 - Target abort 8 - Parity Error 9 - Watchdog timeout 10 - Invalid address 11 - Mirror Broken 12 - Memory Sparing 13 - Scrub corrected error 14 - Scrub uncorrected error 15 - Physical Memory Map-out event All other values reserved. 16 - 255 Reserved
Status	62	1	Bit 0: If set to 0, the memory error is corrected; if set to 1, the memory error is uncorrected Bit 1-7: Reserved values are 0
Reserved	63	1	Reserved values are 0
Requestor ID	64	8	Hardware address of the device that initiated the transaction that took the error.
Responder ID	72	8	Hardware address of the device that responded to the transaction.
Target ID	80	8	Hardware address of the intended target of the transaction.
Card Handle	88	4	This field contains the SMBIOS handle for the Type 16 Memory Array Structure that represents the memory card.
Module Handle	92	4	This field contains the SMBIOS handle for the Type 17 Memory Device Structure that represents the Memory Module.

N.2.7 PCI Express Error Section

Type: {0xD995E954, 0xBBC1, 0x430F, {0xAD, 0x91, 0xB4, 0x4D, 0xCB, 0x3C, 0x6F, 0x35}}

Table N.33: PCI Express Error Record

Mnemonic	Byte Offset	Byte Length	Description
Validation Bits	0	8	Indicates which of the following fields is valid: Bit 0 -Port Type Valid Bit 1 - Version Valid Bit 2 - Command Status Valid Bit 3 - Device ID Valid Bit 4 - Device Serial Number Valid Bit 5 - Bridge Control Status Valid Bit 6 - Capability Structure Status Valid Bit 7 - AER Info Valid Bit 8-63 - Reserved
Port Type	8	4	PCIe Device/Port Type as defined in the PCI Express capabilities register: 0: PCI Express End Point 1: Legacy PCI End Point Device 4: Root Port 5: Upstream Switch Port 6: Downstream Switch Port 7: PCI Express to PCI/PCI-X Bridge 8: PCI/PCI-X to PCI Express Bridge 9: Root Complex Integrated Endpoint Device 10: Root Complex Event Collector
Version	12	4	PCIe Spec. version supported by the platform: Byte 0-1: PCIe Spec. Version Number • Byte0: Minor Version in BCD • Byte1: Major Version in BCD Byte2-3: Reserved
Command Status	16	4	Byte0-1: PCI Command Register Byte2-3: PCI Status Register
Reserved	20	4	Must be zero

continues on next page

Table N.33 – continued from previous page

Device ID	24	16	PCIe Root Port PCI/bridge PCI compatible device number and bus number information to uniquely identify the root port or bridge. Default values for both the bus numbers is zero. Byte 0-1: Vendor ID Byte 2-3: Device ID Byte 4-6: Class Code Byte 7: Function Number Byte 8: Device Number Byte 9-10: Segment Number Byte 11: Root Port/Bridge Primary Bus Number or device bus number Byte 12: Root Port/Bridge Secondary Bus Number Byte 13-14: Bit0:2: Reserved Bit3:15 Slot Number Byte 15 Reserved
Device Serial Number	40	8	Byte 0-3: PCIe Device Serial Number Lower DW Byte 4-7: PCIe Device Serial Number Upper DW
Bridge Control Status	48	4	This field is valid for bridges only. Byte 0-1: Bridge Secondary Status Register Byte 2-3: Bridge Control Register
Capability Structure	52	60	PCIe Capability Structure. - The 60-byte structure is used to report device capabilities. This structure is used to report the 36-byte PCIe 1.1 Capability Structure (See Figure 7-9 of the PCI Express Base Specification, Rev 1.1) with the last 24 bytes padded. - This structure is also used to report the 60-byte PCIe 2.0 Capability Structure (See Figure 7-9 of the PCI Express 2.0 Base Specification.) - The fields in the structure vary with different device types. - The “Next CAP pointer” field should be considered invalid and any reserved fields of the structure are reserved for future use. Note that PCIe devices without AER (PCI e_AER_INFO_STRUCT_VALID_BIT=0) may report status using this structure.
AER Info	112	96	PCIe Advanced Error Reporting Extended Capability Structure.

N.2.8 PCI/PCI-X Bus Error Section

Type: {0xC5753963, 0x3B84, 0x4095, {0xBF, 0x78, 0xED, 0xDA, 0xD3, 0xF9, 0xC9, 0xDD}}

Table N.34: PCI/PCI-X Bus Error Section

Mnemonic	Byte Offset	Byte Length	Description
Validation Bits	0	8	Indicates which of the following fields is valid: Bit 0 -Error Status Valid Bit 1 - Error Type Valid Bit 2 - Bus Id Valid Bit 3 - Bus Address Valid Bit 4 - Bus Data Valid Bit 5 - Command Valid Bit 6 - Requestor Id Valid Bit 7 - Completer Id Valid Bit 8 - Target Id Valid Bit 9-63 Reserved
Error Status	8	8	PCI Bus Error Status. See See *Error Status* for details.
Error Type	16	2	PCI Bus error Type Byte 0: 0 - Unknown or OEM system specific error 1 - Data Parity Error 2 - System Error 3 - Master Abort 4 - Bus Timeout or No Device Present (No DEVSEL#) 5 - Master Data Parity Error 6 - Address Parity Error 7 - Command Parity Error Others - Reserved Byte 1: Reserved
Bus Id	18	2	Bits 0:7 - Bus Number Bits 8:15 - Segment Number
Reserved	20	4	
Bus Address	24	8	Memory or I/O address on the bus at the time of the error.
Bus Data	32	8	Data on the PCI bus at the time of the error.
Bus Command	40	8	Bus command or operation at the time of the error. Byte 7: Bits 7-1: Reserved (should be zero) Byte 7: Bit 0: If 0, then the command is a PCI command. If 1, the command is a PCI-X command.

continues on next page

Table N.34 – continued from previous page

Bus Requestor Id	48	8	PCI Bus Requestor Id.
Bus Completer Id	56	8	PCI Bus Responder Id.
Target Id	64	8	PCI Bus intended target identifier.

N.2.9 PCI/PCI-X Component Error Section

Type: {0xEB5E4685, 0xCA66, 0x4769, {0xB6, 0xA2, 0x26, 0x06, 0x8B, 0x00, 0x13, 0x26}}

Table N.35: PCI/PCI-X Component Error Section

Mnemonic	**Byte Offset**	**Byte Length**	**Description**
Validation Bits	0	8	Indicate which fields are valid: Bit 0 - Error Status Valid Bit 1 - Id Info Valid Bit 2 - Memory Number Valid Bit 3 - IO Number Valid Bit 4 - Register Data Pair Valid Bit 5-63 Reserved
Error Status	8	8	PCI Component Error Status. See *Error Status* for details.
Id Info	16	16	Identification Information: Bytes 0-1: Vendor Id Bytes 1-2: Device Id Bytes 4-6: Class Code Byte 7: Function Number Byte 8: Device Number Byte 9: Bus Number Byte 10: Segment Number Bytes 11-15: Reserved
Memory Number	32	4	Number of PCI Component Memory Mapped register address/data pair values present in this structure.
IO Number	36	4	Number of PCI Component Programmed IO register address/data pair values present in this structure.
Register Data Pairs	40	2x8xN	An array of address/data pair values. The address and data information may be from 2 to 8 bytes of actual data represented in the 8 byte array locations.

N.2.10 Firmware Error Record Reference

Type: {0x81212A96, 0x09ED, 0x4996, {0x94, 0x71, 0x8D, 0x72, 0x9C, 0x8E, 0x69, 0xED}}

Table N.36: Firmware Error Record Reference

Mnemonic	**Byte Offset**	**Byte Length**	**Description**
Firmware Error Record Type	0	1	Identifies the type of firmware error record that is referenced by this section: 0: IPF SAL Error Record 1: SOC Firmware error record Type1 is reserved and used by Legacy CrashLog support 2: SOC Firmware error record Type2 All other values reserved
Revision	1	1	Indicates the Header Revision. For this Revision of the specification value is 2.
Reserved	1	7	Must be zero.
Record Identifier	8	8	This value uniquely identifies the firmware error record referenced by this section. This value may be used to retrieve the referenced firmware error record using means appropriate for the error record type. **Note**: value is ignored for Revision >=1 of the header and must be set to **NULL**.
Record identifier GUID extension	16	16	This value uniquely identifies the firmware error record referenced by this section. This value may be used to retrieve the referenced firmware error record using means appropriate for the error record type. **Note**: in case if Error Record Type == 2 then this filed indicates the GUID. For Error Record Type 0 and Type 1 this field is ignored.

N.2.11 DMAr Error Sections

The DMAr error sections are divided into two different components as described below:

DMAr Generic Error Section:

This section holds information about DMAr errors in a generic form and will be common across all DMAr unit architectures.

Architecture specific DMAr Error Section:

This section consists of DMA remapping errors specific to the architecture. In addition, certain state information of the DMAr unit is captured at the time of error. This section is unique for each DMAr architecture (VT-d, IOMMU).

N.2.11.1 DMAr Generic Error Section

Type: {0x5B51FEF7, 0xC79D, 0x4434, {0x8F, 0x1B, 0xAA, 0x62, 0xDE, 0x3E, 0x2C, 0x64}}

Table N.37: DMAr Generic Errors

Mnemonic	**Byte Offset**	**Byte Length**	**Description**
Requester-ID	0	2	Device ID associated with a fault condition
Segment Number	2	2	PCI segment associated with a device
Fault Reason	4	1	1h: Domain mapping table entry is not present 2h: Invalid domain mapping table entry 3h: DMAr unit's attempt to access the domain mapping table resulted in an error 4h: Reserved bit set to non-zero value in the domain mapping table 5h: DMA request to access an address beyond the device address width 6h: Invalid read or write access 7h: Invalid device request 8h: DMAr unit's attempt to access the address translation table resulted in an error 9h: Reserved bit set to non-zero value in the address translation table Ah: Illegal command error Bh: DMAr unit's attempt to access the command buffer resulted in an error Other values are reserved
Access Type	5	1	0h: DMA Write 1h: DMA Read Other values are reserved
Address Type	6	1	0h: Untranslated request 1h: Translation request Other values are reserved
Architecture Type	7	1	1h: VT-d architecture 2h: IOMMU architecture Other values are reserved
Device Address	8	8	This field contains the 64-bit device virtual address in the faulted DMA request.
Reserved	16	16	Must be 0

N.2.11.2 Intel® VT for Directed I/O specific DMAr Error Section

Type: {0x71761D37, 0x32B2, 0x45cd, {0xA7, 0xD0, 0xB0, 0xFE 0xDD, 0x93, 0xE8, 0xCF}} All fields in this error section are specific to Intel's VT-d architecture. This error section has a fixed size.

Table N.38: Intel® VT for Directed I/O specific DMAr Errors

Mnemonic	Byte Offset	Byte Length	Description
Version	0	1	Value of version register as defined in VT-d architecture
Revision	1	1	Value of revision field in VT-d specific DMA remapping reporting structure
OemId	2	6	Value of OEM ID field in VT-d specific DMA remapping reporting structure
Capability	8	8	Value of capability register in VT-d architecture
Extended Capability	16	8	Value of extended capability register in VT-d architecture
Global Command	24	4	Value of Global Command register in VT-d architecture programmed by the operating system
Global Status	28	4	Value of Global Status register in VT-d architecture
Fault Status	32	4	Value of Fault Status register in VT-d architecture
Reserved	36	12	Must be 0
Fault record	48	16	Fault record as defined in the VT-d specification
Root Entry	64	16	Value from the root entry table for the given requester-ID
Context Entry	80	16	Value from the context entry table for the given requester-ID.
Level 6 Page Table Entry	96	8	PTE entry for device virtual address in page level 6
Level 5 Page Table Entry	104	8	PTE entry for device virtual address in page level 5
Level 4 Page Table Entry	112	8	PTE entry for device virtual address in page level 4
Level 3 Page Table Entry	120	8	PTE entry for device virtual address in page level 3
Level 2 Page Table Entry	128	8	PTE entry for device virtual address in page level 2.
Level 1 Page Table Entry	136	8	PTE entry for device virtual address in page level 1

N.2.11.3 IOMMU Specific DMAr Error Section

Type: {0x036F84E1, 0x7F37, 0x428c, {0xA7, 0x9E, 0x57, 0x5F, 0xDF, 0xAA, 0x84, 0xEC}}

All fields in this error record are specific to AMD's IOMMU specification. This error section has a fixed size.

Table N.39: IOMMU-specific DMAr Errors

Mnemonic	Byte Offset	Byte Length	Description
Revision	0	1	Specifies the IOMMU specification revision
Reserved	1	7	Must be 0
Control	8	8	IOMMU control register
Status	16	8	IOMMU status register
Reserved	24	8	Must be 0

continues on next page

Table N.39 – continued from previous page

Event Log Entry	32	16	IOMMU fault related event log entry as defined in the IOMMU specification
Reserved	48	16	Must be 0
Device Table Entry	64	32	Value from the device table for a given Requester ID
Level 6 Page Table Entry	96	8	PTE entry for device virtual address in page level 6
Level 5 Page Table Entry	104	8	PTE entry for device virtual address in page level 5
Level 4 Page Table Entry	112	8	PTE entry for device virtual address in page level 4
Level 3 Page Table Entry	120	8	PTE entry for device virtual address in page level 3
Level 2 Page Table Entry	128	8	PTE entry for device virtual address in page level 2
Level 1 Page Table Entry	136	8	PTE entry for device virtual address in page level 1

N.2.12 CCIX PER Log Error Section

Type:{0x91335EF6, 0xEBFB, 0x4478, {0xA6, 0xA6, 0x88, 0xB7, 0x28, 0xCF, 0x75, 0xD7}}

Table N.40: CCIX PER Log Error Record

Mnemonic	**Byte Offset**	**Byte Length**	**Description**
Length	0	4	Length in bytes for entire structure.
Validation Bits	4	8	Indicates which of the following fields is valid: Bit 0 - CCIX Source ID Valid Bit 1 - CCIX Port ID Valid Bit 2 - CCIX PER Log Valid Bit 3-63 - Reserved
CCIX Source ID	12	1	If the agent type is an HA, SA, or RA: This field indicates the CCIX Agent ID of the component that reported this error. In this case bits 7:6 must be zero, since Agent ID is only 6 bits. Otherwise, this field this specifies the CCIX Device ID (i.e. in the case of Port, CCIX Link, or device errors).
CCIX Port ID	13	1	This field indicates the CCIX Port ID that reported this error. Bits 7:5 must be zero, since CCIX Port ID is only 5 bits.
Reserved	14	2	Must be zero.

continues on next page

Table N.40 – continued from previous page

CCIX PER Log	16	20…n	DWORD (32-bit) entries in CCIX PER Log Structure, as described in Section 7.3.2 of the CCIX Base Specification - Revision 1.0. **NOTE**: The Per Log Structure contains a header describing the number of DWORDs in the error record.

N.2.13 Compute Express Link (CXL) Protocol Error Section

Type: { 0x80B9EFB4, 0x52B5, 0x4DE3, { 0xA7, 0x77, 0x68, 0x78, 0x4B, 0x77, 0x10, 0x48 } }

Table N.41: CXL Protocol Error Section

Mnemonic	Byte Offset	Byte Length	Description
Validation Bits	0	8	Indicates which of the following fields is valid: Bit 0 - CXL Agent Type field is valid Bit 1 - CXL Agent Address field is valid Bit 2 - Device ID field is valid Bit 3 - Device Serial Number field is valid Bit 4 - Capability Structure field is valid Bit 5 - CXL DVSEC field is valid Bit 6 - CXL Error Log field is valid Bits 7:63 - Reserved
CXL Agent Type	8	1	0 - This error was detected by a CXL 1.1 device 1 - This error was detected by a CXL 1.1 host downstream port 2 - This error was detected by CXL 2.0 device 3 - This error was detected by CXL 2.0 Logical Device 4 - This error was detected by CXL 2.0 Fabric Manager managed Logical device 5 - This error was detected by CXL 2.0 Root Port 6 - This error was detected by CXL 2.0 Downstream Switch Port 7 - This error was detected by CXL 2.0 Upstream Switch Port 8-255 - Reserved In this table, the term “CXL Device” is used to refer to CXL 1.1 Device, CXL 2.0 Device, CXL 2.0 Logical Device or a CXL 2.0 Fabric Manager Managed Logical Device. In this table, the term “CXL Port” is used to refer to CXL 1.1 host downstream port, CXL Root Port, CXL Downstream Switch Port and Upstream Switch Port.
Reserved	9	7	Must be zero

continues on next page

Table N.41 – continued from previous page

CXL Agent Address	16	8	If this CXL agent is a CXL device, CXL Root Port, CXL Downstream Switch Port or CXL Upstream Switch Port, then the PCIe compatible device/function number, bus number, and segment number information are used to uniquely identify the Component: Byte 0 - Function number Byte 1 - Device number Byte 2 - Bus number Bytes 3-4 - Segment number Bytes 5-7 - Reserved If CXL agent is a CXL 1.1 host downstream port: Byte 0-7 - CXL Port RCRB Base address
Device ID	24	16	If this CXL agent is a CXL device, CXL Root Port, CXL Downstream Switch Port, or CXL Upstream Switch Port, then this field provides various identifiers for the device: Bytes 0-1: Vendor ID Bytes 2-3: Device ID Bytes 4-5: Subsystem Vendor ID Bytes 6-7: Subsystem Device ID Bytes 8-9: Class Code Byte 10-11: Bits 0-2: Reserved Bits 3-15: Slot Number Byte 12-15: Reserved
Device Serial Number	40	8	If this CXL agent is a CXL device: Byte 0-3: CXL Device Serial Number Lower DW Byte 4-7: CXL Device Serial Number Upper DW

continues on next page

Table N.41 – continued from previous page

Capability Structure	48	60	If this CXL agent is a CXL device, PCIe Capability Structure, CXL Root Port, CXL Downstream Switch Port, or CXL Upstream Switch Port, this is the PCIe Capability Structure of the agent. • The 60-byte structure is used to report device capabilities. This structure is used to report the 36-byte PCIe 1.1 Capability Structure (See Figure 7-9 of the PCI Express Base Specification, Rev 1.1) with the last 24 bytes padded. • This structure is also used to report the 60-byte PCIe 2.0 Capability Structure (See Figure 7-9 of the PCI Express 2.0 Base Specification.) • The fields in the structure vary with different device types. • The "Next CAP pointer" field should be considered invalid and any reserved fields of the structure are reserved for future use. Note that PCIe devices without AER (PCI e_AER_INFO_STRU CT_VALID_BIT=0) may report status using this structure.
CXL DVSEC Length	108	2	The length in bytes of the CXL DVSEC field
CXL Error Log Length	110	2	The length in bytes of the CXL Error Log field
Reserved	112	4	Must be zero
CXL DVSEC	116	Varies	The length of this variable-length structure is defined by the CXL DVSEC Length field. If the CXL agent is a CXL device, this field contains a copy of the CXL Device DVSEC, as defined by the "PCIe DVSEC for Flex Bus Device" structure in the CXL Specification. If the CXL agent is a CXL port, this field contains a copy of the CXL Port DVSEC, as defined by the "CXL DVSEC for Flex Bus Port" structure in the CXL pecification.
CXL Error Log	Varies	Varies	The length of this variable-length structure is defined by the CXL Error Log Length field. For CXL devices and CXL ports, this field contains a copy of the "CXL RAS Capability Structure", as defined in the CXL Specification.

N.2.14 CXL Component Events Section

Refer to the Events Record Format for CXL components in the CXL Specification, Rev 2.0 or later.

- For the Section Type GUID: Refer to the Event Record Identifier field (Offset 0) of the Events Record Format for each CXL component.
- For the CXL Component Event Log: Refer to the Common Event Record field (Offset 16) of the Events Record Format for each CXL component.

Table N.42: CXL Component Event Log Record

Mnemonic	**Byte Offset**	**Byte Length**	**Description**
Length	0	4	Length in bytes for entire structure.
Validation Bits	4	8	Bit 0 - Device ID Valid Bit 1 - Device Serial Number Valid Bit 2 - CXL Component Event Log Valid Bit 3-63 - Reserved
Device ID	12	12	PCIe Device Identifiers of CXL Component: Byte 0-1: Vendor ID Byte 2-3: Device ID Byte 4: Function Number Byte 5: Device Number Byte 6: Bus Number Byte 7-8: Segment Number Byte 9-10: Bit 0:2: Reserved Bit 3:15 Slot Number Byte 11 Reserved
Device Serial Number	24	8	Byte 0-3: PCIe Device Serial Number Lower DW Byte 4-7: PCIe Device Serial Number Upper DW
CXL Component Event Log	32	•	CXL Component Event Log, starting with the Common Event Record field corresponding to the Component specified by the Section Type GUID. The Length of this field may vary.

APPENDIX O — UEFI ACPI DATA TABLE

To prevent ACPI namespace collision, a UEFI ACPI table format is defined. This allows creation of ACPI tables without colliding with tables reserved in the namespace.

Table O.1: UEFI Table Structure

Field	**Byte Length**	**Byte Offset**	**Description**
Header			
Signature	4	0	'UEFI' (0x55, 0x45, 0x46, 0x49). Signature for UEFI drivers that produce ACPI tables.
Length	4	4	Length, in bytes, of the entire UEFI Table
Revision	1	8	1
Checksum	1	9	Entire table must sum to zero.
OEMID	6	10	OEM ID.
OEM Table ID	8	16	For the UEFI Table, the table ID is the manufacture model ID.
OEM Revision	4	24	OEM revision of UEFI table for supplied OEM Table ID.
Creator ID	4	28	Vendor ID of utility that created the table.
Creator Revision	4	32	Revision of utility that created the table.
Identifier	16	36	This value contains a GUID which identifies the remaining table contents.
DataOffset	2	52	Specifies the byte offset to the remaining data in the UEFI table.
Data	X	DataOffset	Contains the rest of the UEFI table contents

The first use of this UEFI ACPI table format is the SMM Communication ACPI Table. This table describes a special software SMI that can be used to initiate inter-mode communication in the OS present environment by non-firmware agents with SMM code.

NOTE: *The use of the SMM Communication ACPI table is deprecated in UEFI spec. 2.7. This is due to the lack of a use case for inter-mode communication by non-firmware agents with SMM code and support for initiating this form of communication in common OSes.*

Table O.2: SMM Communication ACPI Table.

Field	**Byte Length**	**Byte Offset**	**Description**
Signature	4	0	'UEFI' (0x55, 0x45, 0x46, 0x49) Signature for UEFI drivers that produce ACPI tables.

continues on next page

Table O.2 – continued from previous page

Length	4	4	66+N. Length, in bytes, of the entire Table. N is a length of the optional implementation specific data that can be included in this table.
Revision	1	8	2
Checksum	1	9	Entire table must sum to zero.
OEMID	6	10	OEM ID.
OEM Table ID	8	16	For the UEFI Table, the table ID is the manufacturer model ID.
OEM Revision	4	24	OEM revision of UEFI table for supplied OEM Table ID.
Creator ID	4	28	Vendor ID of utility that created the table.
Creator Revision	4	32	Revision of utility that created the table.
Identifier	16	36	GUID {0xc68ed8e2, 0x9dc6, 0x4cbd, 0x9d, 0x94, 0xdb, 0x65, \ 0xac, 0xc5, 0xc3, 0x32}
DataOffset	2	52	Must be 54 for this version of the specification. Specifies the byte offset of the *SW SMI Number* field, relative to the start of this table. Future expansion may place additional fields between *DataOffset* and *SW SMI Number* , so this offset should always be used to calculate the location of *SW SMI Number* .
SW SMI Number	4	54	Number to write into software SMI triggering port.
Buffer Ptr Address	8	58	Address of the communication buffer pointer. The pointer address (this field) and the pointer value (the actual address of the communication buffer) are 64-bit physical addresses. The creator of this table must initialize pointer value with 0. The communication buffer must begin with the *EFI_SMM_COMM UNICATE_HEADER* defined in the “Related Definitions” section below. The communication buffer must be physically contiguous.
Invocation register	12	66	Generic Address Structure (GAS) which provides the address of a register that must be written to with the address of a communication buffer to invoke a management mode service. Using this method of invocation is optional, and if not present this span of the table should be populated with zeros. See ACPI6.0 “Generic Address Structure”

O.1 Invocation method

There are two methods of invocation provided by this specification:

1. Using invocation register

If the invocation register is non-zero, this then this method takes precedence and the SW SMI number field and DataOffset fields must be ignored. The invocation register entry provides the address of a register that must be written to in order to invoke the SMM service. The caller must write the communication buffer address into the register. This will cause an SMM invocation. Upon return from the SMM service call the value in the register provides a return error codes from the SMM invocation. See PI/SMM Vol 4 version xx.yy *EFI_SMM_COMMUNICATION_PROTOCOL.Communicate* function for valid error codes.

The invocation address field uses generic address structure to specify the register address. GAS allows the address space of the register to be Functional Fixed Hardware (FFH). If this address space is used please refer to CPU architecture specific documentation for ascertaining how the write to the register should be performed. For more details on the GAS format please see the *ACPI Specification* .

Note that for implementations that support concurrent invocation of SMM from multiple processors, the register provided must be a per processor register. In such implementation, the calling execution context must not migrate from one CPU to another between writing to the register, to make the SMM call, and reading the value of the register, to read the error return code.

2. Using the SW SMI number

This method is specific to x86 CPUs .

In order to initiate inter-mode communication OS present agent has to perform the following tasks:

- Prepare communication data buffer that starts with the *EFI_SMM_COMMUNICATE_HEADER* .
- Check the value of the communication buffer pointer (a value at the address specified by the Buffer Ptr Address field). If the pointer's value is zero, update it with the address of the communication buffer. If the pointer's value is non-zero, another inter-mode communication transaction is in progress, and the current communication attempt has to be postponed or canceled.

NOTE: *These steps must be performed as an atomic transaction. For example, on IA-32/x64 platforms this can be done using the CMPXCHG CPU instruction.*

- Generate software SMI using value from the SMM Communication ACPI Table. The actual means of generating the software SMI is platform-specific.
- Set communication buffer pointer's value to zero.

Related Definitions

```
typedef struct {
  EFI_GUID            HeaderGuid;
  UINTN               MessageLength;
  UINT8               Data[ANYSIZE_ARRAY];
}   EFI_SMM_COMMUNICATE_HEADER;
```

HeaderGuid

Allows for disambiguation of the message format. Type *EFI_GUID* is defined in *InstallProtocolInterface()* .

MessageLength

Describes the size of *Data* (in bytes) and does not include the size of the header.

Data

Designates an array of bytes that is *MessageLength* in size

APPENDIX P — HARDWARE ERROR RECORD PERSISTENCE USAGE

The OS determines if a platform implements support for Hardware Error Record Persistence by reading the HwErrRecSupport globally defined variable. If the attempt to read this variable returns EFI_NOT_FOUND (14), then the OS will infer that the platform does not implement Hardware Error Record Persistence. If the attempt to read this variable succeeds, then the OS uses the returned value to determine whether the platform supports Hardware Error Record Persistence. A non-zero value indicates that the platform supports Hardware Error Record Persistence.

P.1 Determining space

To determine the amount of space (in bytes) guaranteed by the platform for saving hardware error records, the OS invokes QueryVariableInfo, setting the HR bit in the Attributes bitmask.

P.2 Saving Hardware error records

To save a hardware error record, the OS invokes SetVariable, supplying EFI_HARDWARE_ERROR_VARIABLE as the VendorGuid and setting the HR bit in the Attributes bitmask. The VariableName will be constructed by the OS by concatenating an index to the string "HwErrRec" (i.e., HwErrRec0001). The index portion of the variable name is determined by reading all of the hardware error record variables currently stored on the platform and choosing an appropriate index value based on the names of the existing variables. The platform saves the supplied Data. If insufficient space is present to store the record, the platform will return EFI_OUT_OF_RESOURCES, in which case, the OS may clear an existing record and retry. A retry attempt may continue to fail with status EFI_OUT_OF_RESOURCES if a reboot is required to coalesce resources after deletion. The OS may only save error records after ExitBootServices is called. Firmware may also use the Hardware Error Record Persistence interface to write error records, but it may only do so before ExitBootServices is called. If firmware uses this interface to write an error record, it must use the VariableName format used by the OS as described above and the error records it creates must contain the firmware's CreatorId. Firmware may overwrite error records whose CreatorId matches the firmware's CreatorId. Firmware may overwrite error records that have been cleared by other components.

During OS initialization, the OS discovers the names of all persisted error record variables by enumerating the current variable names using GetNextVariableName. Having identified the names of all error record variables, the OS will then read and process all of the error records from the store. After the OS processes an error record, it clears the variable if it was the creator of the variable (determined by checking the CreatorId field of the error record).

P.3 Clearing error record variables

To clear error record variables, the OS invokes SetVariable, supplying EFI_HARDWARE_ERROR_VARIABLE as the VendorGuid and setting the HR bit in the Attributes bitmask. The supplied DataSize, and Data parameters will all be set to zero to indicate that the variable is to be cleared. The supplied VariableName identifies which error record variable is to be cleared. The OS may only clear error records after ExitBootServices has been called. The OS itself may only clear error records which it created (e.g. error records whose CreatorId matches that of the OS). However, a management application running on the OS may clear error records created by other components. This enables error records created by firmware or other OSes to be cleared by the currently running OS.

Q.2 Prerequisite Specifications

In general, this specification requires that functionality defined in a number of other existing specifications be present on a system that implements this specification. This specification requires that those specifications be implemented at least to the extent that all the required elements are present.

This specification prescribes the use and extension of previously established industry specification tables whenever possible. The trend to remove runtime call-based interfaces is well documented. The ACPI (Advanced Configuration and Power Interface) specification is an example of new and innovative firmware technologies that were designed on the premise that OS developers prefer to minimize runtime calls into firmware. ACPI focuses on no runtime calls to the BIOS.

Q.2.1 ACPI Specification

The interface defined by the Advanced Configuration and Power Interface (ACPI) Specification is the primary OS runtime interface for IA-32, x64 and Itanium platforms. ACPI fully defines the methodology that allows the OS to discover and configure all platform resources. ACPI allows the description of non-Plug and Play motherboard devices in a plug and play manner. ACPI also is capable of describing power management and hot plug events to the OS. (For more information on ACPI, see "Links to UEFI-Related Documents" (*http://uefi.org/uefi*) under the heading "ACPI"; see also *http://uefi.org/acpi*).

Q.2.2 Additional Considerations for Itanium-BasedPlatforms

Any information or service that is available in Itanium architecture firmware specifications supercedes any requirement in the common supported 32-bit and Itanium architecture specifications listed above. The Itanium architecture firmware specifications (currently the Itanium® System Abstraction Layer Specification and portions of the Intel® Itanium® Architecture Software Developer's Manual, volumes 1-3) define the baseline functionality required for all Itanium architecture platforms. The major addition that UEFI makes to these Itanium architecture firmware specifications is that it defines a boot infrastructure and a set of services that constitute a common platform definition for high-volume Itanium architecture-based systems to implement based on the more generalized Itanium architecture firmware specifications.

The following specifications are the required Intel Itanium architecture specifications for all Itanium architecture-based platforms:

- "Itanium® System Abstraction Layer Specification" heading at "Links to UEFI-Related Documents" (*http://uefi.org/uefi*) .
- "Itanium® Architecture Software Developer's Manual, Volume 1: Application Architecture, Rev. 2.2," heading at "Links to UEFI-Related Documents" (*http://uefi.org/uefi*) .
- "Itanium® Architecture Software Developer's Manual, Volume 2: System Architecture, Rev. 2.2" heading at "Links to UEFI-Related Documents" (*http://uefi.org/uefi*) .
- "Itanium® Architecture Software Developer's Manual, Volume 3: Instruction Set Reference, Rev. 2.2" heading at "Links to UEFI-Related Documents" (*http://uefi.org/uefi*) .

APPENDIX R — GLOSSARY

_ADR

A reserved name in ACPI name space. It refers to an address on a bus that has standard enumeration. An example would be PCI, where the enumeration method is described in the PCI Local Bus specification.

_CRS

A reserved name in ACPI name space. It refers to the current resource setting of a device. A _CRS is required for devices that are not enumerated in a standard fashion. _CRS is how ACPI converts nonstandard devices into Plug and Play devices.

_HID

A reserved name in ACPI name space. It represents a device's plug and play hardware ID and is stored as a 32-bit compressed EISA ID. _HID objects are optional in ACPI. However, a _HID object must be used to describe any device that will be enumerated by the ACPI driver in the OS. This is how ACPI deals with non–Plug and Play devices.

_UID

A reserved name in ACPI name space. It is a serial number style ID that does not change across reboots. If a system contains more than one device that reports the same _HID, each device must have a unique _UID. The _UID only needs to be unique for device that have the exact same _HID value.

ACPI Device Path

A Device Path that is used to describe devices whose enumeration is not described in an industry-standard fashion. These devices must be described using ACPI AML in the ACPI name space; this type of node provides linkage to the ACPI name space.

ACPI

Refers to the Advanced Configuration and Power Interface Specification and to the concepts and technology it discusses. The specification defines a new interface to the system board that enables the operating system to implement operating system-directed power management and system configuration.

Alt-GR Unicode

Represents the character code of a key when the Alt-GR modifier key is held down. This key (A2) in some keyboard layouts is defined as the right alternate key and serves the same function as the left alternate key. However, in many other layouts it is a secondary modifier key similar to shift. For instance, key C1 is equated to the letter a and its Unicode character code in the typical U.K. keyboard is a non-shifted character code of 0x0061. When holding down the Alt-GR key in conjunction with the pressing of key C1, , the value on the same keyboard often produces an á, which is a character code 0x00E1.

Base Code (BC)

The PXE Base Code, included as a core protocol in EFI, is comprised of a simple network stack (UDP/IP) and a few common network protocols (DHCP, Bootserver Discovery, TFTP) that are useful for remote booting machines.

BC

See Base Code (BC)

Big Endian
A memory architecture in which the low-order byte of a multibyte datum is at the highest address, while the high-order byte is at the lowest address. See Little Endian.

BIOS Boot Specification Device Path
A Device Path that is used to point to boot legacy operating systems; it is based on the BIOS Boot Specification, Version 1.01.

BIOS Parameter Block (BPB)
The first block (sector) of a partition. It defines the type and location of the FAT File System on a drive.

BIOS
Basic Input/Output System. A collection of low-level I/O service routines.

Block I/O Protocol
A protocol that is used during boot services to abstract mass storage devices. It allows boot services code to perform block I/O without knowing the type of a device or its controller.

Block Size
The fundamental allocation unit for devices that support the Block I/O Protocol. Not less than 512 bytes. This is commonly referred to as sector size on hard disk drives.

Boot Device
The Device Handle that corresponds to the device from which the currently executing image was loaded.

Boot Manager
The part of the firmware implementation that is responsible for implementing system boot policy. Although a particular boot manager implementation is not specified in this document, such code is generally expected to be able to enumerate and handle transfers of control to the available OS loaders as well as UEFI applications and drivers on a given system. The boot manager would typically be responsible for interacting with the system user, where applicable, to determine what to load during system startup. In cases where user interaction is not indicated, the boot manager would determine what to load and, if multiple items are to be loaded, what the sequencing of such loads would be.

Block Size
The fundamental allocation unit for devices that support the Block I/O Protocol. Not less than 512 bytes. This is commonly referred to as sector size on disk drives.

Boot Services Table
A table that contains the firmware entry points for accessing boot services functions such as Task Priority Services and Memory Allocation Services. The table is accessed through a pointer in the System Table.

Boot Services Time
The period of time between platform initialization and the call to ExitBootServices(). During this time, UEFI Driver and applications are loaded iteratively and the system boots from an ordered list of EFI OS loaders.

Boot Services
The collection of interfaces and protocols that are present in the boot environment. The services minimally provide an OS loader with access to platform capabilities required to complete OS boot. Services are also available to drivers and applications that need access to platform capability. Boot services are terminated once the operating system takes control of the platform.

BPB
See BIOS Parameter Block (BPB).

BTT
Block Translation Table: A software mechanism for adding single block write atomicity to any Block Mode ranges or byte-addressable Persistent Memory ranges.

Callback

Target function which augments the Forms Processor's ability to evaluate or process configuration settings. Callbacks are not available when the Forms Processor is operating in a Disconnected state.

CIM
See Common Information Model (CIM).

Cluster
A collection of disk sectors. Clusters are the basic storage units for disk files. See File Allocation Table (FAT).

COFF
Common Object File Format, a standard file format for binary images.

Coherency Domain

(1) The global set of resources that is visible to at least one processor in a platform.

(2) The address resources of a system as seen by a processor. It consists of both system memory and I/O space.

Common Information Model (CIM)
An object-oriented schema defined by the DMTF. CIM is an information model that provides a common way to describe and share management information enterprise-wide.

Console I/O Protocol
A protocol that is used during Boot Services to handle input and output of text-based information intended for the system administrator. It has two parts, a Simple Input Protocol that is used to obtain input from the ConsoleIn device and a Simple Text Output Protocol that is used to control text-based output devices. The Console I/O Protocol is also known as the EFI Console I/O Protocol.

ConsoleIn
The device handle that corresponds to the device used for user input in the boot services environment. Typically the system keyboard.

ConsoleOut
The device handle that corresponds to the device used to display messages to the user from the boot services environment. Typically a display screen.

DBCS
Double Byte Character Set.

Desktop Management Interface (DMI)

A platform management information framework, built by the DMTF and designed to provide manageability for desktop and server computing platforms by providing an interface that is:

(1) independent of any specific desktop operating system, network operating system, network protocol, management protocol, processor, or hardware platform;

(2) easy for vendors to implement; and

(3) easily mapped to higher-level protocols.

DMTF (formerly Desktop Management Task Force)
The DMTF is a standards organization comprised of companies from all areas of the computer industry. DMTF creates open manageability standards spanning diverse emerging and traditional IT infrastructures including cloud, virtualization, network, servers and storage.

Device Handle
A handle points to a list of one or more protocols that can respond to requests for services for a given device referred to by the handle.

Device I/O Protocol
A protocol that is used during boot services to access memory and I/O. Also called the EFI Device I/O Protocol.

Device Path Instance

When an environment variable represents multiple devices, it is possible for a device path to contain multiple device paths. An example of this would be the ConsoleOut environment variable that consists of both a VGA console and a serial output console. This environment variable would describe a console output stream that would send output to both devices and therefore has a Device Path that consists of two complete device paths. Each of these paths is a device path instance.

Device Path Node

A variable-length generic data structure that is used to build a device path. Nodes are distinguished by type, subtype, length, and path-specific data. See Device Path.

Device Path Protocol

A protocol that is used during boot services to provide the information needed to construct and manage Device Paths. Also called the EFI Device Path Protocol.

Device Path

A variable-length binary data structure that is composed of variable-length generic device path nodes and is used to define the programmatic path to a logical or physical device. There are six major types of device paths: Hardware Device Path, ACPI Device Path, Messaging Device Path, Media Device Path, BIOS Boot Specification Device Path, and End of Hardware Device Path.

DHCP

See Dynamic Host Configuration Protocol (DHCP).

Disconnected

The state when a Forms Processor is manipulating a form set without being connected to the Target's pre-OS environment. For example, after booting an OS, a Forms Processor cannot execute call-backs or read the configuration settings. For example, when running a Forms Browser while on a remote machine that is not connected to the Target. In these cases, the Forms Processor has limited knowledge of the Target's current configuration settings and limited or no ability to use call-backs.

Disk I/O Protocol

A protocol that is used during boot services to abstract Block I/O devices to allow non-block-sized I/O operations. Also called the EFI Disk I/O Protocol.

DMI

See DBCS.

DMTF

See DMTF (formerly Desktop Management Task Force).

DNS

Domain Name System. A protocol used manipulating and translating hostname and IP address

DTLS

Datagram Transport Layer Security. A protocol to provide communication privacy above UDP.

Dynamic Host Configuration Protocol (DHCP)

A protocol that is used to get information from a configuration server. DHCP is defined by the DMTF (formerly Desktop Management Task Force), not EFI.

EAP

Extensible Authentication Protocol. An authentication framework which supports multiple authentication methods

EBC Image

Executable EBC image following the PE32 file format.

EBC

See EFI Byte Code (EBC).

EFI
Extensible Firmware Interface. An interface between the operating system (OS) and the platform firmware.

EFI Byte Code (EBC)
The binary encoding of instructions as output by the EBC C compiler and linker. The EBC Image is executed by the interpreter.

EFI File
A container consisting of a number of blocks that holds an image or a data file within a file system that complies with this specification.

EFI Hard Disk
A hard disk that supports the new EFI partitioning scheme (GUID Partition).

EFI-compliant
Refers to a platform that complies with this specification.

EFI-conformant
See EFI-compliant.

End of Hardware Device Path
A Device Path which, depending on the subtype, is used to indicate the end of the Device Path instance or Device Path structure.

Enhanced Mode (EM)
The 64-bit architecture extension that makes up part of the Intel® Itanium® architecture.

Event Services
The set of functions used to manage events. Includes EFI_BOOT_SERVICES.CheckEvent(), EFI_BOOT_SERVICES.CreateEvent(), EFI_BOOT_SERVICES.CloseEvent(), EFI_BOOT_SERVICES.SignalEvent(), and EFI_BOOT_SERVICES.WaitForEvent().

Event
An EFI data structure that describes an “event”—for example, the expiration of a timer.

Event Services
The set of functions used to manage events.Includes EFI_BOOT_SERVICES.CheckEvent(), EFI_BOOT_SERVICES.CreateEvent(), EFI_BOOT_SERVICES.CloseEvent(), EFI_BOOT_SERVICES.SignalEvent(), and EFI_BOOT_SERVICES.WaitForEvent().

FAT File System
The file system on which the EFI File system is based. See File Allocation Table (FAT) and GUID Partition Table (GPT).

FAT
See File Allocation Table (FAT).

File Allocation Table (FAT)
A table that is used to identify the clusters that make up a disk file. File allocation tables come in three flavors: FAT12, which uses 12 bits for cluster numbers; FAT16, which uses 16 bits; and FAT32, which allots 32 bits but only uses 28 (the other 4 bits are reserved for future use).

File Handle Protocol
A component of the File System Protocol. It provides access to a file or directory. Also called the EFI File Handle Protocol.

File System Protocol
A protocol that is used during boot services to obtain file-based access to a device. It has two parts, a Simple File System Protocol that provides a minimal interface for file-type access to a device, and a File Handle Protocol that provides access to a file or directory.

Firmware
Any software that is included in read-only memory (ROM).

Font
A graphical representation corresponding to a character set, in this case Unicode. For more information and examples, see https://en.wikipedia.org/wiki/Font.

Font glyph
The individual elements of a font corresponding to single characters are called font glyphs or simply glyphs. The first character in each of the above three lines is a glyph for the letter "A" in three different fonts.

Form
Logical grouping of questions with a unique identifier.

Form Set
An HII database package describing a group of forms, including one parent form and zero or more child forms.

Forms Browser
A Forms Processor capable of displaying the user-interface information a display and interacting with a user.

Forms Processor
An application capable of reading and processing the forms data within a forms set.

Globally Unique Identifier (GUID)
A 128-bit value used to differentiate services and structures in the boot services environment. The format of a GUID is defined in Appendix A. See Protocol.

Glyph
The individual elements of a font corresponding to single characters. May also be called font keyboard layout glyphs. Also see font glyph above.

GPT
See GUID Partition Table (GPT).

GPT disk layout:
The data layout on a disk consisting of a protective MBR in LBA 0, a GPT Header in LBA 1, and additional GPT structures and partitions in the remaining LBAs. See chapter 5.

GPTHeader
The header in a GUID Partition Table (GPT). Among other things, it contains the number of GPT Partition Entries and the first and last LBAs that can be used for the entries.

GPT Partition Entry
A data structure that characterizes a Partition in the GPT disk layout. Among other things, it specifies the starting and ending LBA of the partition.

GUID Partition Table (GPT)
A data structure that describes one or more partitions. It consists of a GPTHeader and, typically, at least one GPTPartition Entry. There are two GUID partition tables: the Primary Partition Table (located in LBA 1 of the disk) and a Backup Partition Table (located in the last LBA of the disk). The Backup Partition Table is a copy of the Primary Partition Table.

GPTPartition Entry
A data structure that characterizes a GUID Partition. Among other things, it specifies the starting and ending LBA of the partition.

GUID Partition
A contiguous group of sectors on an EFI Hard Disk.

Handle
See Device Handle.

Hardware Device Path
A Device Path that defines how a hardware device is attached to the resource domain of a system (the resource domain is simply the shared memory, memory mapped I/O, and I/O space of the system).

HII
Human Interface Infrastructure.

HII Database
The centralized repository for HII-related information, organized as package lists.

HTML
Hypertext Markup Language. A particular implementation of SGML focused on hypertext applications. HTML is a fairly simple language that enables the description of pages (generally Internet pages) that include links to other pages and other data types (such as graphics). When applied to a larger world, HTML has many shortcomings, including localization (q.v.) and formatting issues. The HTML form concept is of particular interest to this application.

HTTP
Hypertext transfer protocol. HTTP functions as request-response protocol in the client-server computing rule.

IA-32
See Intel® Architecture-32 (IA-32).

IFR
Internal Form Representation. Used to represent forms in EFI so that it can be interpreted as is or expanded easily into XHTML.

Image Handle
A handle for a loaded image; image handles support the loaded image protocol.

Image Handoff State
The information handed off to a loaded image as it begins execution; it consists of the image's handle and a pointer to the image's system table.

Image Header
The initial set of bytes in a loaded image. They define the image's encoding.

Image Services
The set of functions used to manage EFI images. Includes EFI_BOOT_SERVICES.LoadImage(), EFI_BOOT_SERVICES.StartImage(), EFI_BOOT_SERVICES.UnloadImage(), EFI_BOOT_SERVICES.Exit(), EFI_BOOT_SERVICES.ExitBootServices(), and EFI_IMAGE_ENTRY_POINT.

Image

1. An executable file stored in a file system that complies with this specification. Images may be drivers, applications or OS loaders. Also called an EFI Image.
2. Executable binary file containing EBC and data. Output by the EBC linker.

IME
Input Method Editor. A program or subprogram that is used to map keystrokes to logographic characters. For example, IMEs are used (possibly with user intervention) to map the Kana (Hirigana or Katakana) characters on Japanese keyboards to Kanji.

Intel® Architecture-32 (IA-32)
The 32-bit and 16-bit architecture described in the Intel Architecture Software Developer's Manual. IA-32 is the architecture of the Intel® P6 family of processors, which includes the Intel® Pentium® Pro, Pentium II, Pentium III, and Pentium 4 processors.

Intel® Itanium® Architecture
The Intel architecture that has 64-bit instruction capabilities, new performance-enhancing features, and support

for the IA-32 instruction set. This architecture is described in the Itanium™ Architecture Software Developer's Manual.

internationalization
In this context, is the process of making a system usable across languages and cultures by using universally understood symbols. Internationalization is difficult due to the differences in cultures and the difficulty of creating obvious symbols; for example, why does a red octagon mean "Stop"?

Interpreter
The software implementation that decodes EBC binary instructions and executes them on a VM. Also called EBC interpreter.

Keyboard layout
The physical representation of a user's keyboard. The usage of this is in conjunction to a structure that equates the physical key(s) and the associated action it represents. For instance, key C1 is equated to the letter a and its Unicode value in the typical U.K. keyboard is a non-shifted value of 0x0061.

LAN On Motherboard (LOM)
This is a network device that is built onto the motherboard (or baseboard) of the machine.

LBA:
See Logical Block Address (LBA).

Legacy Platform
A platform which, in the interests of providing backward-compatibility, retains obsolete technology.

LFN
See Long File Names (LFN).

Little Endian
A memory architecture in which the low-order byte of a multibyte datum is at the lowest address, while the high-order byte is at the highest address. See Big Endian.

Load File Protocol
A protocol that is used during boot services to find and load other modules of code.

Loaded Image Protocol
A protocol that is used during boot services to obtain information about a loaded image. Also called the EFI Loaded Image Protocol.

Loaded Image
A file containing executable code. When started, a loaded image is given its image handle and can use it to obtain relevant image data.

Localization
The process of focusing a system in so that it works using the symbols of a language/culture. To a major extent the following design is influenced by the requirements of localization.

Logical Block Address (LBA):
The address of a logical block on a disk. The first LBA on a disk is LBA 0.

Logographic
A character set that uses characters to represent words or parts of words rather than syllables or sounds. Kanji is logographic but Kana characters are not.

LOM
See LAN On Motherboard (LOM).

Long File Names (LFN)
Refers to an extension to the FAT File System that allows file names to be longer than the original standard (eight characters plus a three-character extension).

Machine Check Abort (MCA)
The system management and error correction facilities built into the Intel Itanium processors.

Master Boot Record (MBR)
The data structure that resides on the LBA 0 of a hard disk and defines the partitions on the disk.

MBR
See Master Boot Record (MBR).

MBR boot code:
x86 code in the first LBA of a disk.

MBR disk layout:
The data layout on a disk consisting of an MBR in LBA 0 and partitions described by the MBR in the remaining LBAs. See chapter 5 and Appendix NEW.

MBR Partition Record
A data structure that characterizes a Partition in the MBR disk layout.

MCA
See Machine Check Abort (MCA).

Media Device Path
A Device Path that is used to describe the portion of a medium that is being abstracted by a boot service. For example, a Media Device Path could define which partition on a hard drive was being used.

Memory Allocation Services
The set of functions used to allocate and free memory, and to retrieve the memory map. Includes EFI_BOOT_SERVICES.AllocatePages(), EFI_BOOT_SERVICES.FreePages(), EFI_BOOT_SERVICES.AllocatePool(), EFI_BOOT_SERVICES.FreePool(), and EFI_BOOT_SERVICES.GetMemoryMap().

Memory Map
A collection of structures that defines the layout and allocation of system memory during the boot process. Drivers and applications that run during the boot process prior to OS control may require memory. The boot services implementation is required to ensure that an appropriate representation of available and allocated memory is communicated to the OS as part of the hand-off of control.

Memory Type
One of the memory types defined by UEFI for use by the firmware and UEFI applications. Among others, there are types for boot services code, boot services data, Runtime Services code, and runtime services data. Some of the types are used for one purpose before EFI_BOOT_SERVICES.ExitBootServices() is called and another purpose after.

Messaging Device Path
A Device Path that is used to describe the connection of devices outside the Coherency Domain of the system. This type of node can describe physical messaging information (e.g., a SCSI ID) or abstract information (e.g., networking protocol IP addresses).

Miscellaneous Service
Various functions that are needed to support the EFI environment. Includes EFI_BOOT_SERVICES.InstallConfigurationTable(), ResetSystem(), EFI_BOOT_SERVICES.Stall(), EFI_BOOT_SERVICES.SetWatchdogTimer(), EFI_BOOT_SERVICES.GetNextMonotonicCount(), and GetNextHighMonotonicCount().

MTFTP
See Multicast Trivial File Transfer Protocol (MTFTP).

Multicast Trivial File Transfer Protocol (MTFTP)
A protocol used to download a Network Boot Program to many clients simultaneously from a TFTP server.

Name Space or Namespace
A namespace defines a contiguously-addressed range of Non-Volatile Memory conceptually similar to a SCSI Logical Unit (LUN) or a NVM Express namespace. In general, a collection of device paths; in an EFI Device Path.

Native Code
Low level instructions that are native to the host processor. As such, the processor executes them directly with no overhead of interpretation. Contrast this with EBC, which must be interpreted by native code to operate on a VM.

NBP
See Network Bootstrap Program (NBP) or Network Boot Program.

Network Boot Program
A remote boot image downloaded by a PXE client using the Trivial File Transport Protocol (TFTP) or the Multicast Trivial File Transfer Protocol (MTFTP). See Network Bootstrap Program (NBP).

Network Bootstrap Program (NBP)
This is the first program that is downloaded into a machine that has selected a PXE capable device for remote boot services. A typical NBP examines the machine it is running on to try to determine if the machine is capable of running the next layer (OS or application). If the machine is not capable of running the next layer, control is returned to the EFI boot manager and the next boot device is selected. If the machine is capable, the next layer is downloaded and control can then be passed to the downloaded program. Though most NBPs are OS loaders, NBPs can be written to be standalone applications such as diagnostics, backup/restore, remote management agents, browsers, etc.

Network Interface Card (NIC)
Technically, this is a network device that is inserted into a bus on the motherboard or in an expansion board. For the purposes of this document, the term NIC will be used in a generic sense, meaning any device that enables a network connection - including LOMs and network devices on external buses (USB, 1394, etc.).

NIC
See Network Interface Card (NIC).

Non-spacing key
Typically an accent key that does not advance the cursor and is used to create special characters similar to ÄäÊê. This function is provided only on certain keyboard layouts.

NV
Nonvolatile.

Package
HII information with a unique type, such as strings, fonts, images or forms.

Package List
Group of packages identified by a GUID.

Page Memory
A set of contiguous pages. Page memory is allocated by EFI_BOOT_SERVICES.AllocatePages() and returned by EFI_BOOT_SERVICES.FreePages().

Partition Discovery
The process of scanning a block device to determine whether it contains a Partition.

Partition
A contiguous set of LBAs on a disk, described by the MBR and/or GPT disk layouts.

PC-AT
Refers to a PC platform that uses the AT form factor for their motherboards.

PCI Bus Driver

Software that creates a handle for every PCI Controller on a PCI Host Bus Controller and installs both the PCI I/O Protocol and the Device Path Protocol onto that handle. It may optionally perform PCI Enumeration if resources have not already been allocated to all the PCI Controllers on a PCI Host Bus Controller. It also loads and starts any UEFI drivers found in any PCI Option ROMs discovered during PCI Enumeration. If a driver is found in a PCI Option ROM, the PCI Bus Driver will also attach the Bus Specific Driver Override Protocol to the handle for the PCI Controller that is associated with the PCI Option ROM that the driver was loaded from.

PCI Bus

A collection of up to 32 physical PCI Devices that share the same physical PCI bus. All devices on a PCI Bus share the same PCI Configuration Space.

PCI Configuration Space

The configuration channel defined by PCI to configure PCI Devices into the resource domain of the system. Each PCI device must produce a standard set of registers in the form of a PCI Configuration Header, and can optionally produce device specific registers. The registers are addressed via Type 0 or Type 1 PCI Configuration Cycles as described by the PCI Specification. The PCI Configuration Space can be shared across multiple PCI Buses. On most PC-AT architecture systems and typical Intel® chipsets, the PCI Configuration Space is accessed via I/O ports 0xCF8 and 0xCFC. Many other implementations are possible.

PCI Controller

A hardware components that is discovered by a PCI Bus Driver, and is managed by a PCI Device Driver. PCI Functions and PCI Controller are used equivalently in this document.

PCI Device Driver

Software that manages one or more PCI Controllers of a specific type. A driver will use the PCI I/O Protocol to produce a device I/O abstraction in the form of another protocol (i.e., Block I/O, Simple Network, Simple Input, Simple Text Output, Serial I/O, Load File).

PCI Devices

A collection of up to 8 PCI Functions that share the same PCI Configuration Space. A PCI Device is physically connected to a PCI Buses.

PCI Enumeration

The process of assigning resources to all the PCI Controllers on a given PCI Host Bus Controller. This includes PCI Bus Number assignments, PCI Interrupt assignments, PCI I/O resource allocation, the PCI Memory resource allocation, the PCI Prefetchable Memory resource allocation, and miscellaneous PCI DMA settings.

PCI Functions

A controller that provides some type of I/O services. It consumes some combination of PCI I/O, PCI Memory, and PCI Prefetchable Memory regions, and up to 256 bytes of the PCI Configuration Space. The PCI Function is the basic unit of configuration for PCI.

PCI Host Bus Controller

A chipset component that produces PCI I/O, PCI Memory, and PCI Prefetchable Memory regions in a single Coherency Domain. A PCI Host Bus Controller is composed of one or more PCI Root Bridges.

PCI I/O Protocol

A software interface that provides access to PCI Memory, PCI I/O, and PCI Configuration spaces for a PCI Controller. It also provides an abstraction for PCI Bus Master DMA.

PCI Option ROM

A ROM device that is accessed through a PCI Controller, and is described in the PCI Controller's Configuration Header. It may contain one or more PCI Device Drivers that are used to manage the PCI Controller.

PCI Root Bridge I/O Protocol

A software abstraction that provides access to the PCI I/O, PCI Memory, and PCI Prefetchable Memory regions in a single Coherency Domain.

PCI Root Bridge

A chipset component(s) that produces a physical PCI Local Bus.

PCI Segment

A collection of up to 256 PCI Buses that share the same PCI Configuration Space. PCI Segment is defined in the ACPI Specification as the _SEG object. The SAL_PCI_CONFIG_READ and SAL_PCI_CONFIG_WRITE procedures defined in chapter 9 of the SAL Specification define how to access the PCI Configuration Space in a system that supports multiple PCI Segments. If a system only supports a single PCI Segment the PCI Segment number is defined to be zero. The existence of PCI Segments enables the construction of systems with greater than 256 PCI buses.

Pool Memory

A set of contiguous bytes. A pool begins on, but need not end on, an "8-byte" boundary. Pool memory is allocated in pages—that is, firmware allocates enough contiguous pages to contain the number of bytes specified in the allocation request. Hence, a pool can be contained within a single page or extend across multiple pages. Pool memory is allocated by EFI_BOOT_SERVICES.AllocatePool() and returned by EFI_BOOT_SERVICES.FreePool().

Preboot Execution Environment (PXE)

A means by which agents can be loaded remotely onto systems to perform management tasks in the absence of a running OS. To enable the interoperability of clients and downloaded bootstrap programs, the client preboot code must provide a set of services for use by a downloaded bootstrap. It also must ensure certain aspects of the client state at the point in time when the bootstrap begins executing.

The complete PXE specification covers three areas; the client, the network and the server.

Client

- Makes network devices into bootable devices.
- Provides APIs for PXE protocol modules in EFI and for universal drivers in the OS.

Network

- Uses existing technology: DHCP, TFTP, etc.
- Adds "vendor-specific" tags to DHCP to define PXE-specific operation within DHCP.
- Adds multicast TFTP for high bandwidth remote boot applications.
- Defines Bootserver discovery based on DHCP packet format.

Server

- Bootserver: Responds to Bootserver discovery requests and serves up remote boot images.
- proxyDHCP: Used to ease the transition of PXE clients and servers into existing network infrastructure. proxyDHCP provides the additional DHCP information that is needed by PXE clients and Bootservers without making changes to existing DHCP servers.
- Plug-In Modules: Example proxyDHCP and Bootservers provided in the PXE SDK (software development kit) have the ability to take plug-in modules (PIMs). These PIMs are used to change/enhance the capabilities of the proxyDHCP and Bootservers.

Protocol Handler Services

The set of functions used to manipulate handles, protocols, and protocol interfaces. Includes EFI_BOOT_SERVICES.InstallProtocolInterface(), EFI_BOOT_SERVICES.UninstallProtocolInterface(), EFI_BOOT_SERVICES.ReinstallProtocolInterface(), EFI_BOOT_SERVICES.HandleProtocol(), EFI_BOOT_SERVICES.RegisterProtocolNotify(), EFI_BOOT_SERVICES.LocateHandle(), and EFI_BOOT_SERVICES.LocateDevicePath().

Protocol Handler

A function that responds to a call to a HandleProtocol request for a given handle. A protocol handler returns a protocol interface structure.

Protocol Interface Structure
The set of data definitions and functions used to access a particular type of device. For example, BLOCK_IO is a protocol that encompasses interfaces to read and write blocks from mass storage devices. See Protocol.

Protocol Revision Number
The revision number associated with a protocol. See Protocol.

Protocol
The information that defines how to access a certain type of device during boot services. A protocol consists of a Globally Unique Identifier (GUID), a protocol revision number, and a protocol interface structure. The interface structure contains data definitions and a set of functions for accessing the device. A device can have multiple protocols. Each protocol is accessible through the device's handle.

PXE Base Code Protocol
A protocol that is used to control PXE-compatible devices. It may be used by the firmware's boot manager to support booting from remote locations. Also called the EFI PXE Base Code Protocol.

PXE
See Preboot Execution Environment (PXE).

Question
IFR which describes how a single configuration setting should be presented, stored, and validated.

Read-Only Memory (ROM)
When used with reference to the UNDI specification, ROM refers to a nonvolatile memory storage device on a NIC.

Reset
The action which forces question values to be reset to their defaults.

ROM
See Question.

Runtime Services Table
A table that contains the firmware entry points for accessing runtime services functions such as Time Services and Virtual Memory Services. The table is accessed through a pointer in the System Table.

Runtime Services
Interfaces that provide access to underlying platform specific hardware that may be useful during OS runtime, such as timers. These services are available during the boot process but also persist after the OS loader terminates boot services.

SAL
See System Abstraction Layer (SAL).

scan code
A value representing the location of a key on a keyboard. Scan codes may also encode make (key press) and break (key release) and auto-repeat information.

Serial Protocol
A Protocol that is used during boot services to abstract byte stream devices-that is, to communicate with character-based I/O devices.

SGML
Standard Generalized Markup Language. A markup language for defining markup languages.

shifted Unicode
Shifted Unicode represents the Unicode character code of a key when the shift modifier key is held down. For

instance, key C1 is equated to the letter a and its Unicode character code in the typical U.K. keyboard is a non-shifted value of 0x0061. When the shift key is held down in conjunction with the pressing of key C1, however, the value on the same keyboard often produces an A, which is a the Unicode character code 0x0041.

A Protocol that is used during boot services to abstract byte stream devices—that is, to communicate with character-based I/O devices.

Simple File System Protocol

A component of the File System Protocol. It provides a minimal interface for file-type access to a device.

Simple Input Protocol

A protocol that is used to obtain input from the ConsoleIn device. It is one of two protocols that make up the Console I/O Protocol.

Simple Network Protocol

A protocol that is used to provide a packet-level interface to a network adapter. Also called the EFI Simple Network Protocol.

Simple Text Output Protocol

A protocol that is used to control text-based output devices. It is one of two protocols that make up the Console I/O Protocol.

SKU

Stock keeping unit. An acronym commonly used to reference a “version” of a particular platform. An example might be “We have three different SKUs of this platform.”

SMBIOS

See System Management BIOS (SMBIOS).

SNIA

Storage Network Industry Association.(www.snia.org)

SNIA Common RAID Disk Data Format

Storage Network Industry Association Common RAID Disk Data Format Specification, Revision 1.2, July 28, 2006. (www.snia.org)

SSL

Secure Sockets Layer. A security protocol that provides communications privacy over the Internet. It is predecessor to TLS.

StandardError

The device handle that corresponds to the device used to display error messages to the user from the boot services environment.

Status Codes

Success, error, and warning codes returned by boot services and runtime services functions.

string

A null-terminated array of 16-bit UCS-2 encoded Unicode characters. All strings in this specification are encoded using UCS-2 unless otherwise specified.

Submit

The action which forces modified question values to be written back to storage.

System Abstraction Layer (SAL)

Firmware that abstracts platform implementation differences, and provides the basic platform software interface to all higher level software.

System Management BIOS (SMBIOS)

A table-based interface that is required by the Wired for Management Baseline Specification. It is used to relate platform-specific management information to the OS or to an OS-based management agent.

System Table
Table that contains the standard input and output handles for a UEFI application, as well as pointers to the boot services and runtime services tables. It may also contain pointers to other standard tables such as the ACPI, SMBIOS, and SAL System tables. A loaded image receives a pointer to its system table when it begins execution. Also called the EFI System Table.

Target
The system being configured.

Task Priority Level (TPL)
The boot services environment exposes three task priority levels: “normal,” “callback,” and “notify.”

Task Priority Services
The set of functions used to manipulate task priority levels. Includes EFI_BOOT_SERVICES.RaiseTPL() and EFI_BOOT_SERVICES.RestoreTPL().

TFTP
See Trivial File Transport Protocol (TFTP).

Time Format
The format for expressing time in an EFI-compliant platform. For more information, see Appendix A.

Time Services
The set of functions used to manage time. Includes GetTime(), SetTime(), GetWakeupTime(), and SetWakeupTime().

Timer Services
The set of functions used to manipulate timers. Contains a single function, EFI_BOOT_SERVICES.SetTimer().

TLS
Transport Layer Security. A protocol to provide privacy and data integrity between two communicating applications above TCP.

TPL
See Target.

Trivial File Transport Protocol (TFTP)
A protocol used to download a Network Boot Program from a TFTP server.

UEFI
Unified Extensible Firmware Interface. The interface between the operating system (OS) and the platform firmware defined by this specification.

UEFI Application
Modular code that may be loaded in the boot services environment to accomplish platform specific tasks within that environment. Examples of possible applications might include diagnostics or disaster recovery tools shipped with a platform that run outside the OS environment. UEFI applications may be loaded in accordance with policy implemented by the platform firmware to accomplish a specific task. Control is then returned from the UEFI application to the platform firmware.

UEFI Boot Service Driver
A UEFI driver that is loaded into boot services memory and stays resident until boot services terminate.

UEFI Driver
A module of code typically inserted into the firmware via protocol interfaces. Drivers may provide device support during the boot process or they may provide platform services. It is important not to confuse UEFI drivers with OS drivers that load to provide device support once the OS takes control of the platform.

UEFI OS Loader
A UEFI application that is the first piece of operating system code loaded by the firmware to initiate the OS boot

process. This code is loaded at a fixed address and then executed. The OS takes control of the system prior to completing the OS boot process by calling the interface that terminates all boot services.

UEFI Runtime Services Driver
A UEFI driver that is loaded into runtime services memory and stays resident during runtime.

Unaccepted Memory
Some Virtual Machine platforms, such as AMD SEV-SNP, introduce the concept of memory acceptance, requiring memory to be accepted before it can be used by the guest. This protects against a class of attacks by the virtual machine platform.

UNDI
See Universal Network Device Interface (UNDI).

Unicode Collation Protocol
A protocol that is used during boot services to perform case-insensitive comparisons of strings.

Unicode
An industry standard internationalized character set used for human readable message display.

Universal Network Device Interface (UNDI)
UNDI is an architectural interface to NICs. Traditionally NICs have had custom interfaces and custom drivers (each NIC had a driver for each OS on each platform architecture). Two variations of UNDI are defined in this specification: H/W UNDI and S/W UNDI. H/W UNDI is an architectural hardware interface to a NIC. S/W UNDI is a software implementation of the H/W UNDI.

Universal Serial Bus (USB)
A bi-directional, isochronous, dynamically attachable serial interface for adding peripheral devices such as serial ports, parallel ports, and input devices on a single bus.

URI
Uniform resource identifier. URI is a string of characters used to identify a name of a resource.

USB Bus Driver
Software that enumerates and creates a handle for each newly attached USB Controller and installs both the USB I/O Protocol and the Device Path Protocol onto that handle, starts that device driver if applicable. For each newly detached USB Controller, the device driver is stopped, the USB I/O Protocol and the Device Path Protocol are uninstalled from the device handle, and the device handle is destroyed.

USB Bus
A collection of up to 127 physical USB Devices that share the same physical USB bus. All devices on a USB Bus share the bandwidth of the USB Bus.

USB Controller
A hardware component that is discovered by a USB Bus Driver, and is managed by a USB Device Driver. USB Interface and USB Controller are used equivalently in this document.

USB Device Driver
Software that manages one or more USB Controller of a specific type. A driver will use the USB I/O Protocol to produce a device I/O abstraction in the form of another protocol (i.e., Block I/O, Simple Network, Simple Input, Simple Text Output, Serial I/O, Load File).

USB Device
A USB peripheral that is physically attached to the USB Bus.

USB Enumeration
A periodical process to search the USB Bus to detect if there have been any USB Controller attached or detached. If an attach event is detected, then the USB Controllers device address is assigned, and a child handle is created. If a detach event is detected, then the child handle is destroyed.

USB Host Controller
Moves data between system memory and devices on the USB Bus by processing data structures and generating the USB transactions. For USB 1.1, there are currently two types of USB Host Controllers: UHCI and OHCI.

USB Hub
A special USB Device through which more USB devices can be attached to the USB Bus.

USB I/O Protocol
A software interface that provides services to manage a USB Controller, and services to move data between a USB Controller and system memory.

USB Interface
The USB Interface is the basic unit of a physical USB Device.

USB
See Universal Serial Bus (USB).

Variable Services
The set of functions used to manage variables. Includes GetVariable(), SetVariable(), and GetNextVariableName().

Virtual Memory Services
The set of functions used to manage virtual memory. Includes SetVirtualAddressMap() and ConvertPointer().

VM
The Virtual Machine, a pseudo processor implementation consisting of registers which are manipulated by the interpreter when executing EBC instructions.

Watchdog Timer
An alarm timer that may be set to go off. This can be used to regain control in cases where a code path in the boot services environment fails to or is unable to return control by the expected path.

WfM
See Wired for Management (WfM).

Wired for Management (WfM)
Refers to the Wired for Management Baseline Specification. The Specification defines a baseline for system manageability issues; its intent is to help lower the cost of computer ownership.

x64
Processors that are compatible with instruction sets and operation modes as exemplified by the AMD64 or Intel® Extended Memory 64 Technology (Intel® EM64T) architecture.

XHTML
Extensible HTML. XHTML “will obey all of the grammar rules of XML (properly nested elements, quoted attributes, and so on), while conforming to the vocabulary of HTML (the elements and attributes that are available for use ant their relationships to one another).” [PXML, pg., 153]. Although not completely defined, XHTML is basically the intersection of XML and HTML and does support forms.

XML
Extensible Markup Language. A subset of SGML. Addresses many of the problems with HTML but does not currently (1.0) support forms in any specified way.
